- For a particular SoEMT implementation, that is waiting for a long latency operation, the `CPU_CYCLES` event does not count `Processor cycles`, as the PE thread is not active.

It is IMPLEMENTATION SPECIFIC whether `CPU_CYCLES` event counts `Processor cycles` when the `Effective value` of `PMEVTYPER<n>.MT` bit is 0, the thread is active, and the thread is in WFE or WFI state.

If the `Effective value` of `PMEVTYPER<n>.MT` bit is 1 and at least one thread is not in WFE or WFI state, then the `CPU_CYCLES` event counts each `Processor cycle`, and can only count a maximum of one for each `Processor cycle`.

If the `Effective value` of `PMEVTYPER<n>.MT` bit is 1, then all of the following apply for events that count PE cycles when a condition applies:

- The event does not count `Processor cycles` when all threads are in WFE or WFI state.
- If the event counts PE cycles when a stall condition is true and a second condition is true, then the counter counts `Processor cycles` when the stall condition is true for all of these PEs, and the second condition is true for any of these PEs.
- If the event counts PE cycles when any other condition is true, then the counter counts `Processor cycle` when the condition is true for any of these PEs.
- Otherwise, the event counts by the sum of the count across all of these PEs.

For the stall events, the stall condition means the applicable condition described by the `STALL`, `STALL_FRONTEND`, or `STALL_BACKEND` event. The second condition is any condition in addition to this. For example, for the `STALL_FRONTEND_L1I` event, the stall condition is `STALL_FRONTEND`, and the second condition is when there is a demand instruction miss in the first level of instruction cache. For the `STALL`, `STALL_FRONTEND`, and `STALL_BACKEND` events themselves, the second condition is the null TRUE condition.

Note

The cycle counter, [PMCCNTR](#), is not affected by whether the thread is active or inactive. When enabled, [PMCCNTR](#) counts every processor cycle.

D7.5 Meaningful combinations of common events

The meaningful combinations listed in this section comprise a numerator event and a denominator event.

In many cases, the definition of the numerator event, <EVENT_NUMERATOR>, is defined such that it counts each event <X> counted by the denominator event, <EVENT_DENOMINATOR>, when some condition <COND> is true.

This means that there is a meaningful ratio between between <EVENT_NUMERATOR> and <EVENT_DENOMINATOR> that describes the proportion of <X> counted by <EVENT_DENOMINATOR> for which <COND> applies.

This does not mean that there is a requirement that if <EVENT_NUMERATOR> is implemented that <EVENT_DENOMINATOR> is also implemented.

A *meaningful combination* means that any microarchitectural conditions that affect the counting of events apply equally to all the events. This typically means that they are counted at the same place in the pipeline, so that, for example, they are equally affected by pipeline flushes to discard speculatively executed operations following a mispredicted branch.

The following tables list the highlighted combinations:

- [Table D7-4](#), REFILL events and associated access events.
- [Table D7-5](#), Meaningful combinations of latency events.
- [Table D7-6](#), Cache hit events and associated data source events.
- [Table D7-7](#), Meaningful combinations of cache line state tracking events.
- [Table D7-8](#), Meaningful combinations of at-retirement events.

D7.5.1 Refill events and associated access events

IGSMLS

The following are meaningful combinations of refill events and associated access events:

Table D7-4 Meaningful combinations of refill events and associated access events

Numerator	Denominator	Ratio
0x0001 L1I_CACHE_REFILL	0x0014 L1I_CACHE	Attributable Level 1 instruction cache refill rate
0x0002 L1I_TLB_REFILL	0x0026 L1I_TLB	Attributable Level 1 instruction TLB refill rate

0x00A3 L3D_CACHE_REFILL_WR	0x00A1 L3D_CACHE_WR	Attributable Level 3 data cache refill rate, write

D7.5.2 Latency events

I_{ZHFD}C The following are meaningful combination of latency events:

Table D7-5 Meaningful combinations of latency events

Numerator	Denominator	Ratio
0x8120 INST_FETCH_PERCYC	0x8124 INST_FETCH	Mean duration of instruction fetch events in processor cycles
0x8121 MEM_ACCESS_RD_PERCYC	0x0066 MEM_ACCESS_RD	Mean duration of memory read access events in processor cycles
0x8125, BUS_REQ_RD_PERCYC	0x818D, BUS_REQ_RD	Bus read transaction average latency
0x8128 DTLB_WALK_PERCYC	0x0034 DTLB_WALK	Mean duration of data or unified TLB walk events in processor cycles
0x8129 ITLB_WALK_PERCYC	0x0035 ITLB_WALK	Mean duration of instruction TLB walk events in processor cycles
0x8320, L1D_CACHE_REFILL_PERCYC	0x0003, L1D_CACHE_REFILL	Level 1 data cache refill average duration

D7.5.3 Cache hit events and associated data source events

I_{HMZQ}Y The following are meaningful combination of cache hit events:

Table D7-6 Meaningful combinations of cache hit events and associated data source events

Numerator	Denominator	Ratio
0x820C, L1D_CACHE_HIT_PRFM ^a	0x8142, L1D_CACHE_PRFM ^a	Level 1 data or unified cache software prefetch hit ratio ^a
0x81CC, L1D_CACHE_HIT_RW ^a	0x82A0, MEM_ACCESS_RW	Level 1 data or unified cache demand cache hit rate ^a
0x81CF, LL_CACHE_HIT_RW	0x82A0, MEM_ACCESS_RW	Last level cache demand cache hit rate

Numerator	Denominator	Ratio
0x8232, LOCAL_MEM_RW	0x82A0, MEM_ACCESS_RW	Local memory demand access rate
0x823B, REMOTE_MEM_RW	0x82A0, MEM_ACCESS_RW	Remote memory demand access rate
0x821D, L2D_CACHE_HITM_RW ^a	0x81CD, L2D_CACHE_HIT_RW ^a	Level 2 data or unified cache demand cache hit rate ^a

a. Similar ratios can be defined for other caches.

D7.5.4 Cache line state tracking events

I_{LGBBR}

The following are meaningful combination of cache line stake tracking events:

Table D7-7 Meaningful combinations of cache line state tracking events

Ratio	Meaning
1 - (0x81EC, L1D_CACHE_HIT_RW_FHWPRF ÷ 0x8154, L1D_CACHE_HWPRF) ^a	Level 1 data or unified cache data fetched by hardware prefetcher not used ^a
1 - (0x81DC, L1D_CACHE_HIT_RW_FPRFM ÷ 0x8142, L1D_CACHE_PRFM) ^a	Level 1 data or unified cache data fetched by software prefetch not used ^a
0x825C, L1D_LFB_HIT_RW_FPRFM ÷ 0x8142, L1D_CACHE_PRFM ^a	Level 1 data or unified cache data fetched late by software prefetch ^a

a. Similar ratios can be defined for other caches.

D7.5.5 At-retirement events

I_{CYQZJ}

The following are meaningful combinations of at-retirement events:

Table D7-8 Meaningful combinations of at-retirement events

Numerator	Denominator	Ratio
0x82B0, L1I_CACHE_HIT_RETIRED	0x0008, INST_RETIRED	Architecturally executed instruction hit Level 1 instruction cache
0x82E0, L2I_CACHE_MISS_RETIRED	0x0008, INST_RETIRED	Architecturally executed instruction missed Level 2 instruction cache
0x82EC, L1D_CACHE_HIT_LDST_RETIRED	0x0008, INST_RETIRED	Architecturally executed load or store instruction hit in Level 1 data cache
0x82C9, L2D_CACHE_HITM_ST_RETIRED	0x0008, INST_RETIRED	Architecturally executed store instruction hit modified data in Level 2 data cache
0x82B7, LL_CACHE_MISS_LD_RETIRED	0x0008, INST_RETIRED	Architecturally executed load instruction missed in Last level cache
0x82F0, ITLB_HIT_RETIRED	0x0008, INST_RETIRED	Architecturally executed instruction which hit in the ITLB
0x82F7, DTLB_WALK_LDST_RETIRED	0x82AA, LDST_ANY_RETIRED	Architecturally executed LDST instructions DTLB miss fraction
0x82AF, CRYPTO_RETIRED	0x0008, INST_RETIRED	Architecturally executed cryptographic data processing fraction

D7.5.6 Speculatively executed operation events

I_{RDHPB} The number of speculatively executed operations performed on individual scalar values can be determined from a pair of event counters. Combined multiply-add and multiply-subtract instructions are counted as two operations per element.

Table D7-9 Meaningful combinations of speculatively executed operation events

Ratio	Meaning
$0 \times 80C0, FP_SCALE_OPS_SPEC \times VL \div 128 + 0 \times 80C1, FP_FIXED_OPS_SPEC$	Total number of individual floating-point operations (any precision) performed
$0 \times 80C2, FP_HP_SCALE_OPS_SPEC \times VL \div 128 + 0 \times 80C3, FP_HP_FIXED_OPS_SPEC$	Total number of individual half-precision floating-point operations performed
$0 \times 80C4, FP_SP_SCALE_OPS_SPEC \times VL \div 128 + 0 \times 80C5, FP_SP_FIXED_OPS_SPEC$	Total number of individual single-precision floating-point operations performed
$0 \times 80C6, FP_DP_SCALE_OPS_SPEC \times VL \div 128 + 0 \times 80C7, FP_DP_FIXED_OPS_SPEC$	Total number of individual double-precision floating-point operations performed
$0 \times 80C8, INT_SCALE_OPS_SPEC \times VL \div 128 + 0 \times 80C9, INT_FIXED_OPS_SPEC$	Total number of individual integer operations performed
$0 \times 80CA, LDST_SCALE_OPS_SPEC \times VL \div 128 + 0 \times 80CB, LDST_FIXED_OPS_SPEC$	Total number of individual load/store accesses performed
$0 \times 80CC, LD_SCALE_OPS_SPEC \times VL \div 128 + 0 \times 80CD, LD_FIXED_OPS_SPEC$	Total number of individual load accesses performed
$0 \times 80CE, ST_SCALE_OPS_SPEC \times VL \div 128 + 0 \times 80CF, ST_FIXED_OPS_SPEC$	Total number of individual store accesses performed

D7.5.7 Bytes loaded and stored events

I_{NYJRH} The number of bytes speculatively loaded from memory or stored to memory can be determined from a pair of event counters.

Table D7-10 Meaningful combinations of speculative load or store events

Ratio	Meaning
$0 \times 80DA, LDST_SCALE_BYTES_SPEC \times VL \div 128 + 0 \times 80DB, LDST_FIXED_BYTES_SPEC$	Total number of bytes loaded from memory and stored to memory
$0 \times 80DC, LD_SCALE_BYTES_SPEC \times VL \div 128 + 0 \times 80DD, LD_FIXED_BYTES_SPEC$	Total number of bytes loaded from memory
$0 \times 80DE, ST_SCALE_BYTES_SPEC \times VL \div 128 + 0 \times 80DF, ST_FIXED_BYTES_SPEC$	Total number of bytes stored to memory

D7.6 Required events

When at least one event counter is implemented, the following common events are implemented:

- 0x0000, [SW_INCR](#), Instruction architecturally executed, Condition code check pass, software increment.
- 0x0011, [CPU_CYCLES](#), Cycle.
- When the PE includes a Level 1 data or unified cache:
 - 0x0003, [L1D_CACHE_REFILL](#), Level 1 data cache refill.
 - 0x0004, [L1D_CACHE](#), Level 1 data cache access.
- If the implementation includes program-flow prediction:
 - At least one of the following is implemented:
 - 0x0012, [BR_PRED](#), Predictable branch [Speculatively executed](#).
 - 0x0021, [BR_RETIRED](#), Instruction architecturally executed, branch.
 - At least one of the following is implemented:
 - 0x0010, [BR_MIS_PRED](#), Mispredicted or not predicted branch [Speculatively executed](#).
 - 0x0022, [BR_MIS_PRED_RETIRED](#), Branch instruction architecturally executed, mispredicted.
 - At least one of the following applies:
 - Both [BR_PRED](#) and [BR_MIS_PRED](#) are implemented.
 - Both [BR_RETIRED](#) and [BR_MIS_PRED_RETIRED](#) are implemented.

Note

Arm strongly recommends that both [BR_RETIRED](#) and [BR_MIS_PRED_RETIRED](#) are implemented. If the implementation does not include program-flow prediction, Arm recommends that these events are implemented as described in [Common microarchitectural events](#).

- At least one of:
 - 0x0008, [INST_RETIRED](#), Instruction architecturally executed.
 - 0x001B, [INST_SPEC](#), Operation [Speculatively executed](#).

Note

Arm strongly recommends that event 0x0008 is implemented.

When any of the following common events are implemented, all three of them are implemented:

- 0x003D, [STALL_SLOT_BACKEND](#), No operation sent for execution on a [Slot](#) due to the backend.
- 0x003E, [STALL_SLOT_FRONTEND](#), No operation sent for execution on a [Slot](#) due to the frontend.
- 0x003F, [STALL_SLOT](#), No operation sent for execution on a [Slot](#).

Arm strongly recommends that the following events are implemented:

- 0x003A, [OP_RETIRED](#).
- 0x003B, [OP_SPEC](#).
- 0x003D, [STALL_SLOT_BACKEND](#).
- 0x003E, [STALL_SLOT_FRONTEND](#).
- 0x003F, [STALL_SLOT](#).

D7.7 IMPLEMENTATION DEFINED event numbers

Arm recommends that implementers establish a standardized numbering scheme for their IMPLEMENTATION DEFINED events, with common definitions, and common event numbers, applied to all of their implementations. In general, the recommended approach is for standardization across implementations with common features. However, Arm recognizes that attempting to standardize the encoding of microarchitectural features across too wide a range of implementations is not productive.

The Arm architecture guarantees not to define any event prefixed with *IMP_* as part of the standard Arm architecture.

Arm strongly recommends that at least the following classes of event are identified in the IMPLEMENTATION DEFINED events:

- Separating each of the [STALL_FRONTEND](#) and [STALL_SLOT_FRONTEND](#) events to count holes in instruction availability.
- Separating each of the [STALL_BACKEND](#) and [STALL_SLOT_BACKEND](#) events, to count, for example, cumulative duration of stalls, unavailability of execution resources, or missed superscalar issue opportunities.
- Miss rates for additional levels of caches and TLBs.
- Any external events passed to the PE through an IMPLEMENTATION DEFINED mechanism.
- Cumulative duration of a PSTATE. {A, I, F} interrupt mask set to 1.
- Cumulative occupancy for resource queues, such as data access queues, and entry/exit counts, so that average latencies can be determined, separating out counts for key resources that might exist. An implementation might also provide registers in the IMPLEMENTATION DEFINED space to further extend such counts, for example by specifying a minimum latency for an event to be counted.
- Any other microarchitectural features that the implementer considers are valuable to count.

The range of possible IMPLEMENTATION DEFINED event numbers is described in [The PMU event number space and common events](#).

It is not required that implementations document the behavior of all IMPLEMENTATION DEFINED PMU events, including which PMU event numbers are used for these IMPLEMENTATION DEFINED events. However, Arm strongly recommends that implementations do include and document IMPLEMENTATION DEFINED PMU events. In particular events related to microarchitectural characteristics of the implementation not covered by Common events.

Chapter D8

The Generic Timer in AArch32 state

This chapter describes the implementation of the Arm Generic Timer as an extension to an Armv8 AArch32 implementation. It includes an overview of the AArch32 System register interface to an Arm Generic Timer.

It contains the following sections:

- [About the Generic Timer in AArch32 state](#)
- [The AArch32 view of the Generic Timer](#)

D8.1 About the Generic Timer in AArch32 state

Figure D8-1 shows an example system-on-chip that uses the Generic Timer as a system timer. In this figure:

- This manual defines the architecture of the individual PEs in the multiprocessor blocks.
- The *ARM Generic Interrupt Controller Architecture Specification* defines a possible architecture for the interrupt controllers.
- Generic Timer functionality is distributed across multiple components.

Figure D8-1 Generic Timer example

The Generic Timer:

- Provides a system counter, that measures the passing of time in real-time.

Note

The Generic Timer can also provide other components at a system level, but Figure D8-1 does not show any such components.

- Timers, that can trigger events after a period of time has passed. The timers:
 - Can be used as count-up or as count-down timers.
 - Can operate in real-time or in virtual-time.

This chapter describes an instance of the Generic Timer component that Figure D8-1 shows as Timer_0 or Timer_1 within the Multiprocessor A or Multiprocessor B block.

A Generic Timer implementation must also include a memory-mapped system component. This component:

- Must provide the System counter shown in Figure D8-1.

- Optionally, can provide timer components for use at a system level.

[System Level Implementation of the Generic Timer](#) describes this memory-mapped component.

D8.1.1 The full set of Generic Timer components

Within a system that might include multiple PEs, a full set of Generic Timer components is as follows:

The system counter

This provides a uniform view of system time, see [The system counter](#). Because this must be implemented at the system level, it is accessed through [The system level memory-mapped implementation of the Generic Timer](#). However, during initialization, a status register in each implemented timer in the system must be programmed with the frequency of the system counter, so that software can read this frequency.

PE implementations of the Generic Timer

Each PE implementation of the Generic Timer provides the following components:

- A physical counter, that gives access to the count value of the system counter.
- A virtual counter, that gives access to virtual time. In AArch32 state, the [CNTVOFF](#) register defines the offset between physical time, as defined by the value of the system counter, and virtual time.
- A number of timers. In an implementation where all Exception levels are implemented and can use AArch32 state, the timers that are accessible from AArch32 state are:
 - An EL1 physical timer.
 - An EL2 physical timer.
 - An EL1 virtual timer.

[The AArch32 view of the Generic Timer](#) describes these components.

The system level memory-mapped implementation of the Generic Timer

The memory-mapped registers that control the components of the system level implementation of the Generic Timer are grouped into *frames*. The Generic Timer architecture defines the offset of each register within its frame, but the base address of each frame is IMPLEMENTATION DEFINED, and defined by the system.

Each system level component has one or two register frames. The possible system level components are:

The memory-mapped counter module, required

This module controls the system counter. It has two frames:

- A control frame, CNTControlBase.
- A status frame, CNTReadBase.

The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, CNTCTLBase.

Memory-mapped timers, optional

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the CNTBaseN frame.

- Optionally, provides an unprivileged view of the timer in the CNTEL0Base N frame.

N is the timer number, and the corresponding frame number, in the range 0 - 7.

[System Level Implementation of the Generic Timer](#) describes these components.

D8.1.2 The system counter

The Generic Timer provides a system counter with the following specification:

Width

At least 56 bits wide. The value returned by any 64-bit read of the counter is zero-extended to 64 bits..

Effective frequency

This indicates the amount of time each unit of the counter represents. For example:

- An effective frequency of 50MHz means each unit of the counter represents 20ns.
- An effective frequency of 1GHz means each unit of the counter represents 1ns.
- The effective frequency is indicated in the [CNTFRQ](#) register.

The effective frequency is a fixed value, typically in the range 1-50MHz.

The counter might not be driven by a clock running at the effective frequency. For example, a counter with an effective frequency of 1GHz might have an actual clock running at 125MHz but the counter increments by 8 on each tick of the clock.

Roll-over

Roll-over time of not less than 40 years.

Counter resolution

The counter resolution is a representation of how frequently the counter is updated.

For example, a counter might have an [effective frequency](#) of 1GHz, but the actual clock runs at 125MHz and therefore the [counter resolution](#) is 125Mhz.

The counter resolution might vary over time, to accommodate different operating modes of the system such as lower power modes. Such variation might be invisible to the programmer and be system specific, or might be controllable by the programmer through the frequency modes table.

Accuracy

Arm does not specify a required accuracy, but recommends that the counter does not gain or lose more than ten seconds in a 24-hour period.

Use of different counter resolutions must not affect the implemented accuracy.

Start-up

Starts operating from zero.

The system counter, once configured and running, must provide a uniform view of system time. More precisely, it must be impossible for the following sequence of events to show system time going backwards:

1. Device A reads the time from the system counter.
2. Device A communicates with another agent in the system, Device B.
3. After recognizing the communication from Device A, Device B reads the time from the system counter.

The system counter must be implemented in an always-on power domain.

To support lower-power operating modes the counter can operate with a lower [counter resolution](#) by incrementing by larger amounts at a lower actual clock frequency. For example, a system counter with an [effective frequency](#) of 10MHz might either increment.

- By 1 at 10MHz.
- By 500 at 20kHz, when the system lowers the actual clock frequency, to reduce power consumption.

In this case, the counter must support transitions between higher resolution operation and lower resolution operation, without any impact on the required accuracy of the counter.

The [CNTFRQ](#) register is intended to hold a copy of the [effective frequency](#) to allow fast reference to this frequency by software running on the PE. For more information, see [Initializing and reading the system effective frequency](#).

The mechanism by which the count from the system counter is distributed to system components is IMPLEMENTATION DEFINED, but each PE with a System register interface to the system counter must have a counter input that can capture each increment of the counter.

Note

So that the system counter can be clocked independently from the PE hardware, the count value might be distributed using a Gray code sequence. Gray count scheme for timer distribution scheme gives more information about this possibility.

D8.1.2.1 Initializing and reading the system effective frequency

The [CNTFRQ](#) register must be programmed to the [effective frequency](#) of the system counter. Typically, this is done only during the system boot process, by using the System register interface to write the system [effective frequency](#) to the [CNTFRQ](#) register. Only software executing at the highest implemented Exception level can write to [CNTFRQ](#).

Note

The [CNTFRQ](#) register is UNKNOWN at reset, and therefore the [effective frequency](#) must be set as part of the system boot process.

Software can read the [CNTFRQ](#) register, to determine the [effective frequency](#), in the following states and modes:

- Hyp mode.
- PL1 modes and EL1 modes.
- When [CNTKCTL](#).{PL0PCTEN, PL0VCTEN} is not {0,0}, EL0 modes.

D8.1.2.2 Memory-mapped controls of the system counter

Some system counter controls are accessible only through the memory-mapped interface to the system counter. These controls are:

- Enabling and disabling the counter.
- Setting the counter value.
- Changing the operating mode, to change the [counter resolution](#).
- Enabling Halt-on-debug, which a debugger can then use to suspend counting.

For descriptions of these controls, see [System Level Implementation of the Generic Timer](#).

D8.2 The AArch32 view of the Generic Timer

The following sections describe the components and features of a PE implementation of the Generic Timer, as seen from AArch32 state:

- [The physical counter.](#)
- [The virtual counter.](#)
- [Event streams.](#)

D8.2.1 The physical counter

The PE includes a physical counter that contains the count value of the system counter. The [CNTPCT](#) register holds the current physical counter value. For more information, see The physical offset register.

Reads of [CNTPCT](#) can occur speculatively and out of order relative to other instructions executed on the same PE.

D8.2.1.1 The self-synchronized view of the physical counter

Example D8-1 Ensuring reads of the physical counter occur after signal read from memory

If a read from memory is used to obtain a signal from another agent that indicates that [CNTPCT](#) must be read, an ISB is used to ensure that the read of [CNTPCT](#) occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop                ; polling for some communication to indicate a requirement to
                   ; read the timer
    LDR R1, [R2]
    CMP R1, #1      ; has had the value 1 written to it
    BNE loop
    ISB             ; without this the CNTPCT could be read before the memory location in [R2]
    MRC R1, CNTPCT
```

Similarly where a read of the physical counter is required to take place after the completion of all loads and stores appearing in program order before the read of the counter, then the following code sequences can be used:

```
...                ; earlier loads and stores
    DSB             ; completes earlier loads and stores
    ISB             ; without this the CNTPCT could be read before the completion
                   ; of the earlier loads and stores
    MRC R1, CNTPCT
```

Neither view of the physical counter ensures that:

- Context changes occurring in program order before the read of the counter have been synchronized.
- Accesses to memory appearing in program order after the read of the counter are executed before the counter has been read.

Where there is a [Dependency through registers and memory](#) from the read of the physical counter to a Register effect generated by a read or write, the read or write will be executed after the read of the counter.

Example D8-2 Ensuring reads of the physical counter occur after previous memory accesses

To ensure that all previous memory accesses have completed and all previous context changes have been synchronized before the read of the counter, one of the following sequences should be used:

```
DSB
ISB
MRC Rn, CNTPCT          ; either view of the physical counter has the same effect in
                        ; this example
```

or

```
DSB
ISB
CBZ Ra, next
next
ISB                      ; this ISB is not needed if the MRC is accessing CNTPCT{SS}
MRC Rn, CNTPCT
```

To ensure that a memory access occurs only after a read of the counter, then either of the following sequences should be used:

```
MRC Rn, CNTPCT          ; either view of the physical counter has the same effect
                        ; in this example
ISB
LDR Ra, [Rb]            ; this load will be executed after the timer has been read
```

or

```
MRC Rn, CNTPCT          ; either view of the physical counter has the same effect
                        ; in this example
EOR Rm, Rn, Rn
LDR Ra, [Rb]            ; this load will be executed after the counter has been read
```

D8.2.2 The virtual counter

An implementation of the Generic Timer always includes a virtual counter, that indicates virtual time.

The virtual counter contains the value of the physical counter minus a 64-bit virtual offset. When executing in a EL1 or EL0 mode, the virtual offset value relates to the current virtual machine.

The [CNTVOFF](#) register contains the virtual offset, see [The virtual offset register](#).

The [CNTVCT](#) register holds the current virtual counter value.

Reads of [CNTVCT](#) can occur speculatively and out of order relative to other instructions executed on the same PE.

D8.2.2.1 The self-synchronized view of the virtual counter

Example D8-3 Ensuring reads of virtual counter occur after signal read from memory

If a read from memory is used to obtain a signal from another agent that indicates that **CNTVCT** must be read, an **ISB** is used to ensure that the read of **CNTVCT** occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop                ; polling for some communication to indicate a requirement to
                   ; read the timer

    LDR R1, [R2]
    CMP R1, #1      ; has had the value 1 written to it
    BNE loop
    ISB              ; without this the CNTVCT could be read before the memory
                   ; location in [R2]

    MRC R1, CNTVCT
```

Similarly where a read of the virtual counter is required to take place after the completion of all loads and stores appearing in program order before the read of the counter, then the following two sequences can be used:

```
...                ; earlier loads and stores
    DSB              ; completes earlier loads and stores
    ISB              ; without this the CNTVCT could be read before the completion
                   ; of the earlier loads and stores

    MRC R1, CNTVCT
```

Or, if **FEAT_ECV** is implemented:

```
...                ; earlier loads and stores
    DSB              ; completes earlier loads and stores

    MRC R1, CNTVCTSS
```

Neither view of the virtual counter ensures that:

- Context changes occurring in program order before the read of the counter have been synchronized.
- Accesses to memory appearing in program order after the read of the counter are executed before the counter has been read.

Where there is a [Dependency through registers and memory](#) from the read of the virtual counter to a Register effect generated by a read or write, the read or write will be executed after the read of the counter.

Example D8-4 Ensuring reads of virtual counter occur after previous memory accesses

To ensure that all previous memory accesses have completed and all previous context changes have been synchronized before the read of the counter, one of the following sequences should be used:

```
DSB
ISB
MRC Rn, CNTVCT      ; either view of the virtual counter has the same effect in
                    ; this example
```

or

```
DSB
ISB
CBZ Ra, next
next
ISB                  ; this ISB is not needed if the MRS is accessing CNTVCT{SS}
MRC Rn, CNTVCT
```

To ensure that a memory access occurs only after a read of the counter, then either of the following sequences should be used:

```
MRC Rn, CNTVCT      ; either view of the virtual counter has the same effect in
                    ; this example
ISB
LDR Ra, [Rb]         ; this load will be executed after the timer has been read
```

or

```
MRC Rn, CNTVCT      ; either view of the virtual counter has the same effect in
                    ; this example
EOR Rm, Rn, Rn
LDR Ra, [Rb]         ; this load will be executed after the counter has been read
```

D8.2.2.2 The virtual offset register

The virtual counter is a counter that has a *virtual offset* relative to the physical counter as viewed from EL2. This virtual offset is held in the register [CNTVOFF](#). The virtual counter value is the count compared by the EL1 virtual timer.

D8.2.3 Event streams

An implementation that includes the Generic Timer can use the system counter to generate one or more *event streams*, to generate periodic wakeup events as part of the mechanism described in Wait for Event.

Note

An event stream might be used:

- To impose a time-out on a Wait For Event polling loop.
- To safeguard against any programming error that means an expected event is not generated.

The [CNTKCTL](#).{EVNTEN, EVNTDIR, EVNTI, EVNTIS} fields define an event stream that is generated from the virtual counter.

In all implementations the [CNTHCTL](#).{EVNTEN, EVNTDIR, EVNTI, EVNTIS} fields define an event stream that is generated from the physical counter.

The event stream is configured as follows:

- EVNTI selects the counter bit that triggers the event.
- EVNTI selects between bits[0:15].

- EVNTDIR selects whether the event is generated on each 0 to 1 transition, or each 1 to 0 transition, of the selected counter bit.

Note

If the event stream is configured to produce events from the low order bits of the counter when the [effective frequency](#) is very high (for example 1GHz), then the practical update rate of the counter might mean that the event stream is not generated as the low order bit might not change. Software can rely on an event stream rate of at least 1MHz in normal operation.

The pseudocode descriptions of the operation of an event stream are [SetEventRegister](#), [TestEventCNTV](#), and [TestEventCNTP](#).

Chapter D9

AArch32 System Register Encoding

This chapter describes the AArch32 System register encoding space. It contains the following sections:

- [The AArch32 System register encoding space](#)
- [Organization of registers in the \(coproc == 0b1110\) encoding space](#)
- [Organization of registers in the \(coproc == 0b1111\) encoding space](#)

D9.1 The AArch32 System register encoding space

The T32 and A32 instruction sets includes instructions that access the System register encoding space. These instructions provide:

- Access to *System registers*, including the debug registers, that provide system control, and system status information.
- The cache, branch predictor, and TLB maintenance instructions, and address translation instructions.

[The AArch32 System register interface](#) describes the instructions that provide access to these registers and instructions. [AArch32 System Register Descriptions](#) describes these registers and encodings.

When accessing 32-bit registers, or executing these instructions, entries in the encoding space are characterized by the parameter set $\{\text{coproc}, \text{CRn}, \text{opc1}, \text{CRm}, \text{opc2}\}$. This encoding space is defined only for the `coproc` values 0b1110 and 0b1111.

Note

- When accessing 64-bit registers entries in the encoding space are characterized by the parameter set $\{\text{coproc}, \text{CRm}, \text{opc1}\}$, for the `coproc` values 0b1110 and 0b1111. A `CRm` value in this parameter set is equivalent to a `CRn` value in the parameter set for accessing 32-bit registers.
 - [Background to the System register interface](#) gives more information about this encoding model.
-

The following describe this encoding space:

- [Organization of registers in the \(`coproc == 0b1110` \) encoding space.](#)
- [Organization of registers in the \(`coproc == 0b1111` \) encoding space.](#)

D9.2 Organization of registers in the (coproc == 0b1110) encoding space

The System registers in the (coproc == 0b1110) encoding space provide a number of distinct control functions, covering:

- Debug.
- Trace.
- Execution environment control, for identification of the trivial Jazelle implementation.

Because these functions are distinct, the descriptions of these registers are distributed, as follows:

- In this manual, [Debug System registers](#) describes the Debug System registers.
- The *Embedded Trace Macrocell Architecture Specification* describes the Trace registers.

This section summarizes the allocation of the System registers in the (coproc == 0b1110) encoding space between these different functions, and the register encodings in this space that are reserved.

The 32-bit System register encodings are classified by the {opc1, CRn, opc2, CRm} values required to access them using an MCR or an MRC instruction. The 64-bit System register encodings are classified by the {opc1, CRm} values required to access them using an MCRR or an MRRC instruction. For the registers in the (coproc == 0b1110) encoding space, the opc1 value determines the primary allocation of these registers, as follows:

opc1==0 Debug System registers.

opc1==1 Trace registers.

opc1==7 Jazelle registers. Jazelle registers are implemented as required for a trivial Jazelle implementation.

Other opc1 values

Reserved.

Note

Primary allocation of (coproc == 0b1110) register function by opc1 value differs from the allocation of (coproc == 0b1111) registers, where primary allocation is by CRn value for 32-bit register accesses, or CRm value for 64-bit register accesses.

For the Debug System and Jazelle registers, [Table D9-1](#) defines:

- The {opc1, CRn, opc2, CRm} values used for accessing the 32-bit registers using the MRC and MCR instructions.
- The {opc1, CRm} values used for accessing the 64-bit register using the MRRC instruction.

Some Debug System registers can also be accessed using the LDC and STC instructions. [Table D9-1](#) defines the CRn values used for accessing the registers using these instructions.

Note

The only permitted uses of the LDC and STC instructions are:

- An LDC access to load data from memory to [DBGDTRTXint](#).
- An STC access to store data to memory from [DBGDTRRXint](#).

In the LDC and STC syntax descriptions in this Manual, the required coproc value of p14 and CRn value of c5 are given explicitly.

D9.2.1 Register access instruction arguments, (coproc == 0b1110) registers

Table D9-1 shows the MCR, MRC, and MRRC instruction arguments required for accesses to each register that can be visible in the System register interface in the (coproc == 0b1110) encoding.

Table D9-1 AArch32 PMSA (coproc == 0b1110) register summary, in MCR/MRC parameter order

coproc	opc1	CRn	CRm	opc2	Access	Mnemonic
0b1110	0b000	0b0000	0b0000	0b000	RO	DBGDIDR

0b1110	0b111	0b0001	0b0000	0b000	RW	JOSCR
0b1110	0b111	0b0010	0b0000	0b000	RW	JMCR

Table D9-2 shows the LDC and STC instruction arguments required for accesses to the Debug registers that can be accessed using these instructions.

Table D9-2 Mapping of LDC and STC instruction arguments to System registers

Name	CRn	Instruction	Description
DBGDTRTXint	c5	LDC	Debug Data Transfer Register, Transmit, Internal View
DBGDTRRXint	c5	STC	Debug Data Transfer Register, Receive, Internal View

Note

In the instruction syntax descriptions for the LDC and STC instructions, the required *coproc* and *CRn* values are given explicitly as *coproc* == p14, *CRn* == c5.

D9.3 Organization of registers in the (coproc == 0b1111) encoding space

For 32-bit accesses to the System registers in the (coproc == 0b1111) encoding space, the ordered set of parameters {CRn, opc1, CRm, opc2} determine the register order. Within this ordering, the CRn value originally provided a functional grouping of these registers. As the number of System registers has increased this ordering has become less appropriate.

This document now:

- Groups the System registers in the (coproc == 0b1111) encoding space by functional group, see [Functional index of AArch32 registers and System instructions](#).

Note

Not all System registers introduced by architectural extensions are described in [AArch32 System Register Descriptions](#). For information about the System registers introduced by architectural extensions, see [R-profile Architecture Extensions](#).

This section presents information about the register ordering by {CRn, opc1, CRm, opc2}. It contains the following subsections:

- [System register summary for \(coproc == 0b1111\) encodings by CRn value.](#)
- [Full list of AArch32 PMSA System registers in the \(coproc == 0b1111\) encoding space.](#)

Note

The ordered listing of (coproc == 0b1111) registers by the {CRn, opc1, CRm, opc2} encoding of the 32-bit registers is most likely to be useful to those implementing AArch32 state, and to those validating such implementations. However, otherwise, the grouping of registers by function is more logical.

In addition, the indexes in [Registers Index](#) include all of the System registers.

D9.3.1 System register summary for (coproc == 0b1111) encodings by CRn value

[Figure D9-1](#) summarizes the grouping of the System registers in the (coproc == 0b1111) encoding space, for an AArch32 PMSA implementation, by the value of CRn used for a 32-bit access to the register.

CRn	opc1	CRm	opc2	
c0	{0-2, 4}	{c0-c2}	{0-7}	ID registers
c1	{0, 4}	{c0, c1}	{0-7}	System control registers
c2	{0, 4}	{c0, c1}	{0-2}	Memory system control registers
c3	0	c0	0	
c4	0	c6	0	GIC System register *, Debug exception registers
c5	{0, 4}	{c0,c1}	{0,1}	Memory system fault registers
c6	{0, 4}	c0	{0, 2, 4}	
c7	{0, 4}	Various	Various	Cache maintenance, address translations, legacy operations
c8	{0, 4}	Various	Various	TLB maintenance operations
c9	{0-7}	Various	{0-7}	Performance monitors
c10	{0-7}	Various	{0-7}	Memory mapping registers and TLB operations
c11	{0-7}	{c0-c8,c15}	{0-7}	Reserved for DMA operations for TCM access
c12	{0-2, 4, 6}	Various	{0,1}	System control registers, GIC System registers *
c13	{0, 4}	c0	{0-4}	Process, Context, and Thread ID registers
c14	{0-7}	{c0-c15}	{0-7}	Generic Timer registers *, Performance Monitors registers *
c15	{0-7}	{c0-c15}	{0-7}	IMPLEMENTATION DEFINED registers

* If implemented

Figure D9-1 AArch32 System register groupings for (coproc == 0b1111), for 32-bit registers

Note

For the System registers in the (coproc == 0b1111) encoding space, [Figure D9-1](#) gives only an overview of the assigned encodings for 32-bit registers for each of the CRn values c0 - c15. For more information, see:

- The full list of registers in the (coproc == 0b1111) encoding space, in [Full list of AArch32 System registers in the \(coproc == 0b1111 \) encoding space](#), for the definition of the assigned and unassigned encodings for that register.
 - The register definitions in [AArch32 System Register Descriptions](#) for any dependencies on the implemented Exception levels.
-

In general, System register accesses using an unallocated set of {CRn, opc1, CRm, opc2} values are UNDEFINED.

[Behavior of AArch32 System registers with \(coproc == 0b1111, CRn == c0 \)](#) described the only exceptions to this rule.

The 32-bit System registers with (coproc == 0b1111, CRn == c15), and the corresponding 64-bit System registers, are reserved for IMPLEMENTATION DEFINED registers. For more information, see [Reserved encodings in the AArch32 System register \(coproc == 0b1111 \) space](#).

D9.3.1.1 The HSTR.Tn trap on (coproc == 0b1111) System registers

When the value of [HSTR.Tn](#) is 1, Non-secure PL1 accesses to System registers in the (coproc == 0b1111) encoding space using a CRn or CRm value that corresponds to the value of Tn are trapped to EL2, even if the encoding is UNDEFINED when the value of [HSTR.Tn](#) is 0. This applies:

- For 32 bit register accesses when the value of Rn in the MCR or MRC instruction corresponds to Tn.
- For 64 bit register accesses when the value of Rm in the MCRR or MRRC instruction corresponds to Tn.

If there are matching System register encodings that are accessible from Non-secure EL0 then those accesses are also trapped to EL2 when the value of [HSTR.Tn](#) is 1.

D9.3.1.2 Behavior of AArch32 PMSA System registers with (coproc == 0b1111, CRn == c0)

In the (coproc == 0b1111) encoding space, the 32-bit System registers with (CRn == c0) provide device and feature identification.

[Table D9-3](#) shows all of the architecturally required System registers with { coproc == 0b1111, CRn == c0 }. The behavior of 32-bit System register encodings in this group that are not shown in the table, and encodings that are part of an unimplemented Exception level, depends on the value of opc1, and possibly on the value of CRm and opc2, as follows:

opc1 == 0 All write accesses to the encodings are UNDEFINED.

For read accesses:

- The following encodings return an UNKNOWN value:
 - CRm == 3, opc2 == {0, 1, 2}.
 - CRm == {4, 6, 7}, opc2 == {0, 1}.
 - CRm == 5, opc2 == {0, 1, 4, 5}.
- All other encodings are RES0.

opc1 > 0 All accesses to the encodings are UNDEFINED.

See also [Accesses to unallocated encodings in the \(coproc == 0b111x \) encoding space](#).

Note

Some of these registers were previously described as being part of the CPUID identification scheme, see [The CPUID identification scheme](#).

D9.3.1.3 Reserved encodings in the AArch32 System register (coproc == 0b1111) space

AArch32 state reserves a number of regions in the (coproc == 0b1111) encoding space for IMPLEMENTATION DEFINED System registers. These reservations are defined in terms of the encoding of 32-bit accesses to the System register encoding space. That is, they are defined by the reserved 32-bit {CRn, opc1, CRm, opc2} encodings.

Reserved encodings that do not have an IMPLEMENTATION DEFINED function are UNDEFINED.

The following subsections give more information about these reserved encodings:

- Reserved 32-bit encodings with {coproc == 0b1111, CRn == c9}.
- Reserved 32-bit encodings with {coproc == 0b1111, CRn == c10}.
- Reserved 32-bit encodings with {coproc == 0b1111, CRn == c11}.
- Reserved 32-bit encodings with {coproc == 0b1111, CRn == c15}.

D9.3.1.3.1 Reserved 32-bit encodings with {coproc == 0b1111, CRn == c9}

In the AArch32 encoding space, for 32-bit encodings with {coproc == 0b1111, CRn == c9}, the following encodings are reserved for IMPLEMENTATION DEFINED purposes:

- Encodings with {coproc == 0b1111, CRn == c9, opc1 == {0 - 7}, opc2 == {0 - 7}, CRm == {c0 - c2, c5 - c8}} are reserved for IMPLEMENTATION DEFINED branch predictor, cache, and TCM operations.
- Encodings with {coproc == 0b1111, CRn == c9, opc1 == {0 - 7}, opc2 == {0 - 7}, CRm == c15} are reserved for IMPLEMENTATION DEFINED performance monitors.

Note

These are distinct from the OPTIONAL Arm Performance Monitors Extension, the registers for which use the encoding space {coproc == 0b1111, CRn == c9, opc1 == {0 - 7}, opc2 == {0 - 7}, CRm == {c12 - c14}}.

D9.3.1.3.2 Reserved 32-bit encodings with {coproc == 0b1111, CRn == c10}

In the AArch32 encoding space, for 32-bit encodings with {coproc == 0b1111, CRn == c10}, the following encodings are reserved for IMPLEMENTATION DEFINED purposes:

- Encodings with {coproc == 0b1111, CRn == c10, opc == {0 - 7}, CRm == {c0, c1, c4, c8}} are reserved for IMPLEMENTATION DEFINED TLB lockdown operations.

D9.3.1.3.3 Reserved 32-bit encodings with {coproc == 0b1111, CRn == c11}

In the AArch32 encoding space, for 32-bit encodings with {coproc == 0b1111, CRn == c11}, the following encodings are reserved for IMPLEMENTATION DEFINED purposes:

- Encodings with {coproc == 0b1111, CRn == c11, opc == {0 - 7}, CRm == {c0 - c8, c15}} are reserved for IMPLEMENTATION DEFINED DMA operations for TCM access.

The remainder of the AArch32 {coproc == 0b1111, CRn == c11} encoding space is UNDEFINED.

D9.3.1.3.4 Reserved 32-bit encodings with {coproc == 0b1111, CRn == c15}

The AArch32 System register encodings are reserved with (coproc == 0b1111, CRn == c15) for IMPLEMENTATION DEFINED purposes, and there are no restrictions on the use of these encodings. The documentation of the Arm implementation must describe fully any registers implemented in the {coproc == 0b1111, CRn == c15} encoding space. Normally, for processor implementations by Arm, this information is included in the *Technical Reference Manual* for the processor.

Typically, an implementation uses the {coproc == 0b1111, CRn == c15} encodings to provide test features, and any required configuration options that are not covered by this Manual.

This reservation means that the AArch32 64-bit encodings with {coproc == 0b1111, CRm == c15} are also reserved for IMPLEMENTATION DEFINED purposes, without any restrictions on the use of these encodings.

D9.3.2 Full list of AArch32 System registers in the (coproc == 0b1111) encoding space

Table D9-3 shows the System registers in the (coproc == 0b1111) encoding space in the AArch32 PMSA, in the order of the {CRn, opc1, CRm, opc2} parameter values used in MCR or MRC accesses to the 32-bit registers:

- For MCR or MRC accesses to the 32-bit registers, CRn is the primary identifier of the target System register for the access. This applies, also, to MCR or MRC instructions that provide 32-bit accesses to a single word of a 64-bit System register.
- For MCRR or MRRC accesses to the 64-bit registers, CRm is the primary identifier of the target System register for the access. Table D9-3 orders the 64-bit registers with the 32-bit registers accessed using the same primary register identifier. For example, the 64-bit encoding of TTBR0, that is accessed with (CRm == c2), is listed with the 32-bit registers that are accessed with (CRn == c2).

Table D9-3 AArch32 PMSA (coproc == 0b1111) register summary, in MCR/MRC parameter order

coproc	opc1	CRn	CRm	opc2	Access	Mnemonic

D9.3.2.1 About the GIC System registers

From version 3 of the GIC architecture specification, the specification defines three groups of System registers, identified by the prefix of the register name:

ICC_ GIC physical CPU interface System registers.

ICH_ GIC virtual interface control System registers.

ICV_ GIC Virtual CPU interface System registers.

Note

These registers are in addition to the GIC memory-mapped register groups GICC_, GICD_, GICH_, GICR_, GICV_, and GITS_.

In AArch32, the GIC System registers are all in the (coproc == 0b1111) encoding space with (CRn == c12). The ICV_* registers have the same {CRn, opc1, CRm, op2} encodings as the corresponding ICC_* registers. For these encodings, GIC register configuration fields determine which register is accessed.

When implemented, the GIC System registers form part of an Arm processor implementation, and therefore these registers are included in the register summaries. However, the registers are defined only in the GIC Architecture Specification.

For more information, see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4* (ARM IHI 0069).

Chapter D10

AArch32 System Register Descriptions

This chapter describes each of the AArch32 System registers.

It contains the following sections:

- [About the AArch32 System registers](#)
- [General system control registers](#)
- [Debug System registers](#)
- [Performance Monitors registers](#)
- [Generic Timer registers](#)

D10.1 About the AArch32 System registers

For general information about the AArch32 System registers, see:

In AArch32 System Register Encoding:

- [Organization of registers in the \(coproc == 0b1110 \) encoding space.](#)
- [Organization of registers in the \(coproc == 0b1111 \) encoding space.](#)

In this chapter:

- [Fixed values in the System register descriptions.](#)
- [General behavior of System registers.](#)
- [Principles of the ID scheme for fields in ID registers.](#)
- [About AArch32 System register accesses.](#)

The remainder of this chapter describes the AArch32 System registers, in the following sections:

- [General system control registers.](#)
- [Debug System registers.](#)
- [Performance Monitors registers.](#)
- [Generic Timer registers.](#)

D10.1.1 Fixed values in the System register descriptions

See [Fixed values in AArch32 instruction and System register descriptions](#). This section defines how the glossary terms [RAZ](#), [RES0](#), [RAO](#), and [RES1](#) can be represented in the System register descriptions.

D10.1.2 General behavior of System registers

Except where indicated, System registers are 32-bits wide. As stated in [About the System registers for VMSAv8-32](#), there are some 64-bit registers, and these include cases where software can access either a 32-bit view or a 64-bit view of a register. The register summaries, and the individual register descriptions, identify the 64-bit registers and how they can be accessed.

The following sections give information about the general behavior of these registers:

- [Register names.](#)
- [Read-only bits in read/write registers.](#)
- [The CPUID identification scheme.](#)
- [IMPLEMENTATION DEFINED performance monitors.](#)
- [UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for AArch32 System register accesses.](#)
- [Read-only and write-only register encodings.](#)
- [Reset behavior of AArch32 System registers.](#)
- [Synchronization of changes to AArch32 System registers.](#)

Unless otherwise indicated, information in the listed sections applies to all AArch32 System registers

See also [About AArch32 System register accesses](#).

D10.1.2.1 Register names

The Arm architecture guarantees not to define any register name prefixed with *IMP_* as part of the standard Arm architecture.

Note

Arm strongly recommends that any register names created in the IMPLEMENTATION DEFINED register spaces be prefixed with *IMP_*, where appropriate.

D10.1.2.2 Read-only bits in read/write registers

Some read/write registers include bits that are read-only. These bits ignore writes.

D10.1.2.3 The CPUID identification scheme

The ID_* registers were originally called the CPUID identification scheme registers. However, functionally, there is no value in separating these registers from the slightly larger Identification registers functional group. See [Table H5-3](#) for a list of the ID_* registers.

D10.1.2.4 IMPLEMENTATION DEFINED performance monitors

The architecture reserves some additional System register encodings in the (coproc == 0b1111) encoding space for optional additional IMPLEMENTATION DEFINED performance monitors. [Table D10-1](#) shows the allocation of these encodings:

Table D10-1 Performance Monitors System register encoding allocations

CRn	opc1	CRm	opc2	Name	Type
c9	0-7	c12-c14	0-7	Performance Monitors Extension registers, see Performance monitors System registers	RW or RO ^a
		c15	0-7	IMPLEMENTATION DEFINED	^b

a. The table referenced in the [Name](#) entry shows the type of each of the OPTIONAL Performance Monitors Extension registers.

b. Access depends on the register or operation, and is IMPLEMENTATION DEFINED.

D10.1.2.5 UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for AArch32 System register accesses

This section defines UNPREDICTABLE and UNDEFINED behaviors for accesses to System registers, including those cases where the Armv8 behavior is CONSTRAINED UNPREDICTABLE.

In AArch32 state, the following operations are UNDEFINED:

- All LDC and STC accesses, except for the LDC access to [DBGDTRTXint](#) and the STC access to [DBGDTRRXint](#) specified in [Table D9-2](#).
- All MCRR and MRRC operations to the (coproc == 0b111x) encoding space, except for those explicitly defined as accessing 64-bit System registers specified in [Table D9-1](#) and [Table D9-3](#).

Unless otherwise indicated in the individual register descriptions:

- Reserved fields in registers are RES0.
- Assigning a reserved value to a field has a CONSTRAINED UNPREDICTABLE effect, see [Reserved values in System and memory-mapped registers and translation table entries](#).

The following subsections give more information about UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for accesses to the (coproc == 0b111x) encoding space:

- [Accesses to unallocated encodings in the \(coproc == 0b111x \) encoding space.](#)
- [Additional rules for MCR and MRC accesses to System registers.](#)
- [Effects of EL2 on System register accesses.](#)

D10.1.2.5.1 Accesses to unallocated encodings in the (coproc == 0b111x) encoding space

In the Armv8 architecture, accesses to unallocated register encodings in the (coproc == 0b111x) encoding space are UNDEFINED.

Note

In Armv7, except for 32-bit registers encoded with a CRn value of c12, accesses to unallocated 32-bit registers were UNPREDICTABLE. The Armv8 CONSTRAINED UNPREDICTABLE behavior of these accesses is that they are UNDEFINED, see [Unallocated System register access instructions](#).

D10.1.2.5.2 Additional rules for MCR and MRC accesses to System registers

The following operations are CONSTRAINED UNPREDICTABLE for all encodings in the (coproc == 0b111x) encoding space:

- All MCR operations from the PC.
- All MRC operations to APSR_nzcv, except for the (coproc == 0b1110) MRC operation to APSR_nzcv from [DBGDSCRint](#).

The CONSTRAINED UNPREDICTABLE behavior of these operations is described in [Using R15 by instruction](#).

For registers and operations that are accessible from a particular Privilege level, any attempt to access those registers from a lower Privilege level is UNDEFINED.

Some individual registers can be made inaccessible by setting configuration bits, possibly including IMPLEMENTATION DEFINED configuration bits, to disable access to the register. The effects of the architecturally-defined configuration bits are defined individually in this manual. Unless explicitly stated otherwise in this manual, setting a configuration bit to disable access to a register results in the register becoming UNDEFINED for MRC and MCR accesses.

See also [Read-only and write-only register encodings](#).

D10.1.2.5.3 Effects of EL2 on System register accesses

EL2 introduces classes of System registers, described in Classification of System registers. Some of these classes of register are either:

- Accessible only from certain modes or states.
- Accessible from certain modes or states only when configuration settings permit the access.

Accesses to these registers that are not permitted are UNDEFINED, meaning execution of the register access instruction generates an Undefined Instruction exception.

Note

This section applies only to registers that are accessible from some modes and states. That is, it applies only to register access instructions using an encoding that, under some circumstances, would perform a valid register access.

The following register classes restrict access in this way:

EL2-mode System registers

This register class is defined only in an implementation that includes EL2.

EL2-mode registers are accessible only from Hyp mode.

All other accesses to these registers are UNDEFINED.

For more information, see Hyp mode read/write registers in the (coproc == 0b1111) encoding space and Hyp mode encodings for shared (coproc == 0b1111) System registers.

EL2-mode write-only operations

This register class is defined only in an implementation that includes EL2.

EL2-mode write-only operations are accessible only from Hyp mode.

Write accesses to these operations are UNDEFINED in modes other than Hyp mode.

For more information, see Hyp mode (coproc == 0b1111) write-only System instructions.

D10.1.2.6 Read-only and write-only register encodings

Some System registers are *read-only* (RO) or *write-only* (WO). For example:

- Most identification registers are read-only.
- Most encodings that perform an operation, such as a cache maintenance instruction, are write-only.

If a particular Privilege level defines a register to be:

- RO, then any attempt to write to that register, at that Privilege level, is UNDEFINED. This means that any access to that register with $L = 0$ is UNDEFINED.
- WO, then any attempt to read from that register, at that Privilege level, is UNDEFINED. This means that any access to that register with $L = 1$ is UNDEFINED.

For IMPLEMENTATION DEFINED encoding spaces, the treatment of the encodings is IMPLEMENTATION DEFINED.

Note

This section applies only to registers that this manual defines as RO or WO. It does not apply to registers for which other access permissions are explicitly defined.

D10.1.2.7 Reset behavior of AArch32 System registers

Reset values apply only to RW registers and fields, however:

- Some RO registers or fields, including feature ID registers and some status registers or register fields, always return a known value.
- Some RW and RO registers or register fields return status information about the PE. Unless the register description indicates that the value is UNKNOWN on reset, a read of the register immediately after a reset returns valid information.
- Some RW and RO registers and fields are aliases of other registers or fields. In these cases, the reset behavior of the aliased register or field determines the value returned by a read of the register immediately after a reset.
- WO registers that only have an effect on writes do not have meaningful reset values. However, an access to a WO register might affect underlying state, and that state might have a defined reset value.
- IMPLEMENTATION DEFINED registers have IMPLEMENTATION DEFINED reset behavior.

After a reset, only a limited subset of the PE state is guaranteed to be set to defined values. Also, for debug and trace System registers, reset requirements must take account of different levels of reset. For more information about the reset behavior of System registers when the PE resets into an Exception level that is using AArch32, see:

- [PE state on reset into AArch32 state](#).
- The appropriate Trace architecture specification, for the Trace System registers.

For a PE reset into an Exception level that is using AArch32, the architecture defines which AArch32 System registers have a defined reset value, and when that defined reset value applies. The register descriptions include this information, and [PE state on reset into AArch32 state](#) summarizes these architectural requirements. Otherwise, RW registers reset to an architecturally unknown value.

D10.1.2.7.1 Pseudocode description of resetting System registers

The `AArch32_ResetControlRegisters()` pseudocode function resets all System registers, and register fields, that have defined reset values, as described in this section and [PE state on reset into AArch32 state](#).

Note

For debug and trace System registers, this function resets registers as defined for the appropriate level of reset.

D10.1.2.8 Synchronization of changes to AArch32 System registers

In this section, *this PE* means the PE on which accesses are being synchronized.

Note

See [Definitions of direct and indirect reads and writes and their side-effects](#) for definitions of the terms *direct write*, *direct read*, *indirect write*, and *indirect read*.

A *direct write* to a System register might become visible at any point after the change to the register, but without a [Context Synchronization event](#) there is no guarantee that the change becomes visible.

Any direct write to a System register is guaranteed not to affect any instruction that appears, in program order, before the instruction that performed the direct write, and any direct write to a System register must be synchronized before any instruction that appears after the direct write, in program order, can rely on the effect of that write. The only exceptions to this are:

- All direct writes to the same register, using the same encoding, are guaranteed to occur in program order.
- All direct writes to a register are guaranteed to occur in program order relative to all direct reads of the same register using the same encoding.
- Any System register access that an Arm *Architecture Specification* or equivalent specification defines as not requiring synchronization.
- If an instruction that appears in program order before the direct write performs a memory access, such as a memory-mapped register access, that causes an indirect read or write to a register, that memory access is subject to the memory order model. In this case, if permitted by the memory order model, the instruction that appears in program order before the direct write can be affected by the direct write. For information about the memory order model, see [Definition of the memory model](#).

These rules mean that an instruction that writes to one of the address translation instructions described in Address translation instructions must be explicitly synchronized to guarantee that the result of the address translation instruction is visible in the [PAR](#).

Note

In this case, the direct write to the encoding of the address translation instruction causes an *indirect write* to the [PAR](#). Without a [Context Synchronization event](#) after the direct write, there is no guarantee that the indirect write to the [PAR](#) is visible.

Conceptually, the explicit synchronization occurs as the first step of any [Context Synchronization event](#). This means that if the operation uses the state that had been changed but not synchronized before the operation occurred, the operation is guaranteed to use the state as if it had been synchronized.

Note

- This explicit synchronization is applied as the first step of the execution of any instruction that causes the synchronization operation. This means it does not synchronize any effect of changes to the System registers that might affect the fetch and decode of the instructions that cause the operation, such as breakpoints or changes to translation tables.
 - For a synchronous exception, the control state in use at the time the exception is generated determines the exception syndrome information, and this syndrome information is not changed by this synchronization at the start of taking the exception.
-

Except for the register reads listed in [Registers with some architectural guarantee of ordering or observability](#), if no [Context Synchronization event](#) is performed, direct reads of System registers can occur in any order.

[Table D10-2](#) shows the synchronization requirement between two reads or writes that access the same System register. In the column headings, *First* and *Second* refer to:

- Program order, for any read or write caused by the execution of an instruction by this PE, other than a read or write caused by a memory access made by that instruction.
- The order of arrival of asynchronous reads or writes made by this PE relative to the execution of instructions by this PE.

In addition:

- For indirect reads or writes caused by an external agent, such as a debugger, the mechanism that determines the order of the reads or writes is defined by that external agent. The external agent can provide mechanisms that ensure that any read or write it makes arrives at the PE. These indirect reads and writes are asynchronous to software execution on the PE.
- For indirect reads or writes caused by memory-mapped reads or writes made by this PE, the ordering of the memory accesses is subject to the memory order model, including the effect of the memory type of the accessed memory address. This applies, for example, if this PE reads or writes one of its registers in a memory-mapped register interface.

The mechanism for ensuring completion of these memory accesses, including ensuring the arrival of the asynchronous read or write at the PE, is defined by the system.

Note

Such accesses are likely to be given a Device memory attribute, but requiring this is outside the scope of the architecture.

- For indirect reads or writes caused by autonomous asynchronous events that are counted, for example events caused by the passage of time, the events are ordered so that:
 - Counts progress monotonically.
 - The events arrive at the PE in finite time and without undue delay.

Table D10-2 Synchronization requirements for updates to System registers

First read or write	Second read or write	Context Synchronization event required
Direct read	Direct read	No
	Direct write	No
	Indirect read	No ^a
	Indirect write	No ^a , but see text in this section for exceptions
Direct write	Direct read	No
	Direct write	No
	Indirect read	Yes ^a
	Indirect write	No, but see text in this section for exceptions
Indirect read	Direct read	No
	Direct write	No
	Indirect read	No
	Indirect write	No
Indirect write	Direct read	Yes, but see text in this section for exceptions
	Direct write	No, but see text in this section for exceptions
	Indirect read	Yes, but see text in this section for exceptions
	Indirect write	No, but see text in this section for exceptions

a. Although no synchronization is required between a Direct write and a Direct read, or between a Direct read and an Indirect write, this does not imply that a Direct read causes synchronization of a previous Direct write. This means that the sequence Direct write followed by Direct read followed by Indirect read, with no intervening context synchronization, does not guarantee that the Indirect read observes the result of the Direct write.

If the indirect write is to a register that [Registers with some architectural guarantee of ordering or observability](#) shows as having some guarantee of the visibility of an indirect write, synchronization might not be required.

If a direct read or a direct write to a register is followed by an indirect write to that register that is caused by an external agent, or by an autonomous asynchronous event, or as a result of a memory-mapped write, then synchronization is required to guarantee the ordering of the indirect write relative to the direct read or direct write.

If an indirect write caused by a direct write is followed by an indirect write caused by an external agent, or by an autonomous asynchronous event, or as a result of a memory-mapped write, then synchronization is required to guarantee the ordering of the two indirect writes.

Where an indirect write occurs as a side-effect of an access, this happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect. For other information about indirect writes after a direct read or a direct write, see [Definitions of direct and indirect reads and writes and their side-effects](#).

Note

Where a register has more than one encoding, a direct write to the register using a particular encoding is not an indirect write to the same register with a different encoding.

Where an indirect write is caused by the action of an external agent, such as a debugger, or by a memory-mapped read or write by the PE, then an indirect write by that agent to a register using a particular access mechanism, followed by an indirect read by that agent to the same register using the same access mechanism and address does not need synchronization.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.

To guarantee the visibility of changes to some registers, additional operations might be required before the [Context Synchronization event](#). For such a register, the definition of the register identifies these additional requirements.

In this manual, unless the context indicates otherwise:

- *Accessing* a System register refers to a direct read or write of the register.
- *Using* a System register refers to an indirect read or write of the register.

D10.1.2.8.1 Registers with some architectural guarantee of ordering or observability

For the registers for which [Table D10-3](#) shows that the ordering of direct reads is guaranteed, multiple direct reads of a single register, using the same encoding, occur in program order without any explicit ordering.

For the registers for which [Table D10-3](#) shows that some observability of indirect writes is guaranteed, an indirect write to the register caused by an external agent, an autonomous asynchronous event, or as a result of a memory-mapped write, is both:

- Observable to direct reads of the register, in finite time, without explicit synchronization.
- Observable to subsequent indirect reads of the register without explicit synchronization.

These two sets of registers are similar, as [Table D10-3](#) shows:

Table D10-3 Registers with a guarantee of ordering or observability, VMSAv8-32

Register	Ordering of direct reads	Observability of indirect writes	Notes
ISR	Guaranteed	Guaranteed	Interrupt Status Register
DBGCLAIMCLR	Guaranteed	Guaranteed	Debug CLAIM registers
DBGCLAIMSET	-	Guaranteed	
DBGDTRRXint	Guaranteed	Guaranteed	Debug Communication Channel registers
DBGDTRTXint	-	Guaranteed	

Register	Ordering of direct reads	Observability of indirect writes	Notes
The DCC flags in DBGDSCRint	Guaranteed	Guaranteed	
CNTPCT	Guaranteed	Guaranteed	Generic Timer registers
CNTP_TVAL	Guaranteed	Guaranteed	
CNTVCT	Guaranteed	Guaranteed	
CNTV_TVAL	Guaranteed	Guaranteed	
CNTHP_TVAL	Guaranteed	Guaranteed	
PMCCNTR	Guaranteed	Guaranteed	Performance Monitors Extension registers, if the implementation includes the extension
PMEVCNTR<n>	Guaranteed	Guaranteed	
PMXEVCNTR	Guaranteed	Guaranteed	
PMOVSSET	Guaranteed	Guaranteed	
PMOVSr	Guaranteed	Guaranteed	
EDSCR .PipeAdv and the DCC flags in EDSCR	-	Guaranteed	Fields of the External Debug Status and Control Register

In addition to the requirements shown in [Table D10-3](#):

- Indirect writes to the following registers as a result of memory-mapped writes, including accesses by external agents, are required to be observable to the indirect read made in determining the response to a subsequent memory-mapped access without explicit synchronization:
 - [OSLAR_EL1](#). [OSLAR_EL1](#) is indirectly read to determine whether the subsequent access is permitted.

Note

[OSLAR_EL1](#) maps to the AArch32 System register [DBGOSLAR](#).
 - [EDLAR](#), if implemented. [EDLAR](#) is indirectly read to determine whether a subsequent write or side-effect of an access is ignored.

Note

This requirement is stricter than the general requirement for the observability of indirect writes.
- The requirement that an indirect write to the registers in [Table D10-3](#) is observable to direct reads in finite time does not imply that all observers will observe the indirect write at the same time. For example, an increment of the system counter is an autonomous asynchronous event that performs an indirect write to the counter. This asynchronous event might generate a timer interrupt request, resulting in a [Context Synchronization event](#). When a GIC is used, the timer interrupt might arrive at the GIC after the PE has taken an interrupt request from another source, but before software reads the current interrupt ID from the GIC. This means that the GIC might identify the timer interrupt as the current interrupt. Software must not assume that a subsequent direct read of the counter register is guaranteed to observe the updated value of that register. Although this example uses the counter-timer registers, it applies equally to other registers that might be linked to interrupt requests, including the PMU status registers.
- When the PE is in Debug state, there are synchronization requirements for the Debug Communication Channel and Instruction Transfer registers. See [DCC and ITR access in Debug state](#).

The possibility that direct reads can occur *early*, in the absence of context synchronization, described in [Ordering of reads of System registers](#), still applies to the registers listed in [Table D10-3](#).

D10.1.2.8.2 Definitions of direct and indirect reads and writes and their side-effects

Direct and indirect reads and writes are defined as follows:

Direct read Is a read of a register, using an MRC, MRRC, or STC instruction, that the architecture permits for the current PE state.

If a direct read of a register has a side-effect of changing the value of a register, the effect of a direct read on that register is defined to be an *indirect write*, and has the synchronization requirements of an indirect write. This means the indirect write is guaranteed to have occurred, and to be visible to subsequent direct or indirect reads and writes only if synchronization is performed after the direct read.

Note

The indirect write described here can affect either the register written to by the direct write, or some other register. The synchronization requirement is the same in both cases.

Direct write

Is a write to a register, using an `MCR`, `MCCR`, or `LDC` instruction, that the architecture permits for the current PE state.

In the following cases, the side-effect of the direct write is defined to be an indirect write of the affected register, and has the synchronization requirements of an indirect write:

- If the direct write has a side-effect of changing the value of a register other than the register accessed by the direct write.
- If the direct write has a side-effect of changing the value of the register accessed by the direct write, so that the value in that register might not be the value that the direct write wrote to the register.

In both cases, this means that the indirect write is not guaranteed to be visible to subsequent direct or indirect reads and writes unless synchronization is performed after the direct write.

Note

- As an example of a direct write to a register having an effect that is an indirect write of that register, writing 1 to a `PMCNTENCLR.Px` bit is also an indirect write, because if the `Px` bit had the value 1 before the direct write, the side-effect of the write changes the value of that bit to 0.
 - The indirect write described here can affect either the register written to by the direct write, or some other register. The synchronization requirement is the same in both cases.

For example, writing 1 to a `PMCNTENCLR.Px` bit that is set to 1 also changes the corresponding `PMCNTENSET.Px` bit from 1 to 0. This means that the direct write to the `PMCNTENCLR` defines indirect writes to both itself and to the `PMCNTENSET`.
-

Indirect read

Is a use of the register by an instruction to establish the operating conditions for the instruction. Examples of operating conditions that might be determined by an indirect read are the translation table base address, or whether memory accesses are forced to be Non-cacheable.

Indirect reads include situations where the value of one register determines what value is returned by a second register. This means that any read of the second register is an indirect read of the register that determines what value is returned.

Indirect reads also include:

- Reads of the System registers by external agents, such as debuggers, as described in [Debug System registers](#).
- Memory-mapped reads of the System registers made by the PE on which the System registers are implemented.

Where an indirect read of a register has a side-effect of changing the value of a register, that change is defined to be an indirect write, and has the synchronization requirements of an indirect write.

Indirect write

Is an update to the value of a register as a consequence of either:

- An exception, operation, or execution of an instruction that is not a direct write to that register.
- The asynchronous operation of an external agent.

This can include:

- The passage of time, as seen in counters or timers, including performance counters.
- The assertion of an interrupt.
- A write from an external agent, such as a debugger.

However, for some registers, the architecture gives some guarantee of visibility without any explicit synchronization, see [Registers with some architectural guarantee of ordering or observability](#).

Note

Taking an exception is a [Context Synchronization event](#). Any indirect write performed as part of an exception entry does not require additional synchronization. This includes the indirect writes to the registers that report the exception, as described in [Exception reporting in a VMSAv8-32 implementation](#).

D10.1.3 Principles of the ID scheme for fields in ID registers

The Arm architecture specifies a number of *ID registers* that are characterized as comprising a set of 4-bit *ID fields*. Each ID field identifies the presence, and possibly the level of support for, a particular feature in an implementation of the architecture. These fields follow an architectural model that aids their use by software and provides future compatibility. This section describes that model. [AArch32 ID registers to which this scheme applies](#) identifies the set of ID registers that are accessible from AArch32 state.

A small number of ID fields do not follow the scheme described in this section. In these cases, the field description states that it does not follow this scheme.

Note

- The ID fields described here are unlike the ones that enumerate the number of resources, such as the number of breakpoints, watchpoints, or performance monitors.
 - ID fields that do not follow this scheme include the [ID_DFR0.PerfMon](#) and [EDDFR.PMUVer](#) fields, see [Alternative ID scheme used for the Performance Monitors Extension version](#).
 - The presence of an ID field for a feature does not imply that the feature is optional.
-

To provide forward compatibility, software can rely on the features of these fields that are described in this section.

The ID fields, which are either signed or unsigned, use increasing numerical values to indicate increases in functionality. Therefore, if a value of 0x1 indicates the presence of some instructions, then the value 0x2 will indicate the presence of those instructions plus some additional instructions or functionality. This means software can be written in the form:

```
if (value >= number) {  
    // do something that relies on the value of the feature  
}
```

For ID fields where the value 0x0 defines that a feature is not present, the field holds an unsigned value. This covers the vast majority of such fields.

In a few cases, the architecture has been changed to permit implementations to exclude a feature that has previously been required and for which no ID field has been defined. In these cases, a new ID field is defined and:

- The field holds a signed value.
- The field value 0xF indicates that the feature is not implemented.
- The field value 0x0 indicates that the feature is implemented.
- Software that depends on the feature can use the test:

```
if value >= 0 {  
    // Software features that depend on the presence of the hardware feature  
}
```

In some cases, it has been decided retrospectively that the increase in functionality between two consecutive numerical values is too great, and it is desirable to permit an intermediate degree of functionality, and the means to discover this. This is done by the introduction of a *fractional* field that both:

- Is referred to in the definition of the original field.
- Applies only when the original field is at the lower value of the step.

In principle, a fractional field can be used for two different fractional steps, with different meanings associated with each of these steps. For this reason, a fractional field must be interpreted in the context of the field to which it relates and the value of that field. [Example D10-1](#) shows the use of such a field.

Example D10-1 Example of the use of a fractional field

For a field describing some class of functionality:

- The value `0x1` was defined as indicating that item A is present.
- The value `0x2` was defined as indicating that items B and C are present, in addition to item A.

Subsequently, it might be necessary to introduce a second ID field to indicate that A and B only are present. This new field is a fractional field, and might be defined as having the value `0x1` when A and B only are present. This fractional field is valid only when the original ID field has the value `0x1`.

This approach means that:

- Software that depends on the test `if (value >= 0x2)` can rely on features A, B, and C being present,
- Software that depends on the test `if (value >= 0x1)` can rely on feature A being present.
- If new software needs to check only that features A and B are present, then it can test:

```
if (value >= 0x2 || (value == 0x1 && fractional_value >= 0x1)) {
    // Software features that depend on A and B only
}
```

A fractional field uses the same approach of increasing numerical values indicating increasing functionality, and the fractional approach can also be applied recursively to fractional fields.

Unused ID fields, and fractional fields that are not applicable, are RES0 to allow their future use when features, or fractional implementation options, are added.

D10.1.3.1 AArch32 ID registers to which this scheme applies

- The Auxiliary Feature register [ID_AFR0](#).
- The Processor Feature registers [ID_PFR0](#) and [ID_PFR1](#).
- The Debug Feature register [ID_DFR0](#).
- The Memory Model Feature registers [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), [ID_MMFR3](#), and [ID_MMFR4](#).
- The Instruction Set Attribute registers [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).
- The Media and VFP Feature registers [MVFR0](#), [MVFR1](#), and [MVFR2](#).

Note

Principles of the ID scheme for fields in ID registers includes information about the AArch64 System registers and the memory-mapped registers to which this scheme applies.

D10.1.3.2 Alternative ID scheme used for the Performance Monitors Extension version

The [ID_DFR0_EL1.PerfMon](#), [ID_DFR0.PerfMon](#), and [EDDFR.PMUVer](#) fields, which identify the version of the Performance Monitors Extension, do not follow the standard ID scheme. Software must treat these fields as follows:

- The value `0xF` indicates that the Arm-architected Performance Monitors Extension is not implemented.
- If the field value is not `0xF` the field is treated as an unsigned value, as described for the standard ID scheme.

This means that software that depends on the implementation of a particular version of the Arm Performance Monitors Extension must be written in the form:

```
if (value != 0xF and value >= number) {
    // do something that relies on version 'number' of the feature
}
```

For these fields, Arm deprecates use of the value 0xF in new implementations.

D10.1.4 About AArch32 System register accesses

The following subsections give more information about accesses to the AArch32 System registers:

- [Ordering of reads of System registers.](#)
- [Accessing 32-bit System registers.](#)
- [Accessing 64-bit System registers.](#)

D10.1.4.1 Ordering of reads of System registers

Reads of the System registers can occur out of order with respect to earlier instructions executed on the same PE, provided that both:

- Any data dependencies between the instructions, as specified in [Synchronization of changes to AArch32 System registers](#), including read-after-read dependencies, are respected.
- The reads to the register do not occur earlier than the most recent [Context Synchronization event](#) to its architectural position in the instruction stream.

Note

In particular, the values read from System registers that hold self-incrementing counts, such as the Performance Monitors counters or the Generic Timer counter or timers, could be accessed from any time after the previous [Context Synchronization event](#). For example, where a memory access is used to communicate a read of such a counter, an ISB must be inserted between the read of the memory location that is known to have returned its data, either as a result of a condition on that data or of the read having completed, and the read of the counter, if it is necessary that the counter returns a count value after the memory communication.

D10.1.4.2 Accessing 32-bit System registers

Software accesses most 32-bit System registers using the generic MCR and MRC System register access instructions, specifying some or all of the parameters {coproc, CRn, opc1, CRm, opc2}, where:

coproc	Identifies the primary region of the System register encoding space. Takes one of the values:	
	p14	Encoded as 0b1110.
	p15	Encoded as 0b1111.
CRn	Takes a value in the range c0- c15, encoded the corresponding 4-bit binary value, 0b0000 - 0b1111.	
	In the (coproc== 0b1110) encoding space, the opc1 value identifies the System register functional group, and CRn is the most significant identifier for the required register within that group.	
	In the (coproc== 0b1111) encoding space, CRn is the most significant identifier for the required register.	
opc1	Takes a value in the range 0 - 7, encoded as its 3-bit binary value.	
	In the (coproc== 0b1110) encoding space, the opc1 value identifies the System register functional group, and can take the following values:	
	0	Debug System registers.
	1	Trace System registers.
	7	Legacy Jazelle System registers.

In the (`coproc == 0b1111`) encoding space, `opc1` can take any value in the range 0 - 7.

<code>CRm</code>	Takes a value in the range <code>c0- c15</code> , encoded the corresponding 4-bit binary value, <code>0b0000 - 0b1111</code> .
<code>opc2</code>	Takes a value in the range 0 - 7, encoded as its 3-bit binary value. <code>opc2</code> is optional in the <code>MCR</code> and <code>MRC</code> instruction syntax, and if no value is specified the encoding defaults to <code>0b000</code> .
<code>Rt</code>	A general-purpose register to hold a 32-bit value to transfer to or from the System register. Takes a value in the range <code>R0 - R14</code> , encoded as the corresponding 4-bit binary value, <code>0b0000 - 0b1110</code> .

This means an `MCR` or `MRC` access to a specific 32-bit System register uses:

- A unique combination of `coproc`, `CRn`, `opc1`, `CRm`, and `opc2`, to specify the required System register.
- A general-purpose register, `Rt`, for the transferred 32-bit value.

See also:

- [MCR](#).
- [MRC](#).

A small number of AArch32 debug System registers are accessed using `LDC` or `STC` instructions. In these cases, the register to be accessed is identified in the instruction syntax by the use of `p14`, `c5` where:

<code>p14</code>	Identifies that the access is to the (<code>coproc == 0b1110</code>) encoding space.
<code>c5</code>	Identifies the target debug System register.

See the instruction descriptions:

- [LDC \(immediate\)](#).
- [LDC \(literal\)](#).
- [STC](#).

The only uses of `LDC` and `STC` permitted in Armv8-A are:

- An `LDC` access to load data from memory to [DBGDTRTXint](#), see [LDC \(immediate\)](#) and [LDC \(literal\)](#).
- An `STC` access to store data to memory from [DBGDTRRXint](#), see [STC](#).

A small number of AArch32 System registers are accessed using `MRS`, `MSR`, `VMRS`, or `VMSR` instructions, see the appropriate register and instruction description for more information, see:

- [MRS](#).
- [MSR \(immediate\)](#),
- [MSR \(register\)](#).
- [VMRS](#).
- [VMSR](#).

Note

- For example:
 - The [APSR](#), [CPSR](#), and [SPSR](#) are accessed using `MRS` or `MSR` instructions.
 - The [MVFR0](#), [MVFR1](#), and [MVFR2](#) are accessed using `VMRS` or `VMSR` instructions.
 - In addition, the banked register forms of the `MRS` and `MSR` instructions can be used to access some System registers associated with PE modes other than the mode in which the PE is currently executing, see [MRS \(Banked register\)](#) and [MSR \(Banked register\)](#).
-

D10.1.4.3 Accessing 64-bit System registers

Software accesses a 64-bit System register using the generic MCRR and MRRC System register access instructions, specifying the parameters {coproc, CRm, opc1}, where:

coproc	Identifies the primary region of the System register encoding space. Takes one of the values:	
	p14	Encoded as 0b1110.
	p15	Encoded as 0b1111.
CRm	Takes a value in the range c0- c15, encoded the corresponding 4-bit binary value, 0b0000 - 0b1111.	
	In the (coproc== 0b1110) encoding space, the opc1 value identifies the System register functional group, and CRm is the most significant identifier for the required register within that group.	
	In the (coproc== 0b1111) encoding space, CRm is the most significant identifier for the required register.	
opc1	Takes a value in the range 0 - 15, encoded as its 3-bit binary value.	
	In the (coproc== 0b1110) encoding space, the opc1 value identifies the System register functional group, and can take the following values:	
	0	Debug System registers.
	1	Trace System registers.
	In the (coproc== 0b1111) encoding space, opc1 can take any value in the range 0 - 15.	
Rt	A general-purpose register to hold bits[31:0] of the value to transfer to or from the System register. Takes a value in the range R0 - R14, encoded as the corresponding 4-bit binary value, 0b0000 - 0b1110.	
Rt2	A general-purpose register to hold bits[63:32] of the value to transfer to or from the System register. Takes a value in the range R0 - R14, encoded as the corresponding 4-bit binary value, 0b0000 - 0b1110.	

This means an MCRR or MRRC access to a specific 64-bit System register uses:

- A unique combination of coproc, CRm and opc1, to specify the required 64-bit System register.
- Two general-purpose registers, each holding 32 bits of the value to transfer.

This means a PE can access a 64-bit System register using:

- An MCRR instruction to write to a System register, see [MCRR](#).
- An MRRC instruction to read a System register, see [MRRC](#).

When using an MCRR or MRRC instruction the System register access is 64-bit atomic.

Some 64-bit registers also have an MCR and MRC encoding. The MCR and MRC encodings for these registers access the least significant 32 bits of the register. For example, to access the [PAR](#), software can:

- Use the following instructions to access all 64 bits of the register:

```
MRRC p15, 0, <Rt>, <Rt2>, c7 ; Read 64-bit PAR into Rt (low word) and Rt2 (high word)
```

```
MCRR p15, 0, <Rt>, <Rt2>, c7 ; Write Rt (low word) and Rt2 (high word) to 64-bit PAR
```

- Use the following instructions to access the least-significant 32 bits of the register:

```
MRC p15, 0, <Rt>, c7, c4, 0 ; Read PAR[31:0] into Rt
```

```
MCR p15, 0, <Rt>, c7, c4, 0 ; Write Rt to PAR[31:0]
```

D10.2 General system control registers

This section lists the System registers in AArch32 state that are not part of one of the other listed groups.

D10.2.1 ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

Configuration

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

Attributes

ACTLR is a 32-bit register.

This register has the following instances:

- ACTLR.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ACTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TAC == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ACTLR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ACTLR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TAC == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        ACTLR() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    ACTLR() = R(t);
end;
```

D10.2.2 ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

Purpose

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

Configuration

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining [ID_MMFR4.AC2](#).

From Armv8.2 this register must be implemented.

Attributes

ACTLR2 is a 32-bit register.

This register has the following instances:

- ACTLR2.

Field descriptions

31		0
IMPLEMENTATION DEFINED		

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ACTLR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TAC == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ACTLR2();
```

```
end;  
elseif PSTATE.EL == EL2 then  
    R(t) = ACTLR2();  
end;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b011

```
if PSTATE.EL == EL0 then  
    Undefined();  
elseif PSTATE.EL == EL1 then  
    if EL2Enabled() && HSTR().T1 == '1' then  
        AArch32_TakeHypTrapException(0x03);  
    elseif EL2Enabled() && HCR().TAC == '1' then  
        AArch32_TakeHypTrapException(0x03);  
    else  
        ACTLR2() = R(t);  
    end;  
elseif PSTATE.EL == EL2 then  
    ACTLR2() = R(t);  
end;
```

D10.2.3 ADFSR, Auxiliary Data Fault Status Register

The ADFSR characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for Data Abort exceptions taken to EL1 modes.

Configuration

There are no configuration notes.

Attributes

ADFSR is a 32-bit register.

This register has the following instances:

- ADFSR.

Field descriptions

31	0
IMPLEMENTATION DEFINED	

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ADFSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ADFSR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ADFSR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        ADFSR() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    ADFSR() = R(t);
end;
```

D10.2.4 AIDR, Auxiliary ID Register

The AIDR characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED identification information.
The value of this register must be used in conjunction with the value of MIDR.

Configuration

There are no configuration notes.

Attributes

AIDR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing AIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b001	0b0000	0b0000	0b111

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = AIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = AIDR();
end;
```

D10.2.5 AIFSR, Auxiliary Instruction Fault Status Register

The AIFSR characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for Prefetch Abort exceptions taken to EL1 modes.

Configuration

There are no configuration notes.

Attributes

AIFSR is a 32-bit register.

This register has the following instances:

- AIFSR.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AIFSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0001	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = AIFSR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = AIFSR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0001	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AIFSR() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    AIFSR() = R(t);
end;
```

D10.2.6 AMAIR0, Auxiliary Memory Attribute Indirection Register 0

The AMAIR0 characteristics are:

Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR0.

Configuration

There are no configuration notes.

Attributes

AMAIR0 is a 32-bit register.

This register has the following instances:

- AMAIR0.

Field descriptions

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMAIR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0011	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = AMAIR0();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = AMAIR0();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0011	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AMAIR0() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    AMAIR0() = R(t);
end;
```

D10.2.7 AMAIR1, Auxiliary Memory Attribute Indirection Register 1

The AMAIR1 characteristics are:

Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR1.

Configuration

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Attributes

AMAIR1 is a 32-bit register.

This register has the following instances:

- AMAIR1.

Field descriptions

31	0
IMPLEMENTATION DEFINED	

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMAIR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0011	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = AMAIR1();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = AMAIR1();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0011	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AMAIR1() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    AMAIR1() = R(t);
end;
```

D10.2.8 APSR, Application Program Status Register

The APSR characteristics are:

Purpose

Hold program status and control information.

Note

Some of the fields in this register are permitted to return the value of the PSTATE field on a read. This is an exception to the general rule that an UNKNOWN field must not return information that cannot be obtained, at the current Privilege level, by an architected mechanism.

For more information see ‘[The Application Program Status Register, APSR](#)’.

Configuration

This register is a Special-purpose register.

Attributes

APSR is a 32-bit register.

Field descriptions

N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Bits [26:20]

Reserved, RES0.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]

Reserved, RES0.

E, bit [9]

Endianness. This field is UNKNOWN, but is permitted to return the value of PSTATE.E field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.A field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.I field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.F field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4:0], bits [4:0]

Mode. This field is UNKNOWN, but is permitted to return the value of PSTATE.M[4:0] field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APSR

APSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

The MSR (register) and MRS instructions used to access APSR are data-independent-time instructions as described in About PSTATE.DIT.

D10.2.9 **ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read**

The ATS12NSOPR characteristics are:

Purpose

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if reading from the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS12NSOPR is a 32-bit System instruction.

Field descriptions

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Executing ATS12NSOPR

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b100

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_12, EL1, ATAccess_Read);
end;
```

D10.2.10 **ATS12NSOPW, Address Translate Stages 1 and 2 Non-secure Only PL1 Write**

The ATS12NSOPW characteristics are:

Purpose

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if writing to the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS12NSOPW is a 32-bit System instruction.

Field descriptions

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Executing ATS12NSOPW

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_12, EL1, ATAccess_Write);
end;
```

D10.2.11 **ATS12NSOUR, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read**

The ATS12NSOUR characteristics are:

Purpose

Performs stage 1 and 2 address translations as defined for PL0 and the Non-secure state, with permissions as if reading from the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS12NSOUR is a 32-bit System instruction.

Field descriptions

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Executing ATS12NSOUR

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b110

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_12, EL0, ATAccess_Read);
end;
```

D10.2.12 **ATS12NSOUW, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write**

The ATS12NSOUW characteristics are:

Purpose

Performs stage 1 and 2 address translations as defined for PL0 and the Non-secure state, with permissions as if writing to the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS12NSOUW is a 32-bit System instruction.

Field descriptions

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Executing ATS12NSOUW

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b111

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_12, EL0, ATAccess_Write);
end;
```

D10.2.13 ATS1CPR, Address Translate Stage 1 Current state PL1 Read

The ATS1CPR characteristics are:

Purpose

Performs stage 1 address translation as defined for PL1 and the current Security state, with permissions as if reading from the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS1CPR is a 32-bit System instruction.

Field descriptions

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. If EL2 is implemented and enabled in the current Security state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

Executing ATS1CPR

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_AT(R(t), TranslationStage_1, EL1, ATAccess_Read);
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_1, EL1, ATAccess_Read);
end;
```

D10.2.14 **ATS1CPW, Address Translate Stage 1 Current state PL1 Write**

The ATS1CPW characteristics are:

Purpose

Performs stage 1 address translation as defined for PL1 and the current Security state, with permissions as if writing to the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS1CPW is a 32-bit System instruction.

Field descriptions

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. If EL2 is implemented and enabled in the current Security state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

Executing ATS1CPW

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_AT(R(t), TranslationStage_1, EL1, ATAccess_Write);
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_1, EL1, ATAccess_Write);
end;
```

D10.2.15 **ATS1CUR, Address Translate Stage 1 Current state Unprivileged Read**

The ATS1CUR characteristics are:

Purpose

Performs stage 1 address translation as defined for PL0 and the current Security state, with permissions as if reading from the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS1CUR is a 32-bit System instruction.

Field descriptions

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. If EL2 is implemented and enabled in the current Security state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

Executing ATS1CUR

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_AT(R(t), TranslationStage_1, EL0, ATAccess_Read);
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_1, EL0, ATAccess_Read);
end;
```

D10.2.16 **ATS1CUW, Address Translate Stage 1 Current state Unprivileged Write**

The ATS1CUW characteristics are:

Purpose

Performs stage 1 address translation as defined for PL0 and the current Security state, with permissions as if writing to the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS1CUW is a 32-bit System instruction.

Field descriptions

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. If EL2 is implemented and enabled in the current Security state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

Executing ATS1CUW

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_AT(R(t), TranslationStage_1, EL0, ATAccess_Write);
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_1, EL0, ATAccess_Write);
end;
```

D10.2.17 **ATS1HR, Address Translate Stage 1 Hyp mode Read**

The ATS1HR characteristics are:

Purpose

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if reading from the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS1HR is a 32-bit System instruction.

Field descriptions

31	0
Input address for translation	

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

Executing ATS1HR

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0111	0b1000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_1, EL2, ATAccess_Read);
end;
```

D10.2.18 **ATS1HW, Address Translate Stage 1 Hyp mode Write**

The ATS1HW characteristics are:

Purpose

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if writing to the given virtual address.

Configuration

There are no configuration notes.

Attributes

ATS1HW is a 32-bit System instruction.

Field descriptions

31		0
Input address for translation		

IA, bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

Executing ATS1HW

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0111	0b1000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_AT(R(t), TranslationStage_1, EL2, ATAccess_Write);
end;
```

D10.2.19 BPIALL, Branch Predictor Invalidate All

The BPIALL characteristics are:

Purpose

Invalidate all entries from branch predictors.

Configuration

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing BPIALL

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction. When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [BPIALLIS](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0101	0b110

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().FB == '1' then
        BPIALLIS();
    else
        BPIALL();
    end;
elsif PSTATE.EL == EL2 then
    BPIALL();
end;
```

D10.2.20 BPIALLIS, Branch Predictor Invalidate All, Inner Shareable

The BPIALLIS characteristics are:

Purpose

Invalidate all entries from branch predictors Inner Shareable.

Configuration

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing BPIALLIS

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction. Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0001	0b110

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        BPIALLIS();
    end;
elsif PSTATE.EL == EL2 then
    BPIALLIS();
end;
```

D10.2.21 BPIMVA, Branch Predictor Invalidate by VA

The BPIMVA characteristics are:

Purpose

Invalidate virtual address from branch predictors.

Configuration

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIMVA is a 32-bit System instruction.

Field descriptions

VA, bits [31:0]

Virtual address to use.

Executing BPIMVA

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0101	0b111

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        BPIMVA(R(t));
    end;
elsif PSTATE.EL == EL2 then
    BPIMVA(R(t));
end;
```

D10.2.22 CCSIDR, Current Cache Size ID Register

The CCSIDR characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

When FEAT_CCIDX is implemented, this register is used in conjunction with CCSIDR2.

Configuration

The implementation includes one CCSIDR for each cache that it can access. [CSSELR](#) and the Security state select which Cache Size ID Register is accessible.

Attributes

CCSIDR is a 32-bit register.

Field descriptions

!IsFeatureImplemented(FEAT_CCIDX)

31	28	27	13	12	3	2	0
UNKNOWN		NumSets			Associativity		LineSize

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

($\log_2(\text{Number of bytes in cache line})$) - 4. For example:

For a line length of 16 bytes: $\log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: $\log_2(32) = 5$, LineSize entry = 1.

Note

The C++ 17 specification has two defined parameters relating to the granularity of memory that does not interfere. For generic software and tools, Arm will set the hardware_destructive_interference_size parameter to 256 bytes and the hardware_constructive_interference_size parameter to 64 bytes.

Accessing CCSIDR

If [CSSELR](#).{Level, InD} is programmed to a cache level that is not implemented, then on a read of the CCSIDR the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR read is treated as NOP.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b001	0b0000	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID2 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = CCSIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = CCSIDR();
end;
```

D10.2.23 CLIDR, Cache Level ID Register

The CLIDR characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configuration

There are no configuration notes.

Attributes

CLIDR is a 32-bit register.

Field descriptions

31	30	29	27	26	24	23	21	20	18	17	15	14	12	11	9	8	6	5	3	2	0
ICB		LoUU		LoC		LoUIS		Ctype7	Ctype6	Ctype5	Ctype4	Ctype3	Ctype2	Ctype1							

ICB, bits [31:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ICB	Meaning
0b00	Not disclosed by this mechanism.
0b01	L1 cache is the highest Inner Cacheable level.
0b10	L2 cache is the highest Inner Cacheable level.
0b11	L3 cache is the highest Inner Cacheable level.

Access to this field is RO.

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

For a description of the values of this field, see [Terminology for Clean, Invalidate, and Clean and Invalidate instructions](#).

Note
This field does not describe the requirements for instruction cache invalidation. See [CTR.DIC](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

For a description of the values of this field, see [Terminology for Clean, Invalidate, and Clean and Invalidate instructions](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

For a description of the values of this field, see [Terminology for Clean, Invalidate, and Clean and Invalidate instructions](#).

Note
This field does not describe the requirements for instruction cache invalidation. See [CTR.DIC](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Ctype<n> , bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 0b000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 0b000, the values of Ctype4 to Ctype7 must be ignored.

Accessing CLIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b001	0b0000	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID2 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = CLIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = CLIDR();
end;
```

D10.2.24 CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

Purpose

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Configuration

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

Attributes

CONTEXTIDR is a 32-bit register.

This register has the following instances:

- CONTEXTIDR.

Field descriptions

TTBCR.EAE==1

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CONTEXTIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b001

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    
```

```
        elsif EL2Enabled() && HCR().TRVM == '1' then
            AArch32_TakeHypTrapException(0x03);
        else
            R(t) = CONTEXTIDR();
        end;
    elsif PSTATE.EL == EL2 then
        R(t) = CONTEXTIDR();
    end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        CONTEXTIDR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    CONTEXTIDR() = R(t);
end;
```

D10.2.25 CP15DMB, Data Memory Barrier System instruction

The CP15DMB characteristics are:

Purpose

Performs a Data Memory Barrier.

Arm deprecates any use of this System instruction, and strongly recommends that software use the DMB instruction instead.

Configuration

There are no configuration notes.

Attributes

CP15DMB is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing CP15DMB

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1010	0b101

```
if PSTATE.EL == EL0 then
    if SCTLRL().CP15BEN == '0' then
        Undefined();
    elseif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        CP15DMB();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif SCTLRL().CP15BEN == '0' then
        Undefined();
    else
        CP15DMB();
    end;
elseif PSTATE.EL == EL2 then
    if HSCTLRL().CP15BEN == '0' then
        Undefined();
    else
        CP15DMB();
    end;
end;
```

D10.2.26 CP15DSB, Data Synchronization Barrier System instruction

The CP15DSB characteristics are:

Purpose

Performs a Data Synchronization Barrier.

Arm deprecates any use of this System instruction, and strongly recommends that software use the DSB instruction instead.

Configuration

There are no configuration notes.

Attributes

CP15DSB is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing CP15DSB

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1010	0b100

```
if PSTATE.EL == EL0 then
    if SCTLR().CP15BEN == '0' then
        Undefined();
    elseif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        CP15DSB();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif SCTLR().CP15BEN == '0' then
        Undefined();
    else
        CP15DSB();
    end;
elseif PSTATE.EL == EL2 then
    if HSCTLR().CP15BEN == '0' then
        Undefined();
    else
        CP15DSB();
    end;
end;
```

D10.2.27 CP15ISB, Instruction Synchronization Barrier System instruction

The CP15ISB characteristics are:

Purpose

Performs an Instruction Synchronization Barrier.

Arm deprecates any use of this System instruction, and strongly recommends that software use the ISB instruction instead.

Configuration

There are no configuration notes.

Attributes

CP15ISB is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing CP15ISB

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0101	0b100

```
if PSTATE.EL == EL0 then
    if SCTLRL().CP15BEN == '0' then
        Undefined();
    elseif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        CP15ISB();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif SCTLRL().CP15BEN == '0' then
        Undefined();
    else
        CP15ISB();
    end;
elseif PSTATE.EL == EL2 then
    if HSCTLRL().CP15BEN == '0' then
        Undefined();
    else
        CP15ISB();
    end;
end;
```

D10.2.28 CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

Purpose

Controls access to trace, and to Advanced SIMD and floating-point functionality from EL0, EL1, and EL3.

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

Configuration

Bits in the **NSACR** control Non-secure access to the CPACR fields. See the field descriptions for more information.

Note

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See ‘Security state, Exception levels, and AArch32 execution privilege’.

Attributes

CPACR is a 32-bit register.

Field descriptions

**ASEDIS, bit [31]**

Disables PL0 and PL1 execution of Advanced SIMD instructions.

ASEDIS	Meaning
0b0	This control permits execution of Advanced SIMD instructions at PL0 and PL1.
0b1	All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

For the list of instructions affected by this field, see ‘Controls of Advanced SIMD operation that do not apply to floating-point operation’.

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [30:29]

Reserved, RES0.

TRCDIS, bit [28]

Traps PL0 and PL1 System register accesses to all implemented trace System registers to Undefined mode.

TRCDIS	Meaning
0b0	This control has no effect on PL0 and PL1 System register accesses to trace System registers.
0b1	PL0 and PL1 System register accesses to all implemented trace System registers are trapped to Undefined mode.

If the implementation does not include a trace unit, or does not include a System register interface to the trace unit registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

Note

- The ETMv4 architecture does not permit EL0 to access the trace System registers. If the trace unit implements FEAT_ETMv4, EL0 accesses to the trace System registers are UNDEFINED.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace System registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:24]

Reserved, RES0.

cp11, bits [23:22]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

cp10, bits [21:20]

Defines the access rights for the Advanced SIMD and floating-point functionality. Possible values of the field are:

cp10	Meaning
0b00	PL0 and PL1 accesses to Advanced SIMD and floating-point registers or instructions are UNDEFINED.
0b01	PL0 accesses to Advanced SIMD and floating-point registers or instructions are UNDEFINED.

cp10	Meaning
0b10	Reserved. The effect of programming this field to this value is CONSTRAINED UNPREDICTABLE choice between: - The value of this field is treated as 0b00, 0b01, or 0b11 for all purposes other than reading the value of the field. - PL1 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED.
0b11	This control permits full access to the Advanced SIMD and floating-point functionality from PL0 and PL1.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the [FPSCR](#), [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), or [FPEXC](#) System registers.

Note

The [CPACR](#) has no effect on Advanced SIMD and floating-point accesses from PL2. These can be disabled by the [HCPTR.TCP10](#) field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- [FPEXC](#).EN.
- If executing in Non-secure state:
 - [HCPTR.TCP10](#), or if EL2 is using AArch64, CPTR_EL2.TFP.
 - [NSACR](#).cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
 - CPACR.ASEDIS.
 - If executing in Non-secure state, [HCPTR.TASE](#) and [NSACR.NSASEDIS](#).

See the descriptions of the controls for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

Bits [19:0]

Reserved, RES0.

Accessing CPACR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCPTR().TCPAC == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = CPACR();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = CPACR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCPTR().TCPAC == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        CPACR() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    CPACR() = R(t);
end;
```

D10.2.29 CPSR, Current Program Status Register

The CPSR characteristics are:

Purpose

Holds PE status and control information.

Configuration

This register is a Special-purpose register.

Attributes

CPSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	20				19	16				15	10				9	8	7	6	5	4	3	0	
N	Z	C	V	Q	RES0				GE				RES0				E	A	I	F	RES0		RES1		M			

N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Bits [26:20]

Reserved, RES0.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]

Reserved, RES0.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

E	Meaning
0b0	Little-endian operation
0b1	Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the [SCTLR.EE](#) bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError exception mask bit.

A	Meaning
0b0	Exception not masked.
0b1	Exception masked.

I, bit [7]

IRQ mask bit.

I	Meaning
0b0	Exception not masked.
0b1	Exception masked.

F, bit [6]

FIQ mask bit.

F	Meaning
0b0	Exception not masked.
0b1	Exception masked.

Bit [5]

Reserved, RES0.

Bit [4]

Reserved, RES1.

M, bits [3:0]

Current PE mode.

M	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Accessing CPSR

CPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

The MSR (register) and MRS instructions used to access CPSR are data-independent-time instructions as described in About PSTATE.DIT.

D10.2.30 CSSELR, Cache Size Selection Register

The CSSELR characteristics are:

Purpose

Selects the current Cache Size ID Register, [CCSIDR](#), by specifying the required cache level and the cache type, which is either instruction cache or data cache.

If FEAT_CCIDX is implemented, CSSELR also selects the current CCSIDR2.

Configuration

There are no configuration notes.

Attributes

CSSELR is a 32-bit register.

This register has the following instances:

- CSSELR.

Field descriptions

Bits [31:4]

Reserved, RES0.

Level, bits [3:1]

Cache level of required cache. Permitted values are:

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR.{Level, InD} is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit. Permitted values are:

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR.{Level, InD} is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CSSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b010	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID2 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = CSSELR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = CSSELR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b010	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID2 == '1' then

```

```
        AArch32_TakeHypTrapException(0x03);  
    else  
        CSSELR() = R(t);  
    end;  
elseif PSTATE.EL == EL2 then  
    CSSELR() = R(t);  
end;
```

D10.2.31 CTR, Cache Type Register

The CTR characteristics are:

Purpose

Provides information about the architecture of the caches.

Configuration

There are no configuration notes.

Attributes

CTR is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

DIC, bit [29]

Instruction cache invalidation requirements for data to instruction coherence.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIC	Meaning
0b0	Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.
0b1	Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.

All PEs in the same Inner Shareable shareability domain must have a common value of this field.

Access to this field is RO.

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDC	Meaning
0b0	Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR.LoC == 0b000 or (CLIDR.LoUIS == 0b000 and CLIDR.LoUU == 0b000).
0b1	Data cache clean to the Point of Unification is not required for instruction to data coherence.

If CTR.DIC is 1, then the value reported in this field must be 1.

The Effective value of IDC is 1 if any of the following are true:

- CTR.IDC == 1.
- CLIDR.LoC == 0b000.
- CLIDR.LoUIS == 0b000 and CLIDR.LoUU == 0b000.

All PEs in the same Inner Shareable shareability domain must have a common Effective value of IDC.

Access to this field is RO.

CWG, bits [27:24]

Cache writeback granule. $\log_2$ of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ERG, bits [23:20]

Exclusives reservation granule. $\log_2$ of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value 0b0000 is deprecated.

The value 0b0001 and values greater than 0b1001 are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

DminLine, bits [19:16]

$\log_2$ of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Ip	Meaning
0b00	Reserved.
0b01	ASID-tagged Virtual Index, Virtual Tag (AIVIVT).
0b10	Virtual Index, Physical Tag (VIPT).
0b11	Physical Index, Physical Tag (PIPT).

The table above shows all possible values of this field. The values this field can take in the current implementation are:

- 0b10
- 0b11

From Armv8.0, the value 0b01 is not permitted.

Access to this field is RO.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

Log₂ of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID2 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = CTR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = CTR();
end;
```

D10.2.32 DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC

The DCCIMVAC characteristics are:

Purpose

Clean and Invalidate data or unified cache line by virtual address to PoC.

Configuration

There are no configuration notes.

Attributes

DCCIMVAC is a 32-bit System instruction.

Field descriptions

VA, bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DCCIMVAC

Execution of this instruction might require an address translation from VA to PA, and that translation might fault.

For more information about faults, see [‘Permission fault’](#).

For more information about data cache maintenance instructions, see [‘AArch32 data cache maintenance instructions \(DC*\)’](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1110	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if !AArch32_CanTrapDC(CacheOp_CleanInvalidate, CacheOpScope_PoC) then
        ExecuteAsNOP();
    elsif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TPC == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        if AArch32_TreatDCAsNOP(CacheOp_CleanInvalidate, CacheOpScope_PoC) then
            ExecuteAsNOP();
        else
            AArch32_DC(R(t), CacheOp_CleanInvalidate, CacheOpScope_PoC);
        end;
    end;
```

```
        end;
    elsif PSTATE.EL == EL2 then
        if !AArch32_CanTrapDC(CacheOp_CleanInvalidate, CacheOpScope_PoC) then
            ExecuteAsNOP();
        else
            if AArch32_TreatDCAsNOP(CacheOp_CleanInvalidate, CacheOpScope_PoC) then
                ExecuteAsNOP();
            else
                AArch32_DC(R(t), CacheOp_CleanInvalidate, CacheOpScope_PoC);
            end;
        end;
    end;
end;
```

D10.2.33 DCCISW, Data Cache line Clean and Invalidate by Set/Way

The DCCISW characteristics are:

Purpose

Clean and Invalidate data or unified cache line by set/way.

Configuration

There are no configuration notes.

Attributes

DCCISW is a 32-bit System instruction.

Field descriptions

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \log_2(\text{ASSOCIATIVITY})$, $L = \log_2(\text{LINELEN})$, $B = (L + S)$, $S = \log_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DCCISW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONstrained UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1110	0b010

```
if PSTATE.EL == EL0 then

end;
```

D10.2.34 DCCMVAC, Data Cache line Clean by VA to PoC

The DCCMVAC characteristics are:

Purpose

Clean data or unified cache line by virtual address to PoC.

Configuration

There are no configuration notes.

Attributes

DCCMVAC is a 32-bit System instruction.

Field descriptions

VA, bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DCCMVAC

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see '[AArch32 data cache maintenance instructions \(DC*\)](#)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1010	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if !AArch32_CanTrapDC(CacheOp_Clean, CacheOpScope_PoC) then
        ExecuteAsNOP();
    elseif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TPC == '1' then

            ExecuteAsNOP();
        else
            AArch32_DC(R(t), CacheOp_Clean, CacheOpScope_PoC);
        end;
    end;
elseif PSTATE.EL == EL2 then
    if !AArch32_CanTrapDC(CacheOp_Clean, CacheOpScope_PoC) then
        ExecuteAsNOP();
```

```
    else
        if AArch32_TreatDCasNOP(CacheOp_Clean, CacheOpScope_PoC) then
            ExecuteAsNOP();
        else
            AArch32_DC(R(t), CacheOp_Clean, CacheOpScope_PoC);
        end;
    end;
end;
```

D10.2.35 DCCMVAU, Data Cache line Clean by VA to PoU

The DCCMVAU characteristics are:

Purpose

Clean data or unified cache line by virtual address to PoU.

Configuration

There are no configuration notes.

Attributes

DCCMVAU is a 32-bit System instruction.

Field descriptions

VA, bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DCCMVAU

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see '[AArch32 data cache maintenance instructions \(DC*\)](#)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1011	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TPU == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_DC(R(t), CacheOp_Clean, CacheOpScope_PoU);
    end;
elsif PSTATE.EL == EL2 then
    AArch32_DC(R(t), CacheOp_Clean, CacheOpScope_PoU);
end;
```

D10.2.36 DCCSW, Data Cache line Clean by Set/Way

The DCCSW characteristics are:

Purpose

Clean data or unified cache line by set/way.

Configuration

There are no configuration notes.

Attributes

DCCSW is a 32-bit System instruction.

Field descriptions

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \log_2(\text{ASSOCIATIVITY})$, $L = \log_2(\text{LINELEN})$, $B = (L + S)$, $S = \log_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DCCSW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONstrained UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1010	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TSW == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_DC(R(t), CacheOp_Clean, CacheOpScope_SetWay);
    end;
elsif PSTATE.EL == EL2 then
    AArch32_DC(R(t), CacheOp_Clean, CacheOpScope_SetWay);
end;
```

D10.2.37 DCIMVAC, Data Cache line Invalidate by VA to PoC

The DCIMVAC characteristics are:

Purpose

Invalidate data or unified cache line by virtual address to PoC.

Configuration

There are no configuration notes.

Attributes

DCIMVAC is a 32-bit System instruction.

Field descriptions

31	0
Virtual address to use	

VA, bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DCIMVAC

It is IMPLEMENTATION DEFINED whether, when this instruction is executed, it can generate a watchpoint. If this instruction can generate a watchpoint this is prioritized in the same way as other watchpoints.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see '[AArch32 data cache maintenance instructions \(DC*\)](#)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0110	0b001

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if !AArch32_CanTrapDC(CacheOp_Invalidate, CacheOpScope_PoC) then
        ExecuteAsNOP();
    elsif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TPC == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        if AArch32_TreatDCAsNOP(CacheOp_Invalidate, CacheOpScope_PoC) then
            ExecuteAsNOP();
        else
            AArch32_DC(R(t), CacheOp_Invalidate, CacheOpScope_PoC);
        end;
    end;
end;

```

```
elseif PSTATE.EL == EL2 then
    if !AArch32_CanTrapDC(CacheOp_Invalidate, CacheOpScope_PoC) then
        ExecuteAsNOP();
    else
        if AArch32_TreatDCAsNOP(CacheOp_Invalidate, CacheOpScope_PoC) then
            ExecuteAsNOP();
        else
            AArch32_DC(R(t), CacheOp_Invalidate, CacheOpScope_PoC);
        end;
    end;
end;
```

D10.2.38 DCISW, Data Cache line Invalidate by Set/Way

The DCISW characteristics are:

Purpose

Invalidate data or unified cache line by set/way.

Configuration

There are no configuration notes.

Attributes

DCISW is a 32-bit System instruction.

Field descriptions

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \log_2(\text{ASSOCIATIVITY})$, $L = \log_2(\text{LINELEN})$, $B = (L + S)$, $S = \log_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DCISW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONstrained UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0110	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TSW == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_DC(R(t), CacheOp_Invalidate, CacheOpScope_SetWay);
    end;
elseif PSTATE.EL == EL2 then
    AArch32_DC(R(t), CacheOp_Invalidate, CacheOpScope_SetWay);
end;
```

D10.2.39 DFAR, Data Fault Address Register

The DFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

Configuration

There are no configuration notes.

Attributes

DFAR is a 32-bit register.

This register has the following instances:

- DFAR.

Field descriptions

VA, bits [31:0]

VA of faulting address of synchronous Data Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = DFAR();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = DFAR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        DFAR() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    DFAR() = R(t);
end;
```

D10.2.40 **DFSR, Data Fault Status Register**

The DFSR characteristics are:

Purpose

Holds status information about the last data fault.

Configuration

The current translation table format determines which format of the register is used.

Attributes

DFSR is a 32-bit register.

This register has the following instances:

- DFSR.

Field descriptions

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort.

FnV	Meaning
0b0	DFAR is valid.
0b1	DFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort. It is RES0 for all other Data Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:14]

Reserved, RES0.

CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault.

CM	Meaning
0b0	Abort not caused by execution of a cache maintenance instruction.
0b1	Abort caused by execution of a cache maintenance instruction.

On an asynchronous fault, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ExT, bit [12]

External abort type.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction.

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

Bit [9]

Reserved, RES1.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning
0b000100	Translation fault.
0b001100	Permission fault.
0b010000	Synchronous External abort, other than synchronous parity or ECC error.
0b010001	Asynchronous SError exception.
0b011000	Synchronous parity or ECC error on memory access.
0b011001	Asynchronous SError exception, from a parity or ECC error on memory access.
0b100001	Alignment fault.
0b100010	Debug exception.
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DFSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = DFSR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DFSR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        DFSR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    DFSR() = R(t);
end;
```

D10.2.41 DTLBIALL, Data TLB Invalidate All

The DTLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backward compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is treated as a NOP.

Attributes

DTLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing DTLBIALL

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0110	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_DTLBI_ALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr);
    end;
elseif PSTATE.EL == EL2 then
    AArch32_DTLBI_ALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr);
end;
```

D10.2.42 DTLBIASID, Data TLB Invalidate by ASID match

The DTLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backward compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is treated as a NOP.

Attributes

DTLBIASID is a 32-bit System instruction.

Field descriptions

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing DTLBIASID

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0110	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_DTLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr,
            ↪R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_DTLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr, R(t));
end;
```

D10.2.43 DTLBIMVA, Data TLB Invalidate by VA

The DTLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backward compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is treated as a NOP.

Attributes

DTLBIMVA is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing DTLBIMVA

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0110	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_DTLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
            ↪TLBI_AllAttr, R(t));
    end;
elsif PSTATE.EL == EL2 then
    AArch32_DTLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.44 ELR_hyp, Exception Link Register (Hyp mode)

The ELR_hyp characteristics are:

Purpose

When taking an exception to Hyp mode, holds the address to return to.

Configuration

This register is a Special-purpose register.

Attributes

ELR_hyp is a 32-bit register.

Field descriptions

ADDR, bits [31:0]

Return address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ELR_hyp

ELR_hyp is accessible only at Hyp mode and Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, ELR_hyp

R	M	M1
0b0	0b1	0b1110

MSR{<c>}{<q>} ELR_hyp, <Rn>

R	M	M1
0b0	0b1	0b1110

D10.2.45 FCSEIDR, FCSE Process ID register

The FCSEIDR characteristics are:

Purpose

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

From Armv8.0, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

Configuration

There are no configuration notes.

Attributes

FCSEIDR is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RAZ/WI.

Accessing FCSEIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = FCSEIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = FCSEIDR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        FCSEIDR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    FCSEIDR() = R(t);
end;
```

D10.2.46 FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

Purpose

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

Configuration

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPEXC is a 32-bit register.

Field descriptions

EX, bit [31]

Exception bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RAZ/WI.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

EN	Meaning
0b0	Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10.
- FPEXC.EN.
- If executing in Non-secure state:
 - HCPTR.TCP10.
 - NSACR.cp10.

- For Advanced SIMD instructions only:
 - CPACR.ASEDIS.
 - If executing in Non-secure state, [HCPTR.TASE](#) and [NSACR.NSASEDIS](#).

See the descriptions of the controls for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function `ExecutingCP10or11Instr()` returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
0b0	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function <code>ExecutingCP10or11Instr()</code> . If FPEXC.TFV is RW then it is invalid and UNKNOWN. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	The exception was generated during the execution of an allocated encoding. FPEXC.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the [FPSCR](#).{Stride, Len} fields as RAZ, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction Valid bit. From Armv8.0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RES0.

VV, bit [27]

VECITR Valid bit. From Armv8.0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RES0.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR .{Stride, Len} was nonzero. If FPEXC .{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	FPEXC .{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of [FPEXC](#).DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When an implementation does not implement trapping of floating-point exceptions, access to this field is RAZ/WI.
- When an implementation implements [FPSCR](#).{Stride, Len} as RAZ, access to this field is RAO/WI.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector Iteration count. From Armv8.0, this field is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RES1.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of [FPEXC](#).TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while [FPSCR](#).IDE was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when [FPSCR](#).FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of [FPSCR](#).FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of [FPEXC](#).TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Input Denormal floating-point exceptions, access to this field is RAZ/WI.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while [FPSCR.IXE](#) was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Inexact floating-point exceptions, access to this field is RAZ/WI.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while [FPSCR.UFE](#) was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when [FPSCR.FZ16](#) is 0.
- Otherwise only when [FPSCR.FZ](#) is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Underflow floating-point exceptions, access to this field is RAZ/WI.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while [FPSCR.OFE](#) was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Overflow floating-point exceptions, access to this field is RAZ/WI.

DZE, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while [FPSCR.DZE](#) was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Divide by Zero floating-point exceptions, access to this field is RAZ/WI.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while [FPSCR.IOE](#) was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Invalid Operation floating-point exceptions, access to this field is RAZ/WI.

Accessing FPEXC

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

reg
0b1000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if CPACR().cp10 == '00' then
        Undefined();
    elsif EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x08);
    else
        R(t) = FPEXC();
    end;
elsif PSTATE.EL == EL2 then
    if EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x00);
    else
        R(t) = FPEXC();
    end;
end;
```

VMSR{<c>}{<q>} <spec_reg>, <Rt>

reg
0b1000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if CPACR().cp10 == '00' then
        Undefined();
    elsif EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x08);
    else
        FPEXC() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    if EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x00);
    else
        FPEXC() = R(t);
    end;
end;
```

D10.2.47 FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

Purpose

Provides floating-point system status information and control.

Configuration

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to nonzero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	QC	AHP	DN	FZ	RMode	Stride				Len	IDE	RES0	IXE	UFE	OFE	DZE	IOE	IDC	RES0	IXC	UFC	OFC	DZC	IOC			

└─ RES0

N, bit [31]

Negative condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AHP, bit [26]

Alternative half-precision control bit:

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN control bit:

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the default NaN.

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the default NaN setting, regardless of the value of the DN bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flush-to-zero mode control bit:

FZ	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field. The encoding of this field is:

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation implements FPSCR.{Stride, Len} as RAZ, access to this field is RAZ/WI.

Bit [19]

Reserved, RES0.

Len, bits [18:16]

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation implements FPSCR.{Stride, Len} as RAZ, access to this field is RAZ/WI.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Input Denormal floating-point exceptions, access to this field is RAZ/WI.

Bits [14:13]

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable.

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Inexact floating-point exceptions, access to this field is RAZ/WI.

UFE, bit [11]

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the UFC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Underflow floating-point exceptions, access to this field is RAZ/WI.

OFE, bit [10]

Overflow floating-point exception trap enable.

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Overflow floating-point exceptions, access to this field is RAZ/WI.

DZE, bit [9]

Divide by Zero floating-point exception trap enable.

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Divide by Zero floating-point exceptions, access to this field is RAZ/WI.

IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Invalid Operation floating-point exceptions, access to this field is RAZ/WI.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For more information, see ‘Flush-to-zero’.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, if FPSCR.UFE is 0 or if Flush-to-zero is enabled.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For more information, see ‘Flush-to-zero’.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPSCR

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

reg

0b0001

```
if PSTATE.EL == EL0 then
    if CPACR().cp10 IN {'0x'} then
        Undefined();
    elseif EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x08);
    else
        R(t) = FPSCR();
    end;
elseif PSTATE.EL == EL1 then
    if CPACR().cp10 == '00' then
        Undefined();
    elseif EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x08);
    else
        R(t) = FPSCR();
    end;
elseif PSTATE.EL == EL2 then
    if EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x00);
    else
        R(t) = FPSCR();
    end;
end;
```

    end;
end;
```

D10.2.48 FPSID, Floating-Point System ID register

The FPSID characteristics are:

Purpose

Provides top-level information about the floating-point implementation.
This register largely duplicates information held in the MIDR. Arm deprecates use of it.

Configuration

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSID is a 32-bit register.

Field descriptions

31	24	23	22	16	15	8	7	4	3	0
Implementer		SW	Subarchitecture			PartNum		Variant		Revision

Implementer, bits [31:24]

Implementer codes are the same as those used for the MIDR.
For an implementation by Arm this field is 0x41, the ASCII code for A.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

SW, bit [23]

Software bit.
The value of this field is an IMPLEMENTATION DEFINED choice of:

SW	Meaning
0b0	The implementation provides a hardware implementation of the floating-point instructions.
0b1	The implementation supports only software emulation of the floating-point instructions.

In Armv8, the only permitted value is 0.
Access to this field is RO.

Subarchitecture, bits [22:16]

Subarchitecture version number.
The value of this field is an IMPLEMENTATION DEFINED choice of:

Subarchitecture	Meaning
0b00000000	VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.
0b00000001	VFPv2 architecture with Common VFP subarchitecture v1.
0b00000010	VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.
0b00000011	VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. This value can be used only by an implementation that does not support the trap enable bits in the FPSCR .
0b00000100	VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in FPSCR . The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.

For a subarchitecture designed by Arm the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not Arm, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number 0x40.

In Armv8, the permitted values are 0b00000011 and 0b00000100.

Access to this field is RO.

PartNum, bits [15:8]

Part Number for the floating-point implementation, assigned by the implementer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [7:4]

Variant number. Typically, this field distinguishes between different production variants of a single product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the floating-point implementation.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing FPSID

Accesses to this register use the following encodings in the System register encoding space:

VMRS {<c>} {<q>} <Rt>, <spec_reg>

reg

0b0000

```
if PSTATE.EL == EL0 then
    Undefined();

    end;
end;
```

D10.2.49 HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

Purpose

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

Configuration

There are no configuration notes.

Attributes

HACR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HACR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b111

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HACR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HACR() = R(t);
end;
```

D10.2.50 HACTLR, Hyp Auxiliary Control Register

The HACTLR characteristics are:

Purpose

Controls IMPLEMENTATION DEFINED features of Hyp mode operation.

Configuration

There are no configuration notes.

Attributes

HACTLR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HACTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b001

    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HACTLR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HACTLR() = R(t);
end;
```

D10.2.51 HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

Purpose

Provides additional space to the HACTLR register to hold IMPLEMENTATION DEFINED trap functionality.

Configuration

In Armv8.0, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining [ID_MMFR4.AC2](#).

Attributes

HACTLR2 is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HACTLR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HACTLR2();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HACTLR2() = R(t);
end;
```

D10.2.52 HADFSR, Hyp Auxiliary Data Fault Status Register

The HADFSR characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED syndrome information for Data Abort exceptions taken to Hyp mode.

Configuration

This is an optional register. An implementation that does not require this register can implement it as RES0.

Attributes

HADFSR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HADFSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HADFSR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HADFSR() = R(t);
end;
```

D10.2.53 HAIFSR, Hyp Auxiliary Instruction Fault Status Register

The HAIFSR characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED syndrome information for Prefetch Abort exceptions taken to Hyp mode.

Configuration

This is an optional register. An implementation that does not require this register can implement it as RES0.

Attributes

HAIFSR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HAIFSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0001	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HAIFSR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0001	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HAIFSR() = R(t);
end;
```

D10.2.54 HMAIR0, Hyp Auxiliary Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by [HMAIR0](#). These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in [HMAIR0](#).

Configuration

There are no configuration notes.

Attributes

HMAIR0 is a 32-bit register.

Field descriptions

31	0
IMPLEMENTATION DEFINED	

If an implementation does not provide any IMPLEMENTATION DEFINED memory attributes, this register is RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0011	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then

        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HMAIR0();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0011	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HAMAIR0() = R(t);
end;
```

D10.2.55 HMAIR1, Hyp Auxiliary Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by [HMAIR1](#). These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in [HMAIR1](#).

Configuration

There are no configuration notes.

Attributes

HMAIR1 is a 32-bit register.

Field descriptions

31	0
IMPLEMENTATION DEFINED	

If an implementation does not provide any IMPLEMENTATION DEFINED memory attributes, this register is RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0011	0b001

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HMAIR1();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0011	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HAMAIR1() = R(t);
end;
```

D10.2.56 HCPTR, Hyp Architectural Feature Trap Register

The HCPTR characteristics are:

Purpose

Controls:

- Trapping to Hyp mode at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

Note

Accesses to this functionality:

- From modes other than Hyp mode are also affected by settings in the CPACR and NSACR.
- From Hyp mode are also affected by settings in the NSACR.

Exceptions generated by the CPACR and NSACR controls are higher priority than those generated by the HCPTR controls.

Configuration

There are no configuration notes.

Attributes

HCPTR is a 32-bit register.

Field descriptions

TCPAC, bit [31]

Traps EL1 MRC and MCR accesses to the CPACR to Hyp mode, reported using EC syndrome value 0x03.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the CPACR are trapped to Hyp mode.

Note

The CPACR is not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [30:21]

Reserved, RES0.

TTA, bit [20]

Traps System register MRC, MCR, MRRC, and MCRR accesses to all implemented trace System registers to Hyp mode, reported using EC syndrome values 0x05 and 0x0C.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any System register access to an implemented trace System register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates: - A Hyp Trap exception, if the exception is taken from EL0 or EL1. - An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

If the implementation does not include a trace unit, or does not include a System register interface to the trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

Note

- The ETMv4 architecture does not permit EL0 to access the trace System registers. If the trace unit implements FEAT_ETMv4, EL0 accesses to the trace System registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace System registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [19:16]

Reserved, RES0.

TASE, bit [15]

Traps execution of Advanced SIMD instructions to Hyp mode, reported using EC syndrome value 0x07, when the value of HCPTR.TCP10 is 0.

TASE	Meaning
0b0	This control does not cause any instructions to be trapped.

TASE	Meaning
0b1	When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates: • A Hyp Trap exception, if the exception is taken from EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If the implementation includes floating-point functionality but does not include Advanced SIMD, this field is RES1.

Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

For the list of instructions affected by this field, see ‘[Controls of Advanced SIMD operation that do not apply to floating-point operation](#)’.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [14]

Reserved, RES0.

Bits [13:12]

Reserved, RES1.

TCP11, bit [11]

When FEAT_FP is implemented and FEAT_AdvSIMD is implemented:

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES1.

TCP10, bit [10]

When FEAT_FP is implemented and FEAT_AdvSIMD is implemented:

Trap accesses to Advanced SIMD and floating-point functionality to Hyp mode, reported using EC syndrome value 0x07:

TCP10	Meaning
0b0	This control does not cause any instructions to be trapped.

TCP10	Meaning
0b1	Any attempted access to Advanced SIMD and floating-point functionality is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates: • A Hyp Trap exception, if the exception is taken from EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the [FPSCR](#), [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), or [FPEXC](#) System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES1.

Bits [9:0]

Reserved, RES1.

Accessing HCPTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b010

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then

    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HCPTR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HCPTR() = R(t);
end;
```

D10.2.57 HCR, Hyp Configuration Register

The HCR characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to Hyp mode.

Configuration

There are no configuration notes.

Attributes

HCR is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

TRVM, bit [30]

Trap Reads of Memory controls. Traps EL1 reads of the memory control registers to EL2.

MRC reads of the following registers are trapped and reported using EC syndrome value 0x03 and MRRC reads are trapped and reported using EC syndrome value 0x04:

[SCTLR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#), [PRSELR](#), [PRBAR](#), [PRBAR<n>](#), [PRLAR](#), [PRLAR<n>](#).

TRVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 read accesses to the specified Memory control registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

HCD, bit [29]

HVC instruction disable.

Disables EL1 and EL2 execution of HVC instructions, reported using EC syndrome value 0x00.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.

Note
HVC instructions are always UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [28]

Reserved, RES0.

TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	Following statements are true: - All exceptions that would be routed to EL1 are routed to EL2. - The SCTLR.M bit is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. - The HCR.{FMO, IMO, AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR. - All virtual interrupts are disabled. - Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. - An exception return to EL1 is treated as an illegal exception return.

Also, when HCR.TGE is 1:

- The [HDCR](#).{TDRA, TDOSA, TDA, TDE} bits are ignored and treated as being 1 other than for the purpose of a direct read of [HDCR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TVM, bit [26]

Trap Memory controls. Traps EL1 writes to the memory control registers to EL2.

MCR writes of the following registers are trapped and reported using EC syndrome value 0x03 and MCRR writes are trapped and reported using EC syndrome value 0x04:

[SCTLR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#), [PRSEL](#), [PRBAR](#), [PRBAR<n>](#), [PRLAR](#), [PRLAR<n>](#).

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 write accesses to the specified memory control registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [25]

Reserved, RES0.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps EL1 execution of those cache maintenance instructions to EL2.

MRC and MCR accesses of the following system instructions are trapped and reported using EC syndrome value 0x03:

- [ICIMVAU](#), [ICIALLU](#), [ICIALLUIS](#), [DCCMVAU](#).

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps EL1 execution of those cache maintenance instructions to EL2.

MRC and MCR accesses of the following system instructions are trapped and reported using EC syndrome value 0x03:

- [DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps EL1 execution of those cache maintenance instructions by set/way to EL2.

MRC and MCR accesses of the following system instructions are trapped and reported using EC syndrome value 0x03:

- [DCISW](#), [DCCSW](#), [DCCISW](#).

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified cache maintenance instructions is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TAC, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2.

MRC and MCR accesses of the following registers are trapped and reported using EC syndrome value 0x03:

[ACTLR](#) and, if implemented, [ACTLR2](#).

TAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings for IMPLEMENTATION DEFINED System Registers to EL2.

MRC and MCR accesses of the following encodings are trapped and reported using EC syndrome value 0x03:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 == {0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to EL2.

When HCR.TIDCP is set to 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from EL0 is trapped to EL2. Otherwise, it is UNDEFINED and the PE takes an Undefined Instruction exception to Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [19]

Reserved, RES0.

TID3, bit [18]

Trap ID group 3. Traps EL1 reads of the following registers to EL2 as follows:

- VMRS access to [MVFR0](#), [MVFR1](#), and [MVFR2](#), reported using EC syndrome value 0x08, unless access is also trapped by [HCPTR](#) which takes priority.
- MRC access to the following registers are reported using EC syndrome value 0x03:
 - [ID_PFR0](#), [ID_PFR1](#), [ID_DFR0](#), [ID_AFR0](#), [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), [ID_MMFR3](#), [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).
 - [ID_MMFR4](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_MMFR4](#) is trapped.
- Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to registers not already mentioned, with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}, reported with EC syndrome value 0x03.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 3 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TID2, bit [17]

Trap ID group 2. Traps the following register MRC and MCR accesses to EL2, reported using EC syndrome value 0x03:

- EL1 and EL0 reads of the [CTR](#), [CCSIDR](#), [CLIDR](#), and [CSSELR](#).
- EL1 and EL0 writes to the [CSSELR](#).

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TID1, bit [16]

Trap ID group 1. Traps EL1 MRC reads of the following registers to EL2, reported using EC syndrome value 0x03:

[TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#), [MPUIR](#).

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 1 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 VMRS reads of [FPSID](#) reported using EC syndrome value 0x08.
- EL0 and EL1 MCR and MRC accesses of [JIDR](#) reported using EC syndrome value 0x05.

Note

- It is IMPLEMENTATION DEFINED whether the [JIDR](#) is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The [FPSID](#) is not accessible at EL0.
- Writes to the [FPSID](#) are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 0 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, reported using EC syndrome value 0x01.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE .

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TWI, bit [13]

Traps EL0 and EL1 execution of WFI instructions to EL2, reported using EC syndrome value 0x01.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI .

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DC, bit [12]

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the EL1&0 translation regime.
0b1	This control has following effects: • The HCR.VM field behaves as 1 for all purposes other than a direct read of the value of the field. • The memory type produced by the first stage of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate. • For instruction accesses, XN behaves as 0, meaning execution is permitted.

This field has no effect on the EL2 translation regime.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

[BPIALL](#), [ICIALLU](#).

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VA, bit [8]

Virtual SError exception.

VA	Meaning
0b0	This mechanism is not making a virtual SError exception pending.
0b1	A virtual SError exception is pending because of this mechanism.

The virtual SError exception is enabled only when the value of HCR.{TGE, AMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VI, bit [7]

Virtual IRQ exception.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VF, bit [6]

Virtual FIQ exception.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.

VF	Meaning
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AMO, bit [5]

SError exception Mask Override. When this bit is set to 1, it overrides the effect of CPSR.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError exceptions are enabled.

If the value of HCR.TGE is 1, then the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

IMO, bit [4]

IRQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled.

If the value of HCR.TGE is 1, then HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

FMO, bit [3]

FIQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled.

If the value of HCR.TGE is 1, then HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [2]

Reserved, RES0.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When this bit is set to 1, [DCISW](#) performs the same invalidation as a [DCCISW](#) instruction.

As a result of changes to the behavior of [DCISW](#), this bit is redundant in Armv8. This bit can be implemented as RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VM, bit [0]

Virtualization enable. Enables stage 2 address protection for EL1&0 translation regime.

VM	Meaning
0b0	EL1&0 stage 2 address protection disabled.
0b1	EL1&0 stage 2 address protection enabled.

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing HCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HCR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HCR() = R(t);
end;
```

D10.2.58 HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

Purpose

Provides additional configuration controls for virtualization.

Configuration

There are no configuration notes.

Attributes

HCR2 is a 32-bit register.

Field descriptions

Bits [31:7]

Reserved, RES0.

MIOCNCNCE, bit [6]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regime.

MIOCNCNCE	Meaning
0b0	For the EL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the EL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

The value of this field has no effect on translation regimes other than the EL1&0 translation regime. This field can be implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [5:0]

Reserved, RES0.

Accessing HCR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b100

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HCR2();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b100

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HCR2() = R(t);
end;
```

D10.2.59 HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

Configuration

There are no configuration notes.

Attributes

HDFAR is a 32-bit register.

Field descriptions

31	0
VA of faulting address of synchronous Data Abort exception taken to Hyp mode	

VA, bits [31:0]

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HDFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HDFAR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HDFAR() = R(t);
end;
```

D10.2.60 HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

Configuration

There are no configuration notes.

Attributes

HIFAR is a 32-bit register.

Field descriptions

31	0
VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode	

VA, bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode.

On a Data Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HIFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HIFAR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

```

D10.2.61 HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

Purpose

Along with [HMAIR1](#), provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIdx[2] indicates the HMAIR register to be used:

- When AttrIdx[2] is 0, HMAIR0 is used.
- When AttrIdx[2] is 1, [HMAIR1](#) is used.

Configuration

There are no configuration notes.

Attributes

HMAIR0 is a 32-bit register.

Field descriptions

TTBCR.EAE=1

31	24	23	16	15	8	7	0
Attr3				Attr2			
Attr1				Attr0			

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

end;
```

D10.2.62 HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

Purpose

Along with [HMAIR0](#), provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIdx[2] indicates the HMAIR register to be used:

- When AttrIdx[2] is 0, [HMAIR0](#) is used.
- When AttrIdx[2] is 1, HMAIR1 is used.

Configuration

There are no configuration notes.

Attributes

HMAIR1 is a 32-bit register.

D10.2.63 HMPUIR, Hypervisor MPU Type Register

The HMPUIR characteristics are:

Purpose

Identifies the number of regions supported by the EL2 MPU.

Configuration

There are no configuration notes.

Attributes

HMPUIR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REGION, bits [7:0]

The number of EL2 MPU regions supported.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing HMPUIR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0000	0b0000	0b100

```
if PSTATE.EL == EL0 then

        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HMPUIR();
end;
```

D10.2.64 HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

Configuration

There are no configuration notes.

Attributes

HPFAR is a 32-bit register.

Field descriptions

Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

FIPA[39:12], bits [31:4]

Bits [39:12] of the faulting intermediate physical address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing HPFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b100

```
if PSTATE.EL == EL0 then

    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HPFAR() = R(t);
end;
```

D10.2.65 HPRBAR, Hypervisor Protection Region Base Address Register

The HPRBAR characteristics are:

Purpose

Provides access to the base addresses for the EL2 MPU region. [HPRSEL](#).REGION determines which MPU region is selected.

Configuration

All bits above implemented physical address range in this register should be treated as RES0.

Attributes

HPRBAR is a 32-bit register.

Field descriptions

**BASE, bits [31:6]**

Bits[31:6] of the lower inclusive limit of the selected EL2 MPU memory region. This value is zero extended to provide the base address to be checked against.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SH[1:0], bits [4:3]

Shareability attribute SH[1:0].

SH[1:0]	Meaning
0b00	Non-shareable
0b01	Reserved, CONSTRAINED UNPREDICTABLE
0b10	Outer Shareable
0b11	Inner Shareable

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AP[2:1], bits [2:1]

Access Permission attributes AP[2:1].

AP[2:1]	Meaning
0b00	Read/write at EL2, no access at EL1 or EL0
0b01	Read/write at EL2, EL1 and EL0
0b10	Read-only at EL2, no access at EL1 or EL0
0b11	Read-only at EL2, EL1 and EL0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

XN, bit [0]

Execute Never

XN	Meaning
0b0	Execution of instructions fetched from the region is permitted.
0b1	Execution of instructions fetched from the region is not permitted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HPRBAR

Any access to MPU region register HPRBAR above the number of implemented regions specified by [HMPUIR.REGION](#) is CONSTRAINED UNPREDICTABLE.

CONSTRAINED UNPREDICTABLE behavior is defined as:

- Reads of unimplemented HPRBAR register return an UNKNOWN value.
- Writes to unimplemented HPRBAR register make all HPRBAR registers value UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0011	0b000

```
if UInt(HPRSELR().REGION) >= UInt(HMPUIR().REGION) then
    ConstrainUnpredictableProcedure(Unpredictable_UnimplementedMPURegion_RW_UNKNOWN);
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
```

```
        end;  
    elsif PSTATE.EL == EL2 then  
        R(t) = HPRBAR(UInt(HPRSELR().REGION));  
    end;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0011	0b000

```
if UInt(HPRSELR().REGION) >= UInt(HMPUIR().REGION) then  
    ConstrainUnpredictableProcedure(Unpredictable_UnimplementedMPURRegion_RW_UNKNOWN);  
elsif PSTATE.EL == EL0 then  
    Undefined();  
elsif PSTATE.EL == EL1 then  
    if EL2Enabled() && HSTR().T6 == '1' then  
        AArch32_TakeHypTrapException(0x03);  
    else  
        Undefined();  
    end;  
elsif PSTATE.EL == EL2 then  
    HPRBAR(UInt(HPRSELR().REGION)) = R(t);  
end;
```

D10.2.66 HPRBAR<n>, Hypervisor Protection Region Base Address Register n, n = 0 - 31

The HPRBAR<n> characteristics are:

Purpose

Provides access to the base address for the EL2 MPU region determined by the value of ‘n’.

Configuration

All bits above implemented physical address range in this register should be treated as RES0.

Attributes

HPRBAR<n> is a 32-bit register.

Field descriptions

BASE, bits [31:6]

Bits[31:6] of the lower inclusive limit of the selected EL2 MPU memory region. This value is zero extended to provide the base address to be checked against.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SH[1:0], bits [4:3]

Shareability attribute SH[1:0].

SH[1:0]	Meaning
0b00	Non-shareable
0b01	Reserved, CONSTRAINED UNPREDICTABLE
0b10	Outer Shareable
0b11	Inner Shareable

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AP[2:1], bits [2:1]

Access Permission attributes AP[2:1].

AP[2:1]	Meaning
0b00	Read/write at EL2, no access at EL1 or EL0
0b01	Read/write at EL2, EL1 and EL0
0b10	Read-only at EL2, no access at EL1 or EL0
0b11	Read-only at EL2, EL1 and EL0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

XN, bit [0]

Execute Never

XN	Meaning
0b0	Execution of instructions fetched from the region is permitted.
0b1	Execution of instructions fetched from the region is not permitted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HPRBAR<n>

Any access to MPU region register HPRBAR<n> above the number of implemented regions specified by [HMPUIR.REGION](#) is CONSTRAINED UNPREDICTABLE.

CONSTRAINED UNPREDICTABLE behavior is defined as:

- Reads of unimplemented HPRBAR<n> return an UNKNOWN value.
- Writes to unimplemented HPRBAR<n> register make all HPRBAR registers value UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where n = 0-31

coproc	opc1	CRn	CRm	opc2
0b1111	0b10:n[4]	0b0110	0b1:n[3:1]	n[0]:0b00

```
let n:integer = UInt(opc1[0] :: CRm[2:0] :: opc2[2]);

if n >= UInt(HMPUIR().REGION) then
    ConstrainUnpredictableProcedure(Unpredictable_UnimplementedMPURegion_RW_UNKNOWN);
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
```

```
        else
            Undefined();
        end;
    elsif PSTATE.EL == EL2 then
        R(t) = HPRBAR(n);
    end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where n = 0-31

coproc	opc1	CRn	CRm	opc2
0b1111	0b10:n[4]	0b0110	0b1:n[3:1]	n[0]:0b00

```
let n:integer = UInt(opc1[0] :: CRm[2:0] :: opc2[2]);

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HPRBAR(n) = R(t);
end;
```

D10.2.67 HPRENR, Hypervisor Protection Region Enable Register

The HPRENR characteristics are:

Purpose

Provides direct access to the [HPRLAR](#).EN bits of EL2 MPU regions from 0 to 31.

Configuration

There are no configuration notes.

Attributes

HPRENR is a 32-bit register.

Field descriptions

ENABLE_bits<n> , bits [n], for n = 31 to 0

Enable bit. Each bit, n, enables or disables the respective EL2 MPU region. The bits associated with the unimplemented MPU regions are RAZ/WI.

ENABLE_bits<n>	Meaning
0b0	Disables the EL2 MPU n region.
0b1	Enables the EL2 MPU n region.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression 0x00000000.

Accessing HPRENR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0001	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then

        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HPRENR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0001	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HPRENR() = R(t);
end;
```

D10.2.68 HPRLAR, Hypervisor Protection Region Limit Address Register

The HPRLAR characteristics are:

Purpose

Provides access to the limit addresses for the EL2 MPU region. [HPRSEL.R.REGION](#) determines which MPU region is selected.

Configuration

All bits above implemented physical address range in this register should be treated as RES0.

Attributes

HPRLAR is a 32-bit register.

Field descriptions

LIMIT, bits [31:6]

Bits[31:6] of the upper inclusive limit of the selected EL2 MPU memory region. This value is concatenated with the value 0x3F to provide the limit address to be checked against.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [5:4]

Reserved, RES0.

AttrIndx[2:0], bits [3:1]

AttrIndx[2:0] selects attributes from within the associated Memory Attribute Indirection Register.

AttrIndx[2:0]	Meaning
0b000	Select the Attr0 field from HMAIR0.
0b001	Select the Attr1 field from HMAIR0.
0b010	Select the Attr2 field from HMAIR0.
0b011	Select the Attr3 field from HMAIR0.
0b100	Select the Attr4 field from HMAIR1.
0b101	Select the Attr5 field from HMAIR1.

AttrIdx[2:0]	Meaning
0b110	Select the Attr6 field from HMAIR1.
0b111	Select the Attr7 field from HMAIR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Region enable bit.

EN	Meaning
0b0	Region disabled.
0b1	Region enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing HPRLAR

Any access to MPU region register HPRLAR above the number of implemented regions specified by [HMPUIR](#).REGION is CONSTRAINED UNPREDICTABLE.

CONSTRAINED UNPREDICTABLE behavior is defined as:

- Reads of unimplemented HPRLAR register return an UNKNOWN value.
- Writes to unimplemented HPRLAR register make all HPRLAR registers value UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0011	0b001

```

if UInt(HPRSEL().REGION) >= UInt(HMPUIR().REGION) then
    ConstrainUnpredictableProcedure(Unpredictable_UnimplementedMPURegion_RW_UNKNOWN);
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HPRLAR(UInt(HPRSEL().REGION));
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0011	0b001

```
if UInt(HPRSELR().REGION) >= UInt(HMPUIR().REGION) then
    ConstrainUnpredictableProcedure(Unpredictable_UnimplementedMPURRegion_RW_UNKNOWN);
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HPRLAR(UInt(HPRSELR().REGION)) = R(t);
end;
```

D10.2.69 HPRLAR<n>, Hypervisor Protection Region Limit Address Register n, n = 0 - 31

The HPRLAR<n> characteristics are:

Purpose

Provides access to the limit address for the EL2 MPU region determined by the value of ‘n’.

Configuration

All bits above implemented physical address range in this register should be treated as RES0.

Attributes

HPRLAR<n> is a 32-bit register.

Field descriptions

LIMIT, bits [31:6]

Bits[31:6] of the upper inclusive limit of the selected EL2 MPU memory region. This value is concatenated with the value 0x3F to provide the limit address to be checked against.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [5:4]

Reserved, RES0.

AttrIdx[2:0], bits [3:1]

AttrIdx[2:0] selects attributes from within the associated Memory Attribute Indirection Register.

AttrIdx[2:0]	Meaning
0b000	Select the Attr0 field from HMAIR0.
0b001	Select the Attr1 field from HMAIR0.
0b010	Select the Attr2 field from HMAIR0.
0b011	Select the Attr3 field from HMAIR0.
0b100	Select the Attr4 field from HMAIR1.
0b101	Select the Attr5 field from HMAIR1.

AttrIdx[2:0]	Meaning
0b110	Select the Attr6 field from HMAIR1.
0b111	Select the Attr7 field from HMAIR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Region enable bit.

EN	Meaning
0b0	Region disabled.
0b1	Region enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing HPRLAR<n>

Any access to MPU region register HPRLAR<n> above the number of implemented regions specified by [HMPUIR.REGION](#) is CONSTRAINED UNPREDICTABLE.

CONSTRAINED UNPREDICTABLE behavior is defined as:

- Reads of unimplemented HPRLAR<n> return an UNKNOWN value.
- Writes to unimplemented HPRLAR<n> register make all HPRLAR registers value UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where n = 0-31

coproc	opc1	CRn	CRm	opc2
0b1111	0b10:n[4]	0b0110	0b1:n[3:1]	n[0]:0b01

```
let n:integer = UInt(opc1[0] :: CRm[2:0] :: opc2[2]);

if n >= UInt(HMPUIR().REGION) then
    ConstrainUnpredictableProcedure(Unpredictable_UnimplementedMPURRegion_RW_UNKNOWN);
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
```

```
        R(t) = HPRLAR(n);  
    end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where n = 0-31

coproc	opc1	CRn	CRm	opc2
0b1111	0b10:n[4]	0b0110	0b1:n[3:1]	n[0]:0b01

```
    let n:integer = UInt(opc1[0] :: CRm[2:0] :: opc2[2]);  
  
    if n >= UInt(HMPUIR().REGION) then  
        ConstrainUnpredictableProcedure(Unpredictable_UnimplementedMPURRegion_RW_UNKNOWN);  
    elsif PSTATE.EL == EL0 then  
        Undefined();  
    elsif PSTATE.EL == EL1 then  
        if EL2Enabled() && HSTR().T10 == '1' then  
            AArch32_TakeHypTrapException(0x03);  
        else  
            Undefined();  
        end;  
    elsif PSTATE.EL == EL2 then  
        HPRLAR(n) = R(t);  
    end;
```

D10.2.70 HPRSELR, Hypervisor Protection Region Selection Register

The HPRSELR characteristics are:

Purpose

Selects the region number for the EL2 MPU region associated with the [HPRBAR](#) and [HPRLAR](#) registers.

Configuration

There are no configuration notes.

Attributes

HPRSELR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REGION, bits [7:0]

The number of the current EL2 MPU region visible in [HPRBAR](#) and [HPRLAR](#). For N implemented MPU regions, memory region numbering starts at 0 and increments by 1 to the value N-1.

Writing a value greater than or equal to the number of implemented MPU regions specified by [HMPUIR.REGION](#), results in CONSTRAINED UNPREDICTABLE behavior.

CONSTRAINED UNPREDICTABLE behavior is that HPRSELR register becomes UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HPRSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0010	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
end;
```

```
elseif PSTATE.EL == EL2 then
    R(t) = HPRSELR();
end;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0010	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HPRSELR() = R(t);
end;
```

D10.2.71 HRMR, Hyp Reset Management Register

The HRMR characteristics are:

Purpose

A write to this register at EL2 can request a Warm reset.

Configuration

It is IMPLEMENTATION DEFINED whether this register is implemented.

Attributes

HRMR is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [0]

Reserved, RAZ/WI.

Accessing HRMR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && EL2Enabled() && HSTR().T12 == '1' then
    AArch32_TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 then
    R(t) = HRMR();
else
    Undefined();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && EL2Enabled() && HSTR().T12 == '1' then
    AArch32_TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 then
    HRMR() = R(t);
else
    Undefined();
end;
```

D10.2.72 HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

Purpose

Provides top-level control of the system operation in Hyp mode.

Configuration

There are no configuration notes.

Attributes

HSCTLR is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [29:28]

Reserved, RES1.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

When FEAT_MixedEnd is implemented:

The value of the PSTATE.E bit on entry to Hyp mode.

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode.
0b1	Big-endian. PSTATE.E is set to 1 on entry to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

When FEAT_BigEnd is implemented:

Explicit data accesses at EL1 is big-endian.

Reserved, RES1.

Otherwise:

Explicit data accesses at EL1 is little-endian.

Reserved, RES0.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

FI, bit [21]

Fast Interrupts enable.

FI	Meaning
0b0	All performance features enabled.
0b1	Low interrupt latency configuration. Some performance features disabled.

If HSCTLR.FI == 1, then asynchronous errors and interrupts can interrupt LDM/STM instructions that access Normal memory. The register that provides the base address is restored to its original value and any other modified registers become UNKNOWN.

Up to two MPUs can determine whether an access is to Normal memory, therefore the value of the FI field depends on whether the appropriate MPU or MPUs allow the access to the location as access to Normal memory.

— For EL0 and EL1 accesses, this is the combination of the attributes determined by the configuration settings of the EL1 MPU and the configuration settings of the EL2 MPU. — For EL2 accesses, these are the attributes determined by the configuration settings of the EL2 MPU.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when HSCTLR.M bit is set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

BR, bit [17]

Background Region enable for EL2.

BR	Meaning
0b0	EL2 MPU Background region disabled. Any EL2 transaction that does not match an EL2 MPU region results in a fault.
0b1	EL2 MPU Background region enabled. For EL2 transactions that do not match an EL2 MPU region, the EL2 Background region attributes are used.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [16]

Reserved, RES1.

Bits [15:13]

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

I	Meaning
0b0	All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

I	Meaning
0b1	All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the PL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL2.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL2.
0b1	SETEND instructions are UNDEFINED at EL2.

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL2.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL2.

ITD	Meaning
0b1	Any attempt at EL2 to execute any of the following is UNDEFINED: - All encodings of the IT instruction with hw1[3:0]! = 1000. - All encodings of the subsequent instruction with the following values for hw1: 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. 0b1011xxxxxxxxxxxx: All instructions in ‘Miscellaneous 16-bit instructions’. 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. 0b010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: - A 16-bit instruction, that can only be followed by another 16-bit instruction. - The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1, then behavior is CONSTRAINED UNPREDICTABLE. For more information, see ‘Changes to an ITD control by an instruction in an IT block’.

ITD is optional, but if it is implemented in the HSCTLR, then it must also be implemented in SCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is RAZ/WI.

Bit [6]

Reserved, RES0.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL2:

CP15BEN	Meaning
0b0	EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
0b1	EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the HSCTLR, then it must also be implemented in SCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is RAO/WI.

Bits [4:3]

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL2:

C	Meaning
0b0	All data access to Normal memory from EL2 are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from EL2 can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.
0b1	Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MPU enable for EL2 address translation. Possible values of this bit are:

M	Meaning
0b0	EL2 address translation disabled. See the HSCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL2 address translation enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing HSCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HSCTLR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HSCTLR() = R(t);
end;

```

D10.2.73 HSR, Hyp Syndrome Register

The HSR characteristics are:

Purpose

Holds syndrome information for an exception taken to Hyp mode.

Configuration

There are no configuration notes.

Attributes

HSR is a 32-bit register.

Field descriptions

31	26	25	24	0
EC	IL	ISS		

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:

EC	Meaning	ISS
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason
0b000001	Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.	ISS encoding for Exception from a WFI or WFE instruction
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for Exception from an MCR or MRC access
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for Exception from an MCRR or MRRC access
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for Exception from an MCR or MRC access
0b000110	Trapped LDC or STC access. The only architected uses of these instructions are: - An STC to write data to memory from DBGDTRRXint. - An LDC to read data from memory to DBGDTRTXint.	ISS encoding for Exception from an LDC or STC instruction

EC	Meaning	ISS
0b000111	Access to Advanced SIMD or floating-point functionality trapped by a HCPTR. {TASE, TCP10} control. Excludes exceptions generated because Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR
0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC value 0b000111.	ISS encoding for Exception from an MCR or MRC access
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for Exception from an MCRR or MRRC access
0b001110	Illegal exception return to AArch32 state.	ISS encoding for Exception from an Illegal state or PC alignment fault
0b010001	Exception on SVC instruction execution in AArch32 state routed to EL2.	ISS encoding for Exception from HVC or SVC instruction execution
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	ISS encoding for Exception from HVC or SVC instruction execution
0b100000	Prefetch Abort from a lower Exception level.	ISS encoding for Exception from a Prefetch Abort
0b100001	Prefetch Abort taken without a change in Exception level.	ISS encoding for Exception from a Prefetch Abort
0b100010	PC alignment fault exception.	ISS encoding for Exception from an Illegal state or PC alignment fault
0b100100	Data Abort exception from a lower Exception level.	ISS encoding for Exception from a Data Abort
0b100101	Data Abort exception taken without a change in Exception level.	ISS encoding for Exception from a Data Abort

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped.

This field is RES1 and not valid for the following cases:

- When the EC value is 0b000000, indicating an exception with an unknown reason.

- Prefetch Aborts.
- Data Abort exceptions for which the HSR.ISS.ISV field is 0.
- When the EC value is 0b001110, indicating an Illegal state exception.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

ISS encoding for exceptions with an unknown reason

Bits [24:0]

Reserved, RES0.

Additional Information for ISS encoding for exceptions with an unknown reason

This EC value is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or is not accessible in the current PE mode in the current Security state, including:
 - A read access using a System register encoding pattern that is not allocated for reads or that does not permit reads in the current PE mode and Security state.
 - A write access using a System register encoding pattern that is not allocated for writes or that does not permit writes in the current PE mode and Security state.
 - Instruction encodings that are unallocated.
 - Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR.HCD](#).
 - An HLT instruction when disabled by [EDSCR.HDE](#).
- An HVC instruction when disabled by [HCR.HCD](#). An HLT instruction when disabled by [EDSCR.HDE](#).
- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

Note

An exception is generated only if the CONSTRAINED UNPREDICTABLE behavior of the instruction is that it is UNDEFINED, see '[MSR \(banked register\) and MRS \(banked register\)](#)'.

- Attempted execution, in Debug state, of:
 - A DCPS1 instruction from EL0 when the value of [HCR.TGE](#) is 1.
 - A DCPS2 instruction at EL1 or EL0 when the value of [EDSCR.HDD](#) is 1.

‘Undefined Instruction exception, when the value of HCR.TGE is 1’ describes the configuration settings for a trap that returns an EC value of 0b0000000.

ISS encoding for Exception from a WFI or WFE instruction

24	23	20	19	1	0
CV	COND	RES0			TI

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b11110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

TI	Meaning
0b0	WFI trapped.
0b1	WFE trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional Information for ISS encoding for Exception from a WFI or WFE instruction

[HCR](#).{TWE, TWI} describe the configuration settings for this trap.

ISS encoding for Exception from an MCR or MRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional Information for ISS encoding for Exception from an MCR or MRC access

The following fields describe configuration settings for traps from an MCR or MRC access using coproc 0b1111 that are reported using EC value 0b000011:

- [HCR](#).{TID1, TID2, TID3}, for Non-secure accesses to the ID registers at EL0 and EL1, trapped to EL2.
- [HCR](#).TIDCP, for Non-secure accesses to lockdown, DMA, and TCM operations at EL0 and EL1, trapped to EL2.
- [HCR](#).{TSW, TPC, TPU}, for Non-secure execution of cache maintenance instructions at EL1, trapped to EL2.
- [HCR](#).TLTB, for Non-secure execution of TLB maintenance instructions at EL1, trapped to EL2.
- [HCR](#).TAC, for Non-secure accesses to the Auxiliary Control Register at EL1, trapped to EL2.
- [HDCR](#).{TPM, TPMCR}, for Non-secure accesses to Performance Monitors System registers at EL0 and EL1, trapped to EL2.
- [HCPTR](#).TCPAC, for Non-secure accesses to the CPACR at EL1, trapped to EL2.
- [HCR](#).{TRVM, TVM}, for Non-secure accesses to virtual memory control registers at EL1, trapped to EL2.
- [HSTR](#).T<n>, for Non-secure accesses to System registers in the (coproc == 1111) encoding space at EL0 and EL1, trapped to EL2.
- [HDCR](#).TTRF, for Non-secure accesses to trace filter control registers from System register, trapped to EL2.
- [CNTHCTL](#).PL1PCEN, for Non-secure accesses to the Generic Timer registers at EL0 and EL1, trapped to EL2.

The following fields describe configuration settings for traps from an MCR or MRC access using coproc 0b1110 that are reported using EC value 0b000101:

- [HCR](#).TID0, for Non-secure accesses to the Primary device identification registers at EL0 and EL1, trapped to EL2.
- [HCPTR](#).TTA, for Non-secure accesses to trace System registers from System register, trapped to EL2.
- [HDCR](#).TDRA, for Non-secure accesses to Debug ROM registers from System register, trapped to EL2.
- [HDCR](#).TDOSA, for Non-secure accesses to powerdown debug System registers from System register, trapped to EL2.
- [HDCR](#).TDA, for Non-secure accesses to debug System registers from System register, trapped to EL2.

The following fields describes configuration settings for traps from a VMSR or VMRS access that are reported using EC value 0b001000:

- [HCR](#).TID0, for Non-secure accesses to the Primary device identification registers at EL1, for ID group traps trapped to EL2.
- [HCR](#).TID3, for Non-secure accesses to the Detailed feature identification registers at EL0 and EL1, for ID group traps trapped to EL2.
- [HCPTR](#).{TCP10, TCP11}, for Non-secure accesses to [FPSCR](#), [FPSID](#), [FPEXC](#), [MVFR0](#), [MVFR1](#), and [MVFR2](#), trapped to EL2.

ISS encoding for Exception from an MCRR or MRRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:14]

Reserved, RES0.

Rt2, bits [13:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional Information for ISS encoding for Exception from an MCRR or MRRC access

The following fields describe configuration settings for traps from an MCRR or MRRC access using coproc 0b1111 that are reported using EC value 0b000100:

- [HCR](#).{TRVM, TVM}, for Non-secure accesses to virtual memory control registers at EL1, trapped to EL2.
- [HDCR](#).TPM, for Non-secure accesses to Performance Monitors System registers at EL0 and EL1, trapped to EL2.
- [HCPTR](#).TAM, for Non-secure accesses to Activity Monitors System registers at EL0 and EL1, trapped to EL2.
- [CNTHCTL](#).{PL1PCEN, PL1PCTEN}, for Non-secure accesses to the Generic Timer registers at EL0 and EL1, trapped to EL2.
- [HSTR](#).T<n>, for Non-secure accesses to System registers in the (coproc == 1111) encoding space at EL0 and EL1, trapped to EL2.

The following fields describe configuration settings for traps from an MCRR or MRRC access using coproc 0b1110 that are reported using EC value 0b001100:

- [HCPTR](#).TTA, for Non-secure accesses to trace System registers from System register, trapped to EL2.
- [HDCR](#).TDRA, for Non-secure accesses to Debug ROM registers from System register, trapped to EL2.

ISS encoding for Exception from an LDC or STC instruction

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:9]

Reserved, RES0.

Rn, bits [8:5]

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	Literal unindexed. LDC instruction in A32 instruction set only. For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	Literal offset. LDC instruction only. For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional Information for ISS encoding for Exception from an LDC or STC instruction

[HDCR](#).TDA describes the configuration settings for the trap that is reported using EC value 0b000110.

ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR

Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of [HCR](#).TGE is 1. These are reported with EC value 0b000000.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:6]

Reserved, RES0.

TA, bit [5]

Indicates trapped use of Advanced SIMD functionality.

TA	Meaning
0b0	Exception was not caused by trapped use of Advanced SIMD functionality.
0b1	Exception was caused by trapped use of Advanced SIMD functionality.

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the HCPTR sets this bit to 1.

For a list of these instructions, see ‘Controls of Advanced SIMD operation that do not apply to floating-point operation’.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

coproc, bits [3:0]

When the HSR.TA field returns the value 1, this field returns the value 0b1010. Otherwise, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional Information for ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR

The following fields describe the configuration settings for the traps that are reported using EC value 0b000111:

- [HCPTR](#).{TCP11, TCP10}, for Non-secure accesses to the SIMD and floating-point registers, trapped to EL2.
- [HCPTR](#).TASE, for Non-secure accesses to Advanced SIMD functionality, trapped to EL2.

ISS encoding for Exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- For the T32 instruction, this field is zero-extended from the imm8 field of the instruction. For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional Information for ISS encoding for Exception from HVC or SVC instruction execution

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

‘[Supervisor Call exception, when the value of HCR.TGE is 1](#)’ describes the configuration settings for the trap reported with EC value 0b010001.

ISS encoding for Exception from a Prefetch Abort

Bits [24:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort.

FnV	Meaning
0b0	HIFAR is valid.
0b1	HIFAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

IFSC	Meaning
0b000100	Translation fault.
0b001100	Permission fault.
0b010000	Synchronous External abort, other than synchronous parity or ECC error.
0b011000	Synchronous parity or ECC error on memory access.
0b100010	Debug exception, only when the EC value is 0b100001.

All other values are reserved.

The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional Information for ISS encoding for Exception from a Prefetch Abort

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- ‘Abort exceptions, when the value of HCR.TGE is 1’.
- ‘Routing debug exceptions to EL2 using AArch32’.

ISS encoding for Exception from an Illegal state or PC alignment fault

Bits [24:0]

Reserved, RES0.

Additional Information for ISS encoding for Exception from an Illegal state or PC alignment fault

For more information about the Illegal state exception, see:

- ‘Illegal changes to PSTATE.M’.
- ‘Illegal return events from AArch32 state’.
- ‘Legal returns that set PSTATE.IL to 1’.
- ‘The Illegal Execution state exception’.

For more information about the PC alignment fault exception, see ‘Branching to an unaligned PC’.

ISS encoding for Exception from a Data Abort

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults except Data Abort exceptions generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
- The instruction is not performing register writeback.
- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in Memory access mode, as described in ‘Data Abort exceptions in Memory access mode’, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

Note

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [20]

Reserved, RES0.

SRT, bits [19:16]

Syndrome Register Transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort.

FnV	Meaning
0b0	HDFAR is valid.
0b1	HDFAR is not valid, and holds an UNKNOWN value.

This field is valid only if DFSC is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External Abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache Maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

CM	Meaning
0b0	Fault not generated by a cache maintenance or address translation instruction.
0b1	Fault generated by a cache maintenance or address translation instruction.

For an asynchronous Data Abort exception, this bit is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction.

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For an asynchronous Data Abort exception this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

DFSC	Meaning
0b000100	Translation fault.
0b001100	Permission fault.
0b010000	Synchronous External abort, other than synchronous parity or ECC error.
0b010001	Asynchronous SError exception.
0b011000	Synchronous parity or ECC error on memory access.
0b011001	Asynchronous SError exception, from a parity or ECC error on memory access.
0b100001	Alignment fault.
0b100010	Debug exception, only when the EC value is 0b100100.
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional Information for ISS encoding for Exception from a Data Abort

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100100:

- ‘Abort exceptions, when the value of HCR.TGE is 1’.
- ‘Routing debug exceptions to EL2 using AArch32’.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:

- ‘Hyp mode control of Non-secure access permissions’.
- ‘Memory fault reporting in Hyp mode’.

Accessing HSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HSR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HSR() = R(t);
end;

```

D10.2.74 HSTR, Hyp System Trap Register

The HSTR characteristics are:

Purpose

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == 0b1111 encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

Configuration

There are no configuration notes.

Attributes

HSTR is a 32-bit register.

Field descriptions

Bits [31:16, 14, 4]

Reserved, RES0.

T<n> , bits [n], for n = 15 to 15, 13 to 5, 3 to 0

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR or MRC instructions, reported using EC syndrome value 0x03, and MCRR or MRRC instructions, reported using EC syndrome value 0x04, to the System registers in the coproc == 0b1111 encoding space are trapped to Hyp mode:

T<n>	Meaning
0b0	This control has no effect on Non-secure EL0 or EL1 accesses to System registers.
0b1	Any Non-secure EL1 MCR or MRC access with coproc == 0b1111 and CRn == <n> is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. Any Non-secure EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == <n> is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to Hyp mode.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression 0x0000.

Accessing HSTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b011

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HSTR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b011

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HSTR() = R(t);
end;

```

D10.2.75 HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

Purpose

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

Configuration

Note
The PE never updates this register.

Attributes

HTPIDR is a 32-bit register.

Field descriptions

TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HTPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1101	0b0000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HTPIDR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1101	0b0000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HTPIDR() = R(t);
end;
```

D10.2.76 HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

Purpose

Holds the vector base address for any exception that is taken to Hyp mode.

Configuration

There are no configuration notes.

Attributes

HVBAR is a 32-bit register.

Field descriptions

VBA, bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:0]

Reserved, RES0.

Accessing HVBAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T12 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HVBAR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T12 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    HVBAR() = R(t);
end;
```

D10.2.77 ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

Purpose

Invalidate all instruction caches of the PE executing the instruction to the Point of Unification. If branch predictors are architecturally visible, also flush branch predictors.

Configuration

There are no configuration notes.

Attributes

ICIALLU is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing ICIALLU

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [ICIALLUIS](#).

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0101	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if !AArch32_CanTrapIC(CacheOp_Invalidate, CacheOpScope_PoU) then
        ExecuteAsNOP();
    elseif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TPU == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        if AArch32_TreatICAsNOP(CacheOp_Invalidate, CacheOpScope_PoU) then
            ExecuteAsNOP();
        else
            AArch32_IC(CacheOpScope_ALLU);
        end;
    end;
elseif PSTATE.EL == EL2 then
    if !AArch32_CanTrapIC(CacheOp_Invalidate, CacheOpScope_PoU) then
        ExecuteAsNOP();
    else
        if AArch32_TreatICAsNOP(CacheOp_Invalidate, CacheOpScope_PoU) then
            ExecuteAsNOP();
```

```
        else
            AArch32_IC(CacheOpScope_ALLU);
        end;
    end;
end;
```

D10.2.78 ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

Purpose

Invalidate all instruction caches in the Inner Shareable domain of the PE executing the instruction to the Point of Unification. If branch predictors are architecturally visible, also flush branch predictors.

Configuration

There are no configuration notes.

Attributes

ICIALLUIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing ICIALLUIS

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction. Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if !AArch32_CanTrapIC(CacheOp_Invalidate, CacheOpScope_PoU) then
        ExecuteAsNOP();
    elsif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TPU == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        if AArch32_TreatICAsNOP(CacheOp_Invalidate, CacheOpScope_PoU) then
            ExecuteAsNOP();
        else
            AArch32_IC(CacheOpScope_ALLUIS);
        end;
    end;
elsif PSTATE.EL == EL2 then
    if !AArch32_CanTrapIC(CacheOp_Invalidate, CacheOpScope_PoU) then
        ExecuteAsNOP();
    else
        if AArch32_TreatICAsNOP(CacheOp_Invalidate, CacheOpScope_PoU) then
            ExecuteAsNOP();
        else
            AArch32_IC(CacheOpScope_ALLUIS);
        end;
    end;
end;
```

D10.2.79 ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

Purpose

Invalidate instruction cache line by virtual address to PoU.

Configuration

There are no configuration notes.

Attributes

ICIMVAU is a 32-bit System instruction.

Field descriptions

VA, bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing ICIMVAU

Execution of this instruction might require an address translation from VA to PA, and that translation might fault.

For more information about faults, see [‘Permission fault’](#).

For more information about data cache maintenance instructions, see [‘AArch32 instruction cache maintenance instructions \(IC*\)’](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0101	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if !AArch32_CanTrapIC(CacheOp_Invalidate, CacheOpScope_PoU) then
        ExecuteAsNOP();
    elsif EL2Enabled() && HSTR().T7 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TPU == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        if AArch32_TreatICAsNOP(CacheOp_Invalidate, CacheOpScope_PoU) then
            ExecuteAsNOP();
        else
            AArch32_IC(R(t), CacheOpScope_PoU);
        end;
    end;
```

```
        end;  
    elsif PSTATE.EL == EL2 then  
        if !AArch32_CanTrapIC(CacheOp_Invalidate, CacheOpScope_PoU) then  
            ExecuteAsNOP();  
        else  
            if AArch32_TreatICAsNOP(CacheOp_Invalidate, CacheOpScope_PoU) then  
                ExecuteAsNOP();  
            else  
                AArch32_IC(R(t), CacheOpScope_PoU);  
            end;  
        end;  
    end;  
end;
```

D10.2.80 ID_AFR0, Auxiliary Feature Register 0

The ID_AFR0 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR](#).

For general information about the interpretation of the ID registers see ‘[Principles of the ID scheme for fields in ID registers](#)’.

Configuration

There are no configuration notes.

Attributes

ID_AFR0 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [15:12]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [11:8]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [7:4]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [3:0]

IMPLEMENTATION DEFINED.

Accessing ID_AFR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_AFR0();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = ID_AFR0();
end;
```

D10.2.81 ID_DFR0, Debug Feature Register 0

The ID_DFR0 characteristics are:

Purpose

Provides top-level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR](#).

For general information about the interpretation of the ID registers see ‘[Principles of the ID scheme for fields in ID registers](#)’.

Configuration

There are no configuration notes.

Attributes

ID_DFR0 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
RES0		PerfMon		MProfDbg		MMapTrc		CopTrc		MMapDbg		CopSDBG		CopDbg	

Bits [31:28]

Reserved, RES0.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in ‘[Alternative ID scheme used for the Performance Monitors Extension version](#)’.

The value of this field is an IMPLEMENTATION DEFINED choice of:

All other values are reserved.

[FEAT_PMUv3](#) implements the functionality identified by the value 0b0011.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 and PMUv2 are not permitted in an Armv8 implementation.

Access to this field is RO.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

For more information, see the Arm® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

Access to this field is RO.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

For more information, see the Arm® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

Access to this field is RO.

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MMapDbg	Meaning
0b0000	Not supported.
0b0100	Support for Armv7, v7 Debug architecture, with memory-mapped access.
0b0101	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

Access to this field is RO.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CopDBG, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture.

The value of this field is an IMPLEMENTATION DEFINED choice of:

All other values are reserved.

The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

Access to this field is RO.

Accessing ID_DFR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b010

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_DFR0();
    end;
elsif PSTATE.EL == EL2 then

```

```
R(t) = ID_DFR0();  
end;
```

D10.2.82 ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_ISAR0 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
RES0		Divide		Debug		Coprocc		CmpBranch		BitField		BitCount		Swap	

Bits [31:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Divide	Meaning
0b0000	None implemented.
0b0001	Adds SDIV and UDIV in the T32 instruction set.
0b0010	As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

Debug, bits [23:20]

Indicates the implemented Debug instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Debug	Meaning
0b0000	None implemented.
0b0001	Adds BKPT.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Coproc, bits [19:16]

Indicates the implemented System register access instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Coproc	Meaning
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CmpBranch	Meaning
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

BitField, bits [11:8]

Indicates support for BitField instructions BFC, BFI, SBFX, and UBFX.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitField	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitCount	Meaning
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

Accessing ID_ISAR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_ISAR0();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = ID_ISAR0();
end;
```

D10.2.83 ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_ISAR1 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
Jazelle				Interwork				Immediate				IfThen			
								Extend				Except_AR			
												Except			
												Endian			

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Jazelle	Meaning
0b0000	No support for Jazelle.
0b0001	Adds the <code>BXJ</code> instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Interwork	Meaning
0b0000	None implemented.

Interwork	Meaning
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8, the only permitted value is 0b0011.

Access to this field is RO.

Immediate, bits [23:20]

Indicates support for data-processing instructions with long immediates:

- The `MOVT` instruction
- The `MOV` instruction encodings with zero-extended 16-bit immediates.
- The T32 `ADD` and `SUB` instruction encodings with zero-extended 12-bit immediates, and the other `ADD`, `ADR`, and `SUB` encodings cross-referenced by the pseudocode for those encodings.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Immediate	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Extend, bits [15:12]

Indicates the implemented Extend instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTB, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Except	Meaning
0b0000	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Endian, bits [3:0]

Indicates the implemented Endian instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Endian	Meaning
0b0000	None implemented.
0b0001	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

Accessing ID_ISAR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b001

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_ISAR1();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_ISAR1();
end;

```

D10.2.84 ID_ISAR2, Instruction Set Attribute Register 2

The ID_ISAR2 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_ISAR2 is a 32-bit register.

Field descriptions

Reversal, bits [31:28]

Indicates the implemented Reversal instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PSR_AR	Meaning
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC, LR, #N instruction.

Access to this field is RO.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultU	Meaning
0b0000	None implemented.
0b0001	Adds the UMULL and UMLAL instructions.
0b0010	As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultS	Meaning
0b0000	None implemented.
0b0001	Adds the SMULL and SMLAL instructions.
0b0010	As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0b0011	As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0011.

Access to this field is RO.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Mult	Meaning
0b0000	No additional instructions implemented. This means only MUL is implemented.
0b0001	Adds the MLA instruction.
0b0010	As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)

MemHint	Meaning
0b0011	As for 0b0001 (or 0b0010), and adds the <code>PLI</code> instruction.
0b0100	As for 0b0011, and adds the <code>PLDW</code> instruction.

All other values are reserved.

In Armv8, the only permitted value is 0b0100.

Access to this field is RO.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the <code>LDRD</code> and <code>STRD</code> instructions.
0b0010	As for 0b0001, and adds the Load Acquire (<code>LDAB</code> , <code>LDAH</code> , <code>LDA</code> , <code>LDAEXB</code> , <code>LDAEXH</code> , <code>LDAEX</code> , <code>LDAEXD</code>) and Store Release (<code>STLB</code> , <code>STLH</code> , <code>STL</code> , <code>STLEXB</code> , <code>STLEXH</code> , <code>STLEX</code> , <code>STLEXD</code>) instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

Accessing ID_ISAR2

Accesses to this register use the following encodings in the System register encoding space:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b010

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_ISAR2();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_ISAR2();
end;

```

D10.2.85 ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR4](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers see ‘[Principles of the ID scheme for fields in ID registers](#)’.

Configuration

There are no configuration notes.

Attributes

ID_ISAR3 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
T32EE		TrueNOP		T32Copy		TabBranch		SynchPrim		SVC		SIMD		Saturate	

T32EE, bits [31:28]

Indicates the implemented T32EE instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the <code>ENTERX</code> and <code>LEAVEX</code> instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

TrueNOP, bits [27:24]

Indicates the implemented true `NOP` instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == 0b000, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == 0b000, adds the LDREX and STREX instructions. If SynchPrim_frac == 0b011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == 0b000, as for [0b001, 0b011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

SVC, bits [11:8]

Indicates the implemented SVC instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMD	Meaning
0b0000	None implemented.
0b0001	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
0b0011	As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHSAX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

Access to this field is RO.

Saturate, bits [3:0]

Indicates support for Saturate instructions `QADD`, `QDADD`, `QDSUB`, and `QSUB` instructions, and the Q bit in the PSRs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Saturate	Meaning
0b0000	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Accessing ID_ISAR3

Accesses to this register use the following encodings in the System register encoding space:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b011

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_ISAR3();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_ISAR3();
end;

```

D10.2.86 ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR5.

For general information about the interpretation of the ID registers, see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_ISAR4 is a 32-bit register.

Field descriptions

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SWP_frac	Meaning
0b0000	SWP or SWPB instructions not implemented.
0b0001	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M-profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

SynchPrim_frac, bits [23:20]

Used in conjunction with [ID_ISAR3.SynchPrim](#) to indicate the implemented Synchronization Primitive instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

Barrier, bits [19:16]

Indicates support for Barrier instructions DMB, DSB, and ISB in the T32 and A32 instruction sets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

SMC, bits [15:12]

Indicates the implemented SMC instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-R AArch32, the only permitted value is 0b0001.

Access to this field is RO.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8, the only permitted value is 0b0100.

Access to this field is RO.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

Accessing ID_ISAR4

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b100

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_ISAR4();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_ISAR4();
end;
```

D10.2.87 ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_ISAR5 is a 32-bit register.

Field descriptions

Bits [31:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates support for the CRC32 instructions CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CRC32	Meaning
0b0000	CRC32 instructions are not implemented.
0b0001	The specified instructions are implemented.

The table above shows all possible values of this field. 0b0001 is the value of this field in the current implementation.

All other values are reserved.

FEAT_CRC32 implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

SHA2, bits [15:12]

Indicates support for the SHA2 instructions SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

SHA1, bits [11:8]

Indicates support for the SHA1 instructions SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

AES, bits [7:4]

Indicates support for the AES instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0010.

Access to this field is RO.

SEVL, bits [3:0]

Indicates support for the SEVL instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Accessing ID_ISAR5

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_ISAR5();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_ISAR5();
end;
```

D10.2.88 ID_MMFR0, Memory Model Feature Register 0

The ID_MMFR0 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_MMFR0 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
InnerShr		FCSE		AuxReg		TCM		ShareLvl		OuterShr		PMSA		VMSA	

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

InnerShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

In Armv8, the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0.ShareLvl having the value 0b0001.

When ID_MMFR0.ShareLvl is zero, this field is UNKNOWN.

Access to this field is RO.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

Access to this field is RO.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-R AArch32, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

In Armv8, the permitted values are 0b0000, 0b0001, and 0b1111.

Access to this field is RO.

PMSA, bits [7:4]

Indicates support for a PMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.
0b0100	Support for PMSAv8-32, with base and limit. Armv8-R AArch32 profile.

All other values are reserved.

In Armv8-R AArch32, the only permitted value is 0b0100.

Access to this field is RO.

VMSA, bits [3:0]

Indicates support for a VMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.
0b0100	As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-R AArch32, the only permitted value is 0b0000.

Access to this field is RO.

Accessing ID_MMFR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_MMFR0();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_MMFR0();
end;

```

D10.2.89 ID_MMFR1, Memory Model Feature Register 1

The ID_MMFR1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_MMFR1 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
BPred				L1TstCln				L1Uni				L1Hvd			
								L1UniSW				L1HvdSW			
												L1UniVA			
												L1HvdVA			

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPred	Meaning
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: - Enabling or disabling a stage of address translation. - Writing new data to instruction locations. - Writing new mappings to the translation tables. - Changes to the TTBR0, TTBR1, or TTBCR registers. - Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
0b0010	Branch predictor requires flushing on: - Enabling or disabling a stage of address translation. - Writing new data to instruction locations. - Writing new mappings to the translation tables.
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8, the permitted values are 0b0010, 0b0011, or 0b0100. For values other than 0b0000 and 0b0100, the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

Access to this field is RO.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1TstCln	Meaning
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are:
	Test and clean data cache.
0b0010	As for 0b0001, and adds:
	Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Uni	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are:
	- Invalidate cache, including branch predictor if appropriate. - Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds:
	- Clean cache, using a recursive model that uses the cache dirty status bit. - Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Hvd	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate.
0b0011	As for 0b0010, and adds: • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1UniSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: • Clean cache line by set/way.
0b0010	As for 0b0001, and adds: • Clean and invalidate cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate cache line by set/way.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: - Clean data cache line by set/way. - Clean and invalidate data cache line by set/way.
0b0010	As for 0b0001, and adds: Invalidate data cache line by set/way.
0b0011	As for 0b0010, and adds: Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1UniVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: - Clean cache line by VA. - Invalidate cache line by VA. - Clean and invalidate cache line by VA.
0b0010	As for 0b0001, and adds: Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: - Clean data cache line by VA. - Invalidate data cache line by VA. - Clean and invalidate data cache line by VA. - Clean instruction cache line by VA.
0b0010	As for 0b0001, and adds: Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

Accessing ID_MMFR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b101

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_MMFR1();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_MMFR1();
end;

```

D10.2.90 ID_MMFR2, Memory Model Feature Register 2

The ID_MMFR2 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see [‘Principles of the ID scheme for fields in ID registers’](#).

Configuration

There are no configuration notes.

Attributes

ID_MMFR2 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
HWAACFlg				WFIStall				MemBarr				UniTLB			

0b0001

Support for WFI stalling.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc == 1111) encoding space.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: • Data Synchronization Barrier (DSB).
0b0010	As for 0b0001, and adds: • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB).

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Arm deprecates the use of these operations. [ID_ISAR4.Barrier_instrs](#) indicates the level of support for the preferred barrier instructions.

Access to this field is RO.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: • Invalidate all entries in the TLB. • Invalidate TLB entry by VA.
0b0010	As for 0b0001, and adds: • Invalidate TLB entries by ASID match.

UniTLB	Meaning
0b0011	As for 0b0010, and adds: • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation
0b0100	As for 0b0011, and adds: • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB.
0b0101	As for 0b0100, and adds the following operations: TLBIMVALIS , TLBIMVAALIS , TLBIMVALHIS , TLBIMVAL , TLBIMVAAL , TLBIMVALH .
0b0110	As for 0b0101, and adds the following operations: TLBIIPAS2IS , TLBIIPAS2LIS , TLBIIPAS2 , TLBIIPAS2L .

All other values are reserved.

In Armv8-R AArch32, the only permitted value is 0b0000.

Access to this field is RO.

HvdTLB, bits [15:12]

If the value of ID_MMFR2.UniTLB is not 0b0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdBG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache background fetch operations are: - Fetch instruction cache range by VA. - Fetch data cache range by VA.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdFG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache foreground fetch operations are: - Fetch instruction cache range by VA. - Fetch data cache range by VA.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

Accessing ID_MMFR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b110

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    
```

```
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_MMFR2();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_MMFR2();
end;
```

D10.2.91 ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_MMFR3 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
Supersec		CMemSz		CohWalk		RES0		MaintBcst		BPMaint		CMaintSW		CMaintVA	

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b1111.

Access to this field is RO.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMemSz	Meaning
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.

0b0010

1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is RO.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CohWalk	Meaning
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Bits [19:16]

Reserved, RES0.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MaintBcst	Meaning
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: • Invalidate all branch predictors.
0b0010	As for 0b0001, and adds: • Invalidate branch predictors by VA.

All other values are reserved.

In Armv8, the only permitted value is 0b0010.

Access to this field is RO.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMaintSW	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance instructions by set/way are: • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

Access to this field is RO.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMaintVA	Meaning
0b0000	None supported.

CMaintVA	Meaning
0b0001	Supported hierarchical cache maintenance operations by VA are: • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Access to this field is RO.

Accessing ID_MMFR3

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b111

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_MMFR3();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_MMFR3();
end;

```

D10.2.92 ID_MMFR4, Memory Model Feature Register 4

The ID_MMFR4 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_MMFR4 is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

Bits [27:8]

Reserved, RAZ.

AC2, bits [7:4]

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AC2	Meaning
0b0000	ACTLR2 and HACTLR2 are not implemented.
0b0001	ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Access to this field is RO.

Bits [3:0]

Reserved, RES0.

Accessing ID_MMFR4

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b110

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && (!IsZero(ID_MMFR4()) || ImpDefBool("ID_MMFR4 trapped by HCR.TID3")) &&
        ↪HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_MMFR4();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = ID_MMFR4();
end;
```

D10.2.93 ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

Purpose

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1.

For general information about the interpretation of the ID registers, see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_PFR0 is a 32-bit register.

Field descriptions

31	16	15	12	11	8	7	4	3	0	
RES0			State3		State2		State1		State0	

Bits [31:16]

Reserved, RES0.

State3, bits [15:12]

T32EE instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

State2, bits [11:8]

Jazelle extension support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

State1, bits [7:4]

T32 instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8, the only permitted value is 0b0011.

Access to this field is RO.

State0, bits [3:0]

A32 instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Accessing ID_PFR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_PFR0();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_PFR0();
end;

```

D10.2.94 ID_PFR1, Processor Feature Register 1

The ID_PFR1 characteristics are:

Purpose

Gives information about the AArch32 programmers’ model.

Must be interpreted with ID_PFR0.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

ID_PFR1 is a 32-bit register.

Field descriptions

GIC, bits [31:28]

System register GIC CPU interface.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface System registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

The table above shows all possible values of this field. The values this field can take in the current implementation are:

- 0b0000
- 0b0001

All other values are reserved.

In Armv8-R AArch32, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virt_frac	Meaning
0b0000	No Virtualization Extensions are implemented.
0b0001	The following Virtualization Extensions are implemented: • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction.

All other values are reserved.

In Armv8-R AArch32 the permitted value is 0b0000.

This field is valid only when the value of ID_PFR1.Virtualization is 0, otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Access to this field is RO.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for Security Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Sec_frac	Meaning
0b0000	No Security Extensions are implemented.
0b0001	The following Security Extensions are implemented: • The VBAR register.
0b0010	As for 0b0001, and the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-R AArch32 the permitted value is 0b0001.

This field is valid only when the value of ID_PFR1.Security is 0, otherwise it holds the value 0b0000.

Access to this field is RO.

GenTimer, bits [19:16]

Generic Timer support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GenTimer	Meaning
0b0000	Generic Timer is not implemented.
0b0001	Generic Timer is implemented.
0b0010	Generic Timer is implemented, and also includes support for CNTHCTL.EVTIS and CNTKCTL.EVTIS fields, and CNTPCTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

Access to this field is RO.

Virtualization, bits [15:12]

Virtualization support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, and the HVC instruction.

All other values are reserved.

In Armv8-R AArch32 the permitted value is 0b0001.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

Access to this field is RO.

MProMod, bits [11:8]

M-profile programmers' model support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MProMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A and Armv8-R, the only permitted value is 0b0000.

Access to this field is RO.

Security, bits [7:4]

Security support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In Armv8-R AArch32 the permitted value is 0b0000.

Access to this field is RO.

ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ProgMod	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

In Armv8, the only permitted value is 0b0001.

Access to this field is RO.

Accessing ID_PFR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b001

```

if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);

```

```
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ID_PFR1();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ID_PFR1();
end;
```

D10.2.95 IFAR, Instruction Fault Address Register

The IFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

Configuration

There are no configuration notes.

Attributes

IFAR is a 32-bit register.

This register has the following instances:

- IFAR.

Field descriptions

31	0
VA of faulting address of synchronous Prefetch Abort exception	

VA, bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = IFAR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = IFAR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        IFAR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    IFAR() = R(t);
end;
```

D10.2.96 IFSR, Instruction Fault Status Register

The IFSR characteristics are:

Purpose

Holds status information about the last instruction fault.

Configuration

The current translation table format determines which format of the register is used.

Attributes

IFSR is a 32-bit register.

This register has the following instances:

- IFSR.

Field descriptions

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Bit [9]

Reserved, RES1.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning
0b000100	Translation fault.
0b001100	Permission fault.
0b010000	Synchronous External abort, other than synchronous parity or ECC error.
0b011000	Synchronous parity or ECC error on memory access.
0b100001	PC alignment fault.
0b100010	Debug exception.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0000	0b001

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = IFSR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = IFSR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T5 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        IFSR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    IFSR() = R(t);
end;
```

D10.2.97 **ISR, Interrupt Status Register**

The ISR characteristics are:

Purpose

Shows the pending status of the IRQ and FIQ interrupts and the SError exceptions.

Configuration

There are no configuration notes.

Attributes

ISR is a 32-bit register.

Field descriptions

Bits [31:9]

Reserved, RES0.

A, bit [8]

SError exception pending bit:

A	Meaning
0b0	No pending SError exception.
0b1	An SError exception is pending.

If all of the following apply then this field shows the pending status of virtual SError exceptions:

- [HCR.AMO](#) is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical SError exceptions.

If the SError exception is edge-triggered, this field is cleared to zero when the physical SError exception is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

I	Meaning
0b0	No pending IRQ.
0b1	An IRQ interrupt is pending.

If all of the following apply then this field shows the pending status of virtual IRQ interrupts:

- [HCR.IMO](#) is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical IRQ interrupts.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

F	Meaning
0b0	No pending FIQ.
0b1	An FIQ interrupt is pending.

If all of the following apply then this field shows the pending status of virtual FIQ interrupts:

- [HCR.FMO](#) is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical FIQ interrupts.

Bits [5:0]

Reserved, RES0.

Accessing ISR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0001	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T12 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = ISR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = ISR();
end;

```

D10.2.98 ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backward compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is treated as a NOP.

Attributes

ITLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing ITLBIALL

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0101	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_ITLBI_ALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr);
    end;
elseif PSTATE.EL == EL2 then
    AArch32_ITLBI_ALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr);
end;
```

D10.2.99 ITLBIASID, Instruction TLB Invalidate by ASID match

The ITLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backward compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is treated as a NOP.

Attributes

ITLBIASID is a 32-bit System instruction.

Field descriptions

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing ITLBIASID

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0101	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_ITLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr,
            ↪R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_ITLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr, R(t));
end;
```

D10.2.100 ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backward compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is treated as a NOP.

Attributes

ITLBIMVA is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Executing ITLBIMVA

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0101	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_ITLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
            ↪TLBI_AllAttr, R(t));
    end;
elsif PSTATE.EL == EL2 then
    AArch32_ITLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.101 JIDR, Jazelle ID Register

The JIDR characteristics are:

Purpose

A Jazelle register, which identified the Jazelle architecture version.

Configuration

There are no configuration notes.

Attributes

JIDR is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RAZ.

Accessing JIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b111	0b0000	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if ImpDefBool("JIDR UNDEFINED at EL0") then
        Undefined();
    elseif EL2Enabled() && HCR().TID0 == '1' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = JIDR();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR().TID0 == '1' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = JIDR();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = JIDR();
end;
```

D10.2.102 **JMCR, Jazelle Main Configuration Register**

The JMCR characteristics are:

Purpose

A Jazelle register, which provides control of the Jazelle extension.

Configuration

There are no configuration notes.

Attributes

JMCR is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RAZ/WI.

Accessing JMCR

For accesses from EL0 it is IMPLEMENTATION DEFINED whether the register is RW or UNDEFINED.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b111	0b0010	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if ImpDefBool("JMCR UNDEFINED at EL0") then
        Undefined();
    else
        R(t) = JMCR();
    end;
elsif PSTATE.EL == EL1 then
    R(t) = JMCR();
elsif PSTATE.EL == EL2 then
    R(t) = JMCR();
end;
```

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b111	0b0010	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if ImpDefBool("JMCR UNDEFINED at EL0") then
        Undefined();
    else
        return;
    end;
elseif PSTATE.EL == EL1 then
    return;
elseif PSTATE.EL == EL2 then
    return;
end;
```

D10.2.103 JOSCR, Jazelle OS Control Register

The JOSCR characteristics are:

Purpose

A Jazelle register, which provides operating system control of the Jazelle Extension.

Configuration

There are no configuration notes.

Attributes

JOSCR is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RAZ/WI.

Accessing JOSCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b111	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if ImpDefBool("JOSCR UNDEFINED at EL0") then
        Undefined();
    else
        R(t) = JOSCR();
    end;
elsif PSTATE.EL == EL1 then
    R(t) = JOSCR();
elsif PSTATE.EL == EL2 then
    R(t) = JOSCR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b111	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if ImpDefBool("JOSCR UNDEFINED at EL0") then
        Undefined();
    else
        return;
    end;
elsif PSTATE.EL == EL1 then
    return;
elsif PSTATE.EL == EL2 then
    return;
end;
```

D10.2.104 MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

Purpose

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

Configuration

There are no configuration notes.

Attributes

MAIR0 is a 32-bit register.

This register has the following instances:

- MAIR0.

Field descriptions

TTBCR.EAE=1

31	24	23	16	15	8	7	0
Attr3				Attr2			
Attr1				Attr0			

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = MAIR0();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = MAIR0();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        MAIR0() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    MAIR0() = R(t);
end;
```

D10.2.105 MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

Purpose

Along with MAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

Configuration

There are no configuration notes.

Attributes

MAIR1 is a 32-bit register.

This register has the following instances:

- MAIR1.

Field descriptions

TTBCR.EAE=1

Attr<n> , bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b001

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = MAIR1();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = MAIR1();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T10 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        MAIR1() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    MAIR1() = R(t);
end;
```

D10.2.106 MIDR, Main ID Register

The MIDR characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

Some fields of the MIDR are IMPLEMENTATION DEFINED. For more information about the values of these fields for a particular Armv8 implementation, and any implementation-specific significance of these values, see the product documentation.

AArch32 System register MIDR bits [31:0] are architecturally mapped to External register [MIDR_EL1](#)[31:0].

Attributes

MIDR is a 32-bit register.

Field descriptions

31	24	23	20	19	16	15		4	3	0
Implementer			Variant		Architecture		PartNum			Revision

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is RO.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture, bits [19:16]

Architecture version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() then
        R(t) = VPIDR();
    else
        R(t) = MIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = MIDR();
end;
```

D10.2.107 MPIDR, Multiprocessor Affinity Register

The MPIDR characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism.

Configuration

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR is a 32-bit register.

Field descriptions

31	30	29	25	24	23	16	15	8	7	0
M	U	RES0			MT	Aff2		Aff1		Aff0

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

M	Meaning
0b0	This implementation does not include the Armv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the Armv7 Multiprocessing Extensions functionality.

Access to this field is RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() then
        R(t) = VMPIDR();
    else
        R(t) = MPIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = MPIDR();
end;
```

D10.2.108 MPUIR, MPU Type Register (EL1)

The MPUIR characteristics are:

Purpose

Identifies the number of regions supported by the EL1 MPU.

Configuration

There are no configuration notes.

Attributes

MPUIR is a 32-bit register.

Field descriptions

31	16	15	8	7	0
RES0		REGION		RES0	

Bits [31:16]

Reserved, RES0.

REGION, bits [15:8]

The number of EL1 MPU regions supported.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [7:0]

Reserved, RES0.

Accessing MPUIR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = MPUIR();
    end;
end;

```

```
elseif PSTATE.EL == EL2 then
    R(t) = MPUIR();
end;
```

D10.2.109 MVFR0, Media and VFP Feature Register 0

The MVFR0 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with [MVFR1](#) and [MVFR2](#).

For general information about the interpretation of the ID registers see ‘[Principles of the ID scheme for fields in ID registers](#)’.

Configuration

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR0 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0																
FPRound				FPShVec				FPSqrt				FPDivide				FPTrap				FPDP				FPSP				SIMDReg			

FPSHVec	Meaning
0b0000	Short vectors not supported.
0b0001	Short vector operation supported.

All other values are reserved.

In Armv8, the only permitted value is 0b0000.

Access to this field is RO.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPSqrt	Meaning
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

Access to this field is RO.

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDivide	Meaning
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

Access to this field is RO.

FPTrap, bits [15:12]

Floating-Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPTrip	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

Access to this field is RO.

FPDP, bits [11:8]

Floating-Point Double-Precision. Indicates whether the floating-point implementation provides support for double-precision operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

Access to this field is RO.

FPSP, bits [7:4]

Floating-Point Single-Precision. Indicates whether the floating-point implementation provides support for single-precision operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPSP	Meaning
0b0000	Not supported in hardware.

FPSP	Meaning
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

Access to this field is RO.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDReg	Meaning
0b0000	The implementation has no Advanced SIMD and floating-point support.
0b0001	The implementation includes floating-point support with 16 x 64-bit registers.
0b0010	The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0010.

In Armv8-R AArch32, the value 0b0001 is also permitted.

Access to this field is RO.

Accessing MVFR0

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

reg

0b0111

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if CPACR().cp10 == '00' then
```

```
        Undefined();
    elseif EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x08);
    elseif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x08);
    else
        R(t) = MVFR0();
    end;
elseif PSTATE.EL == EL2 then
    if EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x00);
    else
        R(t) = MVFR0();
    end;
end;
```

D10.2.110 MVFR1, Media and VFP Feature Register 1

The MVFR1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with [MVFR0](#) and [MVFR2](#).

For general information about the interpretation of the ID registers see ‘[Principles of the ID scheme for fields in ID registers](#)’.

Configuration

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR1 is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
SIMDFMAC				FPHP				SIMDHP				SIMDSP			
								SIMDInt				SIMDLS			
												FPDNaN			
												FPFtZ			

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDFMAC	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

Access to this field is RO.

FPHP, bits [27:24]

Floating-Point Half-Precision. Indicates the level of half-precision floating-point support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPHP	Meaning
0b0000	Not supported.
0b0001	Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds instructions for conversion between double-precision and half-precision.
0b0011	As for 0b0010, and adds support for half-precision floating-point arithmetic.

The table above shows all possible values of this field. The values this field can take in the current implementation are:

- 0b0000
- 0b0001
- 0b0010

All other values are reserved.

In Armv8-R AArch32, the permitted values are 0b0000, 0b0001 and 0b0010.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half-Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001

Access to this field is RO.

SIMDHP, bits [23:20]

Advanced SIMD Half-Precision. Indicates the level of half-precision floating-point support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDHP	Meaning
0b0000	Not supported.
0b0001	SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds support for half-precision floating-point arithmetic.

The table above shows all possible values of this field. The values this field can take in the current implementation are:

- 0b0000
- 0b0001

All other values are reserved.

In Armv8-R AArch32, the permitted value are 0b0000 and 0b0001.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half-Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001

Access to this field is RO.

SIMDSP, bits [19:16]

Advanced SIMD Single-Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDSP	Meaning
0b0000	Not implemented.
0b0001	Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDInt	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDLS	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

FPDNaN, bits [7:4]

Default NaN. Indicates whether the floating-point implementation provides support only for the default NaN.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDNaN	Meaning
0b0000	Not implemented, or hardware supports only the default NaN.
0b0001	Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPFtZ	Meaning
0b0000	Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
0b0001	Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

Accessing MVFR1

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

reg
0b0110

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if CPACR().cp10 == '00' then
        Undefined();
    elseif EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x08);
    elseif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x08);
    else
        R(t) = MVFR1();
    end;
elseif PSTATE.EL == EL2 then
    if EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x00);
    else
        R(t) = MVFR1();
    end;
end;
```

D10.2.111 MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with [MVFR0](#) and [MVFR1](#).

For general information about the interpretation of the ID registers see ‘[Principles of the ID scheme for fields in ID registers](#)’.

Configuration

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Support for Floating-point selection.
0b0010	As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.
0b0011	As 0b0010, and Floating-point Round to Integer Floating-point.
0b0100	As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0100.

Access to this field is RO.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Floating-point Conversion to Integer with Directed Rounding modes.
0b0010	As 0b0001, and Floating-point Round to Integer Floating-point.
0b0011	As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8, the permitted values are 0b0000 and 0b0011.

Access to this field is RO.

Accessing MVFR2

Accesses to this register use the following encodings in the System register encoding space:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

reg
0b0101

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if CPACR().cp10 == '00' then
        Undefined();
    elsif EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x08);
    elsif EL2Enabled() && HCR().TID3 == '1' then
        AArch32_TakeHypTrapException(0x08);
    else
        R(t) = MVFR2();
    end;
elsif PSTATE.EL == EL2 then
    if EL2Enabled() && HCPTR().TCP10 == '1' then
        AArch32_TakeHypTrapException(0x00);
    else
        R(t) = MVFR2();
    end;
end;
```

D10.2.112 NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

Purpose

Defines the access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

Configuration

Any read of the NSACR from EL2 or EL1 returns a value of 0x00000C00.
Any write accesses, unless trapped to EL2, are UNDEFINED

Attributes

NSACR is a 32-bit register.

Field descriptions

Bits [31:21]

Reserved, RES0.

NSTRCDIS, bit [20]

Disables Non-secure System register accesses to all implemented trace System registers.

NSTRCDIS	Meaning
0b0	This control has no effect on: - System register access to implemented trace System registers. - The behavior of CPACR.TRCDIS and HCPTR.TTA.
0b1	Non-secure System register accesses to all implemented trace System registers are disabled, meaning: - CPACR.TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value. - HCPTR.TTA behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the CPACR.TRCDIS field:

- If CPACR.TRCDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.TRCDIS is RW, this field is RW.

Note

- The ETMv4 architecture does not permit EL0 to access the trace System registers. If the trace unit implements FEAT_ETMv4, EL0 accesses to the trace System registers are UNDEFINED.
- The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace System registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

Bit [19]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [18:16]

IMPLEMENTATION DEFINED.

NSASEDIS, bit [15]

Disables Non-secure access to the Advanced SIMD functionality.

NSASEDIS	Meaning
0b0	This control has no effect on: • Non-secure access to Advanced SIMD functionality. • The behavior of CPACR.ASEDIS and HCPTR.TASE.
0b1	Non-secure access to the Advanced SIMD functionality is disabled, meaning: • CPACR.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value. • HCPTR.TASE behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the CPACR.ASEDIS field:

- If CPACR.ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If CPACR.ASEDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.ASEDIS is RW, this field is RW.

Bits [14:12]

Reserved, RES0.

cp11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

cp10, bit [10]

Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

cp10	Meaning
0b0	Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. When the PE is in Non-secure state: - The CPACR.{cp11, cp10} fields ignore writes and read as 0b00, access denied. - The HCPTR.{TCP11, TCP10} fields behave as RAO/WI, regardless of their actual values.
0b1	Advanced SIMD and floating-point features can be accessed from both Security states.

If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing NSACR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0001	0b010

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = Zeros{20} :: '1100' :: Zeros{8};
    end;
elsif PSTATE.EL == EL2 then
    R(t) = Zeros{20} :: '1100' :: Zeros{8};
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

D10.2.113 PAR, Physical Address Register

The PAR characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

PAR returns a 64-bit value.

Attributes

PAR is a 64-bit register.

This register has the following instances:

- PAR.

Field descriptions

When the instruction returned a 64-bit value to the PAR, PAR.F==0:

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits. This applies to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR0 and MAIR1.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:40]

Reserved, RES0.

PA, bits [39:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b1	PAR returned a 64-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

In Armv8-R AArch32, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is UNKNOWN/WI.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==1:

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b1	PAR returned a 64-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

FSTAGE, bit [9]

Indicates the translation stage at which the translation aborted:

FSTAGE	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:7]

Reserved, RES0.

FST, bits [6:1]

Fault status field. Values are as in the [DFSR.STATUS](#) and [IFSR.STATUS](#) fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0100	0b000

```

    end;
elseif PSTATE.EL == EL2 then
    PAR() = R(t, t2);
end;
```

D10.2.114 PRBAR, Protection Region Base Address Register (EL1)

The PRBAR characteristics are:

Purpose

Provides access to the base addresses for the EL1 MPU region. **PRSELR.REGION** determines which MPU region is selected.

Configuration

All bits above implemented physical address range in this register should be treated as RES0.

Attributes

PRBAR is a 32-bit register.

Field descriptions

**BASE, bits [31:6]**

Bits[31:6] of the lower inclusive limit of the selected EL1 MPU memory region. This value is zero extended to provide the base address to be checked against.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SH[1:0], bits [4:3]

Shareability attribute SH[1:0].

SH[1:0]	Meaning
0b00	Non-shareable
0b01	Reserved, CONSTRAINED UNPREDICTABLE
0b10	Outer Shareable
0b11	Inner Shareable

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AP[2:1], bits [2:1]

Access Permission attributes AP[2:1].

AP[2:1]	Meaning
0b00	Read/write at EL1, no access at EL0
0b01	Read/write at EL1 and EL0
0b10	Read-only at EL1, no access at EL0
0b11	Read-only at EL1 and EL0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

XN, bit [0]

Execute Never

XN	Meaning
0b0	Execution of instructions fetched from the region is permitted.
0b1	Execution of instructions fetched from the region is not permitted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PRBAR

Any access to MPU region register PRBAR above the number of implemented regions specified by MPUIR.REGION is CONSTRAINED UNPREDICTABLE.

CONSTRAINED UNPREDICTABLE behavior is defined as:

- Reads of unimplemented PRBAR register return an UNKNOWN value.
- Writes to unimplemented PRBAR register make all PRBAR registers value UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0011	0b000

```

end;
```

D10.2.115 PRBAR<n>, Protection Region Base Address Register n (EL1), n = 0 - 31

The PRBAR<n> characteristics are:

Purpose

Provides access to the base address for the EL1 MPU region determined by the value of ‘n’.

Configuration

All bits above implemented physical address range in this register should be treated as RES0.

Attributes

PRBAR<n> is a 32-bit register.

Field descriptions

BASE, bits [31:6]

Bits[31:6] of the lower inclusive limit of the selected EL1 MPU memory region. This value is zero extended to provide the base address to be checked against.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SH[1:0], bits [4:3]

Shareability attribute SH[1:0].

SH[1:0]	Meaning
0b00	Non-shareable
0b01	Reserved, CONSTRAINED UNPREDICTABLE
0b10	Outer Shareable
0b11	Inner Shareable

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AP[2:1], bits [2:1]

Access Permission attributes AP[2:1].

AP[2:1]	Meaning
0b00	Read/write at EL1, no access at EL0
0b01	Read/write at EL1 and EL0
0b10	Read-only at EL1, no access at EL0
0b11	Read-only at EL1 and EL0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

XN, bit [0]

Execute Never

XN	Meaning
0b0	Execution of instructions fetched from the region is permitted.
0b1	Execution of instructions fetched from the region is not permitted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PRBAR<n>

Any access to MPU region register PRBAR<n> above the number of implemented regions specified by [MPUIR.REGION](#) is CONSTRAINED UNPREDICTABLE.

CONSTRAINED UNPREDICTABLE behavior is defined as:

- Reads of unimplemented PRBAR<n> return an UNKNOWN value.
- Writes to unimplemented PRBAR<n> register make all PRBAR registers value UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where n = 0-31

coproc	opc1	CRn	CRm	opc2
0b1111	0b00:n[4]	0b0110	0b1:n[3:1]	n[0]:0b00

```
let n:integer = UInt(opc1[0] :: CRm[2:0] :: opc2[2]);

if n >= UInt(MPUIR().REGION) then
    ConstrainUnpredictableProcedure(Unpredictable_UnimplementedMPURegion_RW_UNKNOWN);

    PRBAR(n) = R(t);
end;
```

D10.2.116 PRLAR, Protection Region Limit Address Register (EL1)

The PRLAR characteristics are:

Purpose

Provides access to the limit addresses for the EL1 MPU region. PRSEL.RREGION determines which MPU region is selected.

Configuration

All bits above implemented physical address range in this register should be treated as RES0.

Attributes

PRLAR is a 32-bit register.

Field descriptions

LIMIT, bits [31:6]

Bits[31:6] of the upper inclusive limit of the selected EL1 MPU memory region. This value is concatenated with the value 0x3F to provide the limit address to be checked against.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [5:4]

Reserved, RES0.

AttrIndx[2:0], bits [3:1]

AttrIndx[2:0] selects attributes from within the associated Memory Attribute Indirection Register.

AttrIndx[2:0]	Meaning
0b000	Select the Attr0 field from MAIR0.
0b001	Select the Attr1 field from MAIR0.
0b010	Select the Attr2 field from MAIR0.
0b011	Select the Attr3 field from MAIR0.
0b100	Select the Attr4 field from MAIR1.
0b101	Select the Attr5 field from MAIR1.

AttrIdx[2:0]	Meaning
0b110	Select the Attr6 field from MAIR1.
0b111	Select the Attr7 field from MAIR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Region enable bit.

EN	Meaning
0b0	Region disabled.
0b1	Region enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PRLAR

Any access to MPU region register PRLAR above the number of implemented regions specified by MPUIR.REGION is CONSTRAINED UNPREDICTABLE.

CONSTRAINED UNPREDICTABLE behavior is defined as:

- Reads of unimplemented PRLAR register return an UNKNOWN value.
- Writes to unimplemented PRLAR register make all PRLAR registers value UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0011	0b001

end;
```

D10.2.117 PRLAR<n>, Protection Region Limit Address Register n (EL1), n = 0 - 31

The PRLAR<n> characteristics are:

Purpose

Provides access to the limit address for the EL1 MPU region determined by the value of ‘n’.

Configuration

All bits above implemented physical address range in this register should be treated as RES0.

Attributes

PRLAR<n> is a 32-bit register.

Field descriptions

LIMIT, bits [31:6]

Bits[31:6] of the upper inclusive limit of the selected EL1 MPU memory region. This value is concatenated with the value 0x3F to provide the limit address to be checked against.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [5:4]

Reserved, RES0.

AttrIdx[2:0], bits [3:1]

AttrIdx[2:0] selects attributes from within the associated Memory Attribute Indirection Register.

AttrIdx[2:0]	Meaning
0b000	Select the Attr0 field from MAIR0.
0b001	Select the Attr1 field from MAIR0.
0b010	Select the Attr2 field from MAIR0.
0b011	Select the Attr3 field from MAIR0.
0b100	Select the Attr4 field from MAIR1.
0b101	Select the Attr5 field from MAIR1.

AttrIdx[2:0]	Meaning
0b110	Select the Attr6 field from MAIR1.
0b111	Select the Attr7 field from MAIR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Region enable bit.

EN	Meaning
0b0	Region disabled.
0b1	Region enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PRLAR<n>

Any access to MPU region register PRLAR<n> above the number of implemented regions specified by [MPUIR.REGION](#) is CONSTRAINED UNPREDICTABLE.

CONSTRAINED UNPREDICTABLE behavior is defined as:

- Reads of unimplemented PRLAR<n> return an UNKNOWN value.
- Writes to unimplemented PRLAR<n> register make all PRLAR registers value UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where n = 0-31

    PRLAR(n) = R(t);  
end;
```

D10.2.118 PRSELR, Protection Region Selection Register (EL1)

The PRSELR characteristics are:

Purpose

Selects the region number for the EL1 MPU region associated with the [PRBAR](#) and [PRLAR](#) registers.

Configuration

There are no configuration notes.

Attributes

PRSELR is a 32-bit register.

Field descriptions

31	8	7	0
RES0			REGION

Bits [31:8]

Reserved, RES0.

REGION, bits [7:0]

The number of the current EL1 MPU region visible in [PRBAR](#) and [PRLAR](#). For N implemented MPU regions, memory region numbering starts at 0 and increments by 1 to the value N-1.

Writing a value greater than or equal to the number of implemented MPU regions specified by [MPUIR](#).REGION, results in CONSTRAINED UNPREDICTABLE behavior.

CONSTRAINED UNPREDICTABLE behavior is that PRSELR register becomes UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PRSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0010	0b001

```

if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else

```

```
        R(t) = PRSELR();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = PRSELR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0010	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T6 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elseif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        PRSELR() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    PRSELR() = R(t);
end;
```

D10.2.119 REVIDR, Revision ID Register

The REVIDR characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

If REVIDR has the same value as MIDR, then its contents have no significance.

Attributes

REVIDR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing REVIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b110

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = REVIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = REVIDR();
end;
```

D10.2.120 RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

Purpose

This register contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

Configuration

There are no configuration notes.

Attributes

RVBAR is a 32-bit register.

Field descriptions

ResetAddress, bits [31:1]

Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [0]

Reserved, RES1.

Accessing RVBAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T12 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = RVBAR();
end;
```

D10.2.121 SCTLR, System Control Register

The SCTLR characteristics are:

Purpose

Provides the top-level control of the system, including its memory system.

Configuration

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

Attributes

SCTLR is a 32-bit register.

This register has the following instances:

- SCTLR.

Field descriptions

Bit [31]

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception level that is executing at PL1 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [29:28]

Reserved, RES1.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset.

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset.
0b1	Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset.

If an implementation does not provide Big-endian support for data accesses at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

FI, bit [21]

Fast Interrupts enable. This bit is a read-only copy of the [HSCTLR.FI](#) bit.

UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1.

UWXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.

WXN	Meaning
0b1	Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

This bit applies only when SCTLR.M bit is set.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

BR, bit [17]

Background Region enable. When the EL1 MPU is enabled, this bit controls how an EL1 access that does not map to any MPU memory region is handled.

BR	Meaning
0b0	EL1 MPU Background region disabled. Any EL1 transaction that does not match an EL1 MPU region results in a fault.
0b1	EL1 MPU Background region enabled. For EL1 transactions that do not match an EL1 MPU region, the EL1 Background region attributes are used and access is permitted subject to any stage 2 checks.

This bit only applies to EL1 accesses.

An EL0 access that does not match an EL1 MPU region always results in a Translation fault.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Bits [15:13]

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

I	Meaning
0b0	All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTL.R is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTL.R is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTL.R bit if the value of HCR.DC is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

SED	Meaning
0b0	SETEND instruction execution is enabled at PL0 and PL1.
0b1	SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

ITD	Meaning
0b0	All IT instruction functionality is enabled at PL1 and PL0.
0b1	Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED: - All encodings of the IT instruction with hw1[3:0]!1000. - All encodings of the subsequent instruction with the following values for hw1: 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. 0b10100xxxxxxxxxxxx: ADD Rd, PC, #imm 0b01001xxxxxxxxxxxx: LDR Rd, [PC, #imm] 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. 0b010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: - A 16-bit instruction, that can only be followed by another 16-bit instruction. - The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1, then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR, then it must also be implemented in the HSCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When an implementation does not implement ITD, access to this field is RAZ/WI.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

CP15BEN	Meaning
0b0	PL0 and PL1 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED.
0b1	PL0 and PL1 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR, then it must also be implemented in the [HSCTLR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

When an implementation does not implement CP15BEN, access to this field is RAO/WI.

Bits [4:3]

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

C	Meaning
0b0	All data access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from PL1 and PL0 can be cached at all levels of data and unified cache.

The PE ignores SCTLR.C, and data accesses to Normal memory from EL1 and EL0 are Cacheable, if the value of [HCR.DC](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

A	Meaning
0b0	Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

M, bit [0]

MPU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL1 and EL0 stage 1 address translation disabled. See the SCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1 and EL0 stage 1 address translation enabled.

The PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if HCR.TGE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing SCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TRVM == '1' then
        AArch32_TakeHypTrapException(0x03);

```

```
        else
            R(t) = SCTLRL();
        end;
    elsif PSTATE.EL == EL2 then
        R(t) = SCTLRL();
    end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TVM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        SCTLRL() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    SCTLRL() = R(t);
end;
```

D10.2.122 SPSR, Saved Program Status Register

The SPSR characteristics are:

Purpose

Holds the saved process state for the current mode.

Configuration

This register is a Special-purpose register.

Attributes

SPSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	21	20	19	16	15	10	9	8	7	6	5	4	0
N	Z	C	V	Q			J	RES0	IL		GE			IT[7:2]		E	A	I	F	T	M[4:0]

└─ IT[1:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to the current mode, and copied to PSTATE.IT on executing an exception return operation in the current mode.

On executing an exception return operation in the current mode, SPSR.IT must contain a value that is valid for the instruction being returned to.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Access to this field is RES0.

Bits [23:21]

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to the current mode, and copied to PSTATE.IL on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to the current mode, and copied to PSTATE.E on executing an exception return operation in the current mode.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to the current mode, and copied to PSTATE.F on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to the current mode, and copied to PSTATE.T on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to the current mode, and copied to PSTATE.M[4:0] on executing an exception return operation in the current mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in the current mode is an illegal return event, as described in [‘Illegal return events from AArch32 state’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR

SPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

The MSR (register) and MRS instructions used to access SPSR are data-independent-time instructions as described in [About PSTATE.DIT](#).

D10.2.123 SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

This register is a Special-purpose register.

Attributes

SPSR_abt is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	21	20	19	16	15	10	9	8	7	6	5	4	0
N	Z	C	V	Q			J	RES0	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]

└─ IT[1:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode, SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Access to this field is RES0.

Bits [23:21]

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in [‘Illegal return events from AArch32 state’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

SPSR_abt is accessible in all modes other than User mode and Abort mode.

The MSR (register) and MRS instructions used to access SPSR_abt are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_abt

R	M	M1
0b1	0b1	0b0100

MSR{<c>}{<q>} SPSR_abt, <Rn>

R	M	M1
0b1	0b1	0b0100

D10.2.124 SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

This register is a Special-purpose register.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	21	20	19	16	15	10	9	8	7	6	5	4	0
N	Z	C	V	Q			J	RES0	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]

└─ IT[1:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode, SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Access to this field is RES0.

Bits [23:21]

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in [‘Illegal return events from AArch32 state’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

The MSR (register) and MRS instructions used to access SPSR_fiq are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_fiq

R	M	M1
0b1	0b0	0b1110

MSR{<c>}{<q>} SPSR_fiq, <Rn>

R	M	M1
0b1	0b0	0b1110

D10.2.125 SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configuration

This register is a Special-purpose register.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	21	20	19	16	15	10	9	8	7	6	5	4	0
N	Z	C	V	Q			J	RES0	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]

└─ IT[1:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Hyp mode, and copied to PSTATE.IT on executing an exception return operation in Hyp mode.

On executing an exception return operation in Hyp mode, SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Access to this field is RES0.

Bits [23:21]

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in [‘Illegal return events from AArch32 state’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.

The MSR (register) and MRS instructions used to access SPSR_hyp are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_hyp

R	M	M1
0b1	0b1	0b1110

MSR{<c>}{<q>} SPSR_hyp, <Rn>

R	M	M1
0b1	0b1	0b1110

D10.2.126 SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

This register is a Special-purpose register.

Attributes

SPSR_irq is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	21	20	19	16	15	10	9	8	7	6	5	4	0
N	Z	C	V	Q			J	RES0	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]

└─ IT[1:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode, SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Access to this field is RES0.

Bits [23:21]

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in [‘Illegal return events from AArch32 state’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

The MSR (register) and MRS instructions used to access SPSR_irq are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_irq

R	M	M1
0b1	0b1	0b0000

MSR{<c>}{<q>} SPSR_irq, <Rn>

R	M	M1
0b1	0b1	0b0000

D10.2.127 SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

Configuration

This register is a Special-purpose register.

Attributes

SPSR_svc is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	21	20	19	16	15	10	9	8	7	6	5	4	0
N	Z	C	V	Q			J	RES0	IL		GE			IT[7:2]		E	A	I	F	T	M[4:0]

└─ IT[1:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Supervisor mode, and copied to PSTATE.IT on executing an exception return operation in Supervisor mode.

On executing an exception return operation in Supervisor mode, SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Access to this field is RES0.

Bits [23:21]

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in [‘Illegal return events from AArch32 state’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_svc

SPSR_svc is accessible in all modes other than User mode and Supervisor mode.

The MSR (register) and MRS instructions used to access SPSR_svc are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_svc

R	M	M1
0b1	0b1	0b0010

MSR{<c>}{<q>} SPSR_svc, <Rn>

R	M	M1
0b1	0b1	0b0010

D10.2.128 SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

This register is a Special-purpose register.

Attributes

SPSR_und is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	21	20	19	16	15	10	9	8	7	6	5	4	0
N	Z	C	V	Q			J	RES0	IL		GE			IT[7:2]		E	A	I	F	T	M[4:0]

└─ IT[1:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode, SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Access to this field is RES0.

Bits [23:21]

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in [‘Illegal return events from AArch32 state’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode.

The MSR (register) and MRS instructions used to access SPSR_und are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_und

R	M	M1
0b1	0b1	0b0110

MSR{<c>}{<q>} SPSR_und, <Rn>

R	M	M1
0b1	0b1	0b0110

D10.2.129 TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configuration

If EL1 or above can use AArch32 then this register must be implemented.

Attributes

TCMTR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing TCMTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = TCMTR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = TCMTR();
end;
```

D10.2.130 TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALL

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr);
    end;
elsif PSTATE.EL == EL2 then
    AArch32_TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr);
end;
```

D10.2.131 TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIALLH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Broadcast_NSH, TLBI_AllAttr);
end;
```

D10.2.132 TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIALLHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLHIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Broadcast_ISH, TLBI_AllAttr);
end;

```

D10.2.133 TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLIS

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

`MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBI_AllAttr);
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBI_AllAttr);
end;

```

D10.2.134 TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIALLNSNH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLNSNH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b100

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_TLBI_ALL(SecurityStateAtEL(EL1), Regime_EL10, Broadcast_NSH, TLBI_AllAttr);
end;
```

D10.2.135 TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable

The TLBIALLNSNHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIALLNSNHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLNSNHIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_ALL(SecurityStateAtEL(EL1), Regime_EL10, Broadcast_ISH, TLBI_AllAttr);
end;

```

D10.2.136 TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing TLBIASID

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr,
            ↪R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr, R(t));
end;
```

D10.2.137 TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIASIDIS is a 32-bit System instruction.

Field descriptions

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing TLBIASIDIS

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBI_AllAttr,
            ↪R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBI_AllAttr, R(t));
end;
```

D10.2.138 TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configuration

Note

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions

31	28	27		0
RES0			IPA[39:12]	

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing TLBIIPAS2

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0100	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
        ↪ TLBI_AllAttr, R(t));
end;
```

D10.2.139 TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

Note

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIIPAS2IS is a 32-bit System instruction.

Field descriptions

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing TLBIIPAS2IS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0000	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Any,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.140 TLBIIPAS2L, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level

The TLBIIPAS2L characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configuration

Note

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIIPAS2L is a 32-bit System instruction.

Field descriptions

31	28	27		0
RES0			IPA[39:12]	

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing TLBIIPAS2L

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0100	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Last,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.141 TLBIIPAS2LIS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable

The TLBIIPAS2LIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

Note

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIIPAS2LIS is a 32-bit System instruction.

Field descriptions

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing TLBIIPAS2LIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0000	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Last,
        ↪ TLBI_AllAttr, R(t));
end;
```

D10.2.142 TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

31	12	11	8	7	0
VA			RES0	ASID	

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVA

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
            ↪TLBI_AllAttr, R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.143 TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIMVAA is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAA

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VAA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
            ↪TLBI_AllAttr, R(t));
    end;
elsif PSTATE.EL == EL2 then
    AArch32_TLBI_VAA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBILevel_Any,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.144 TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable

The TLBIMVAAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIMVAAIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAAIS

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VAA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Any,
            ↪TLBI_AllAttr, R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VAA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Any,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.145 TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level

The TLBIMVAAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

Note

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIMVAAL is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAAL

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b111

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VAA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBIlevel_Last,
            ↪TLBI_AllAttr, R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VAA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBIlevel_Last,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.146 TLBIMVAALIS, TLB Invalidate by VA, All ASID, Last level, Inner Shareable

The TLBIMVAALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

Note

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIMVAALIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAALIS

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b111

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VAA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Last,
            ↪TLBI_AllAttr, R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VAA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Last,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.147 TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIMVAH is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
```

```
        else
            Undefined();
        end;
    elsif PSTATE.EL == EL2 then
        AArch32_TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Broadcast_NSH, TLBIlevel_Any,
            ↪ TLBI_AllAttr, R(t));
    end;
```

D10.2.148 TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable

The TLBIMVAHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIMVAHIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAHIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Broadcast_ISH, TLBIlevel_Any,
        ↪ TLBI_AllAttr, R(t));
end;
```

D10.2.149 TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is treated as a NOP.

Attributes

TLBIMVAIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVAIS

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Any,
            ↪TLBI_AllAttr, R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Any,
        ↪TLBI_AllAttr, R(t));
end;
```

D10.2.150 TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIMVAL is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVAL

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBIlevel_Last,
            ↪ TLBI_AllAttr, R(t));
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBIlevel_Last,
        ↪ TLBI_AllAttr, R(t));
end;
```

D10.2.151 TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode

The TLBIMVALH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIMVALH is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVALH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Broadcast_NSH, TLBIlevel_Last,
        ↪ TLBI_AllAttr, R(t));
end;
```

D10.2.152 TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable

The TLBIMVALHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIMVALHIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVALHIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elseif PSTATE.EL == EL2 then
    AArch32_TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Broadcast_ISH, TLBIlevel_Last,
        ↪ TLBI_AllAttr, R(t));
end;
```

D10.2.153 TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This System instruction is not implemented in architecture versions before Armv8.

This instruction is treated as a NOP.

Attributes

TLBIMVALIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVALIS

The following pseudocode describes traps which apply to the System instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the [Pseudocode for AArch32 operation](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b101

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Last,
            ↪ TLBI_AllAttr, R(t));
    end;
elsif PSTATE.EL == EL2 then
    AArch32_TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_ISH, TLBILevel_Last,
        ↪ TLBI_AllAttr, R(t));
end;
```

D10.2.154 TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

Configuration

There are no configuration notes.

Attributes

TLBTR is a 32-bit register.

Field descriptions

31		1	0
IMPLEMENTATION DEFINED			nU

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nU	Meaning
0b0	Unified TLB.
0b1	Separate Instruction and Data TLBs.

Access to this field is RO.

Accessing TLBTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HCR().TID1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = TLBTR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = TLBTR();
end;
```

D10.2.155 TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

Note

The PE never updates this register.

Attributes

TPIDRPRW is a 32-bit register.

This register has the following instances:

- TPIDRPRW.

Field descriptions

TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRPRW

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = TPIDRPRW();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = TPIDRPRW();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b100

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        TPIDRPRW() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    TPIDRPRW() = R(t);
end;
```

D10.2.156 TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

Note

The PE never updates this register.

Attributes

TPIDRURO is a 32-bit register.

This register has the following instances:

- TPIDRURO.

Field descriptions

31	0
Thread ID	

TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRURO

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b011

```

if PSTATE.EL == EL0 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = TPIDRURO();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    end;
end;

```

```
        else
            R(t) = TPIDRURO();
        end;
    elsif PSTATE.EL == EL2 then
        R(t) = TPIDRURO();
    end;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b011

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        TPIDRURO() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    TPIDRURO() = R(t);
end;
```

D10.2.157 TPIDRURW, PL0 Read/Write Software Thread ID Register

The TPIDRURW characteristics are:

Purpose

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configuration

Note

The PE never updates this register.

Attributes

TPIDRURW is a 32-bit register.

This register has the following instances:

- TPIDRURW.

Field descriptions

31	0
Thread ID	

TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRURW

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b010

```

if PSTATE.EL == EL0 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = TPIDRURW();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    end;
end;

```

```
        else
            R(t) = TPIDRURW();
        end;
    elsif PSTATE.EL == EL2 then
        R(t) = TPIDRURW();
    end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b010

```
if PSTATE.EL == EL0 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        TPIDRURW() = R(t);
    end;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T13 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        TPIDRURW() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    TPIDRURW() = R(t);
end;
```

D10.2.158 VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configuration

There are no configuration notes.

Attributes

VBAR is a 32-bit register.

This register has the following instances:

- VBAR.

Field descriptions

31	5	4	0
Vector Base Address			RES0

VBA, bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [4:0]

Reserved, RES0.

Accessing VBAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T12 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = VBAR();
```

```
end;  
elseif PSTATE.EL == EL2 then  
    R(t) = VBAR();  
end;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b000

```
if PSTATE.EL == EL0 then  
    Undefined();  
elseif PSTATE.EL == EL1 then  
    if EL2Enabled() && HSTR().T12 == '1' then  
        AArch32_TakeHypTrapException(0x03);  
    else  
        VBAR() = R(t);  
    end;  
elseif PSTATE.EL == EL2 then  
    VBAR() = R(t);  
end;
```

D10.2.159 VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR](#), which in a multiprocessor system, provides an additional PE identification system.

Configuration

There are no configuration notes.

Attributes

VMPIDR is a 32-bit register.

Field descriptions

31	30	29	25	24	23	16	15	8	7	0
M	U	RES0	MT	Aff2			Aff1		Aff0	

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

M	Meaning
0b0	This implementation does not include the Armv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the Armv7 Multiprocessing Extensions functionality.

Access to this field is RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MPIDR](#).U.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MPIDR.MT](#).

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MPIDR.Aff2](#).

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MPIDR.Aff1](#).

Aff0, bits [7:0]

Affinity level 0. The value of the [MPIDR](#).{Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MPIDR.Aff0](#).

Accessing VMPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0000	0b0000	0b101

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = VMPIDR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0000	0b0000	0b101

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    VMPIDR() = R(t);
end;

```

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() then
        R(t) = VMPIDR();
    else
        R(t) = MPIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = MPIDR();
end;

```

D10.2.160 VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of [MIDR](#).

Configuration

There are no configuration notes.

Attributes

VPIDR is a 32-bit register.

Field descriptions

31	24	23	20	19	16	15	4	3	0
Implementer		Variant		Architecture		PartNum		Revision	

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MIDR](#).Implementer.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MIDR](#).Variant.

Architecture, bits [19:16]

Architecture version.

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MIDR](#).Architecture.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MIDR](#).PartNum.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [MIDR](#).Revision.

Accessing VPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = VPIDR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    VPIDR() = R(t);
end;

```

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T0 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() then
        R(t) = VPIDR();
    else
        R(t) = MIDR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = MIDR();
end;

```

D10.2.161 VSCTLR, Virtualization System Control Register

The VSCTLR characteristics are:

Purpose

Provides control and configuration information for PMSAv8-32 virtualization using stage 2 of EL1&0 translation regime.

Configuration

There are no configuration notes.

Attributes

VSCTLR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

VMID, bits [23:16]

Virtual machine identifier.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:3]

Reserved, RES0.

S2NIE, bit [2]

Stage 2 Normal Interrupt Enable.

S2NIE	Meaning
0b0	This feature is disabled.
0b1	Multi-word accesses are interruptible, regardless of stage 1 attributes, where the access: - Uses base-restore addressing. - Is executed at EL1 or EL0. - Is an access to memory marked as Normal in the corresponding EL2 MPU region.

This field only has any effect when [HSCTLR.FI](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

S2DMA, bit [1]

Stage 2 Device Multiword Access Disable.

S2DMA	Meaning
0b0	This feature is disabled.
0b1	Multi-word accesses at EL1 or EL0 that span an aligned 64-bit boundary generate a stage 2 Permission Fault if the memory region is marked as Device in the corresponding EL2 MPU region.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing VSCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0000	0b000

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T2 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = VSCTLR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0000	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T2 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    VSCTLR() = R(t);
end;
```

D10.3 Debug System registers

This section lists the Debug System registers in AArch32 state, in alphabetic order.

D10.3.1 DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

This register is required in all implementations.

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to External register [DBGAUTHSTATUS_EL1](#) [31:0].

Attributes

DBGAUTHSTATUS is a 32-bit register.

Field descriptions

Bits [31:12]

Reserved, RES0.

HNID, bits [11:10]

Hyp non-invasive debug.

HNID	Meaning
0b00	Separate Hyp enable not implemented.
0b10	Implemented and disabled. ExternalHypNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalHypNoninvasiveDebugEnabled() == TRUE.

Only permitted values for this field are 0b10 and 0b11. All other values are reserved.

HID, bits [9:8]

Hyp invasive debug.

HID	Meaning
0b00	Separate Hyp enable not implemented.
0b10	Implemented and disabled. ExternalHypInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalHypInvasiveDebugEnabled() == TRUE.

Only permitted values for this field are 0b10 and 0b11. All other values are reserved.

SNID, bits [7:6]

Secure Non-Invasive Debug.

SNID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. <code>ExternalSecureNoninvasiveDebugEnabled()</code> == FALSE.
0b11	Implemented and enabled. <code>ExternalSecureNoninvasiveDebugEnabled()</code> == TRUE.

For Armv8-R AArch32, the only permitted value for this field is 0b00.

All other values are reserved.

SID, bits [5:4]

Secure Invasive Debug.

SID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. <code>ExternalSecureInvasiveDebugEnabled()</code> == FALSE.
0b11	Implemented and enabled. <code>ExternalSecureInvasiveDebugEnabled()</code> == TRUE.

For Armv8-R AArch32, the only permitted value for this field is 0b00.

All other values are reserved.

NSNID, bits [3:2]

Non-secure Non-Invasive Debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. <code>ExternalNoninvasiveDebugEnabled()</code> == FALSE.
0b11	Implemented and enabled. <code>ExternalNoninvasiveDebugEnabled()</code> == TRUE.

For Armv8-R AArch32, the only permitted values for this field are 0b10 and 0b11.

All other values are reserved.

NSID, bits [1:0]

Non-secure Invasive Debug.

NSID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

For Armv8-R AArch32, the only permitted values for this field are 0b10 and 0b11.
All other values are reserved.

Accessing DBGAUTHSTATUS

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1110	0b110

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGAUTHSTATUS();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGAUTHSTATUS();
end;
```

D10.3.2 DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>](#). If this breakpoint supports Context matching, [DBGBVR<n>](#) can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

Configuration

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register [DBGBCR<n>_EL1](#)[31:0].

Attributes

DBGBCR<n> is a 32-bit register.

Field descriptions

31	24	23	20	19	16	15	14	13	12	9	8	5	4	3	2	1	0
RES0		BT		LBN		SSC	HMC		RES0		BAS		RES0		PMC		E

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n> is the address of an instruction.
0b0001	As 0b0000, but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. DBGBVR<n> .ContextID is compared against CONTEXTIDR .
0b0011	As 0b0010 with linking enabled.
0b0100	Unlinked instruction address mismatch. DBGBVR<n> is the address of an instruction to be stepped.
0b0101	As 0b0100, but linked to a Context matching breakpoint.
0b0110	Unlinked CONTEXTIDR match. DBGBVR<n> .ContextID is a Context ID compared against CONTEXTIDR .
0b0111	As 0b0110 with linking enabled.
0b1000	Unlinked VMID match. DBGBXVR<n> .VMID is a VMID compared against VSCTLR .VMID.
0b1001	As 0b1000 with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n> .ContextID is a Context ID compared against CONTEXTIDR , and DBGBXVR<n> .VMID is a VMID compared against VSCTLR .VMID.

BT	Meaning
0b1011	As 0b1010 with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBG BXVR<n> .ContextID2 is a Context ID compared against CONTEXTIDR_EL2.
0b1101	As 0b1100 with linking enabled.
0b1110	Unlinked Full Context ID match. DBG BVR<n> .ContextID is compared against CONTEXTIDR , and DBG BXVR<n> .ContextID2 is compared against CONTEXTIDR_EL2.
0b1111	As 0b1110 with linking enabled.

For more information on Breakpoints and their constraints, see ‘[Breakpoint exceptions](#)’ and ‘[Reserved DBGBCR<n>.BT values](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number. For Linked address matching breakpoints, this specifies the index of the context-matching breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>.E is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see ‘[Execution conditions for which a breakpoint generates Breakpoint exceptions](#)’ and ‘[Reserved DBGBCR<n>.{SSC, HMC, PMC} values](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see ‘[Execution conditions for which a breakpoint generates Breakpoint exceptions](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which halfwords an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n>+2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see [‘Reserved DBGBCR<n>.BAS values’](#).

For more information on using the BAS field in Address Match breakpoints, see [‘Using the BAS field in Address Match breakpoints’](#).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Step instruction at	Constraint for debuggers
0b0000	•	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n>+2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see [‘Reserved DBGBCR<n>.BAS values’](#).

For more information on using the BAS field in address mismatch breakpoints, see [‘Using the BAS field in Address Match breakpoints’](#).

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see [‘Execution conditions for which a breakpoint generates Breakpoint exceptions’](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [DBGBVR<n>](#). Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	m[3:0]	0b101

```

let m:integer = UInt(CRm[3:0]);

if m >= NUM_BREAKPOINTS then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elsif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGBCR(m);
    end;
elsif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGBCR(m);
    end;
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	m[3:0]	0b101

```
let m:integer = UInt(CRM[3:0]);

if m >= NUM_BREAKPOINTS then
    Undefined();
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elseif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGBCR(m) = R(t);
    end;
elseif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGBCR(m) = R(t);
    end;
end;
```

D10.3.3 DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register [DBGBCR<n>](#). If this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

Configuration

How this register is interpreted depends on the value of [DBGBCR<n>](#).BT.

- When [DBGBCR<n>](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>](#).BT is 0bxx1x, this register holds a Context ID.

For other values of [DBGBCR<n>](#).BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the [DBGDIDR.CTX_CMPs](#) field.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to External register [DBGBVR<n>_EL1](#)[31:0].

Attributes

DBGBVR<n> is a 32-bit register.

Field descriptions

When [DBGBCR<n>](#).BT IN {'0x0x'}:

VA[31:2], bits [31:2]

Bits[31:2] of the address value for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When [DBGBCR<n>](#).BT IN {'001x'}:

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT IN {'101x'}:

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	m[3:0]	0b100

```

let m:integer = UInt(CRm[3:0]);

if m >= NUM_BREAKPOINTS then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elsif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGBVR(m);
    end;
elsif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGBVR(m);
    end;
end;
end;

```

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	m[3:0]	0b100

```
let m:integer = UInt(CRm[3:0]);

if m >= NUM_BREAKPOINTS then
    Undefined();
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elseif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGGBVR(m) = R(t);
    end;
elseif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGGBVR(m) = R(t);
    end;
end;
```

D10.3.4 DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register [DBGBCR<n>](#) and a value register [DBGBVR<n>](#), where breakpoint n supports Context matching.

Configuration

How this register is interpreted depends on the value of [DBGBCR<n>](#).BT.

- When [DBGBCR<n>](#).BT is 0b10xx, this register holds a VMID.
- When [DBGBCR<n>](#).BT is 0b11xx, this register holds a Context ID.

For other values of [DBGBCR<n>](#).BT, this register is RES0.

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.

For more information, see the description of the [DBGDIDR](#).CTX_CMPs field.

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to External register [DBGBVR<n>](#).EL1[63:32].

Attributes

DBGBXVR<n> is a 32-bit register.

Field descriptions

When [DBGBCR<n>](#).BT IN {'10xx'}:

Bits [31:8]

Reserved, RES0.

VMID[7:0], bits [7:0]

VMID value for comparison. The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When [DBGBCR<n>](#).BT IN {'11xx'}:

Bits [31:0]

Reserved, RES0.

Accessing DBGXVR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	m[3:0]	0b001

```
let m:integer = UInt(CRm[3:0]);

if m >= NUM_BREAKPOINTS then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elsif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGXVR(m);
    end;
elsif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGXVR(m);
    end;
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	m[3:0]	0b001

```
let m:integer = UInt(CRm[3:0]);

if m >= NUM_BREAKPOINTS then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elsif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGXVR(m) = R(t);
    end;
elsif PSTATE.EL == EL2 then
```

```
if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
    Halt(DebugHalt_SoftwareAccess);
else
    DBG BXVR(m) = R(t);
end;
end;
```

D10.3.5 DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET register.

Configuration

An implementation must include eight CLAIM tag bits.

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

Attributes

DBGCLAIMCLR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bits [m], for m = 7 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is W1C.

Accessing DBGCLAIMCLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1001	0b110

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGCLAIMCLR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGCLAIMCLR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1001	0b110

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        DBGCLAIMCLR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    DBGCLAIMCLR() = R(t);
end;
```

D10.3.6 DBGCLAIMSET, Debug CLAIM Tag Set register

The DBGCLAIMSET characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.
The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR register.

Configuration

An implementation must include eight CLAIM tag bits.
AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].
AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].
AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

Attributes

DBGCLAIMSET is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bits [m], for m = 7 to 0

Claim Tag Set. Used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a write: Ignored.
0b1	On a write: Set Claim Tag bit <m> to 1.

Access to this field is RAO/WIS.

Accessing DBGCLAIMSET

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1000	0b110

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGCLAIMSET();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGCLAIMSET();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1000	0b110

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        DBGCLAIMSET() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    DBGCLAIMSET() = R(t);
end;

```

D10.3.7 DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configuration

There are no configuration notes.

Attributes

DBGDCCINT is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

RX	Meaning
0b0	No interrupt request generated by DTRRX.
0b1	Interrupt request will be generated on RXfull == 1.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

TX	Meaning
0b0	No interrupt request generated by DTRTX.

0b1	Interrupt request will be generated on TXfull == 0.
-----	---

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [28:0]

Reserved, RES0.

Accessing DBGDCCINT

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0010	0b000

```

if Halted() && PSTATE.EL != EL0 && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    R(t) = DBGDCCINT();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDCCINT();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGDCCINT();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0010	0b000

```

if Halted() && PSTATE.EL != EL0 && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    DBGDCCINT() = R(t);
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        DBGDCCINT() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    DBGDCCINT() = R(t);
end;

```

D10.3.8 **DBGDEVID, Debug Device ID register 0**

The DBGDEVID characteristics are:

Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

Configuration

This register is required in all implementations.

Attributes

DBGDEVID is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
CIDMask		AuxRegs		DoubleLock		VirtExtns		VectorCatch		BPAAddrMask		WPAAddrMask		PCSample	

CIDMask, bits [31:28]

Indicates the level of support for the Context ID matching breakpoint masking capability.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CIDMask	Meaning
0b0000	Context ID masking is not implemented.
0b0001	Context ID masking is implemented.

All other values are reserved. The value of this for Armv8 is 0b0000.

Access to this field is RO.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR .

All other values are reserved.

Access to this field is RO.

DoubleLock, bits [23:20]

OS Double Lock implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DoubleLock	Meaning
0b0000	OS Double Lock is not implemented. DBGOSDLR is RAZ/WI.
0b0001	OS Double Lock is implemented. DBGOSDLR is RW.

[FEAT_DoubleLock](#) implements the functionality identified by the value 0b0001.

All other values are reserved.

Access to this field is RO.

VirtExtns, bits [19:16]

Indicates whether EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VirtExtns	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 is implemented.

All other values are reserved.

Access to this field is RO.

VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VectorCatch	Meaning
0b0000	Address matching Vector Catch exception implemented.
0b0001	Exception matching Vector Catch exception implemented.

All other values are reserved.

Access to this field is RO.

BPAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPAAddrMask	Meaning
0b0000	Breakpoint address masking might be implemented. If not implemented, DBGBCR<n> [28:24] is RAZ/WI.
0b0001	Breakpoint address masking is implemented.
0b1111	Breakpoint address masking is not implemented. DBGBCR<n> [28:24] is RES0.

All other values are reserved. The value of this for Armv8 is 0b1111.

Access to this field is RO.

WPAAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WPAAddrMask	Meaning
0b0000	Watchpoint address masking might be implemented. If not implemented, DBGWCR<n> .MASK (Address mask) is RAZ/WI.
0b0001	Watchpoint address masking is implemented.
0b1111	Watchpoint address masking is not implemented. DBGWCR<n> .MASK (Address mask) is RES0.

All other values are reserved. The value of this for Armv8 is 0b0001.

Access to this field is RO.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDS are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR , EDCIDS , and EDVIDSR are implemented.

The table above shows all possible values of this field. The values this field can take in the current implementation are:

- 0b0010
- 0b0011

All other values are reserved.

Access to this field is RO.

Accessing DBGDEVID

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b0010	0b111

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDEVID();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGDEVID();
end;
```

D10.3.9 DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

Configuration

This register is required in all implementations.

Attributes

DBGDEVID1 is a 32-bit register.

Field descriptions

**Bits [31:4]**

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCR](#).

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSROffset	Meaning
0b0000	EDPCSR is not implemented.
0b0010	EDPCSR implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.

The table above shows all possible values of this field. 0b0010 is the value of this field in the current implementation.

Access to this field is RO.

Accessing DBGDEVID1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b0001	0b111

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDEVID1();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGDEVID1();
end;
```

D10.3.10 **DBGDEVID2, Debug Device ID register 2**

The DBGDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configuration

There are no configuration notes.

Attributes

DBGDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing DBGDEVID2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b0000	0b111

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDEVID2();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGDEVID2();
end;
```

D10.3.11 DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

Purpose

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

Configuration

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDIDR is a 32-bit register.

Field descriptions

WRPs, bits [31:28]

Number of watchpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0b0001..0b1111	The number of watchpoints, minus 1.

The value 0b0000 is reserved.

Access to this field is RO.

BRPs, bits [27:24]

Number of breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0b0001..0b1111	The number of breakpoints, minus 1.

The value 0b0000 is reserved.

Access to this field is RO.

CTX_CMPs, bits [23:20]

Number of context-aware breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0b0000..0b1111	The number of context-aware breakpoints, minus 1.

The value of this field is never greater than DBGDIDR.BRPs.

Access to this field is RO.

Version, bits [19:16]

Debug architecture version. Indicates presence of Armv8 debug architecture.

The value of this field is an IMPLEMENTATION DEFINED choice of:

All other values are reserved.

From Armv8.0, the values 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

Access to this field is RO.

Bit [15]

Reserved, RES1.

nSUHD_imp, bit [14]

Previously indicated that Secure User Halting Debug is not implemented.

The value of this field must match the value of the SE_imp field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [13]

Reserved, RES0.

SE_imp, bit [12]

EL3 implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SE_imp	Meaning
0b0	EL3 not implemented.
0b1	EL3 implemented.

The value of this field must match the value of the nSUHD_imp field.

Access to this field is RO.

Bits [11:0]

Reserved, RES0.

Accessing DBGDIDR

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0000	0b000

```
if Halted() && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    R(t) = DBGDIDR();
elseif PSTATE.EL == EL0 then
    if DBGDSCRExt().UDCCdis == '1' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && (HCR().TGE == '1' || HDCR().[TDE,TDA] != '00') then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDIDR();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDIDR();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = DBGDIDR();
end;
```

D10.3.12 DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Use of this register is deprecated.

Configuration

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Attributes

DBGDRAR is a 64-bit register.

Field descriptions

Bits [63:48]

Reserved, RES0.

ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR[47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

If DBGDRAR.Valid == 0b00, then this field is UNKNOWN.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing DBGDRAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0000	0b000

```
if Halted() && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    R(t) = DBGDRAR() [31:0];
elsif PSTATE.EL == EL0 then
    if DBGDSCRext().UDCCdis == '1' then
        if EL2Enabled() && HCR().TGE == '1' then

D10.3.13 DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

Purpose

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in [DBGDRAR](#) of the physical base address of the debug registers for the PE. Use of this register is deprecated.

Configuration

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Attributes

DBGDSAR is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

Bits [1:0]

Reserved, RAZ.

This field indicates whether the debug self address offset is valid. For ARMv8, this field is always 0b00, the offset is not valid.

Accessing DBGDSAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0010	0b0000	0b000

```
if Halted() && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    R(t) = DBGDSAR() [31:0];
elsif PSTATE.EL == EL0 then

```

D10.3.14 DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

This register is required in all implementations.

AArch32 System register DBGDSCRext bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to External register [EDSCR](#)[31:29, 27:26, 23:21, 19, 14, 6].

AArch32 System register DBGDSCRext bit [15] is architecturally mapped to AArch32 System register [DBGDSCRint](#)[15].

AArch32 System register DBGDSCRext bit [12] is architecturally mapped to AArch32 System register [DBGDSCRint](#)[12].

AArch32 System register DBGDSCRext bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRint](#)[5:2].

Attributes

DBGDSCRext is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Used for save/restore of [EDSCR](#).RXfull.

When [DBGOSLSR](#).OSLK = 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR](#).OSLK = 1, this bit holds the value of [EDSCR](#).RXfull. Reads and writes of this bit are indirect accesses to [EDSCR](#).RXfull.

Arm deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRRX full status.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When [DBGOSLSR](#).OSLK = '1', access to this field is RW.
- When [DBGOSLSR](#).OSLK = '0', access to this field is RO.

TXfull, bit [29]

DTRTX full. Used for save/restore of [EDSCR](#).TXfull.

When [DBGOSLSR](#).OSLK = 0, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.TXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.TXfull`.

Arm deprecates use of this bit other than for save/restore. Use `DBGDSCRint` to access the DTRTX full status.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == '1'`, access to this field is RW.
- When `DBGOSLSR.OSLK == '0'`, access to this field is RO.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of `EDSCR.RXO`.

When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.RXO`. Reads and writes of this bit are indirect accesses to `EDSCR.RXO`.

When `DBGOSLSR.OSLK == 1`, if bits [27,6] of the value written to `DBGDSCRExt` are {1,0}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets `EDSCR.{RXO,ERR}` to UNKNOWN values.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == '1'`, access to this field is RW.
- When `DBGOSLSR.OSLK == '0'`, access to this field is RO.

TXU, bit [26]

Used for save/restore of `EDSCR.TXU`.

When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.TXU`. Reads and writes of this bit are indirect accesses to `EDSCR.TXU`.

When `DBGOSLSR.OSLK == 1`, if bits [26,6] of the value written to `DBGDSCRExt` are {1,0}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets `EDSCR.{TXU,ERR}` to UNKNOWN values.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == '1'`, access to this field is RW.
- When `DBGOSLSR.OSLK == '0'`, access to this field is RO.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of `EDSCR.INTdis`.

When `DBGOSLSR.OSLK == 0`, software must treat it as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this field holds the value of `EDSCR.INTdis`. Reads and writes of this field are indirect accesses to `EDSCR.INTdis`.

The reset behavior of this field is:

- On a Cold reset, this field resets to '00'.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == '1'`, access to this field is RW.
- When `DBGOSLSR.OSLK == '0'`, access to this field is RO.

TDA, bit [21]

Used for save/restore of `EDSCR.TDA`.

When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.TDA`. Reads and writes of this bit are indirect accesses to `EDSCR.TDA`.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == '1'`, access to this field is RW.
- When `DBGOSLSR.OSLK == '0'`, access to this field is RO.

Bits [20:19]

Reserved, RES0.

NS, bit [18]

Non-secure status.

Arm deprecates use of this field.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

Access to this field is RAO/WI.

Bits [17:16]

Reserved, RES0.

MDBGen, bit [15]

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDBGen	Meaning
0b0	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.

0b1	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.
-----	--

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == '1', access to this field is RW.
- When [DBGOSLSR.OSLK](#) == '0', access to this field is RO.

Bit [13]

Reserved, RES0.

UDCCdis, bit [12]

Traps EL0 accesses to the DCC registers to Undefined mode.

UDCCdis	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 accesses to the DBGDSCRint , DBGDTRRXint , DBGDTRTXint , DBGDIDR , DBGDSAR , and DBGDRAR are trapped to Undefined mode.

Note

All accesses to these registers are trapped, including LDC and STC accesses to [DBGDTRTXint](#) and [DBGDTRRXint](#), and MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#).

Traps of EL0 accesses to the [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR.ERR](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.ERR](#). Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == '1', access to this field is RW.
- When DBGOSLSR.OSLK == '0', access to this field is RO.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

MOE	Meaning
0b0001	Breakpoint.
0b0011	Software breakpoint (BKPT) instruction.
0b0101	Vector catch.
0b1010	Watchpoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGDSCRext

Individual fields within this register might have restricted accessibility when the OS Lock is unlocked, [DBGOSLSR.OSLK](#) == 0. See the field descriptions for more detail.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0010	0b010

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDSCRext();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGDSCRext();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0010	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        DBGDSCRext() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    DBGDSCRext() = R(t);
end;
```

D10.3.15 DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

Purpose

Main control register for the debug implementation. This is an internal, read-only view.

Configuration

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRext.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of `DBGDSCRint` at EL1 or above.

AArch32 System register DBGDSCRint bits [30:29] are architecturally mapped to External register [EDSCR](#)[30:29].

AArch32 System register DBGDSCRint bit [15] is architecturally mapped to AArch32 System register [DBGDSCRext](#)[15].

AArch32 System register `DBGDSCRint` bit [12] is architecturally mapped to AArch32 System register `DBGDSCRext`[12].

AArch32 System register DBGDSCRint bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRext](#)[5:2].

Attributes

DBGDSCRint is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the [EDSCR](#).

TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the [EDSCR](#).**Bits [28:19]**

Reserved, RES0.

NS, bit [18]

Non-secure status.

Read-only view of the equivalent bit in the [DBGDSCRext](#). Arm deprecates use of this field.

SPNIDdis, bit [17]

Secure privileged non-invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRExt](#). Arm deprecates use of this field.

SPIDdis, bit [16]

Secure privileged invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRExt](#). Arm deprecates use of this field.

MDBGen, bit [15]

Monitor debug events enable.

Read-only view of the equivalent bit in the [DBGDSCRExt](#).

Bits [14:13]

Reserved, RES0.

UDCCdis, bit [12]

User mode access to Debug Communications Channel disable.

Read-only view of the equivalent bit in the [DBGDSCRExt](#). Arm deprecates use of this field.

Bits [11:6]

Reserved, RES0.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

MOE	Meaning
0b0001	Breakpoint
0b0011	Software breakpoint (BKPT) instruction
0b0101	Vector catch
0b1010	Watchpoint

Read-only view of the equivalent bit in the [DBGDSCRExt](#).

Bits [1:0]

Reserved, RES0.

Accessing DBGDSCRint

When <Rt> is APSR_nzcv, encoded as R15, then instead of reading the entire register, the access copies DBGDSCRint[31:28] into the PSTATE NZCV flags.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0001	0b000

```

if Halted() && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    if t == 15 then

            else
                PSTATE.[N,Z,C,V] = DBGDSCRint()[31:28];
            end;
        else
            R(t) = DBGDSCRint();
        end;
    end;
elsif PSTATE.EL == EL2 then
    if t == 15 then
        if Halted() then
            ConstrainUnpredictableProcedure(Unpredictable_MRC_APSR_TARGET);
        else
            PSTATE.[N,Z,C,V] = DBGDSCRint()[31:28];
        end;
    else
        R(t) = DBGDSCRint();
    end;
end;
end;

```

D10.3.16 DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRXext characteristics are:

Purpose

Used for save/restore of [DBGDTRRXint](#). It is a component of the Debug Communications Channel.

Configuration

There are no configuration notes.

Attributes

DBGDTRRXext is a 32-bit register.

Field descriptions

31	0
Update DTRRX without side-effect	

DTRRX, bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see ‘[The Debug Communication Channel and Instruction Transfer Register](#)’.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRXext

Arm deprecates reads and writes of DBGDTRRXext through the System register interface when the OS Lock is unlocked, [DBGOSLSR](#).OSLK == 0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0000	0b010

```

if Halted() && PSTATE.EL != EL0 && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    R(t) = DBGDTRRXext();
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDTRRXext();

```

```
end;  
elseif PSTATE.EL == EL2 then  
    R(t) = DBGDTRRXext();  
end;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0000	0b010

```
if Halted() && PSTATE.EL != EL0 && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then  
    DBGDTRRXext() = R(t);  
elseif PSTATE.EL == EL0 then  
    Undefined();  
elseif PSTATE.EL == EL1 then  
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then  
        AArch32_TakeHypTrapException(0x05);  
    else  
        DBGDTRRXext() = R(t);  
    end;  
elseif PSTATE.EL == EL2 then  
    DBGDTRRXext() = R(t);  
end;
```

D10.3.17 DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0].

Attributes

DBGDTRRXint is a 32-bit register.

Field descriptions

DTRRX, bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is 1, return the last value written to DTRRX.
- If RXfull is 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see ‘[The Debug Communication Channel and Instruction Transfer Register](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRXint

Data can be stored to memory from this register using [STC](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0101	0b000

```
if Halted() then
    R(t) = Read_DBGDTR_EL0{32}();
elseif PSTATE.EL == EL0 then
    if DBGDSCRext().UDCCdis == '1' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && (HCR().TGE == '1' || HDCR().[TDE,TDA] != '00') then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = Read_DBGDTR_EL0{32}();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then

    MemA{32}(address) = Read_DBGDTR_EL0{32}();
end;
```

D10.3.18 DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTXext characteristics are:

Purpose

Used for save/restore of [DBGDTRTXint](#). It is a component of the Debug Communication Channel.

Configuration

There are no configuration notes.

Attributes

DBGDTRTXext is a 32-bit register.

Field descriptions

31	0
Return DTRTX without side-effect	

DTRTX, bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see ‘[The Debug Communication Channel and Instruction Transfer Register](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTXext

Arm deprecates reads and writes of DBGDTRTXext through the System register interface when the OS Lock is unlocked, [DBGOSLSR](#).OSLK == 0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0011	0b010

```

if Halted() && PSTATE.EL != EL0 && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    R(t) = DBGDTRTXext();
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGDTRTXext();

```

```
        end;  
    elsif PSTATE.EL == EL2 then  
        R(t) = DBGDTRTXext();  
    end;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0011	0b010

```
if Halted() && PSTATE.EL != EL0 && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then  
    DBGDTRTXext() = R(t);  
elseif PSTATE.EL == EL0 then  
    Undefined();  
elseif PSTATE.EL == EL1 then  
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then  
        AArch32_TakeHypTrapException(0x05);  
    else  
        DBGDTRTXext() = R(t);  
    end;  
elseif PSTATE.EL == EL2 then  
    DBGDTRTXext() = R(t);  
end;
```

D10.3.19 DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0].

Attributes

DBGDTRTXint is a 32-bit register.

Field descriptions

DTRTX, bits [31:0]

DTRTX. Writes to this register:

- If TXfull is 1, DTRTX is set to an UNKNOWN value.
- If TXfull is 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see ‘[The Debug Communication Channel and Instruction Transfer Register](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTXint

Data can be loaded from memory into this register using ‘LDC (immediate)’ and ‘LDC (literal)’.

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0101	0b000

```
if Halted() then
    Write_DBGDTR_EL0{32}(R(t));
elseif PSTATE.EL == EL0 then
    if DBGDSCRExt().UDCCdis == '1' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
```

```
        else
            Undefined();
        end;
    elsif EL2Enabled() && (HCR().TGE == '1' || HDCR().[TDE,TDA] != '00') then
        AArch32_TakeHypTrapException(0x05);
    else
        Write_DBGDTR_EL0{32}(R(t));
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        Write_DBGDTR_EL0{32}(R(t));
    end;
elseif PSTATE.EL == EL2 then
    Write_DBGDTR_EL0{32}(R(t));
end;
```

LDC{<c>}{<q>} <coproc>, <CRd>, <addressing_mode>

coproc	CRd
0b1110	0b0101

```
if Halted() then
    Write_DBGDTR_EL0{32}(MemA{32}(address));
elseif PSTATE.EL == EL0 then
    if DBGDSCRext().UDCCdis == '1' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elsif EL2Enabled() && (HCR().TGE == '1' || HDCR().[TDE,TDA] != '00') then
        AArch32_TakeHypTrapException(0x06);
    else
        Write_DBGDTR_EL0{32}(MemA{32}(address));
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x06);
    else
        Write_DBGDTR_EL0{32}(MemA{32}(address));
    end;
elseif PSTATE.EL == EL2 then
    Write_DBGDTR_EL0{32}(MemA{32}(address));
end;
```

D10.3.20 **DBGOSDLR, Debug OS Double Lock Register**

The DBGOSDLR characteristics are:

Purpose

Locks out the external debug interface.

Configuration

There are no configuration notes.

Attributes

DBGOSDLR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

DLK, bit [0]

When FEAT_DoubleLock is implemented:

OS Double Lock control bit.

DLK	Meaning
0b0	OS Double Lock unlocked.
0b1	OS Double Lock locked, if DBGPRCR.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RAZ/WI.

Accessing DBGOSDLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0011	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDOSA] != '00' && (IsFeatureImplemented(FEAT_DoubleLock) ||
        ↪ImpDefBool("Trapped by HDCR.TDOSA")) then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGOSDLR();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = DBGOSDLR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0011	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDOSA] != '00' && (IsFeatureImplemented(FEAT_DoubleLock) ||
        ↪ImpDefBool("Trapped by HDCR.TDOSA")) then
        AArch32_TakeHypTrapException(0x05);
    else
        DBGOSDLR() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    DBGOSDLR() = R(t);
end;

```

D10.3.21 DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

Configuration

If DBGOSLSR.OSLK == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to External register EDECCR[31:0].

Attributes

DBGOSECCR is a 32-bit register.

Field descriptions

When DBGOSLSR.OSLK == '1':

EDECCR, bits [31:0]

Used for save/restore to EDECCR over powerdown.

Reads or writes to this field are indirect accesses to EDECCR.

The reset behavior of this field is:

- On a Cold reset, this field resets to the expression 0x00.

Accessing DBGOSECCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0110	0b010

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elsif DBGOSLSR().OSLK == '0' then
        R(t) = ARBITRARY:bits(32);
    else
        R(t) = DBGOSECCR();
    end;
elsif PSTATE.EL == EL2 then
```

```
        if DBGOSLSR().OSLK == '0' then
            R(t) = ARBITRARY:bits(32);
        else
            R(t) = DBGOSECCR();
        end;
    end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0110	0b010

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elsif DBGOSLSR().OSLK == '0' then
        return;
    else
        DBGOSECCR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' then
        return;
    else
        DBGOSECCR() = R(t);
    end;
end;
```

D10.3.22 **DBGOSLAR, Debug OS Lock Access Register**

The DBGOSLAR characteristics are:

Purpose

Provides a lock for the debug registers. The OS Lock also disables some debug exceptions and debug events.

Configuration

There are no configuration notes.

Attributes

DBGOSLAR is a 32-bit register.

Field descriptions

OSLA, bits [31:0]

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS Lock to 1. Writing any other value sets the OS Lock to 0.

Use [DBGOSLSR.OSLK](#) to check the current status of the lock.

Accessing DBGOSLAR

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0000	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDOSA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        DBGOSLAR() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    DBGOSLAR() = R(t);
end;
```

D10.3.23 DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

Purpose

Provides status information for the OS Lock.

Configuration

The OS Lock status is also visible in the external debug interface through EDPRSR.

Attributes

DBGOSLSR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OSLM	Meaning
0b00	OS Lock not implemented.
0b10	OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

Access to this field is RO.

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

OSLK, bit [1]

OS Lock Status.

OSLK	Meaning
0b0	OS Lock unlocked.
0b1	OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing DBGOSLSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0001	0b100

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDOSA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGOSLSR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGOSLSR();
end;
```

D10.3.24 DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configuration

AArch32 System register DBGPRCR bit [0] is architecturally mapped to External register [EDPRCR](#)[0].

Attributes

DBGPRCR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

CORENPD RQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPD RQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGNOPWRDWN** signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR](#).COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see ‘[Core power domain power states](#)’.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR](#).COREPURQ.

Accessing DBGPRCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0100	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDOSA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGPRCR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGPRCR();
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0100	0b100

```

if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDOSA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        DBGPRCR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    DBGPRCR() = R(t);
end;

```

D10.3.25 DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

Purpose

Controls Vector Catch debug events.

Configuration

This register is required in all implementations.

Attributes

DBGVCR is a 32-bit register.

Field descriptions

EL3 is not implemented

Bits [31:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.

The exception vector offset is $0 \times 1C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.

The exception vector offset is 0×18 .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort exception vector catch enable.

The exception vector offset is 0×10 .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing DBGVCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0111	0b000

```

if PSTATE.EL == EL0 then

        DBGVCR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    DBGVCR() = R(t);
end;
```

D10.3.26 DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>](#).

Configuration

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to External register [DBGWCR<n>_ELI](#)[31:0].

Attributes

DBGWCR<n> is a 32-bit register.

Field descriptions

31	29	28	24	23	21	20	19	16	15	14	13	12	5	4	3	2	1	0
RES0		MASK		RES0	WT		LBN		SSC	HMC		BAS		LSC		PAC		E

When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address Mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If programmed with a reserved value, the watchpoint behaves as if either:

- DBGWCR<n>.MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCR<n>.
- The watchpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number. For Linked data address watchpoints, this specifies the index of the context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint *n* is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see [‘Execution conditions for which a watchpoint generates Watchpoint exceptions’](#), and [‘Reserved DBGWCR<n>. {SSC, HMC, PAC} values’](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint *n* is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [‘Execution conditions for which a watchpoint generates Watchpoint exceptions’](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or doubleword addressed by [DBGWVR<n>](#) is being watched.

BAS	Description
0bxxxxxxx1	Match byte at DBGWVR<n>
0bxxxxxx1x	Match byte at DBGWVR<n>+1
0bxxxxx1xx	Match byte at DBGWVR<n>+2
0bxxxx1xxx	Match byte at DBGWVR<n>+3

In cases where [DBGWVR<n>](#) addresses a doubleword:

BAS	Description, if DBGWVR<n> [2] == 0
0bxxx1xxxx	Match byte at DBGWVR<n> +4
0bxx1xxxxx	Match byte at DBGWVR<n> +5
0bx1xxxxxx	Match byte at DBGWVR<n> +6
0b1xxxxxxx	Match byte at DBGWVR<n> +7

If [DBGWVR<n>](#)[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting [DBGWVR<n>](#)[2] == 1.

The valid values for BAS are nonzero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See ‘[Reserved DBGWCR<n>.BAS values](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see ‘[Execution conditions for which a watchpoint generates Watchpoint exceptions](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	m[3:0]	0b111

```

let m:integer = UInt(CRm[3:0]);

if m >= NUM_WATCHPOINTS then
    Undefined();
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elseif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGWCR(m);
    end;
elseif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGWCR(m);
    end;
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	m[3:0]	0b111

```

let m:integer = UInt(CRm[3:0]);

if m >= NUM_WATCHPOINTS then
    Undefined();
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then

```

```
        AArch32_TakeHypTrapException(0x05);
    elsif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGWCR(m) = R(t);
    end;
elsif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSCR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGWCR(m) = R(t);
    end;
end;
```

D10.3.27 DBGW FAR, Debug Watchpoint Fault Address Register

The DBGW FAR characteristics are:

Purpose

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RES0.

Configuration

There are no configuration notes.

Attributes

DBGW FAR is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing DBGW FAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0110	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        R(t) = DBGW FAR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = DBGW FAR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0110	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    else
        DBGWFSR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    DBGWFSR() = R(t);
end;
```

D10.3.28 DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>.

Configuration

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to External register DBGWVR<n>_EL1[31:0].

Attributes

DBGWVR<n> is a 32-bit register.

Field descriptions

VA, bits [31:2]

Bits[31:2] of the address value for comparison.

Arm deprecates setting DBGWVR<n>[2] = 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	m[3:0]	0b110

```
let m:integer = UInt(CRm[3:0]);

if m >= NUM_WATCHPOINTS then
    Undefined();
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
```

```
        AArch32_TakeHypTrapException(0x05);
    elseif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGWVR(m);
    end;
elseif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        R(t) = DBGWVR(m);
    end;
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	m[3:0]	0b110

```
let m:integer = UInt(CRm[3:0]);

if m >= NUM_WATCHPOINTS then
    Undefined();
elseif PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().[TDE,TDA] != '00' then
        AArch32_TakeHypTrapException(0x05);
    elseif DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGWVR(m) = R(t);
    end;
elseif PSTATE.EL == EL2 then
    if DBGOSLSR().OSLK == '0' && HaltingAllowed() && EDSR().TDA == '1' then
        Halt(DebugHalt_SoftwareAccess);
    else
        DBGWVR(m) = R(t);
    end;
end;
```

D10.3.29 DLR, Debug Link Register

The DLR characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configuration

This register is a Special-purpose register.

Attributes

DLR is a 32-bit register.

Field descriptions

ADDR, bits [31:0]

Restart address.

Accessing DLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b001

```
if !Halted() then
    Undefined();
else
    R(t) = DLR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b001

```
if !Halted() then
    Undefined();
else
    DLR() = R(t);
end;
```

D10.3.30 DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

This register is a Special-purpose register.

Attributes

DSPSR is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on entering Debug state, and copied to PSTATE.IT on exiting Debug state.

On exiting Debug state, DSPSR.IT must contain a value that is valid for the instruction being returned to.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:22]

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is RES0. If the implementation does not support little-endian operation, DSPSR.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If DSPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in [‘Illegal return events from AArch32 state’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DSPSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    Undefined();
else
    R(t) = DSPSR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    Undefined();
else
    DSPSR() = R(t);
end;
```

D10.3.31 HDCCR, Hyp Debug Control Register

The HDCCR characteristics are:

Purpose

Controls the trapping to Hyp mode of accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

Configuration

There are no configuration notes.

Attributes

HDCCR is a 32-bit register.

Field descriptions

Bits [31:22]

Reserved, RES0.

EPMAD, bit [21]

External debug interface access to Hyp mode Performance Monitors registers disable. This disables access by an external debugger to counters that are reserved for use from Hyp mode.

EPMAD	Meaning
0b0	Access to all Performance Monitors counters by an external debugger is permitted.
0b1	Access to Performance Monitors counters in the range [HDCCR.HPMN..(PMCR.N-1)] by an external debugger is disabled, unless overridden by ExternalHypNoninvasiveDebugEnabled().

If the Performance Monitors Extension is not implemented or does not support external debug interface accesses this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [20:18]

Reserved, RES0.

HPMD, bit [17]

Guest Performance Monitors Disable. Controls PMU operation in Hyp mode.

HPMD	Meaning
0b0	Counters are not affected by this mechanism.
0b1	Affected counters are prohibited from counting in Hyp mode. If PMCR.DP is 1, then PMCCNTR is disabled in Hyp mode. Otherwise, PMCCNTR is not affected by this mechanism.

The counters affected by this field are:

- Event counters [PMEVCNTR<n>](#) for values of n less than [HDCR.HPMN](#).
- If [PMCR.DP](#) is 1, the cycle counter [PMCCNTR](#).

Other event counters are not affected by this field.

When [PMCR.DP](#) is 0, [PMCCNTR](#) is not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [16:12]

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps EL0 and EL1 System register MRC or MCR accesses, reported using EC syndrome value 0x05, and MRRC accesses, reported using EC syndrome value 0x0C, to the Debug ROM registers to Hyp mode.

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 System register accesses to the DBGDRAR or DBGDSAR are trapped to Hyp mode, unless it is trapped by DBGDSCRExt.UDCCdis .

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TDOSA, bit [10]

Trap debug OS-related register access. Traps EL1 System register MRC or MCR accesses, reported using EC syndrome value 0x05, to the powerdown debug System registers to Hyp mode.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug System registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).

- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

Note

These registers are not accessible at EL0.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TDA, bit [9]

Trap debug access. Traps EL0 and EL1 System register MRC or MCR accesses, reported using EC syndrome value 0x05, to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:

- [HDCR.TDRA](#).
- [HDCR.TDOSA](#).

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 or EL1 System register accesses to the debug System registers, other than the registers trapped by HDCR.TDRA and HDCR.TDOSA , are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis .

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TDE, bit [8]

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D .

TDE	Meaning
0b0	The debug target Exception level is EL1.
0b1	Debug exceptions generated at EL1 or EL0 are routed to EL2. The HDCR.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see '[Routing debug exceptions](#)'.

When [HCR.TGE](#) = 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

HPME, bit [7]

When FEAT_PMUv3 is implemented:

Hyp Enable.

HPME	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET .

The counters affected by this field are event counters [PMEVCNTR<n>](#) for values of n greater than or equal to HDCR.HPMN and less than [PMCR.N](#).

Other event counters and [PMCCNTR](#) are not affected by this field.

If HDCR.HPMN is equal to [PMCR.N](#), then this field has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap accesses of PMU System registers. Enables a trap to EL2 on accesses of PMU System registers.

TPM	Meaning
0b0	Accesses of the specified PMU System registers are not trapped by this mechanism.
0b1	Accesses of the specified PMU System registers at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.

The instructions affected by this control are:

- MRC and MCR accesses to [PMCCFILTR](#), [PMCCNTR](#), [PMCNTENCLR](#), [PMCNTENSET](#), [PMCR](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMINTENCLR](#), [PMINTENSET](#), [PMOVSRR](#), [PMOVSSET](#), [PMSELR](#), [PMSWINC](#), [PMUSERENR](#), [PMXVCNTR](#), and [PMXEVTYPER](#).
- MRC accesses to [PMCEID0](#) and [PMCEID1](#).
- MRRC and MCRR accesses to [PMCCNTR](#).

Unless the instruction generates a higher priority exception, trapped instructions generate a Hyp Trap exception.

Trapped instructions are reported using EC syndrome value 0x03 for MRC and MCR accesses, and 0x04 for MRRC and MCRR accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

Trap [PMCR](#) accesses. Traps EL0 and EL1 MCR or MRC accesses to the [PMCR](#) to Hyp mode, reported using EC syndrome value 0x03.

TPMCR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to the PMCR are trapped to Hyp mode, unless it is trapped by PMUSERENR.EN .

Note

EL2 does not provide traps on Performance Monitor System register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

Defines the number of event counters [PMEVCNTR<n>](#) that are accessible from EL1 and, if permitted, from EL0.

HDCR.HPMN divides the event counters into a first range and a second range.

If HDCR.HPMN is not 0 and is less than the number of PMU event counters implemented by the PE, `NUM_PMU_COUNTERS`, then event counters `[0..(HDCR.HPMN-1)]` are in the first range, and the remaining event counters `[HDCR.HPMN..(NUM_PMU_COUNTERS-1)]` are in the second range.

If HDCR.HPMN is equal to `NUM_PMU_COUNTERS`, or EL2 is not implemented, then all of the following apply:

- All event counters are in the first range.
- No event counters are in the second range.

All of the following apply for an event counter [PMEVCNTR<n>](#) in the first range:

- The counter is accessible from EL1 and EL2.
- The counter is accessible from EL0 if permitted by [PMUSERENR](#).
- [PMCR.E](#) and [PMCNTENSET\[n\]](#) enable the operation of the event counter.

All of the following apply for an event counter [PMEVCNTR<n>](#) in the second range:

- The counter is only accessible from EL2.
- HDCR.HPME and [PMCNTENSET\[n\]](#) enable the operation of the event counter.

Values greater than `NUM_PMU_COUNTERS` and 0 are reserved.

If this field is set to a reserved value, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of HDCR.HPMN is UNKNOWN.
- The number of event counters in each of the first and second ranges is UNKNOWN. That is, either:
 - The PE behaves as if HDCR.HPMN is set to an UNKNOWN nonzero value less than or equal to `NUM_PMU_COUNTERS`.
 - All counters are in the second range and none are in the first range.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `NUM_PMU_COUNTERS`.

Otherwise:

Reserved, `RES0`.

Accessing HDCR

Accesses to this register use the following encodings in the System register encoding space:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = HDCR();
end;
```

`MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b001

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T1 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HDCR() = R(t);
end;
```

D10.4 Performance Monitors registers

This section lists the Performance Monitors registers in AArch32.

D10.4.1 PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

Configuration

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

Attributes

PMCCFILTR is a 32-bit register.

Field descriptions

P, bit [31]

Privileged filtering. Controls counting cycles in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL1.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL1 is further controlled by PMCCFILTR.NSK.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

U, bit [30]

User filtering. Controls counting cycles in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL0.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL0 is further controlled by PMCCFILTR.NSU.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [29:28]

Reserved, RES0.

NSH, bit [27]

EL2 filtering. Controls counting cycles in EL2.

NSH	Meaning
0b0	The PE does not count cycles in EL2.
0b1	This mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [26:0]

Reserved, RES0.

Accessing PMCCFILTR

PMCCFILTR can also be accessed by using [PMXEVTYPER](#) with [PMSELR.SEL](#) set to 0b11111.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b1111	0b111

```
if !IsFeatureImplemented(FEAT_PMUv3) then
    Undefined();
elsif PSTATE.EL == EL0 then
    if PMUSERENR().EN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = PMCCFILTR();
    end;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = PMCCFILTR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = PMCCFILTR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b1111	0b111

```

if !IsFeatureImplemented(FEAT_PMUv3) then
    Undefined();
elsif PSTATE.EL == EL0 then
    if PMUSERENR().EN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elsif EL2Enabled() && HDCR().TPM == '1' then

    else
        PMCCFILTR() = R(t);
    end;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        PMCCFILTR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    PMCCFILTR() = R(t);
end;

```

D10.4.2 PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See ‘Time as measured by the Performance Monitors cycle counter’ for more information.

[PMCCFILTR](#) determines the modes and states in which the PMCCNTR can increment.

Configuration

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is **CONSTRAINED UNPREDICTABLE** whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register [PMCCNTR_EL0](#)[63:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are **UNDEFINED**.

Attributes

PMCCNTR is a 64-bit register.

Field descriptions

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR](#).C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Accessing PMCCNTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b000

```

```

D10.4.3 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see ‘The PMU event number space and common events’.

Configuration

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

ID<n> , bits [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b110

```

if !IsFeatureImplemented(FEAT_PMUv3) then
    Undefined();
elsif PSTATE.EL == EL0 then
    if PMUSERENR().EN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elsif EL2Enabled() && HSTR().T9 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = PMCEID0();
    end;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T9 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = PMCEID0();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = PMCEID0();
end;

```

D10.4.4 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0020 to 0x003F.

For more information about the Common events and the use of the PMCEIDn registers see ‘[The PMU event number space and common events](#)’.

Configuration

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to External register [PMCEID1](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are UNDEFINED.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

ID<n> , bits [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b111

```

if !IsFeatureImplemented(FEAT_PMUv3) then
    Undefined();
elsif PSTATE.EL == EL0 then
    if PMUSERENR().EN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elsif EL2Enabled() && HSTR().T9 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = PMCEID1();
    end;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T9 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = PMCEID1();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = PMCEID1();
end;

```

D10.4.5 PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

Purpose

Allows software to disable the following counters:

- The cycle counter [PMCCNTR](#).
- The event counters [PMEVCNTR<n>](#).

Reading from this register shows which counters are enabled.

Configuration

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET](#)[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register [PMCNTENCLR_ELO](#)[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register [PMCNTENSET_ELO](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

Attributes

PMCNTENCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR](#) disable. On writes, allows software to disable [PMCCNTR](#). On reads, returns the [PMCCNTR](#) enable status.

C	Meaning
0b0	PMCCNTR disabled.
0b1	PMCCNTR enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

P<m> , bits [m], for m = 30 to 0

[PMEVCNTR<m>](#) disable. On writes, allows software to disable [PMEVCNTR<m>](#). On reads, returns the [PMEVCNTR<m>](#) enable status.

P<m>	Meaning
0b0	PMEVCNTR<m> disabled.
0b1	PMEVCNTR<m> enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{GetNumEventCountersAccessible}()$, access to this field is RAZ/WI.
- Otherwise, access to this field is WIC.

Accessing PMCNTECLR

Accesses to this register use the following encodings in the System register encoding space:

$\text{MRC}\{\langle c \rangle\}\{\langle q \rangle\} \langle \text{coproc} \rangle, \{\#\}\langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle\{\{, \{\#\}\langle \text{opc2} \rangle\}$

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b010

```

```

D10.4.6 PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

Purpose

Allows software to enable the following counters:

- The cycle counter [PMCCNTR](#).
- The event counters [PMEVCNTR<n>](#).

Reading from this register shows which counters are enabled.

Configuration

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR](#)[31:0].

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register [PMCNTENSET_ELO](#)[31:0].

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register [PMCNTENCLR_ELO](#)[31:0].

This register is present only when FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

Attributes

PMCNTENSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

C, bit [31]

[PMCCNTR](#) enable. On writes, allows software to enable [PMCCNTR](#). On reads, returns the [PMCCNTR](#) enable status.

C	Meaning
0b0	PMCCNTR disabled.
0b1	PMCCNTR enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1S.

P<m> , bits [m], for m = 30 to 0

[PMEVCNTR<m>](#) enable. On writes, allows software to enable [PMEVCNTR<m>](#). On reads, returns the [PMEVCNTR<m>](#) enable status.

P<m>	Meaning
0b0	PMEVCNTR<m> disabled.
0b1	PMEVCNTR<m> enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{GetNumEventCountersAccessible}()$, access to this field is RAZ/WI.
- Otherwise, access to this field is WIS.

Accessing PMCNTENSET

Accesses to this register use the following encodings in the System register encoding space:

$\text{MRC}\{\langle c \rangle\}\{\langle q \rangle\} \langle \text{coproc} \rangle, \{\#\}\langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle\{, \{\#\}\langle \text{opc2} \rangle\}$

    end;
elsif PSTATE.EL == EL2 then
    PMCNTENSET() = R(t);
end;

```

D10.4.7 PMCR, Performance Monitors Control Register

The PMCR characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch32 System register PMCR bits [10:0] are architecturally mapped to External register [PMCR_EL0](#)[10:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

Attributes

PMCR is a 32-bit register.

Field descriptions

31	24	23	16	15	11	10	7	6	5	4	3	2	1	0	
IMP		IDCODE			N		RES0		LC	DP	X	D	C	P	E

IMP, bits [31:24]

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use [MIDR](#) to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A nonzero value has the same interpretation as [MIDR](#).Implementer.

Arm deprecates use of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

IDCODE, bits [23:16]

When PMCR.IMP != '00000000':

Identification code. Arm deprecates use of this field.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b111111. If the value is 0b000000, then only [PMCCNTR](#) is implemented. If the value is 0b111111, then [PMCCNTR](#) and 31 event counters are implemented.

If EL2 is implemented, then all of the following apply:

- If EL2 is using AArch32, then reads of this field from Non-secure EL1 and Non-secure EL0 return the Effective value of [HDCR](#).HPMN.
- If EL2 is enabled in the current Security state and using AArch64, then reads of this field from EL1 and EL0 return the Effective value of [MDCR_EL2](#).HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [10:7]

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by [PMOVS](#).C.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR [63:0].

Arm deprecates use of [PMCR](#).LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is disabled in prohibited regions:

The conditions when this field disables the cycle counter are the same as when event counting by an event counter in the first range is prohibited. For more information about event counter ranges, see [HDCR](#).HPMN.

For more information, see ‘[Prohibiting event and cycle counting](#)’.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If [FEAT_ETMv4](#) is implemented, this field does affect the use of PMU events as an External Input by the trace unit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR counts every clock cycle.
0b1	When enabled, PMCCNTR counts once every 64 clock cycles.

If the Effective value of PMCR.LC is 1, then this field is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

C, bit [2]

Cycle counter reset. The effects of writing to this field are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR to zero.

Note

Resetting [PMCCNTR](#) does not change the cycle counter overflow field. The value of PMCR.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset.

P	Meaning
0b0	No action.
0b1	Reset all affected event counters PMEVCNTR<n> to zero.

The event counters affected by this field are:

- All event counters in the first range.
- If any of the following are true, all event counters in the second range:
 - EL2 is not implemented.
 - The PE is executing at EL2.

Writes to this field do not affect other event counters or the cycle counter [PMCCNTR](#).

For more information about event counter ranges, see [HDCR.HPMN](#).

Note

Resetting the event counters does not change the event counter overflow fields.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

E	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET .

The counters affected by this field are:

- The event counters in the first range. For more information about event counter ranges, see [HDCR.HPMN](#).
- The cycle counter [PMCCNTR](#).

Other event counters are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PMCR

Accesses to this register use the following encodings in the System register encoding space:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2

```

D10.4.8 PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to External register [PMEVCNTR<n>_EL0](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n> are UNDEFINED.

Attributes

PMEVCNTR<n> is a 32-bit register.

Field descriptions

EVCNT, bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>

PMEVCNTR<n> can also be accessed by using [PMXEVCNTR](#) with [PMSELR](#).SEL set to n.

If <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVCNTR<n>](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR](#).{ER,EN} or [PMUSERENR_EL0](#).{ER,EN}.

At EL0 and EL1, [HDCR](#).HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-30

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b10:m[4:3]	m[2:0]

```

let m:integer = UInt(CRm[1:0] :: opc2[2:0]);

end;
```

D10.4.9 PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPEPER<n> are UNDEFINED.

Attributes

PMEVTYPEP<n> is a 32-bit register.

Field descriptions

P, bit [31]

Privileged filtering. Controls counting events in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL1.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL1 is further controlled by PMEVTYPEPER<n>.NSK.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering. Controls counting events in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL0.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL0 is further controlled by PMEVTYPER<n>.NSU.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [29:28]

Reserved, RES0.

NSH, bit [27]

EL2 filtering. Controls counting events in EL2.

NSH	Meaning
0b0	The PE does not count events in EL2.
0b1	This mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [26]

Reserved, RES0.

MT, bit [25]

When an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Unless otherwise stated:

- If the event counts PE cycles when a stall condition is true and a second condition is true, then the counter counts Processor cycles when the stall condition is true for all of these PEs, and the second condition is true for any of these PEs.
- If the event counts PE cycles when any other condition is true, then the counter counts Processor cycles when the condition is true for any of these PEs.
- Otherwise, the event counts by the sum of the count across all of these PEs.

For the stall events, the stall condition means the applicable condition described by the STALL, STALL_FRONTEND, or STALL_BACKEND event.

The second condition is any condition in addition to this.

For example, for the STALL_FRONTEND_L1I event, the stall condition is STALL_FRONTEND, and the second condition is when there is a demand instruction miss in the first level of instruction cache.

For the STALL, STALL_FRONTEND, and STALL_BACKEND events themselves, the second condition is the null TRUE condition.

See [‘Multithreaded implementations’](#) and [‘Cycle event counting in multithreaded implementations’](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:10]

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter [PMEVCNTR<n>](#).

The ranges of event numbers allocated to each type of event are shown in ‘[Allocation of the PMU event number space](#)’.

If [PMEVTYPER<n>](#).evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the [PMEVTYPER<n>](#).evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the [PMEVTYPER<n>](#).evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>

[PMEVTYPER<n>](#) can also be accessed by using [PMXEVTYPER](#) with [PMSELR.SEL](#) set to n.

If <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVTYPER<n>](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR.EN](#) or [PMUSERENR_EL0.EN](#).

At EL0 and EL1 [HDCR.HPMN](#) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}` ; Where m = 0-30

coproc	opc1	CRn	CRm	opc2

```

D10.4.10 PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

Purpose

Allows software to disable the generation of interrupt requests on overflows from the following counters:

- The cycle counter [PMCCNTR](#).
- The event counters [PMEVCNTR<n>](#).

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET](#)[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register [PMINTENCLR_EL1](#)[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register [PMINTENSET_EL1](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

Attributes

PMINTENCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

C, bit [31]

Interrupt request on unsigned overflow of [PMCCNTR](#) disable. On writes, allows software to disable the interrupt request on unsigned overflow of [PMCCNTR](#). On reads, returns the interrupt request on unsigned overflow of [PMCCNTR](#) enable status.

C	Meaning
0b0	Interrupt request on unsigned overflow of PMCCNTR disabled.
0b1	Interrupt request on unsigned overflow of PMCCNTR enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

P<m>, bits [m], for m = 30 to 0

Interrupt request on unsigned overflow of [PMEVCNTR<m>](#) disable. On writes, allows software to disable the interrupt request on unsigned overflow of [PMEVCNTR<m>](#). On reads, returns the interrupt request on unsigned overflow of [PMEVCNTR<m>](#) enable status.

P<m>	Meaning
0b0	Interrupt request on unsigned overflow of PMEVCNTR<m> disabled.
0b1	Interrupt request on unsigned overflow of PMEVCNTR<m> enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{GetNumEventCountersAccessible}()$, access to this field is RAZ/WI.
- Otherwise, access to this field is WIC.

Accessing PMINTENCLR

Accesses to this register use the following encodings in the System register encoding space:

$\text{MRC}\{\langle c \rangle\}\{\langle q \rangle\} \langle \text{coproc} \rangle, \{\#\}\langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle\{, \{\#\}\langle \text{opc2} \rangle\}$

```

D10.4.11 PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Allows software to enable the generation of interrupt requests on overflows from the following counters:

- The cycle counter [PMCCNTR](#).
- The event counters [PMEVCNTR<n>](#).

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR](#)[31:0].

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register [PMINTENCLR_EL1](#)[31:0].

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register [PMINTENSET_EL1](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

Attributes

PMINTENSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

D10.4.12 PMOVSr, Performance Monitors Overflow Flag Status Register

The PMOVSr characteristics are:

Purpose

Allows software to clear the unsigned overflow flags for the following counters to 0:

- The cycle counter [PMCCNTR](#).
- The event counters [PMEVCNTR<n>](#).

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSET](#)[31:0].

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to External register [PMOVSCLR_EL0](#)[31:0].

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to External register [PMOVSSET_EL0](#)[31:0].

This register is present only when FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMOVSr are UNDEFINED.

Attributes

PMOVSr is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

C, bit [31]

Unsigned overflow flag for [PMCCNTR](#) clear. On writes, allows software to clear the unsigned overflow flag for [PMCCNTR](#) to 0. On reads, returns the unsigned overflow flag for [PMCCNTR](#) overflow status.

C	Meaning
0b0	PMCCNTR has not overflowed.
0b1	PMCCNTR has overflowed.

[PMCR.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

P<m> , bits [m], for m = 30 to 0

Unsigned overflow flag for **PMEVCNTR<m>** clear. On writes, allows software to clear the unsigned overflow flag for **PMEVCNTR<m>** to 0. On reads, returns the unsigned overflow flag for **PMEVCNTR<m>** overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m> has not overflowed.
0b1	PMEVCNTR<m> has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{GetNumEventCountersAccessible}()$, access to this field is RAZ/WI.

C, bit [31]

Unsigned overflow flag for [PMCCNTR](#) set. On writes, allows software to set the unsigned overflow flag for [PMCCNTR](#) to 1. On reads, returns the unsigned overflow flag for [PMCCNTR](#) overflow status.

C	Meaning
0b0	PMCCNTR has not overflowed.
0b1	PMCCNTR has overflowed.

[PMCR.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1S.

P<m> , bits [m], for m = 30 to 0

Unsigned overflow flag for **PMEVCNTR<m>** set. On writes, allows software to set the unsigned overflow flag for **PMEVCNTR<m>** to 1. On reads, returns the unsigned overflow flag for **PMEVCNTR<m>** overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m> has not overflowed.
0b1	PMEVCNTR<m> has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{GetNumEventCountersAccessible}()$, access to this field is RAZ/WI.
- Otherwise, access to this field is WIS.

Accessing PMOVSSET

Accesses to this register use the following encodings in the System register encoding space:

$\text{MRC}\{\langle c \rangle\}\{\langle q \rangle\} \langle \text{coproc} \rangle, \{ \# \} \langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle \{, \{ \# \} \langle \text{opc2} \rangle \}$

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b011

```

D10.4.14 PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

- Selects the current event counter [PMEVCNTR<n>](#) or the cycle counter [PMCCNTR](#).
- Used in conjunction with [PMXEVTYPER](#) to determine the event that increments a selected counter, and the modes and states in which the selected counter increments.
- Used in conjunction with [PMXEVCNTR](#) to determine the value of a selected counter.

Configuration

This register is present only when FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

Attributes

PMSELR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Event counter select. Selects the counter accessed by subsequent accesses to [PMXEVTYPER](#) and [PMXEVCNTR](#).

SEL	Meaning
0b00000..0b11110	Select event counter PMEVCNTR<n> , where n is the value of this field: - MRC and MCR of PMXEVTYPER access PMEVTYPER<n>. - MRC and MCR of PMXEVCNTR access PMEVCNTR<n>.
0b11111	Select the cycle counter, PMCCNTR : - MRC and MCR of PMXEVTYPER access PMCCFILTR. - MRC and MCR of PMXEVCNTR are CONSTRAINED UNPREDICTABLE. For more information, see PMXEVCNTR.

For more information about the results of accesses to the event counters, including when PMSELR.SEL is set to the index of an unimplemented or inaccessible event counter, see [PMXEVTYPER](#) and [PMXEVCNTR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b101

```

```

D10.4.15 PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see ‘SW_INCR’.

Configuration

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

Attributes

PMSWINC is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

P<m> , bits [m], for m = 30 to 0

Software increment.

P<m>	Meaning
0b0	Write is ignored.
0b1	Increment PMEVCNTR<m>, if PMEVCNTR<m> is configured to count software increment events.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

Accessing PMSWINC

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b100

```

if !IsFeatureImplemented(FEAT_PMUv3) then

        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        PMSWINC() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    PMSWINC() = R(t);
end;

```

D10.4.16 PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configuration

This register is present only when FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

Attributes

PMUSERENR is a 32-bit register.

Field descriptions

**Bits [31:4]**

Reserved, RES0.

ER, bit [3]

Event counters Read enable.

When PMUSERENR.EN is 0, PMUSERENR.ER enables EL0 reads of the event counters and EL0 reads and writes of the select register.

ER	Meaning
0b0	EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC reads of **PMEVCNTR<n>** and **PMXEVCNTR**.
- MRC and MCR accesses to **PMSELR**.

When disabled, reads and writes are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]

Cycle counter Read enable.

When PMUSERENR.EN is 0, PMUSERENR.CR enables EL0 reads of the cycle counter.

CR	Meaning
0b0	EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 reads of the cycle counter are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC reads of [PMCCNTR](#).
- MRRC reads of [PMCCNTR](#).

When disabled, reads are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [1]

Software increment register Write enable.

When PMUSERENR.EN is 0, PMUSERENR.SW enables EL0 writes to the Software increment register.

SW	Meaning
0b0	EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 writes to the Software increment register are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MCR writes to [PMSWINC](#).

When disabled, writes are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enable. Enables EL0 read/write access to PMU System registers.

EN	Meaning
0b0	EL0 accesses to the specified PMU System registers are trapped, unless enabled by PMUSERENR.{ER,CR,SW}.
0b1	EL0 accesses to the specified PMU System registers are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC or MCR accesses to [PMCCFILTR](#), [PMCCNTR](#), [PMCNTENCLR](#), [PMCNTENSET](#), [PMCR](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMOVSr](#), [PMOVSSET](#), [PMSELR](#), [PMXEVCNTR](#), and [PMXEVTYPER](#).
- MRC reads of [PMCEID0](#) and [PMCEID1](#).
- MCR writes to [PMSWINC](#).
- MRRC or MCRR accesses to [PMCCNTR](#).

When trapped, reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMUSERENR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b000

```
if !IsFeatureImplemented(FEAT_PMUv3) then
    Undefined();
elsif PSTATE.EL == EL0 then

        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = PMUSERENR();
    end;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T9 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = PMUSERENR();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = PMUSERENR();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b000

```
if !IsFeatureImplemented(FEAT_PMUv3) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HSTR().T9 == '1' then
```

```
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && HDCR().TPM == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        PMUSERENR() = R(t);
    end;
elsif PSTATE.EL == EL2 then
    PMUSERENR() = R(t);
end;
```

D10.4.17 PMXEVNTR, Performance Monitors Selected Event Count Register

The PMXEVNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMEVCNTR<n>](#). [PMSELR.SEL](#) determines which event counter is selected.

Configuration

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVNTR are UNDEFINED.

Attributes

PMXEVNTR is a 32-bit register.

Field descriptions

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, [PMEVCNTR<n>](#), where n is the value stored in [PMSELR.SEL](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVNTR

If [PMSELR.SEL](#) is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVCNTR](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- If [PMSELR.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR.{ER,EN}](#) or [PMUSERENR_EL0.{ER,EN}](#).

At EL0 and EL1 [HDCR.HPMN](#) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b010

```

    end;
elseif PSTATE.EL == EL2 then
    PMEVCNTR(UInt(PMSELR().SEL)) = R(t);
end;
```

D10.4.18 PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When [PMSELR.SEL](#) selects an event counter, this accesses a [PMEVTYPER<n>](#) register. When [PMSELR.SEL](#) selects the cycle counter, this accesses [PMCCFILTR](#).

Configuration

This register is present only when FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions

ETR, bits [31:0]

Event type register or [PMCCFILTR](#).

When [PMSELR.SEL](#) == 31, this register accesses [PMCCFILTR](#).

Otherwise, this register accesses [PMEVTYPER<n>](#) where n is the value in [PMSELR.SEL](#).

Accessing PMXEVTYPER

If [PMSELR.SEL](#) is not 31, and is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVTYPER](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR.SEL](#) is 31.
- If EL2 is implemented and enabled in the current Security state, and [PMSELR.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR.EN](#) or [PMUSERENR_EL0.EN](#).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2.HPMN](#) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR.HPMN](#) and [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b001

D10.5 Generic Timer registers

This section lists the Generic Timer registers in AArch32.

D10.5.1 CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the [effective frequency](#) of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

There are no configuration notes.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

ClockFreq, bits [31:0]

Clock frequency. Indicates the [effective frequency](#) of the system counter, in Hz.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOPCTEN == '0' && CNTKCTL().PL0VCTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    else
        R(t) = CNTFRQ();
    end;
elsif PSTATE.EL == EL1 then
    R(t) = CNTFRQ();
elsif PSTATE.EL == EL2 then
    R(t) = CNTFRQ();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0000	0b000

```
if IsHighestEL(PSTATE.EL) then
    CNTFRQ() = R(t);
else
    Undefined();
end;
```

D10.5.2 CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

Configuration

There are no configuration notes.

Attributes

CNTHCTL is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of CNTPCT, as seen from EL2, is the trigger for the event stream generated from that counter when that stream is enabled.

This field selects a trigger bit in the range 0 to 15 of CNTPCT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTPCT trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from CNTPCT as seen from EL2.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 MRC or MCR accesses, reported using EC syndrome value 0x03, and MRRC or MCRR accesses, reported using EC syndrome value 0x04, to the physical timer registers to Hyp mode.

PL1PCEN	Meaning
0b0	Non-secure EL0 and EL1 accesses to the CNTP_CTL , CNTP_CVAL , and CNTP_TVAL are trapped to Hyp mode, unless trapped by CNTKCTL.PL0PTEN .
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 MRRC or MCRR accesses, reported using EC syndrome value 0x04, to the physical counter register to Hyp mode.

PL1PCTEN	Meaning
0b0	Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to Hyp mode, unless it is trapped by CNTKCTL.PL0PCTEN .
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1110	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    R(t) = CNTHCTL();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1110	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    CNTHCTL() = R(t);
end;
```

D10.5.3 CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

Purpose

Control register for the Hyp mode physical timer.

Configuration

There are no configuration notes.

Attributes

CNTHP_CTL is a 32-bit register.

This register has the following instances:

- CNTHP_CTL.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP_TVAL](#) continues to count down.

Note
Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing CNTHP_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

    else
        CNTP_CTL() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    CNTP_CTL() = R(t);
end;
```

D10.5.4 CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

Purpose

Holds the compare value for the Hyp mode physical timer.

Configuration

There are no configuration notes.

Attributes

CNTHP_CVAL is a 64-bit register.

This register has the following instances:

- CNTHP_CVAL.

Field descriptions

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHP_CTL.ISTATUS](#) is set to 1.
- If [CNTHP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CVAL

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

    end;
elseif PSTATE.EL == EL2 then
    CNTP_CVAL() = R(t, t2);
end;
```

D10.5.5 CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

Purpose

Holds the timer value for the Hyp mode physical timer.

Configuration

There are no configuration notes.

Attributes

CNTHP_TVAL is a 32-bit register.

This register has the following instances:

- CNTHP_TVAL.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP_CTL.ENABLE](#) is 1, the value returned is ([CNTHP_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTHP_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTHP_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP_CTL.ISTATUS](#) is set to 1.
- If [CNTHP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL.ENABLE](#) is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_TVAL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

D10.5.6 CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

Purpose

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

Configuration

There are no configuration notes.

Attributes

CNTKCTL is a 32-bit register.

Field descriptions

Bits [31:10]

Reserved, RES0.

PL0PTEN, bit [9]

Traps PL0 accesses to the physical timer registers to Undefined mode.

PL0PTEN	Meaning
0b0	PL0 accesses to the CNTP_CTL , CNTP_CVAL , and CNTP_TVAL registers are trapped to Undefined mode.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0VTEN, bit [8]

Traps PL0 accesses to the virtual timer registers to Undefined mode.

PL0VTEN	Meaning
0b0	PL0 accesses to the CNTV_CTL , CNTV_CVAL , and CNTV_TVAL registers are trapped to Undefined mode.

PL0VTEN	Meaning
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of [CNTVCT](#), as seen from EL1, is the trigger for the event stream generated from that counter when that stream is enabled.

This field selects a trigger bit in the range 0 to 15 of [CNTVCT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the [CNTVCT](#) trigger bit, as seen from EL1 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from [CNTVCT](#) as seen from EL1.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0VCTEN, bit [1]

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

PL0VCTEN	Meaning
0b0	PL0 accesses to the CNTVCT are trapped to Undefined mode. PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0PCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0PCTEN, bit [0]

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

PL0PCTEN	Meaning
0b0	PL0 accesses to the CNTPCT are trapped to Undefined mode. PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0VCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTKCTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    R(t) = CNTKCTL();
elsif PSTATE.EL == EL2 then
    R(t) = CNTKCTL();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0001	0b000

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    CNTKCTL() = R(t);
elsif PSTATE.EL == EL2 then
    CNTKCTL() = R(t);
end;
```

D10.5.7 CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

There are no configuration notes.

Attributes

CNTP_CTL is a 32-bit register.

This register has the following instances:

- CNTP_CTL.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing CNTP_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b001

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOPTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = CNTP_CTL();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
```

```
        AArch32_TakeHypTrapException(0x03);
    else
        R(t) = CNTP_CTL();
    end;
elseif PSTATE.EL == EL2 then
    R(t) = CNTP_CTL();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b001

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOPTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x03);
    else
        CNTP_CTL() = R(t);
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x03);
    else
        CNTP_CTL() = R(t);
    end;
elseif PSTATE.EL == EL2 then
    CNTP_CTL() = R(t);
end;
```

D10.5.8 CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configuration

There are no configuration notes.

Attributes

CNTP_CVAL is a 64-bit register.

This register has the following instances:

- CNTP_CVAL.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0010

```

if PSTATE.EL == EL0 then
    if CNTKCTL().PLOPTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x04);
    else
        R(t, t2) = CNTP_CVAL();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x04);
    else
        R(t, t2) = CNTP_CVAL();
    end;
elseif PSTATE.EL == EL2 then
    R(t, t2) = CNTP_CVAL();
end;

```

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0010

```

if PSTATE.EL == EL0 then
    if CNTKCTL().PLOPTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x04);
    else
        CNTP_CVAL() = R(t, t2);
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x04);
    else
        CNTP_CVAL() = R(t, t2);
    end;
elseif PSTATE.EL == EL2 then
    CNTP_CVAL() = R(t, t2);
end;

```

D10.5.9 CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

There are no configuration notes.

Attributes

CNTP_TVAL is a 32-bit register.

This register has the following instances:

- CNTP_TVAL.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP_CTL.ENABLE](#) is 1, the value returned is ([CNTP_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTP_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTP_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b000

```

if PSTATE.EL == EL0 then
    if CNTKCTL().PLOPTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && CNTHCTL().PL1PCEN == '0' then

            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x03);
    else
        CNTP_CVAL() = SignExtend{64}(R(t)) + PhysicalCountInt();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && CNTHCTL().PL1PCEN == '0' then
        AArch32_TakeHypTrapException(0x03);
    else

```

```
        CNTP_CVAL() = SignExtend{64}(R(t)) + PhysicalCountInt();  
    end;  
    elsif PSTATE.EL == EL2 then  
        CNTP_CVAL() = SignExtend{64}(R(t)) + PhysicalCountInt();  
    end;
```

D10.5.10 CNTPCT, Counter-timer Physical Count register

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

There are no configuration notes.

Attributes

CNTPCT is a 64-bit register.

Field descriptions

PhysicalCount, bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0000

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOPCTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    elseif EL2Enabled() && CNTHCTL().PL1PCTEN == '0' then
        AArch32_TakeHypTrapException(0x04);
    else
        R(t, t2) = PhysicalCountInt();
    end;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && CNTHCTL().PL1PCTEN == '0' then
        AArch32_TakeHypTrapException(0x04);
```

```
        else
            R(t, t2) = PhysicalCountInt();
        end;
    elsif PSTATE.EL == EL2 then
        R(t, t2) = PhysicalCountInt();
    end;
```

D10.5.11 CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

There are no configuration notes.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

Note
Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing CNTV_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b001

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOVTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    else
        R(t) = CNTV_CTL();
    end;
elsif PSTATE.EL == EL1 then
    R(t) = CNTV_CTL();
elsif PSTATE.EL == EL2 then
    R(t) = CNTV_CTL();
end;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b001

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOVTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    else
        CNTV_CTL() = R(t);
    end;
elsif PSTATE.EL == EL1 then
    CNTV_CTL() = R(t);
elsif PSTATE.EL == EL2 then
    CNTV_CTL() = R(t);
end;
```

D10.5.12 CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configuration

There are no configuration notes.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0011

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOVTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    else
        R(t, t2) = CNTV_CVAL();
    end;
elseif PSTATE.EL == EL1 then
    R(t, t2) = CNTV_CVAL();
elseif PSTATE.EL == EL2 then
    R(t, t2) = CNTV_CVAL();
end;
```

MCCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0011

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOVTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    else
        CNTV_CVAL() = R(t, t2);
    end;
elseif PSTATE.EL == EL1 then
    CNTV_CVAL() = R(t, t2);
elseif PSTATE.EL == EL2 then
    CNTV_CVAL() = R(t, t2);
end;
```

D10.5.13 CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

There are no configuration notes.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If `CNTV_CTL.ENABLE` is 0, the value returned is UNKNOWN.
- If `CNTV_CTL.ENABLE` is 1, the value returned is `(CNTV_CVAL - CNTVCT)`.

On a write of this register, `CNTV_CVAL` is set to `(CNTVCT + TimerValue)`, where `TimerValue` is treated as a signed 32-bit integer.

When `CNTP_CTL.ENABLE` is 1, the timer condition is met when `(CNTVCT - CNTP_CVAL)` is greater than or equal to zero. This means that `TimerValue` acts like a 32-bit downcounter timer. When the timer condition is met:

- `CNTV_CTL.ISTATUS` is set to 1.
- If `CNTV_CTL.IMASK` is 0, an interrupt is generated.

When `CNTV_CTL.ENABLE` is 0, the `TimerValue` cannot be read but continues to decrement. When the timer is enabled, the `TimerValue` represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b000

```

if PSTATE.EL == EL0 then
    if CNTKCTL().PLOVTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    else
        if CNTV_CTL().ENABLE == '0' then
            R(t) = ARBITRARY:bits(32);
        else
            R(t) = (CNTV_CVAL() - (PhysicalCountInt() - CNTVOFF()))[31:0];
        end;
    end;
elseif PSTATE.EL == EL1 then
    if CNTV_CTL().ENABLE == '0' then
        R(t) = ARBITRARY:bits(32);
    else
        R(t) = (CNTV_CVAL() - (PhysicalCountInt() - CNTVOFF()))[31:0];
    end;
elseif PSTATE.EL == EL2 then
    if CNTV_CTL().ENABLE == '0' then
        R(t) = ARBITRARY:bits(32);
    else
        R(t) = (CNTV_CVAL() - (PhysicalCountInt() - CNTVOFF()))[31:0];
    end;
end;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b000

```

if PSTATE.EL == EL0 then
    if CNTKCTL().PLOVTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    else
        CNTV_CVAL() = (SignExtend{64}(R(t)) + PhysicalCountInt()) - CNTVOFF();
    end;
elseif PSTATE.EL == EL1 then
    CNTV_CVAL() = (SignExtend{64}(R(t)) + PhysicalCountInt()) - CNTVOFF();
elseif PSTATE.EL == EL2 then
    CNTV_CVAL() = (SignExtend{64}(R(t)) + PhysicalCountInt()) - CNTVOFF();
end;

```

D10.5.14 CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF.

Configuration

There are no configuration notes.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

VirtualCount, bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0001

```
if PSTATE.EL == EL0 then
    if CNTKCTL().PLOVCTEN == '0' then
        if EL2Enabled() && HCR().TGE == '1' then
            AArch32_TakeHypTrapException(0x00);
        else
            Undefined();
        end;
    else
        R(t, t2) = PhysicalCountInt() - CNTVOFF();
    end;
elsif PSTATE.EL == EL1 then
    R(t, t2) = PhysicalCountInt() - CNTVOFF();
elsif PSTATE.EL == EL2 then
    R(t, t2) = PhysicalCountInt() - CNTVOFF();
end;
```

D10.5.15 CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT and the virtual count value visible in CNTVCT.

Configuration

There are no configuration notes.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

VOffset, bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0100

```
if PSTATE.EL == EL0 then
    Undefined();
elseif PSTATE.EL == EL1 then
    Undefined();
elseif PSTATE.EL == EL2 then
    R(t, t2) = CNTVOFF();
end;
```

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0100

```
if PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    CNTVOFF() = R(t, t2);
end;
```

Part E

External Debug

Chapter E1

About External Debug

This chapter gives an overview of A-profile external debug and specifies the required debug authentication. It contains the following sections:

- [Introduction to external debug](#)
- [External debug](#)
- [Required debug authentication](#)

Note

For information about self-hosted debug, see [AArch32 Self-hosted Debug](#).

E1.1 Introduction to external debug

The architecture supports both:

Self-hosted debug

The PE itself hosts a debugger. That is, developers developing software to run on the PE use debugger software running on the same PE.

External debug

The debugger is external to the PE. The debugging might be either on-chip, for example in a second PE, or off-chip, for example a JTAG debugger that accesses the chip through a Debug Access Port.

External debug is particularly useful for:

- Hardware bring-up. That is, debugging during development when a system is first powered up and not all of the software functionality is available.
- PEs that are deeply embedded inside systems.

To support external debug, the Arm architecture defines required features that are called *external debug features*.

Note

An external debugger has a potentially high level of control over and visibility into the PE. The system sets this level using debug authentication. See [Required debug authentication](#). If the debug authentication level is set too low, agents may be able to bypass elements of the security and privilege models. This includes both off-chip agents and on-chip agents such as unprivileged or Non-secure software.

E1.1.1 Definition and constraints of a debugger in the context of external debug

When the description of external debug in this Part of the manual describes a *debugger* as controlling external debug this debugger might be a second on-chip PE or an off-chip device such as a JTAG debugger using a Debug Access Port (DAP).

If a Debug Access Port is implemented:

- When debug is prohibited at the Debug Access Port, the port must not generate accesses to the external debug interface of the PE.

Accesses to the PE are controlled by the external authentication interface functions, [ExternalInvasiveDebugEnabled\(\)](#) and [ExternalNoninvasiveDebugEnabled\(\)](#).

The Debug Access Port is not required to use the same authentication interface as the PE.

Arm recommends that when [ExternalInvasiveDebugEnabled\(\)](#) == FALSE at the PE, all debug is prohibited at the DAP.

See also [Required debug authentication](#).

E1.2 External debug

Debug events allow an external debugger to halt the PE. The provides the following debug events:

- [Halting Step debug events:](#)
 - The debugger can use this resource to make the PE step through code one line at a time.
- [Halt Instruction debug event:](#)
 - This might occur when software executes the Halting breakpoint instruction, `HLT`.
- [Exception Catch debug event:](#)
 - This can be programmed to occur on all entries to a given Exception level.
- [External Debug Request debug event:](#)
 - An embedded cross-trigger can signal this debug event.
- [OS Unlock Catch debug event:](#)
 - This might occur when the state of the OS Lock changes from locked to unlocked.
- [Reset Catch debug events:](#)
 - This might occur when the PE exits reset state.
- [Software Access debug event:](#)
 - This can be programmed to occur when software tries to access the Breakpoint Value registers, the Breakpoint Control registers, the Watchpoint value registers, or the Watchpoint Control registers. It caused a trap to Debug state.

Breakpoints and watchpoints can also halt the PE.

When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state:
 - The ITR contains a single register, EDITR, and associated flow-control flags.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger:
 - The DCC includes the data transfer registers, DTRRX and DTRTX, and associated flow-control flags.
 - Although the DCC is an essential part of Debug state operation, it can also be used in Non-debug state.
- The PE cannot service any interrupts in Debug state.

[Debug State](#) describes Debug state in more detail.

E1.3 Required debug authentication

A PE implements the debug authentication interface defined in this section. The debug authentication interface controls:

- Whether halting the PE and entering Debug state is allowed or prohibited.
- Whether some aspects of non-invasive debug are allowed or prohibited.
- Some legacy aspects of the AArch32 self-hosted debug model.

The pseudocode functions shown in [Table E1-1](#), and the conditions that follow that table, define the architectural requirements for debug authentication.

Table E1-1 Debug authentication functions

Pseudocode function	Description
ExternalNoninvasiveDebugEnabled()	Returns TRUE if non-invasive debug is enabled.
ExternalInvasiveDebugEnabled()	Returns TRUE if invasive debug is enabled.

The following conditions always apply:

- If [ExternalInvasiveDebugEnabled\(\)](#) is TRUE then [ExternalNoninvasiveDebugEnabled\(\)](#) is TRUE.

Arm recommends the use of the interface described in Recommended authentication interface to provide this debug authentication. The pseudocode functions in [R-profile Architecture Pseudocode](#), which are linked to by the entries in the [Pseudocode function](#) column of [Table E1-1](#), assume that this interface is implemented.

Chapter E2

Debug State

This chapter describes Debug state. It contains the following sections:

- [About Debug state](#)
- [Halting the PE on debug events](#)
- [Entering Debug state](#)
- [Behavior in Debug state](#)
- [Exiting Debug state](#)

E2.1 About Debug state

In external debug, debug events allow an external debugger to halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the Program Counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger.

The PE cannot service any interrupts in Debug state.

E2.2 Halting the PE on debug events

For details of debug events, see [Introduction to Halting debug events](#) and [Breakpoint and Watchpoint debug events](#).

On a debug event, the PE must do one of the following:

- Enter Debug state.
- Pend the debug event.
- Generate a debug exception.
- Ignore the debug event.

This behavior depends on both:

- Whether halting is allowed by the current state of the debug authentication interface. See [Halting allowed and halting prohibited](#).
- The type of debug event and the programming of the debug control registers.
 - See [Halting debug events](#) for all Halting debug events.
 - See [Breakpoint and Watchpoint debug events](#) for Breakpoint and Watchpoint debug events.

See also [Other debug exceptions](#).

This means that behavior can be CONSTRAINED UNPREDICTABLE if the conditions change. See [Synchronization and Halting debug events](#).

[Table E3-1](#) summarizes the possible outcomes of each type of debug event.

E2.2.1 Halting allowed and halting prohibited

Halting can be either allowed or prohibited:

- Halting is always prohibited in Debug state.
- Halting is always prohibited when `DoubleLockStatus() == TRUE`.
 - This means that `FEAT_DoubleLock` is implemented and OS Double lock is locked.
- Otherwise, halting is allowed.

For more information, see:

- [Pseudocode description of Halting on debug events](#).
- [Required debug authentication](#).
- Recommended External Debug Interface.

E2.2.2 Halting debug events

The Halting debug events are described in [Halting Debug Events](#).

When a Halting debug event is generated, it causes entry to Debug state if all of the following are true:

- Halting is allowed. See [Halting allowed and halting prohibited](#).
- The Halting debug event is one of:
 - A Halt Instruction debug event and `EDSCR.HDE == 1`.
 - A Software Access debug event and `OSLSR_EL1.OSLK == 0`, meaning that the OS Lock is unlocked.
 - Neither a Halt Instruction debug event nor a Software Access debug event.

Note

- A Halt Instruction debug event is the only Halting debug event that relies on [EDSCR.HDE == 1](#).
 - Halting on Breakpoint and Watchpoint debug events is also controlled by [EDSCR.HDE](#). See [Breakpoint and Watchpoint debug events](#).
 - [EDSCR.HDE](#) can be written by software when the OS Lock is locked. Privileged code can use [HDCR.TDOSA](#) to trap writes to OS Lock registers.
-

If a Halting debug event does not generate entry to Debug state because the conditions listed in this section do not hold, then:

- If the Halting debug event is a Halt Instruction debug event, the instruction that generated the Halting debug event is treated as UNDEFINED.
- If the Halting debug event is a Software Access debug event, it is ignored.
- If the Halting debug event is an Exception Catch debug event, it is ignored except when FEAT_Debugv8p8 is implemented, in which case the event might be pended.

In all other cases the Halting debug event is pended, see [Pending Halting debug events](#).

[Summary of actions from debug events](#) summarizes the possible outcome for each type of Debug event.

Note

Halting debug events never generate debug exceptions.

E2.2.3 Breakpoint and Watchpoint debug events

A breakpoint or watchpoint generates an entry to Debug state if all of the following conditions hold:

- Halting debug is enabled, that is [EDSCR.HDE == 1](#).
- Halting is allowed. See [Halting allowed and halting prohibited](#).
- The OS Lock is unlocked, that is [DBGOSLSR.OSLK == 0](#).

The Address Mismatch breakpoint type is reserved when all of these conditions are met.

[DBGDSCRExt.MDBGen](#) is ignored when determining whether to enter Debug state. A breakpoint or watchpoint that generates entry to Debug state is a Breakpoint or Watchpoint debug event and does not generate a debug exception.

A breakpoint or watchpoint that does not generate an entry to Debug state either:

- Generates a Breakpoint or Watchpoint exception.
- Is ignored.

Note

[EDSCR.HDE](#) is ignored when determining whether to generate a debug exception. The debug exception is suppressed only if the PE enters Debug state. This means that the use of Halting debug mode in one Security state does not affect the Exception model in another Security state.

See [AArch32 Self-hosted Debug](#), and the Note in [Other debug exceptions](#).

E2.2.4 Other debug exceptions

The following events never generate entry to Debug state:

- Breakpoint Instruction exceptions.
- Software Step exceptions.

- Vector Catch exceptions.

The behavior of these events is unchanged when Halting debug mode is enabled, that is when `EDSCR.HDE == 1`. This means that these events can do one of the following:

- They can generate a debug exception.
- They can be ignored.

For additional information, see [AArch32 Self-hosted Debug](#).

E2.2.5 Debug state entry and debug event prioritization

The following are synchronous debug events:

- Breakpoint debug event.
- Watchpoint debug event.
- Halting Step debug event.
- Halt Instruction debug event.
- Exception Catch debug event.
- Software Access debug event.
- Reset Catch debug event.

Each of these synchronous debug events are treated as a synchronous exception generated by an instruction, or by the taking of an exception or reset. That is, if halting is allowed, the synchronous debug event must be taken before any subsequent instructions are executed. Reset Catch debug events must be taken before the PE executes the instruction at the reset vector.

Note

- Reset Catch and Exception Catch debug events might be generated asynchronously, because they can result from an asynchronous exception. However, if halting is allowed after the reset or asynchronous exception has been processed, the Reset Catch or Exception Catch debug event is taken synchronously.
 - The Halting Step debug event is generated by the instruction after the stepped instruction. Therefore, if the stepped instruction generates any other synchronous exceptions or debug events these are taken first.
-

If halting is prohibited then Halting Step debug events and Reset Catch debug events might be pended and taken asynchronously. OS Unlock Catch debug events are always pended and taken asynchronously. See [Pending Halting debug events](#).

The architecture does not define when asynchronous debug events are taken, and therefore the prioritization of asynchronous debug events is IMPLEMENTATION DEFINED. See [Synchronization and Halting debug events](#).

The following list shows how the synchronous debug events are prioritized, with 1 being the highest priority.

Note

The priority numbering is the same as the numbering for AArch64 synchronous exception priorities listed in Synchronous exception types, and in particular Prioritization of asynchronous exceptions. This numbering correlates with the equivalent AArch32 list in [Exception prioritization for exceptions taken to AArch32 state](#).

The priority for synchronous debug events is as follows:

- 1 Reset Catch debug event. See [Reset Catch debug events](#).

This debug event has a higher priority than the synchronous exceptions listed in Synchronous exception types.
- 2 Exception Catch debug event if it has a priority of 2. See [Exception Catch debug event](#).

This debug event can be assigned one of two priorities, 2 or 5. When it has a priority of 2, it has a higher priority than the synchronous exceptions listed in the Exception model.

3	Halting Step debug event. See Halting Step debug events . This debug event has a higher priority than the synchronous exceptions listed in the Exception model.
4	This event is not a debug event.
5	Exception Catch debug event if it has a priority of 5. See Exception Catch debug event . This debug event can be assigned one of two priorities, 2 or 5.
6-9	These events are not debug events.
10	Breakpoint debug events. See Breakpoint and Watchpoint debug events .
11-13	These events are not debug events.
14	Halt Instruction debug event. See Halt Instruction debug event .
15-40	These events are not debug events.
41	Software Access debug event. See Software Access debug event .
42-46	These events are not debug events.
47	Watchpoint debug events. See Breakpoint and Watchpoint debug events .
48-49	These events are not debug events.

For Reset Catch debug events and Halting Step debug events, the priorities listed in this section apply only when halting is allowed at the time the event is generated. This means that the event is taken synchronously and not pended.

For more information on the prioritization of exceptions, see:

- Synchronous exception types.
- Prioritization of asynchronous exceptions.
- [Exception prioritization for exceptions taken to AArch32 state](#). This section covers synchronous and asynchronous exceptions.

E2.2.5.1 Breakpoint debug events and Vector Catch exception

An Address Matching Vector Catch exception has the same priority as a Breakpoint debug event. See Prioritization of Synchronous exceptions taken to AArch64 state.

The prioritization of these events is unchanged even if the breakpoint generates entry to Debug state instead of a Breakpoint exception. This means that if a single instruction generates both an Address Matching Vector Catch exception and a Breakpoint debug event, there is a CONSTRAINED UNPREDICTABLE choice of:

- The PE entering Debug state due to the Breakpoint debug event.
- A Vector Catch exception.

This applies only if all of the following are true:

- Halting debug is enabled.
- Halting is allowed.
- The OS Lock is unlocked.

An Exception Trapping Vector Catch exception must be generated immediately following the exception that generated it. This means that it does not appear in the priority table.

E2.2.6 Imprecise entry to Debug state

Debug state entry is normally *precise*. This means that the PE cannot enter Debug state if it can neither complete nor abandon all currently executing instructions and leave the PE in a precise state. See Definition of a precise exception and imprecise exception.

A debugger can write a value of 1 to [EDRCCR.CBRRQ](#) to allow imprecise entry to Debug state. An External Debug Request debug event must be pending before writing 1 to this bit. If 1 is written when an External Debug Request debug event is not pending, and the PE does not ignore the write, then the resulting PE behavior is UNPREDICTABLE. Support for allowing imprecise entry to Debug state using [EDRCCR.CBRRQ](#) is OPTIONAL, and it is IMPLEMENTATION DEFINED when this mechanism is effective at forcing entry to Debug state.

Arm recommends that the PE ignores writes to [EDRCCR.CBRRQ](#) when an External Debug Request debug event is not pending.

If forcing this PE to enter Debug state imprecisely could have an adverse effect on the wider system, then Arm recommends that a write to [EDRCCR.CBRRQ](#) is ignored if the highest level of debug authentication is not enabled at the system level.

[Example E2-1](#) shows how entry to Debug state can be forced.

Example E2-1 Forcing entry to Debug state

The debugger pends an External Debug Request debug event through the CTI to halt a program that has stopped responding. However, the memory system is not responding and a memory access instruction cannot complete. This means that Debug state cannot be entered precisely. The debugger writes a value of 1 to [EDRCCR.CBRRQ](#). The PE cancels all outstanding memory accesses and enters Debug state. As some instructions might not have completed correctly, entry to Debug state is imprecise.

When Debug state is entered imprecisely, all memory access instructions executed through the ITR have CONSTRAINED UNPREDICTABLE behavior. The value of all registers is UNKNOWN, but might be useful for diagnostic purposes.

E2.2.7 Summary of actions from debug events

[Table E2-1](#) shows the Software and Halting debug events. In [Table E2-1](#), the columns have the following meaning:

DLK	This indicates whether FEAT_DoubleLock is implemented and locked, DoubleLockStatus() == TRUE.
OSLK	This is the value of DBGOSLSR.OSLK . It indicates whether the OS Lock is locked.
HDE	This is the value of EDSCR.HDE . It indicates whether Halting debug is enabled.

The letter X in [Table E2-1](#) indicates that the value can be either 0 or 1.

Table E2-1 Debug authentication for external debug

Debug event type	Authentication	DLK	OSLK	HDE	Behavior
Other software	X	X	X	X	Handled by the Exception model
Breakpoint or Watchpoint debug event	X	TRUE	X	X	Handled by the Exception model (ignored)
	X	FALSE	1	X	Handled by the Exception model (ignored)
	FALSE	FALSE	0	X	Handled by the Exception model
	TRUE	FALSE	0	0	Handled by the Exception model

Debug event type	Authentication	DLK	OSLK	HDE	Behavior
Halt Instruction debug event	TRUE	FALSE	0	1	Entry to Debug state
	FALSE	X	X	X	UNDEFINED
	TRUE	TRUE	X	X	UNDEFINED
	TRUE	FALSE	X	0	UNDEFINED
Exception Catch debug event	TRUE	FALSE	X	1	Entry to Debug state
	FALSE	X	X	X	Might be pended ^a
	TRUE	TRUE	X	X	Ignored
Software Access debug event	TRUE	FALSE	X	X	Entry to Debug state
	FALSE	X	X	X	Ignored
	TRUE	TRUE	X	X	Ignored
	TRUE	FALSE	1	X	Ignored
Other Halting	TRUE	FALSE	0	X	Entry to Debug state
	FALSE	X	X	X	Debug event is pended
	TRUE	TRUE	X	X	Debug event is pended
	TRUE	FALSE	X	X	Entry to Debug state

a. See [Exception Catch debug event](#).

E2.2.8 Pseudocode description of Halting on debug events

The `Halted()`, `Restarting()`, `HaltingAllowed()`, and `HaltOnBreakpointOrWatchpoint()` functions are described in the pseudocode.

E2.3 Entering Debug state

On entry to Debug state, the preferred restart address and PSTATE are saved in [DLR](#) and [DSPSR](#). The PE remains in the mode and Security state from which it entered Debug state.

If [EDRCR.CBRRQ](#) has a value of 0, entry to Debug state is precise. If [EDRCR.CBRRQ](#) has a value of 1, then imprecise entry to Debug state is permitted.

If a Watchpoint debug event causes an entry to Debug state, the PE records the following:

- The address of the access that generated the Watchpoint debug event is recorded in [EDWAR](#).

For more information, see:

- [Exception syndrome information, fault address information, and preferred return address](#) for a debug event taken from AArch32 state.

Other than the effect on PSTATE and [EDSCR](#), entry to Debug state is not a [Context Synchronization event](#). The effects of entry to Debug state on PSTATE and [EDSCR](#) are synchronized.

E2.3.1 Entering Debug state from AArch32 state

When entering Debug state from AArch32 state, the PE remains in AArch32 state. In AArch32 Debug state the PE executes T32 instructions, regardless of the value of PSTATE.T before entering Debug state.

To allow the debugger to determine the state of the PE, the current Execution state for all four Exception levels can be read from [EDSCR.RW](#), and the current Exception level can be read from [EDSCR.EL](#).

The current endianness state, PSTATE.E, is unchanged on entry to Debug state.

Note

- If EL1 is using AArch32 state, the current endianness state can differ from that indicated by [SCTLR.EE](#).
 - If EL2 is using AArch32 state, the current endianness state can differ from that indicated by [HSCTLR.EE](#).
 - On entry to Debug state from AArch32 state, PSTATE.SS is copied to DSPSR.SS, even though the PE remains in AArch32 state.
-

See also [Effect of entering Debug state on PSTATE](#).

E2.3.2 Effect of Debug state entry on DLR and DSPSR

[DLR](#) is set to the preferred restart address for the debug event, which depends on the event type. The value of PSTATE is saved in [DSPSR](#).

For entry to Debug state from AArch32 state, the values saved in [DSPSR.IT](#) are always correct for the preferred restart address.

For synchronous Halting debug events, the preferred restart address is the address of the instruction that generated the debug event.

For asynchronous Halting debug events, including pending Halting debug events taken asynchronously, the preferred restart address is the address of the first instruction that must be executed on exit from Debug state.

This means that:

- For Breakpoint and Watchpoint debug events, the preferred restart address is the same as the preferred return address for a debug exception, as described in AArch64 Self-hosted Debug and [AArch32 Self-hosted Debug](#).
- For Halt Instruction debug events, [DLR](#) is set to the address of the `HLT` instruction and [DSPSR.IT](#) is correct for the `HLT` instruction.
- For Software Access debug events, [DLR](#) is set to the address of the accessing instruction and [DSPSR.IT](#) is correct for this instruction.

- For Halting Step debug events taken synchronously, [DLR](#) and [DSPSR](#) are set as the ELR and SPSR would be set for a Software Step exception. This is usually the address of, and PSTATE for, the instruction after the one that was stepped.
- For Exception Catch debug events, [DLR](#) is set to the address of the first instruction that must be executed on exit from Debug state, and [DSPSR](#) is correct for this instruction. This is the exception vector or reset vector address.
 - If the debug event is generated on taking an exception to a trapped Exception level, the [DLR](#) is set to the address of the exception vector the PE would have started fetching from. This is UNKNOWN if the VBAR for the Exception level has never been initialized. The [DSPSR](#) records the value of PSTATE after taking the exception. The Exception Catch occurs after the SPSR and the Link register are set, and the debugger can use these registers to determine where in the application program the exception occurred.

Note

Depending on the target Exception level and Execution state for the exception, the Link register is one of [ELR_hyp](#), or LR (R14).

- If the debug event is generated on an exception return to a trapped Exception level, the [DLR](#) is set to the target address of the exception return and the [DSPSR](#) records the value of PSTATE after the exception return.
- Reset Catch debug events taken synchronously behave like Exception Catch debug events.
- For Reset Catch debug events and Exception Catch debug events generated on reset to a trapped Exception level, the [DLR](#) is set to the reset address and the [DSPSR](#) records the reset value of PSTATE.
- For pending Halting debug events and External Debug Request debug events, [DLR](#) is set to the address of the first instruction that must be executed on exit from Debug state and [DSPSR](#). It is correct for this instruction. See [Pending Halting debug events](#).

Normally [DLR](#) is aligned according to the instruction set state indicated in [DSPSR](#). However, a debug event might be taken at a point where the PC is not aligned.

E2.3.3 Effect of Debug state entry on System registers, the Event register, and Exclusives monitors

Entering Debug state has no effect on System registers other than [DLR](#) and [DSPSR](#). In particular, ESRs, FARs, and FSRs are not updated on entering Debug state.

Entering Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors.

Entry to Debug state might set the Event Register or clear the Exclusives monitors, or both. However, this is not a requirement, and debuggers must not rely on any IMPLEMENTATION SPECIFIC behavior.

Unless otherwise described in this reference manual, instructions executed in Debug state have their architecturally-defined effects on the System registers, the Event register, and Exclusives monitors.

E2.3.4 Effect of entering Debug state on PSTATE

The effect of an entry to Debug state on PSTATE is described in [Entering Debug state](#) and [Entering Debug state from AArch32 state](#).

On entry to Debug state after PSTATE is saved in [DSPSR](#):

For more information, see [PSTATE in Debug state](#).

E2.3.5 Entering Debug state during loads and stores

The PE can enter Debug state during instructions that perform a sequence of memory accesses, as opposed to a single single-copy atomic access, because of a Watchpoint debug event. The effect of entering Debug state on such an instruction is the same as taking a Data Abort exception during such an instruction.

In addition, when executing in AArch64 state, the PE can enter Debug state because of an External Debug Request debug event during instructions that perform a sequence of memory accesses. The effect of entering Debug state on such an instruction is the same as taking an interrupt exception during such an instruction.

This applies to all memory types.

E2.3.6 Entering Debug state and Software Step

When Software Step is active, a debug event that causes entry to Debug state behaves like an exception taken to an Exception level above the debug target Exception level. That is:

- If the instruction that is stepped generates a synchronous debug event that causes entry to Debug state, or an asynchronous debug event is taken before the step completes, the PE enters Debug state with **DSPSR**.SS set to 1.
- A pending Halting debug event or an asynchronous debug event can be taken after the step has completed. In this case the PE enters Debug state with **DSPSR**.SS set to 0.

In addition:

- If the instruction that is stepped generates an exception trapped by an Exception Catch debug event, the PE enters Debug state at the exception vector with **DSPSR**.SS set to 0. This is because PSTATE.SS is set to 0 by taking the exception.
- If the PE is reset, PSTATE.SS is reset to 0. If the following debug events are enabled, and halting is allowed, the PE enters Debug state with **DSPSR**.SS set to 0:
 - Reset Catch debug event at the reset Exception level.
 - Exception Catch debug event at the reset Exception level.
 - Halting Step debug event.
- If Halting Step is also active, then Halting Step and Software Step operate in parallel and can both become active-pending. In this case Halting step has a higher priority than Software step. This means that the PE enters Debug state and **DSPSR**.SS is set to 0.

E2.3.7 Pseudocode description of entering Debug state

The `DebugHalt` constants are described in [shared/debug/halting/DebugHalt](#) in the pseudocode. The `UpdateEDSCRFields()` and `Halt()` functions are described in [R-profile Architecture Pseudocode](#).

E2.4 Behavior in Debug state

Instructions are executed in Debug state from the Instruction Transfer Register, ITR. The debugger controls which instructions are executed in Debug state by writing the instructions to the External Debug Instruction Transfer register, [EDITR](#).

The Execution state of the PE determines which instruction set is executed:

- If the PE is in AArch32 state it executes T32 instructions:
 - For a 32-bit T32 instruction, [EDITR](#)[15:0] specifies the first halfword and [EDITR](#)[31:16] specifies the second halfword.
 - For a 16-bit T32 instruction, [EDITR](#)[15:0] contains the instruction and [EDITR](#)[31:16] is ignored. All 16-bit T32 instructions are UNPREDICTABLE in Debug state.

The PE does not execute A32 instructions in Debug state.

Some instructions are available only in Debug state. See [Debug state operations](#), [DCPS](#), [DRPS](#), [MRS](#), [MSR](#). In Non-debug state these instructions are UNDEFINED.

The following sections describe behavior in Debug state:

- [PSTATE in Debug state](#).
- [Executing instructions in Debug state](#).
- [Decode tables](#).
- [Security in Debug state](#).
- [Privilege in Debug state](#).
- [Debug state operations](#), [DCPS](#), [DRPS](#), [MRS](#), [MSR](#).
- [Exceptions in Debug state](#).
- [Accessing registers in Debug state](#).
- [Accessing memory in Debug state](#).

This section specifies the CONSTRAINED UNPREDICTABLE behaviors that apply in Debug state, but see [Changing the value of EDECR.SS when not in Debug state](#) for a change in Non-debug state that causes CONSTRAINED UNPREDICTABLE behavior.

E2.4.1 PSTATE in Debug state

PSTATE. are all ignored in Debug state:

- There are no conditional instructions in Debug state.
- In AArch32 state, the PE executes only T32 instructions and [PSTATE.IT](#) is ignored.
- Software step is inactive.
- Asynchronous exceptions and debug events are ignored.

Instructions executed in Debug state indirectly read PSTATE.{TCO, UAO, PAN, IL, E, M, nRW, EL, SP} as they would in Non-debug state.

Note

[PSTATE.DIT](#) is not guaranteed to have any effect in Debug state.

In Debug state:

E2.4.2 Executing instructions in Debug state

The instructions executed in Debug state must be either A64 instructions or T32 instructions, depending on the current Execution state.

Each instruction falls into one of the following groups:

- Debug state instructions. These are instructions that are changed in Debug state. See A64 instructions that are changed in Debug state and [T32 instructions that are changed in Debug state](#).
- Instructions that are unchanged in Debug state. See A64 instructions that are unchanged in Debug state and [T32 instructions that are unchanged in Debug state](#). Where these sections describe the behavior of an instruction as unchanged in Debug state, or having the same behavior as in Non-debug state, and that instruction would generate an exception in Non-debug state, then the behavior of the exception is as described in [Exceptions in Debug state](#).
- Instructions that are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state. See A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state and [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state](#).

All T32 instructions are treated as unconditional, regardless of [PSTATE.IT](#). See [PSTATE in Debug state](#).

E2.4.2.1 Executing T32 instructions in Debug state

The following sections describe the behavior of the T32 instructions in Debug state:

- [T32 instructions that are changed in Debug state](#).
- [T32 instructions that are unchanged in Debug state](#).
- [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state](#).

E2.4.2.1.1 T32 instructions that are changed in Debug state

The following T32 instructions are defined in Debug state, but are UNDEFINED in Non-debug state:

- DCPS.

Note

DCPS can be UNDEFINED in certain conditions in Debug state. See [DCPS<n>](#).

- MRC p15, 3, <Rt>, c4, c5, 0 (DSPSR).
- MCR p15, 3, <Rt>, c4, c5, 0 (DSPSR).
- MRC p15, 3, <Rt>, c4, c5, 1 (DLR).
- MCR p15, 3, <Rt>, c4, c5, 1 (DLR).

In addition, [ERET](#) executes the DRPS operation in Debug state.

For more information, see [Debug state operations](#), [DCPS](#), [DRPS](#), [MRS](#), [MSR](#).

E2.4.2.1.2 T32 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state. Any T32 instruction that uses the PC or APSR. {N, Z, C, V} as the source or destination register is not included in the list. Moreover, the list includes only the 32-bit T32 encodings.

Any instruction that is UNDEFINED in Non-debug state

The list of instructions:

- Excludes any instruction listed in [T32 instructions that are changed in Debug state](#).
- Excludes any instruction listed in [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state](#) that is UNDEFINED because an enable or disable bit is not RES0 or RES1.

Instructions that move System or Special-purpose registers to or from a general-purpose register

The list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes APSR and CPSR access instructions.
- Excludes instructions for accessing banked registers for the current mode.

These instructions are:

- MRS <banked_reg>, MSR <banked_reg>.

Note

This does not apply to cases which are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state in the current mode.

- MRC, MCR.

Note

This includes all allocated System registers in the (coproc == 0b111x) encoding space other than an MRC move to APSR_nzcv.

- MRS SPSR, MSR SPSR_fsrc (register).
- VMRS <vfp_system_reg>, VMSR <vfp_system_reg>.

Note

This includes all allocated Advanced SIMD and floating-point System registers, other than an a VMRS move to APSR_nzcv.

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a single-precision register).
- VMOV (between a general-purpose register and a doubleword floating-point register).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a scalar).

Barriers

These instructions are:

- DFB
- DMB.
- DSB.
- ISB.

Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
 - Immediate (8-bit or 12-bit) offset.
 - Immediate (8-bit) post-indexed.
 - Immediate (8-bit) pre-indexed.
 - Unprivileged (8-bit).
- Not literal.
- One of the following types:
 - (Single) register.
 - Dual.
 - Exclusive.
 - Exclusive doubleword.
 - Acquire/Release.
 - Acquire/Release Exclusive.
 - Acquire/Release Exclusive doubleword.

These instructions are:

- LDR.W, LDRB.W, LDRH.W, LDRD, LDRSB.W, LDRSH.W (immediate, not literal).
- LDRT, LDRBT, LDRHT, LDRSBT, LDRSHT(immediate).
- LDREX, LDREXB, LDREXH, LDA, LDAB, LDAH, LDAEX, LDAEXB, LDAEXH.
- LDREXD, LDAEXD.
- STR.W, STRB.W, STRH.W, STRD (immediate).
- STRT, STRBT, STRHT (immediate).
- STREX, STREXB, STREXH, STL, STLB, STLH, STLEX, STLEXB, STLEXH.
- STREXD, STLEXD.

Move to general-purpose register

These instructions are:

- MOVW, MOVT(immediate).

System instructions, Send Event, NOP, and Clear Exclusive

The System instructions are Cache maintenance instructions, TLB maintenance instructions, and Address translation instructions. These are encoded in the (coproc == 0b1111) System register encoding space.

These instructions are:

- ICIALLU, ICIALUIS, ICIMVAU.
- DCCIMVAC, DCCISW, DCCMVAC, DCCMVAU, DCCSW, DCIMVAC, DCISW.
- TLBIALL, TLBIALLH, TLBIALLHIS, TLBIALLIS, TLBIALLNSNH, TLBIALLNSNHIS, TLBIASID, TLBIASIDIS, TLBIIPAS2, TLBIIPAS2IS, TLBIIPAS2L, TLBIIPAS2LIS, TLBIMVA, TLBIMVAA, TLBIMVAAIS, TLBIMVAAL, TLBIMVAALIS, TLBIMVAH, TLBIMVAHIS, TLBIMVAIS, TLBIMVAL, TLBIMVALH, TLBIMVALHIS, TLBIMVALIS.
- ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, ATS12NSOUW, ATS1CPR, ATS1CPW, ATS1CUR, ATS1CUW, ATS1HR, ATS1HW.
- BPIALL, BPIALLIS, BPIMVA.
- SEV.W, SEVL.W.
- NOP.W.
- CLREX.

E2.4.2.1.3 T32 instructions that are **CONSTRAINED UNPREDICTABLE** in Debug state

This subsection describes all instruction not listed in either:

- [T32 instructions that are changed in Debug state.](#)
- [T32 instructions that are unchanged in Debug state.](#)

These instructions are **CONSTRAINED UNPREDICTABLE** in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a NOP.
- If the instruction reads the PC or [PSTATE](#), it uses an UNKNOWN value.
- If the instruction modifies the PC or [PSTATE](#), other than by advancing the PC to the sequentially next instruction, it sets [DLR](#), and [DSPSR](#) to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for T32 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed.

Exception-generating instructions

These instructions are:

- SVC.

- HVC.
- SMC.
- UDF.
- BKPT.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception the instruction would generate in Non-debug state. The exception is taken as described in [Exceptions in Debug state](#).

Note

SMC must not generate a Secure Monitor Call exception if EDSCR.SDD is 1.

Instructions that explicitly write to the PC (branches)

These instructions are:

- B, B (conditional), CBZ, CBNZ, BL.
- BX, BLX (register or immediate).
- BXJ, TBB, TBH.
- MOV pc and related instructions.
- LDR pc, LDM (with a register list includes the PC), POP (with a register list that includes the PC).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set [DLR](#) and [DSPSR](#) to UNKNOWN values.

Exception return and related instructions, other than ERET

These instructions are:

- SRS, RFE, SUBS pc, 1r, and related instructions.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching, setting [DLR](#) and [DSPSR](#) to UNKNOWN values, and either:
 - Execute the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
 - Not changing Exception level or PE mode.

Instructions that request entry to a low-power state

These instructions are:

- WFE, WFI, WFET, WFIT

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.

- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See [Configurable instruction controls](#).
- A WFE instruction is permitted to clear the Event register if it is set.

Note

This means that these instructions must not suspend execution.

Instructions that read the PC

These instructions are:

- LDR (literal), LDRB (literal), LDRH (literal), LDRSB (literal), LDRSH (literal).
- ADR, ADRL, ADRH.
- PLD (literal), PLI (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state using an UNKNOWN value for the PC operand.

Instructions that explicitly modify **PSTATE**, other than DCPS and ERET

These instructions are:

- CMP, TST, TEQ, CMN.
- <opc>S.
- MRC p14, 0, APSR_nzcv, c0, c1, 0 (accessing DBGDSCRint).
- CPS, SETEND, IT.
- MSR CPSR (immediate), MSR CPSR (register), MSR APSR (immediate), MSR APSR (register).
- VMRS APSR_nzcv, FPSCR.
- QADD, QDADD, QSUB, QDSUB.
- SMLABB, SMLABT, SMLATB, SMLATT, SMLAD, SMLAWB, SMLAWT, SMLSD, SMUAD.
- SSAT, SSAT16, USAT, USAT16.
- SADD, SADD8, SADD16, SASX, SSAX, SSUB, SSUB8, SSUB16.
- UADD, UADD8, UADD16, UASX, USAX, USAUB, USUN8, USUB16.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting **DLR**, **DSPSR**, and any PSTATE field written by the instruction to UNKNOWN values.

Instructions that read **PSTATE**.{N, Z, C, V} or other **PSTATE** fields

These instructions are:

- SEL, VSEL.
- ADC, SBC, all instructions with an RRX shift.
- MRS CPSR “.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
 - For the conditional operations and those using the **PSTATE.C** flag as an input, these instructions use an UNKNOWN value for the Condition flag.
 - For the MRS instruction, they return an UNKNOWN value.

All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

Note

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are CONSTRAINED UNPREDICTABLE in Debug state. This includes some T32 instructions that specify R15 as a destination or source register.

[Architectural Constraints on UNPREDICTABLE Behaviors](#) describes the CONSTRAINED UNPREDICTABLE behavior for these instructions. In Debug state these CONSTRAINED UNPREDICTABLE choices are further restricted:

- Instructions that specify R15 as a destination register:
 - Are not permitted to branch, because the architecture does not define a branch operation in Debug state.
 - Might set [DLR](#) and [DPSR](#) to UNKNOWN values.
 - Might have any of the other permitted behaviors.
 - Instructions that specify R15 as a source operand:
 - Cannot use PC + offset, because there is no architecturally-defined PC in Debug state.
 - Might have any of the other permitted behaviors, including using an UNKNOWN value.
-

E2.4.3 Decode tables

The syntax in the decode tables is defined as follows:

1	The bit has a fixed value of 1.
0	The bit has a fixed value of 0.
!=	The field has any value other than the value or values specified. The field might be an encoding field in the instruction whose value is supplied by the debugger.

Note

The instruction encodings in A64 Base Instruction Descriptions and [T32 and A32 Base Instruction Set Instruction Descriptions](#) might show these bits as (0) or (1). A debugger must set these bits to 0 or 1, as appropriate.

Any other value indicates an encoding field in the instruction whose value is supplied by the debugger. Some values might be reserved or UNDEFINED, in which case the instruction is UNDEFINED or CONSTRAINED UNPREDICTABLE in Debug state, as it is in Non-debug state.

For more information about the instruction encodings, see [T32 and A32 Base Instruction Set Instruction Descriptions](#).

For information about the syntax used in [Figure E2-1](#) and [Figure E2-2](#) see:

- Common syntax terms.
- [Assembler symbols](#).

E2.4.3.1 T32 instructions that are modified in Debug state

[Figure E2-1](#) shows the T32 instructions that are modified in Debug state, with the first halfword on the left side and the second halfword on the right side. For information of how these are packed in the [EDITR](#), see the register description.

Figure E2-2 T32 instructions that are unchanged in Debug state

E2.4.4 Security in Debug state

On entry to Debug state

[EDSCR.SDD](#) is the Secure debug disabled flag. If entering Debug state from Non-secure state, [EDSCR.SDD](#) is set to 1.

Note

If halting is prohibited in a Security state, it is not possible to enter Debug state from that Security state. However, because changes to the authentication signals require a [Context Synchronization event](#) to guarantee their effect, there is a period during which the PE might halt even though the authentication signals prohibit halting.

In Debug state

The value of [EDSCR.SDD](#) does not change, even if [ExternalSecureInvasiveDebugEnabled\(\)](#) changes.

Note

- [DBGAUTHSTATUS_EL1](#) is not frozen in Debug state. However, a Context Synchronization event is required to guarantee that changes are visible in [DBGAUTHSTATUS_EL1](#).
 - If [EDSCR.SDD](#) is 1 in Debug state, there is no means to enter a Security state where halting was prohibited on entry to Debug state. This means that it is not possible for the PE to be in such a Security state when [EDSCR.SDD](#) is 1. This is a general principle of behavior in Debug state.
-

In Non-debug state

[EDSCR.SDD](#) returns the inverse of [ExternalSecureInvasiveDebugEnabled\(\)](#). If the authentication signals that control [ExternalSecureInvasiveDebugEnabled\(\)](#) change, a [Context Synchronization event](#) is required to guarantee their effect.

Note

- A [Context Synchronization event](#) is also required to guarantee that changes in the authentication signals are visible in [DBGAUTHSTATUS_EL1](#).
-

E2.4.5 Privilege in Debug state

The only additional privileges offered to Debug state are:

- The privilege to execute [Debug state operations, DCPS, DRPS, MRS, MSR](#).
- The privilege to execute DTR access instructions regardless of the Exception level and traps.

The DTR access instructions can be executed at any Exception level, including EL0, regardless of any control register settings that might force these instructions to be UNDEFINED or trapped in Non-debug state. These instruction are:

- The MRC and MCR instructions that access [DBGDTRTXint](#) and [DBGDTRRXint](#) in AArch32 state.

All other instructions operate with the privilege determined by the current Exception level and Security state. This applies to all Special-purpose and System registers accesses, memory accesses, and UNDEFINED instructions, and includes generating exceptions when the System registers trap or disable an instruction.

E2.4.6 Debug state operations, DCPS, DRPS, MRS, MSR

The architecture defines operations to change between Exception levels in Debug state. These operations can also change the mode at the current Exception level.

E2.4.6.1 DCPS<n>

Executing a DCPS<n> instruction in Debug state moves the PE to a higher Exception level or to a specific mode at the current Exception level.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state the current endianness is determined by the value of [SCTLR.EE](#) or [HSCTLR.EE](#) for the target Exception level.

In AArch32 state, in the T32 instruction set only

- DCPS1
- DCPS2
- DCPS3

The DCPS instructions are UNDEFINED in Non-debug state.

[Table E2-2](#) shows the target of the instruction. In [Table E2-2](#), the entries have the following meaning:

EL1h/Svc This means that the target is EL1 and Supervisor mode.

EL2h/Hyp This means that the target is EL2 and Hyp mode.

Table E2-2 Target for DCPS instructions in Debug state

Instruction	Target when DCPS instruction executed at stated Exception level:		
	EL0	EL1	EL2
DCPS1	EL1h	EL1h	EL2h
DCPS2	EL2h	EL2h	EL2h
DCPS3	•	•	•

However:

- DCPS1 is UNDEFINED at EL0 if HCR_EL2.TGE == 1.
- DCPS3 is UNDEFINED at all Exception levels.

On executing a DCPS instruction:

- If the target Exception level is using AArch32, [DLR](#), [DSPSR](#), and if FEAT_Debugv8p9 is implemented, DSPSR2, become UNKNOWN and:
 - If the target Exception level is EL1 the LR and SPSR of the target mode become UNKNOWN.
 - If the target Exception level is EL2, then [ELR_hyp](#), [SPSR_hyp](#), and [HSR](#) become UNKNOWN.

If the target Exception level is using AArch32, and the target Exception level is EL1 the LR and SPSR of the target mode become UNKNOWN.

The [DCPSInstruction\(\)](#) function is described in [A-profile Architecture Pseudocode](#).

E2.4.6.2 DRPS

Executing the DRPS operation in Debug state moves the PE to a lower Exception level, or the current Exception level, by copying the current SPSR to PSTATE.

If DRPS is executed in AArch64 state and the target Exception level is using AArch32:

- The current instruction set switches from A64 to T32.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for exception returns in Non-debug state. See Execution state.

Otherwise, the instruction set state does not change.

If the target Exception level is the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- If targeting an Exception level using AArch64, current endianness is set according to SCTLR_ELx.EE, or SCTLR_EL1.E0E for the target Exception level.
- If targeting an Exception level using AArch32, current endianness is set by SPSR.E as appropriate.

The DRPS instructions are:

In AArch32 state, in the T32 instruction set only

- `ERET`

If the SPSR specifies an illegal exception return, then PSTATE.{M, nRW, EL, SP} are unchanged and PSTATE.IL is set to 1. For further information on illegal exception returns, see Illegal exception returns from AArch64 state.

Some PSTATE fields are ignored in Debug state. The effect of the DRPS operation on them is to set them to an UNKNOWN value that might be the value from the SPSR. For more information, see [PSTATE in Debug state](#).

All other PSTATE fields are copied from SPSR.

Unlike an exception return, the DRPS operation has no architecturally-defined effect on the Event Register and Exclusives monitors. DRPS might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any IMPLEMENTATION SPECIFIC behavior.

On executing a DRPS instruction then [DLR](#) and [DSPSR](#) become UNKNOWN.

The [DRPSInstruction\(\)](#) function is described in [R-profile Architecture Pseudocode](#).

E2.4.6.3 MRS and MSR

The other Debug state instructions are used to read or write DLR_EL0 and DSPSR_EL0.

These instructions are:

In AArch32 state

- [MRC](#)
- [MCR](#)

MRC <Rn>, DLR	; Copy DLR to <Rn>
MRC <Rn>, DSPSR	; Copy DSPSR to <Rn>
MCR DLR, <Rn>	; Copy <Rn> to DLR
MCR DSPSR, <Rn>	; Copy <Rn> to DSPSR

These instructions can be executed at any Exception level when in Debug state, including EL0. They are UNDEFINED in Non-debug state.

E2.4.7 Exceptions in Debug state

The following sections describe how exceptions are handled in Debug state:

- [Generating exceptions when in Debug state.](#)
- [Taking exceptions when in Debug state.](#)
- [Reset in Debug state.](#)

E2.4.7.1 Generating exceptions when in Debug state

In Debug state:

- Instruction Abort exceptions cannot happen because instructions are not fetched from memory.
- Interrupts, including SError and virtual interrupts are ignored and remain pending:
 - The pending interrupt remains visible in [ISR](#).
- Debug exceptions and debug events are ignored.
- Any attempt to execute an instruction bit pattern that is an allocated instruction at the current Exception level, but is listed in [Executing instructions in Debug state](#) as UNDEFINED in Debug state, generates an exception. The priority and syndrome for these exceptions is the same as for executing an encoding that does not have an allocated instruction.

Otherwise, synchronous exceptions are generated as they would be in Non-debug state and taken to the appropriate Exception level in Debug state.

E2.4.7.2 Taking exceptions when in Debug state

When the PE is in Debug state, all exceptions are synchronous. When an exception is generated, it is taken to Debug state. This means that:

- The target Exception level is as defined for the exception in Non-debug state.
- The exception syndrome is reported as defined for the exception in Non-debug state, except for the case described in [Data Aborts in Memory access mode](#) for which the reporting requirements are relaxed. The exception syndrome is reported using the syndrome register or registers for the target Exception level. In AArch64 state, these are [DFSR](#), [DFAR](#), [HSR](#), [HDFAR](#), and [HPFAR](#). For example, if an instruction is trapped to an Exception level using AArch64 due to a configurable trap, disable, or enable, the exception code reported is the same as it would be in Non-debug state.

Note

Generally, the AArch32 Fault Address Registers (FARs) and Fault Status Registers (FSRs) are not described as *syndrome registers*, although the term is appropriate to their function.

The effect on auxiliary syndrome registers, such as AFSR, is IMPLEMENTATION DEFINED.

- The PE remains in Debug state and changes to the target mode.
- The endianness switches to that indicated by the EE bit of the System register for the target Exception level.
- The SPSR for the target Exception level or mode is corrupted and becomes UNKNOWN.
- If the target Exception level is using AArch64, ELR_ELx for the target Exception level becomes UNKNOWN.
- [DLR](#) and [DPSR](#) become UNKNOWN.
- The cumulative error flag, [EDSCR.ERR](#), is set to 1. See [Cumulative error flag](#).
- PSTATE.IL is cleared to 0.
- PSTATE.{IT, T, SS, D, A, I, F} are set to UNKNOWN values, and PSTATE.{N, Z, C, V, Q, GE} are unchanged. However, these fields are ignored and are not observable in Debug state. For more information, see [PSTATE in Debug state](#).

The debugger must save any state that can be corrupted by an exception before executing an instruction that might generate another exception.

E2.4.7.3 Pseudocode description of taking exceptions in Debug state

[AArch32_EnterMode\(\)](#), [AArch32_EnterHypMode\(\)](#), and [AArch32_EnterMonitorMode\(\)](#) show the behavior when the PE takes an exception to an Exception level using AArch32 in Non-debug state. In Debug state:

- [AArch32_EnterMode\(\)](#) redirects to [AArch32_EnterModeInDebugState\(\)](#).
- [AArch32_EnterHypMode\(\)](#) redirects to [AArch32_EnterHypModeInDebugState\(\)](#).
- [AArch32_EnterMonitorMode\(\)](#) redirects to [AArch32_EnterMonitorModeInDebugState\(\)](#).

E2.4.7.4 Reset in Debug state

If the PE is reset when in Debug state, it exits Debug state and enters Non-debug reset state. When the PE is in reset state, [EDSCR.STATUS](#) == 0b000010 and writes to [EDITR](#) are ignored.

Note

If [EDECR.RCE](#) == 1 or [CTIDEVCTL.RCE](#) == 1, meaning that a Reset Catch debug event is programmed, and if halting is allowed on exiting reset state, then on exiting reset state the PE halts and reenters Debug state. See [Reset Catch debug events](#). All PE registers have taken their reset values, which might be UNKNOWN.

E2.4.8 Accessing registers in Debug state

Register accesses are unchanged in Debug state. The view of each register is determined by either the current Exception level or the mode, or both, and accesses might be disabled or trapped by controls at a higher Exception level.

E2.4.8.1 General-purpose register access

A single general-purpose register can be read by issuing an `nMCR` instruction through the ITR to write `DBGDTRTXint`.

The debugger can then read the DTR register or registers through the external debug interface. The reverse sequence writes to a general-purpose register.

Figure E2-3 shows the reading and writing of general-purpose registers in Debug state in AArch32 state.

Figure E2-3 Reading and writing general-purpose registers in Debug state in AArch32 state

E2.4.8.2 PC and PSTATE access

The debugger reads the Program Counter and PSTATE of the process being debugged through the `DLR` and `DSPSR` System registers. The actual values of PC and PSTATE cannot be directly observed in Debug state:

- Instructions that are used for direct reads and writes of PC and PSTATE in Non-debug state are **CONSTRAINED UNPREDICTABLE** in Debug state.
- On taking an exception, `ELR_ELx` and `SPSR_ELx` at the target Exception level are **UNKNOWN**. They do not record the PC and PSTATE.

PSTATE. are indirectly read by instructions executed in Debug state, but all other PSTATE fields are ignored and cannot be observed. See also:

- [PSTATE in Debug state.](#)
- [Executing instructions in Debug state.](#)
- [Exceptions in Debug state.](#)

E2.4.8.3 Other register accesses

To access other registers, the debugger can use the operations described in [General-purpose register access](#) and the operations described below to build a sequence of operations to move the registers to or from a general-purpose register.

To access a SIMD&FP, SP, or System register, the debugger can use an instruction from the following list to transfer the register to or from a general-purpose register:

- The `VMOV` instruction in AArch32 state for SIMD transfers from SIMD&FP registers.
- The `VMOV` instruction in AArch32 state for floating-point transfers to or from SIMD&FP registers.
- [MCR](#), [MCRR](#), [MRRC](#), and [MRC](#) instructions in AArch32 state for transfers to or from System registers.

E2.4.9 Accessing memory in Debug state

How the PE accesses memory is unchanged in Debug state. This includes:

- The operation of the MPU, including address translation, access permissions, and memory attribute determination.
- The operation of any caches and coherency mechanisms.
- Alignment support.
- Endianness support.
- The Memory order model.
- The operation of the MPU, including access permissions and memory attribute determination.

E2.4.9.1 Simple memory transfers

Simple memory accesses can be performed in Debug state by issuing memory access instructions through the ITR and passing data through the DTR registers. [Executing instructions in Debug state](#) lists the memory access instructions that are supported in Debug state.

E2.4.9.2 Bulk memory transfers

Memory access mode can accelerate bulk memory transfers in Debug state. See [DCC and ITR access modes](#).

E2.5 Exiting Debug state

The PE exits Debug state when it receives a Restart request trigger event. If `EDSCR.ITE == 0`, when the PE receives a Restart Request trigger event, the behavior of any instruction issued through the ITR in Normal access mode or an operation issued by a DTR access in Memory access mode that has not completed execution is one of the following:

- The instruction completes execution in Debug state and the PE ignores the restart request and remains in Debug state.
- The instruction completes execution in Debug state before the PE executes the restart sequence.
- The instruction completes execution in Non-debug state after the PE executes the restart sequence.
- The instruction is abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

Note

- Implementations can set `EDSCR.ITE` to 1 to indicate that further instructions can be accepted by ITR before the previous instructions have completed. If any previous instruction has not completed and `EDSCR.ITE == 1`, then the PE must complete these instructions in Debug state before executing the restart sequence. `EDSCR.ITE == 0` indicates that the PE is not ready to restart.
 - A debugger must observe that any instructions issued through `EDITR` that might generate a synchronous exception, as complete, before issuing a restart request. It can do this by observing the completion of a later instruction, as synchronous exceptions must occur in program order. For example, a debugger can observe that an instruction that reads or writes a DTR register is complete because of its effect on the `EDSCR.{TXfull, RXfull}` flags.
-

On exiting Debug state, the PE sets the Program Counter to the address in `DLR`, where:

- If exiting to AArch32 state:
 - Bits[31:1] of the PC are set to the value of bits[31:1] of `DLR`.
 - Bit[0] of the PC is set to a CONSTRAINED UNPREDICTABLE choice of 0 or the value of bit[0] in `DLR`.

Exit from Debug state can give rise to a PC alignment fault exception when the Program Counter is used. Unlike an exception return, this might also happen when returning to AArch32 state. For more information, see PC alignment checking.

On exiting Debug state, `PSTATE` is set from `DSPSR` in the same way that an exception return sets `PSTATE` from `SPSR_ELx`:

- The same illegal exception return checks that apply to an exception return also apply to exiting Debug state. If the return from Debug state is an illegal exception return then the effect on `PSTATE` and the PC is the same as for any other illegal exception return. See Exception return and [Exception return to an Exception level using AArch32](#).
- The checks on the `PSTATE.IT` bits that apply to exiting Debug state into AArch32 state are the same as those that apply to an exception return. See [Architectural Constraints on UNPREDICTABLE Behaviors](#).
- `PSTATE.SS` is copied from `DSPSR.SS` if all of the following hold:
 - Software step exceptions from the restart Exception level are enabled.Otherwise `PSTATE.SS` is set to 0.

Note

Unlike a return using `ERET`, `PSTATE.SS` must be restored from `DSPSR.SS` because otherwise it is UNKNOWN.

However, if `DBGOSDLR.DLK == 1` and `DBGPRCR.CORENPDRQ == 0`, meaning `FEAT_DoubleLock` is implemented and locked in Non-debug state and therefore Software Step exceptions are disabled, but otherwise Software Step exceptions would be enabled from the restart Exception level, it is CONSTRAINED UNPREDICTABLE whether `PSTATE.SS` is copied from `DSPSR.SS`.

- Exit from Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors. An exit from Debug state might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any IMPLEMENTATION SPECIFIC behavior.

Note

- One important difference between Debug state exit and an exception return is that the PE can exit Debug state at EL0. Despite this, the behavior of an exit from Debug state is similar to an exception return.
-

The `ExitDebugState()` function is described in [R-profile Architecture Pseudocode](#).

Chapter E3

Halting Debug Events

This chapter describes a particular class of debug events. It contains the following sections:

- [Introduction to Halting debug events](#)
- [Halting Step debug events](#)
- [Halt Instruction debug event](#)
- [Exception Catch debug event](#)
- [External Debug Request debug event](#)
- [OS Unlock Catch debug event](#)
- [Reset Catch debug events](#)
- [Software Access debug event](#)
- [Synchronization and Halting debug events](#)

E3.1 Introduction to Halting debug events

External debug defines Halting debug events. The following Halting debug events are available from the introduction of Armv8:

- [Halting Step debug events](#).
- [Halt Instruction debug event](#).
- [Exception Catch debug event](#).
- [External Debug Request debug event](#).
- [OS Unlock Catch debug event](#).
- [Reset Catch debug events](#).
- [Software Access debug event](#).

If halting is allowed, a Halting debug event halts the PE. The PE enters Debug state.

In addition, breakpoints and watchpoints might halt the PE if halting is allowed. See [Breakpoint and Watchpoint debug events](#). Because breakpoints and watchpoints can generate an exception or halt the PE, Breakpoint and Watchpoint debug events are not classified as Halting debug events.

For a definition of Debug state, see [Debug State](#). For a definition of halting allowed, see [Halting allowed and halting prohibited](#).

[Debug state entry and debug event prioritization](#) describes the behavior when multiple debug events are generated by an instruction.

See also [Synchronization and Halting debug events](#).

[Table E3-1](#) shows the behavior of Breakpoint, Watchpoint, and Halting debug events.

Table E3-1 Summary of debug events and possible outcomes

Debug event type	PE behavior when halting is:	
	Allowed	Prohibited
Breakpoint and Watchpoint debug events	Halt	See Table D2-1
Halt Instruction debug event	Halt	UNDEFINED
Software Access debug event	Halt	Ignored
Exception Catch debug event	Halt	Ignored or pended
Halting Step debug events	Halt	Pended
External Debug Request debug event	Halt	Pended
Reset Catch debug events	Halt	Pended
OS Unlock Catch debug event	Pended	Pended

[Table E3-2](#) shows where the pseudocode for each Halting debug event type is located.

Table E3-2 Pseudocode description of Halting debug events

Halting debug event type	Pseudocode
Halt Instruction debug event	HLT

Halting debug event type	Pseudocode
Software Access debug event	Pseudocode description of Software Access debug event
Exception Catch debug event	Pseudocode description of Exception Catch debug events
Halting Step debug events	Pseudocode description of Halting Step debug events
External Debug Request debug event	Pseudocode description of External Debug Request debug events
Reset Catch debug events	Pseudocode description of Reset Catch debug event
OS Unlock Catch debug event	Pseudocode description of OS Unlock Catch debug event

E3.2 Halting Step debug events

Halting Step is a debug resource that a debugger can use to make the PE step through code one instruction at a time. This section describes the Halting Step debug events. It is divided into the following sections:

- [Overview of a Halting Step debug event.](#)
- [The Halting Step state machine.](#)
- [Using Halting Step.](#)
- [Detailed Halting Step state machine behavior.](#)
- [Synchronization and the Halting Step state machine.](#)
- [Stepping T32 IT instructions.](#)
- [Disabling interrupts while stepping.](#)
- [Syndrome information on Halting Step.](#)
- [Pseudocode description of Halting Step debug events.](#)

The architecture describes the behavior as a simple Halting Step state machine. See [The Halting Step state machine.](#)

E3.2.1 Overview of a Halting Step debug event

The behavior of Halting Step is defined by a state machine, shown in [Figure E3-1](#). A Halting Step debug event executes a single instruction and then returns control to the debugger. When the debugger software wants to execute a Halting Step:

1. With the PE in Debug state, the debugger activates Halting Step.
2. The debugger signals the PE to exit Debug state and return to the instruction that is to be stepped.
3. The PE executes that single instruction.
4. The PE enters Debug state before executing the next instruction.

However, an exception might be generated during this process. That is, one of the following occurs:

- A synchronous exception generated by the instruction being stepped.
- An asynchronous exception taken before or during the instruction being stepped, to the extent permitted by the definition of a precise exception, without completing execution of the instruction being stepped.
- An asynchronous exception taken after completing execution of the instruction being stepped, before the PE enters Debug state.

See also [Definitions of synchronous and asynchronous exceptions.](#)

Halting Step has its own enable control bit, [EDECR.SS](#) and [EDES.R.SS](#).

Note

Because the Halting Step state machine states occur as a result of normal PE operation, the states can be described as both:

- PE states.
- Halting Step states.

E3.2.2 The Halting Step state machine

The state machine states are:

Inactive Halting Step is inactive. No Halting Step debug events can be generated, therefore execution is not affected by Halting Step. The PE is in this state whenever either of the following is true:

- Halting Step is disabled. That is, [EDECR.SS](#) is set to 0 and [EDES.R.SS](#) is set to 0.

- Halting is prohibited. See [Halting the PE on debug events](#). In this state, if `EDEC.R.SS` is set to 1, then a Halting Step debug event is pending.

In [Figure E3-1](#), this state is shown in red.

Active-not-pending

Halting Step is enabled and active. This is the state in which the PE steps an instruction. `EDEC.R.SS` == 1 and `EDES.R.SS` == 0. Software must not set `EDEC.R.SS` to 1 unless the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE, as described in [Changing the value of EDEC.R.SS when not in Debug state](#).

In [Figure E3-1](#), this state is shown in green.

Active-pending

Halting Step is enabled and active. The step has completed and the PE enters Debug state. `EDES.R.SS` == 1.

In [Figure E3-1](#), this state is shown in green.

Whenever Halting Step is enabled and active, whether the state machine is in the active-not-pending state or in the active-pending state depends on `EDES.R.SS`. [Table E3-3](#) shows this.

In the simple sequential execution of the program, the PE executes the Halting Step state machine as follows:

1. Initially, Halting Step is inactive.
2. After exiting Debug state, Halting Step is active-not-pending.
3. The PE executes an instruction and Halting Step is active-pending.
4. The pending Debug state entry is taken on the next instruction and the step is complete.

Exceptions and other changes to the PE context can interrupt this sequence.

[Figure E3-1](#) shows a Halting Step state machine.

Halting step is disabled

Halting step is enabled

- a. Step completed occurs when:
- A debug event, other than a Halting Step debug event, causes entry into Debug state.
- b. Step completed occurs when:
- An instruction is executed without taking an exception.
 - An exception is taken to a state where halting is allowed.
 - A reset.
- c. An asynchronous exception taken to a state where halting is allowed.
- d. An asynchronous exception taken to Secure state where halting is prohibited.

Figure E3-1 Halting Step state machine

Note

Figure E3-1 describes only state transitions to and from the inactive state by exit from Debug state, executing an exception return, or taking an exception. Other changes to the PE context, including writes to registers such as EDECR and DBGOSDLR and changes to the authentication interface can also cause changes to the Halting Step state machine. These can lead to UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior. See Synchronization and the Halting Step state machine.

The following bits control the state machine, as shown in Table E3-3:

- EDECR.SS. This is the Halting Step enable bit.
- EDESR.SS. This is the Halting Step debug event pending bit.

Table E3-3 shows the Halting Step state machine states. The letter X in a register column means that the relevant bit can be set to either zero or one.

Table E3-3 Halting Step state machine states

Halting	EDECR.SS	EDESR.SS	Halting Step state
Prohibited	X	X	Inactive (Halting Step debug even not pending)
Prohibited	X	1	Inactive (Halting Step debug event pending)
Allowed	0	0	Inactive
Allowed	1	0	Active-not-pending
Allowed	X	1	Active-pending

E3.2.3 Using Halting Step

To step a single instruction the PE must be in Debug state:

1. The debugger sets EDECR.SS to 1 to enable Halting step.
2. The debugger signals the PE to exit Debug state with DLR set to the address of the instruction being stepped. The PE clears EDESR.SS to 0 and the Halting Step state machine enters the active-not-pending state.
3. The PE executes the instruction being stepped.
If an exception is taken to a state where halting is prohibited, then EDESR.SS is always correct for the preferred return address of the exception.
4. The PE enters Debug state before executing the next instruction and the step is complete.

Note

- If FEAT_DoPD is not implemented, EDECR.SS value is in the Debug power domain, meaning that the state machine is maintained over a powerdown of the Core power domain.
- If FEAT_DoPD is implemented, the values of EDECR.SS and EDESR.SS are set to 0 on a Cold reset, and, if the PE was stepping an instruction, EDESR.SS is effectively UNKNOWN after a Warm reset. A debugger must use a Reset Catch debug event to step over a powerdown state.
- A debugger must only change the value of EDECR.SS when the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE as described in Changing the value of EDECR.SS when not in Debug state.

E3.2.4 Detailed Halting Step state machine behavior

The behavior of the Halting Step state machine is described in the following sections:

- [Entering the active-not-pending state.](#)
- [PE behavior in the active-not-pending state.](#)
- [Entering the active-pending state.](#)
- [PE behavior in the active-pending state.](#)
- [PE behavior in the inactive state when in Non-debug state.](#)
- [PE behavior in Debug state.](#)

E3.2.4.1 Entering the active-not-pending state

The PE enters the active-not-pending state:

- By exiting Debug state to a state where halting is allowed with `EDEC.R.SS == 1`.
- By an exception return from a state where halting is prohibited to a state where halting is allowed with `EDEC.R.SS == 1` and `EDES.R.SS == 0`.
- As described in [Synchronization and the Halting Step state machine](#).

E3.2.4.2 PE behavior in the active-not-pending state

When the PE is in the active-not-pending state it does one of the following:

- It executes one instruction and does one of the following:
 - Completes it without taking a synchronous exception.
 - Takes a synchronous exception generated by the instruction.
 - Generates a debug event that causes entry to Debug state.
- It takes an asynchronous exception without completing execution of the instruction.
- It takes an asynchronous debug event into Debug state.

E3.2.4.2.1 If no exception or debug event is generated

If no exception or debug event is generated the PE sets `EDES.R.SS` to 1. This means that the Halting Step state machine advances to the active-pending state.

E3.2.4.2.2 If an exception or debug event is generated

The PE sets `EDES.R.SS` according to all of the following:

If an exception or debug event is generated, the PE sets `EDES.R.SS` to 1 if the exception is an SMC exception or is taken to a state where halting is allowed.

Otherwise, `EDES.R.SS` is unchanged.

It is IMPLEMENTATION SPECIFIC whether `EDES.R.SS` is set to 1 or unchanged when an SError exception is taken to EL2 without completing execution of the instruction, and halting is prohibited at EL2.

If halting is prohibited after taking the exception or debug event, then the Halting Step state machine advances to the inactive state. Otherwise, the Halting Step state machine advances to the active-pending state.

Note

The underlying criteria for the value of `EDES.R.SS` on an exception are:

- Whether halting is allowed at the target of the exception. If halting is allowed, the PE must step into the exception. If halting is prohibited, the PE must step over the exception.
 - Whether the preferred return address of the exception is the instruction itself or the next instruction, if the PE steps over the exception.
-

shows the behavior of the active-not-pending state.

E3.2.4.3 Entering the active-pending state

The PE enters the active-pending state by one of the following:

- From the active-not-pending state by:
 - Executing an instruction without taking an exception.
 - Taking an exception so that the PE remains in a state where halting is allowed.
- An exception return from a state where halting is prohibited when `EDES.R.SS == 1`.
- A reset when the value of `EDEC.R.SS == 1`, regardless of the state the PE was in before the reset occurred.
- From the active-pending state by taking an asynchronous exception to a state where halting is allowed.
- Following the description in [Synchronization and the Halting Step state machine](#).

E3.2.4.4 PE behavior in the active-pending state

When the PE is in the active-pending state, it enters Debug state before executing an instruction.

The entry into Debug state has higher priority than all other types of synchronous debug event and synchronous exception. However, the architecture does not define the prioritization of this Debug state entry with respect to any unmasked pending asynchronous exception. If an asynchronous exception is prioritized over the entry to Debug state, then `EDES.R.SS` is unchanged.

For more information on the prioritization of debug events, see [Debug state entry and debug event prioritization](#).

E3.2.4.5 PE behavior in the inactive state when in Non-debug state

`EDES.R.SS` is not updated by the execution of an instruction or the taking of an exception when Halting Step is inactive. This means that `EDES.R.SS` is not changed by an exception handled in a state where halting is prohibited.

On return to a state where halting is allowed, the Halting Step state machine is restored either to the active-pending state or the active-not-pending state, depending on the value of `EDES.R.SS`. The return to a state where halting is allowed is normally by an exception return, which in some situations is a [Context Synchronization event](#).

See also [Synchronization and the Halting Step state machine](#).

E3.2.4.6 PE behavior in Debug state

Halting Step is inactive in Debug state because halting is prohibited, see [Halting allowed and halting prohibited](#).

Entry to Debug state does not change `EDES.R.SS`.

`EDES.R.SS` is cleared to 0 on exiting Debug state as the result of a restart request. If `EDEC.R.SS == 1`, Halting Step enters the active-not-pending state.

Note

This means that `EDES.R.SS` is never cleared to 0 by the execution of an instruction in Debug state, or by taking an exception when in Debug state as described in [PE behavior in the active-not-pending state](#), because the Halting Step state machine is not in the active-not-pending state. `EDES.R.SS` can be cleared by a write to `EDES.R`, see the register description.

However, if the PE exits Debug state as the result of a PE reset and `EDEC.R.SS == 1`, then Halting Step immediately enters the active-pending state, as `EDES.R.SS` is set to the value of `EDEC.R.SS`.

E3.2.5 Synchronization and the Halting Step state machine

The Halting Step state machine also changes state if:

- Halting becomes allowed or prohibited other than by exit from Debug state, an exception return, or taking an exception. This means that halting becomes allowed or prohibited because:
- A write to `EDEC.R` when the PE is in Non-debug state changes the value of `EDEC.R.SS`.

Note

Behavior is CONSTRAINED UNPREDICTABLE if the value of `EDEC.R.SS` is changed when the PE is in Non-debug state, see [Changing the value of EDEC.R.SS when not in Debug state](#).

- A write to `EDES.R` when the PE is in Non-debug state clears `EDES.R.SS` to 0.

These operations are guaranteed to take effect only after a [Context Synchronization event](#). If the instruction being stepped generates a [Context Synchronization event](#), then the PE might use the old or new state.

The PE must perform the required behavior of the new state before or immediately following the next [Context Synchronization event](#), but it is not required to do so immediately. This means that the PE can perform the required behavior of the old state before the next [Context Synchronization event](#). This is illustrated in [Example E3-1](#) and [Example E3-2](#).

Example E3-1 Synchronization requirements 1

`EDEC.R.SS` is set to 1 in Debug state, requesting the active-not-pending state on exit from Debug state. On exit from Debug state the PE immediately takes an exception to , where halting is prohibited. The PE does not step any instructions but executes the software at as normal. `EDES.R.SS` remains set to 0. If halting is subsequently allowed, the PE must perform the required behavior of the active-not-pending state before or immediately following the next [Context Synchronization event](#), but it is not required to do so immediately.

Example E3-2 Synchronization requirements 2

`EDEC.R.SS` is set to 1 in Debug state. On exit from Debug the PE executes an `MSR` instruction that sets `OSDLR_EL1.DLK` to 1 and `DoubleLockStatus()` becomes TRUE. This change requires a [Context Synchronization event](#) to guarantee its effect, meaning it is CONSTRAINED UNPREDICTABLE whether:

- Halting is allowed:
 - The PE enters Debug state on the next instruction.
- Halting is prohibited:
 - The PE does not enter Debug state.

The value in `EDES.R.SS` depends on whether halting was allowed or prohibited when the write to `OSDLR_EL1.DLK` completed, and so it might be 0 or 1. If a second `MSR` instruction clears `OSDLR_EL1.DLK` to 0, the PE must perform the required behavior of the state indicated by `EDES.R.SS` before or immediately following the next [Context Synchronization event](#), but it is not required to do so immediately.

See also [Synchronization and Halting debug events](#).

E3.2.5.1 Changing the value of EDEC.R.SS when not in Debug state

If software changes the value of `EDEC.R.SS` when the PE is not in Debug state then behavior is CONSTRAINED UNPREDICTABLE, and one or more of the following behaviors occurs:

- The value of `EDEC.R.SS` becomes UNKNOWN.
- The state of the Halting Step state machine becomes UNKNOWN.
- On a reset of the PE, the value of `EDEC.R.SS` and the state of the Halting Step state machine are UNKNOWN.

E3.2.6 Stepping T32 IT instructions

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and another 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

For the purpose of stepping an item, it is IMPLEMENTATION DEFINED whether:

- The PE considers such a pair of instructions to be one instruction.
- The PE considers such a pair of instructions be two instructions.

It is IMPLEMENTATION DEFINED whether this behavior depends on the value of the applicable ITD bit. For example:

- The debug logic might consider such a pair of instructions as one instruction, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as two instructions, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as one instruction when the value of the applicable ITD field is 1, and as two instructions when the value of the ITD field is 0.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

The ITD control fields are:

HSCTLR.ITD

Applies to execution at EL2 when EL2 is using AArch32.

SCTLR.ITD

Applies to execution at EL0 or EL1 when EL1 is using AArch32.

E3.2.7 Disabling interrupts while stepping

When using Halting Step, the sequence of entering Debug state, interacting with the debugger, and then exiting Debug state for each instruction reduces the rate at which the PE executes instructions. However, the rate at which certain interrupts, such as timer interrupts, are generated might be fixed by the system. This means it might be necessary to disable interrupts while using Halting Step by setting [EDSCR.INTdis](#), to allow the code being debugged to make forward progress.

E3.2.8 Syndrome information on Halting Step

On entering Debug state on a Halting Step debug event, the PE optionally records information about the debug event:

Halting Step, normal

An instruction other than a Load-Exclusive instruction was stepped.

Halting Step, exclusive

A Load-Exclusive instruction was stepped.

Halting Step, no syndrome

The syndrome data is not available.

If no syndrome is recorded, then [EDSCR.STATUS](#) is set to Halting Step, no syndrome.

If no instruction was stepped because Halting step entered the active-pending state from the inactive state without passing through the active-not-pending state, then no syndrome is recorded.

This happens when the active-pending state is entered for other reasons. See [Synchronization and the Halting Step state machine](#).

When a syndrome is recorded, [EDSCR.STATUS](#) is set to one of:

- Halting step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

Note

A Load-Exclusive instruction is any instruction that has a mnemonic starting with either LDREX or LDAEX

Note

Arm deprecates the use of the Halting Step, normal and Halting Step, exclusive syndrome values, and recommends software treats these values as Halting Step, no syndrome.

Table E3-4 summarizes the possible values that the PE can record in EDSCR.STATUS.

Table E3-4 Values that the PE can record in EDSCR.STATUS

Description	EDSCR.STATUS
Syndrome data is not available.	Halting Step, no syndrome.
Syndrome data is available. The instruction stepped was an instruction other than a Load-Exclusive instruction.	Syndrome data is available. Halting Step, normal.
Syndrome data is available. The instruction stepped was a Load-Exclusive instruction.	Syndrome data is available. Halting Step, exclusive.

E3.2.9 Pseudocode description of Halting Step debug events

There are two pseudocode functions for Halting Step debug events:

- `HSAdvance()`. This is called after an instruction has executed and any exception generated by the instruction is taken, except for the case of an SMC exception, in which case it is called before the exception is taken. `HSAdvance()` affects the next instruction.
- `CheckHaltingStep()`. This is called before the next instruction is executed. If a step is pending, it generates the debug event.

E3.3 Halt Instruction debug event

A Halt Instruction debug event is generated when `EDSCR.HDE == 1`, halting is allowed, and the PE executes the Halt instruction, `HLT`.

The pseudocode for Halt Instruction debug events is described in `HLT` for T32 and A32.

`HLT` never generates a debug exception. It is treated as `UNDEFINED` if `EDSCR.HDE == 0`, or if halting is prohibited.

Note

A debugger can replace a program instruction with a Halt instruction to generate a Halt Instruction debug event. Debuggers that use the `HLT` instruction must be aware of the rules for concurrent modification of executable code, `CMODX`. The rules for concurrent modification and execution of instructions do not allow one thread of execution or an external debugger to replace an instruction with an `HLT` instruction when these same instructions are being executed by a different thread of execution. See Concurrent modification and execution of instructions.

The T32 `HLT` instruction is unconditionally executed inside an `IT` block, even when it is treated as undefined. The A32 `HLT` instruction is `CONSTRAINED UNPREDICTABLE` if the Condition code field is not `0b1110`, with the set of behaviors the same as for `BKPT`. See [Architectural Constraints on UNPREDICTABLE Behaviors](#).

Note

The `HLT` instruction is part of the external debug solution from the introduction of Armv8-A. As such, the presence of the `HLT` instruction is not indicated in the ID registers. In particular, the AArch32 System register `ID_ISAR0`. Debug does not indicate the presence of the `HLT` instruction.

E3.3.1 HLT instructions as the first instruction in a T32 IT block

In an implementation that supports the ITD control, the architecture permits a combination of one T32 `IT` instruction and certain other 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

The T32 `HLT` instruction cannot be combined with an `IT` instruction in this way. In an implementation that supports the ITD control, if the first instruction in an IT block is an `HLT` instruction, then the behavior of the instruction depends on the value of the applicable ITD field:

- If the value of the ITD field is 1, then the combination is treated as undefined and an Undefined Instruction exception is generated either by the `IT` instruction or by the `HLT` instruction.
- If the value of the ITD field is 0, then the `HLT` instruction unconditionally executed.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

To set an Halt Instruction debug event on the first instruction of an IT block, debuggers must replace the `IT` instruction with an `HLT` instruction to ensure consistent behavior.

The ITD control fields are:

HSCTLR.ITD

Applies to execution at EL2 when EL2 is using AArch32.

SCTLR.ITD

Applies to execution at EL0 or EL1 when EL1 is using AArch32.

Note

An `HLT` instruction is always unconditional, even within an IT block.

E3.4 Exception Catch debug event

Exception Catch debug events:

- Are generated when the corresponding bit in the Exception Catch Control Register, [EDECCR](#), is set to 1 on all entries to a given Exception level. This means:
 - Exceptions taken to the Exception level.
 - Exception returns to the Exception level.
 - It is IMPLEMENTATION DEFINED whether a reset into an Exception level generates an Exception Catch debug event.
- Might be taken synchronously, after the exception or reset entry or the exception return has been processed by the PE.
- Ignore the Execution state of the target Exception level.
- Might be ignored if halting is prohibited.

The [EDECCR](#) register contains fields that control when Exception Catch debug events are generated.

See Controlling Exception Catch debug events when FEAT_Debugv8p2 is implemented and [Controlling Exception Catch debug events when FEAT_Debugv8p2 is not implemented](#).

For exception returns, the final Exception level of the exception return determines whether an Exception Catch debug event is generated. On an illegal exception return, an Exception Catch debug event is generated only if EDECCR is programmed to generate an Exception Catch debug event for an exception return to the current Exception level.

E3.4.1 Prioritization of Exception Catch debug events

The following rules define the prioritization of Exception Catch debug events:

- It is IMPLEMENTATION DEFINED whether Exception Catch debug events are higher or lower priority than Software Step exceptions and [Halting Step debug events](#).
- Exception Catch debug events are higher priority than all synchronous exceptions other than Software Step exceptions and debug events other than [Halting Step debug events](#).
- Exception Catch debug events are lower priority than [Reset Catch debug events](#).
- Exception Catch debug events are higher priority than pending asynchronous exceptions. Otherwise, the prioritization between asynchronous exceptions, asynchronous debug events, and an Exception Catch debug event, is IMPLEMENTATION DEFINED.

E3.4.2 Generating Exception Catch debug events

When an Exception Catch debug event is generated after exception entry and halting is allowed at the target of the exception, the PE halts and enters Debug state:

- The PE halts and enters Debug state before the first instruction at the handler is executed, after the exception entry has updated the program counter, PSTATE, and syndrome registers for the exception.
- The PE does not fetch instructions from the vector address before entering Debug state, if address translation is disabled in the translation regime at the target Exception level.
- A second unmasked asynchronous exception can be taken before the PE enters Debug state. If this second exception does not generate an Exception Catch debug event, the exception handler executed at the higher Exception level later returns to the trapped Exception level, causing the Exception Catch debug event to be generated again.

When an Exception Catch debug event is generated on exception return and halting is allowed at the target of the exception return:

- There is no prioritization between asynchronous exceptions, asynchronous debug events, and an Exception Catch debug event generated on an exception return.
- The PE halts and enters Debug state after the exception return has updated the program counter and PSTATE, and before the execution of the first instruction at the return address is completed.

Otherwise, when the PE is executing code at a given Exception level, and the corresponding [EDECCR](#) bit is 1, it is CONstrained UNpredictable whether an Exception Catch debug event is generated.

Examples of this are:

- If the debugger writes to [EDECCR](#) so that the current Exception level is trapped.
- If the OS restore code writes to [DBGOSECCR](#) so that the current Exception level is trapped.
- If the code executing in AArch32 state changes the Exception level other than by an exception return, and the target Exception level is trapped. See [State and mode changes without explicit Context Synchronization events](#).

See also [Debug state entry and debug event prioritization](#).

Note

It is possible to generate Exception Catch debug events:

- As a trap on all instruction fetches from the trapped Exception level as part of an instruction fetch.
- On entry to the Exception level, as described in [Detailed Halting Step state machine behavior](#).

This is similar to the implementation options allowed for Vector Catch debug events. The architecture does not require that the event is generated following an [ISB](#) operation executed at the Exception level.

E3.4.3 Controlling Exception Catch debug events

All Exception Catch debug events are enabled by a combination of the fields NSE and SE in [EDECCR](#), as shown in [Table E3-5](#).

Table E3-5 Summary of Exception Catch debug event control

(N)SE<n>	Behavior on exception taken to ELn, return to ELn, and if resets are Exception Catch debug events, reset into ELn
0	No action.
1	Halt if allowed.

E3.4.4 Examples of Exception Catch debug events

If [EDECCR](#) == 0x0020, meaning that the Exception Catch debug event is enabled for EL1, then the following exceptions generate Exception Catch debug events:

- An exception taken from EL0 to EL1.
- An exception return from EL2 to EL1.

For example, on taking a Data Abort exception from EL0 to EL1:

- LR and [SPSR_abt](#) are written with the preferred return address and PE state for a return to EL0.
- ESR and FAR are written with the syndrome information for the exception.
- [DLR](#) is set to VBAR + 0x400, the synchronous exception vector.
- [DSPSR](#) is written with the PE state for an exit to EL1.

The following do not generate Exception Catch debug events:

- An exception taken from EL0 to EL2.
- An exception return from EL2 to EL0.
- An exception taken from EL0 to EL1.

E3.4.5 Pseudocode description of Exception Catch debug events

The pseudocode functions `CheckExceptionCatch()` and `CheckPendingExceptionCatch()` are described in [R-profile Architecture Pseudocode](#).

E3.5 External Debug Request debug event

External Debug Request debug events are asynchronous debug events.

An External Debug Request debug event can be generated by any of the following:

- When signaled by the embedded cross-trigger. See [The Embedded Cross-Trigger Interface](#).
- The Performance Monitoring Unit. See [PMU Overflow external debug request](#).
- An implementation might also support IMPLEMENTATION DEFINED ways of generating an External Debug Request debug event.

E3.5.1 Synchronization and External Debug Request debug events

For all Context synchronization events, if an External Debug Request debug event is asserted before the [Context Synchronization event](#), and the External Debug Request debug event remains asserted and halting is allowed after the Context synchronization event, then the debug event is taken and the PE enters Debug state before the first instruction following the Context synchronization event completes its execution.

An External Debug Request debug event that is being asserted when the PE comes out of reset is taken, and the PE enters Debug state before the first instruction after the reset completes its execution, provided that halting is allowed when the PE exits reset state.

If the first instruction after the [Context Synchronization event](#) or after coming out of reset generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

Otherwise, when all of the following are true, External Debug Request debug events must be taken in finite time, without requiring the synchronization of any necessary change to the external authentication interface:

- Halting is allowed.
- The PE is not in a low-power state that is not required to exit on an external debug request. See [Core power domain power states](#).

External debug request is a wakeup event for WFI, WFE, or WFET instructions. See Mechanisms for entering a low-power state.

Note

These rules are based on the rules that apply when taking asynchronous exceptions. See Asynchronous exception types.

If an unmasked External Debug Request debug event was pending but is changed to not pending before it is taken, then the architecture permits the External Debug Request debug event to be taken, but does not require this to happen. If the External Debug Request debug event is taken then it must be taken before the first [Context Synchronization event](#) after the External Debug Request debug event was changed to not pending.

[Example E3-3](#) shows an example of the synchronization requirements.

Example E3-3 Synchronization requirements

Secure software locks up in a tight loop, so it executes indefinitely without any synchronization operations. An External debug request must be able to break the PE out of that loop. This is a requirement even if **DBGEN** or **SPIDEN** or both are LOW on entry to the loop, meaning that halting is prohibited, and are only asserted HIGH later.

E3.5.2 PMU Overflow external debug request

When the PE halts and enters Debug state because of a PMU Overflow external debug request:

- DLR_EL0 is set to the address of the first instruction that must be executed on exit from Debug state. DSPSR_EL0 is correct for this instruction.

- [EDSCR.STATUS](#) is set to 0b010011, external debug request.

E3.5.3 Pseudocode description of External Debug Request debug events

The [ExternalDebugRequest \(\)](#) function is described in [R-profile Architecture Pseudocode](#).

E3.6 OS Unlock Catch debug event

An OS Unlock Catch debug event is generated when enabled and the state of the OS Lock changes from locked to unlocked. When FEAT_DoPD is implemented, CTIDEVCTL.OSUCE enables an OS Unlock Catch debug event, otherwise EDECR.OSUCE enables an OS Unlock Catch debug event.

When the OS Lock is unlocked, the PE sets EDESR.OSUC to 1 if the OS Unlock Catch debug event is enabled, and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. However, this is an indirect write to EDESR.OSUC, meaning the OS Unlock Catch debug event is not guaranteed to be taken before a subsequent Context synchronization event. If the PE enters Debug state or the OS Unlock Catch debug event is disabled before EDESR.OSUC becomes set to 1, then EDESR.OSUC might not be set.

OS Unlock Catch debug events are not generated if the OS Lock is unlocked when the PE is in Debug state. See also [Synchronization and Halting debug events](#).

EDESR.OSUC is cleared to 0 on a Warm reset and on exiting Debug state.

E3.6.1 Using the OS Unlock Catch debug event

When the Core power domain is completely off or in a low-power state, a debugger is permitted to access a debug register that is implemented in the External debug power domain. However, if a debugger attempts to access a debug register that is implemented in the Core power domain when the Core power domain registers cannot be accessed, and that access returns an error, the debugger must retry the access.

Regularly powering down the Core power domain can result in unreliable debugger behavior.

The debugger can program a Reset Catch debug event to halt the PE when it has powered up, and can program the debug registers from Debug state. However, if the PE boot software restores the debug registers, as described in [Debug OS Save and Restore sequences](#), then newly written values are overwritten by the restore sequence.

The debugger can program an OS Unlock Catch debug event to halt the PE after the restore sequence has completed, and program the debug registers from Debug state.

E3.6.2 Pseudocode description of OS Unlock Catch debug event

The `CheckOSUnlockCatch()` function is called when the OS Lock is unlocked.

The `CheckPendingOSUnlockCatch()` function is called before an instruction is executed. If an OS Unlock Catch is pending, it generates the debug event.

E3.7 Reset Catch debug events

A Reset Catch debug event is generated when enabled, and the PE exits reset state. When the Reset Catch debug event is generated, it is recorded by setting [EDES.RC](#) to 1. When FEAT_DoPD is implemented, CTIDEVCTL.RCE enables a Reset Catch debug event, otherwise [EDECR.RCE](#) enables a Reset Catch debug event.

If halting is allowed when the event is generated, the Reset Catch debug event is taken immediately and synchronously. On entering Debug state, [DLR](#) has the address of the reset vector. The PE must not fetch any instructions from memory.

Otherwise, the Reset Catch debug event is pended and taken when halting is allowed. See [Synchronization and Halting debug events](#) for more information.

This means that [EDES.RC](#) is set to the value of [EDECR.RCE](#) or CTIDEVCTL.RCE on a Warm reset. [EDES.RC](#) is cleared to 0 on exiting Debug state.

E3.7.1 Pseudocode description of Reset Catch debug event

The [CheckResetCatch\(\)](#) function is called after reset before executing any instruction.

The [CheckPendingResetCatch\(\)](#) function is called before an instruction is executed. If a Reset Catch is pending, it generates the Reset Catch debug event.

E3.8 Software Access debug event

When the value of [EDSCR.TDA](#) is 1, software access to the following debug System registers generate a Software Access debug event:

- The Breakpoint Value Registers, [DBGBVR<n>](#).
- The Breakpoint Control Registers, [DBGBCR<n>](#).
- The Watchpoint Value Registers, [DBGWVR<n>](#).
- The Watchpoint Control Registers, [DBGWCR<n>](#).

However, [EDSCR.TDA](#) is ignored if any of the following applies:

- The value of [DBGOSLSR.OSLK](#) == 1, meaning that the OS Lock is locked.
- Halting is prohibited. See [Halting allowed and halting prohibited](#).
- The register access generates a higher priority synchronous exception or debug event.

Note

- The only accesses to the specified registers that generate a Software Access debug event are:
 - Accesses to System registers in the (`coproc == 0b1110`) encoding space in AArch32 state.
 - Accesses by a PE using the external debug interface never generate a Software Access debug event.
-

E3.8.1 Pseudocode description of Software Access debug event

The [CheckSoftwareAccessToDebugRegisters\(\)](#) function is described in .

E3.9 Synchronization and Halting debug events

The behavior of external debug depends on:

- Indirect reads of:
 - External debug registers.
 - System registers, including system debug registers.
 - Special-purpose registers.
- The state of the external authentication interface.

For some registers, all read and write accesses that update the register occur in program order, without any additional synchronization, but others require an explicit [Context Synchronization event](#). For more information on the synchronization of register updates, see:

- [Synchronization of changes to the external debug registers.](#)
- [State and mode changes without explicit Context Synchronization events.](#)

Changes to the external authentication interface do not require explicit synchronization to affect External Debug Request debug events. See [Synchronization and External Debug Request debug events](#).

For changes that require explicit synchronization, it is **CONSTRAINED UNPREDICTABLE** whether instructions between the change and the [Context Synchronization event](#) observe the old state or the new state.

This means that any change to these registers or the external authentication interface requires explicit synchronization by a [Context Synchronization event](#) before the change takes effect. This ensures that for instructions appearing in program order after the change, the change affects the following:

- The generation and behavior of Breakpoint and Watchpoint debug events. See [Synchronization and debug exceptions](#).
- The generation of all Halting debug events by instructions.
- Taking a pending Halting debug event or other asynchronous debug event. See:
 - [Pending Halting debug events.](#)
 - [Synchronization and External Debug Request debug events.](#)
- The behavior of the Halting Step state machine. See [Synchronization and the Halting Step state machine](#).

E3.9.1 Pending Halting debug events

A Halting debug event might be pending:

- If Halting Step of an instruction sets [EDES.RC](#) to 1, and halting is prohibited following the step, then the Halting Step state machine is inactive but a Halting Step debug event is pending.
- If a Reset Catch debug event sets [EDES.RC](#) to 1, and halting is prohibited following reset, then a Reset Catch debug event is pending.
- If an OS Unlock Catch debug event sets [EDES.OSUC](#) to 1, then an OS Unlock Catch debug event is pending.

Pending Halting debug events are taken asynchronously when halting is allowed.

Pending Halting debug events are discarded by a Cold reset. The debugger can also force a pending event to be dropped by writing to [EDES](#).

Any Halting debug event that is observed as pending in the [EDES](#) before a [Context Synchronization event](#) is taken and the PE enters Debug state before the first instruction following the [Context Synchronization event](#) completes its execution. This is possible only if halting is allowed after completion of the [Context Synchronization event](#).

Chapter E4

The Debug Communication Channel and Instruction Transfer Register

This chapter describes communication between a debugger and the implemented debug logic, using the *Debug Communications Channel* (DCC) and the *Instruction Transfer Register* (ITR), and associated control flags. It contains the following sections:

- [Introduction](#)
- [DCC and ITR registers](#)
- [DCC and ITR access modes](#)
- [Flow control of the DCC and ITR registers](#)
- [Synchronization of DCC and ITR accesses](#)
- [Interrupt-driven use of the DCC](#)
- [Pseudocode description of the operation of the DCC and ITR registers](#)

E4.1 Introduction

The *Debug Communications Channel*, DCC, is a channel for passing data between the PE and an external agent, such as a debugger. The DCC provides a communications channel between:

- An external debugger, described as the *debug host*.
- The debug implementation on the PE, described as the *debug target*.

The DCC can be used:

- As a 32-bit full-duplex channel.
- As a 64-bit half-duplex channel.

The DCC is an essential part of Debug state operation and can also be used in Non-debug state.

The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.

The PE includes flow-control mechanisms for both the DCC and ITR.

E4.2 DCC and ITR registers

The DCC comprises *data transfer registers*, the DTRs, and associated flow-control flags. The data transfer registers are DTRRX and DTRTX.

The ITR comprises a single register, [EDITR](#), and associated flow-control flags.

In AArch32 state, software can access the data transfer registers only as:

- A receive and transmit pair, for 32-bit full duplex operation:
 - The write-only [DBGDTRTXint](#) register to transmit data.
 - The read-only [DBGDTRRXint](#) register to receive data.
- The read/write [DBGDTRTXext](#) and [DBGDTRRXext](#) registers for save and restore.

The data transfer registers are also accessible by the external debug interface as a pair of 32-bit registers, [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#). Both registers are read/write, allowing both 32-bit full-duplex and 64-bit half-duplex operation.

The DCC flow-control flags are [EDSCR](#). {RXfull, TXfull, RXO, TXU}:

- The RXfull and TXfull ready flags are used for flow-control and are visible to software in the Debug System registers in [DBGDSCRint](#).
- The RX overrun flag, RXO, and the TX underrun flag, TXU, report flow-control errors.
- The flow-control flags are also accessible by software as simple read/write bits for saving and restoring over a powerdown when the OS Lock is locked in [DBGDSCRExt](#).
- The flow-control flags are accessible from the external debug interface in [EDSCR](#).

[Figure E4-1](#) shows the System register and external debug interface views of the [EDSCR](#) and DTR registers. These figures do not include the save and restore views.

Figure E4-1 System register and external debug interface views of EDSCR and DTR registers, Normal access mode

EDITR and the ITR flow-control flags, **EDSCR**.{ITE, ITO} are accessible only by the external debug interface:

- The **EDITR** specifies an instruction to execute in Debug state.
- The ITR empty flag, ITE, is used for flow-control.
- The ITR overrun flag, ITO, reports flow-control errors.

Figure E4-2 External debug interface views of EDSCR and EDITR registers, Normal access mode

The sticky overflow flag, [EDSCR.ERR](#), is used by both the DCC and ITR to report flow-control errors.

To save and restore the DCC registers for an external debugger over powerdown, software uses:

- The [DBGDSCRext](#), [DBGDTRTXext](#), and [DBGDTRRXext](#) registers in AArch32 state.

Note

There is no save and restore mechanism for the ITR registers as the ITR is used only in Debug state.

Figure E4-3 System register views of EDSCR and DTR registers for save and restore

E4.3 DCC and ITR access modes

The DCC and ITR support two access modes:

DCC and ITR access mode, links to description	Applies when:
Normal access mode	EDSCR.MA == 0 or the PE is in Non-debug state
Memory access mode	EDSCR.MA == 1 and the PE is in Debug state

E4.3.1 Normal access mode

The Normal access mode allows use of the DCC as a communications channel between target and host. It also allows the use of the ITR for issuing instructions to the PE in Debug state.

In Normal access mode, if there is no overrun or underrun, the following occurs:

For accesses by software:

- Direct writes to [DBGDTRTXint](#) update the value in DTRTX and indirectly write 1 to TXfull.
- Direct reads from [DBGDTRRXint](#) return the value in DTRRX and indirectly write 0 to RXfull.

Software reads TXfull and RXfull using [DBGDSCRint](#).

For accesses by the external debug interface:

- Writes to [EDITR](#) trigger the instruction to be executed if the PE is in Debug state:
 - If the PE is in AArch32 state, this is a T32 instruction. The T32 instruction is a pair of halfwords where the first halfword is taken from the lower 16-bits, and the second halfword is taken from the upper 16-bits.
- Reads of [DBGDTRTX_ELO](#) return the value in DTRTX and indirectly write 0 to TXfull.
- Writes to [DBGDTRTX_ELO](#) update the value in DTRTX and do not change TXfull.
- Reads of [DBGDTRRX_ELO](#) return the value in DTRRX and do not change RXfull.
- Writes to [DBGDTRRX_ELO](#) update the value in DTRRX and indirectly write 1 to RXfull. TXfull and RXfull are visible to the external debug interface in [EDSCR](#).

The PE detects overrun and underrun by the external debug interface, and records errors in [EDSCR](#). {TXU, RXO, ITO, ERR}. See [Flow control of the DCC and ITR registers](#).

See also [Synchronization of DCC and ITR accesses](#).

E4.3.2 Memory access mode

When the PE is in Debug state, *Memory access mode* can be selected to accelerate word-aligned block reads or writes of memory by an external debugger. Memory access mode can be enabled only in Debug state, and no instructions can be issued directly by the debugger when in Memory access mode.

If there is no overrun or underrun when in Memory access mode, an access by the external debug interface results in the following:

- External reads from [DBGDTRTX_ELO](#) cause:
 1. The existing value in DTRTX to be returned. This clears [EDSCR.TXfull](#) to 0.
 2. The equivalent of `LDR W1, [X0], #4`, if in AArch64 state, or `LDR R1, [R0], #4`, if in AArch32 state, to be executed.
 3. The equivalent of the `MSR DBGDTRTX_ELO, X1` instruction, if in AArch64 state, or the `MCR p14, 0, R1, c0, c5, 0` instruction, if in AArch32 state, to be executed.

4. [EDSCR](#).{TXfull, ITE} to be set to {1, 1}, and X1 or R1 to be set to an UNKNOWN value.
- External writes to [DBGDTRRX_EL0](#) cause:
 1. The value in DTRRX to be updated. This sets [EDSCR](#).RXfull to 1.
 2. The equivalent of the instruction `MRS X1, DBGDTRRX_EL0`, if in AArch64 state, or `MRC p14, 0, R1, c0, c5, 0` if in AArch32 state, to be executed.
 3. The equivalent of the instruction `STR W1, [X0], #4`, if in AArch64 state, or `STR R1, [R0], #4`, if in AArch32 state, to be executed.
 4. [EDSCR](#).{RXfull, ITE} to be set to {0, 1}, and X1 or R1 to be set to an UNKNOWN value.
- External reads from [DBGDTRRX_EL0](#) return the last value written to DTRRX.
- External writes to [EDITR](#) generate an overrun error.

During these accesses, [EDSCR](#).{TXfull, RXfull, ITE} are used for flow control.

Note

An overrun or underrun might result in [EDSCR](#).ERR being set to 1 asynchronously to the sequence of operations that are outlined in this section. As this is timing-dependent, it is UNPREDICTABLE when the [EDSCR](#).ERR flag affects the instructions and therefore whether neither instruction, only the first instruction, or both instructions are executed. If the second instruction is executed, then the first instruction must have been executed. However, in each case X1 or R1 is set to an UNKNOWN value. This means that:

- In both cases, if the memory access instruction is not executed, then the base register X0 or R0 is not updated, meaning the debugger can determine the last accessed location.
- In the list describing External reads from [DBGDTRTX_EL0](#), DTRTX and [EDSCR](#).TXfull get set to UNKNOWN values. If the load was executed, then the value that was read by the PE is lost. This means the operation might need to be repeated by the debugger, and it is not advisable to use Memory access mode to read from read-sensitive locations using the underrun and overrun detection for flow control.
- In the list describing External writes to [DBGDTRRX_EL0](#), [EDSCR](#).RXfull is set to an UNKNOWN value.

A Data Abort from the memory access can also set [EDSCR](#).ERR to 1. See [Data Aborts in Memory access mode](#).

The architecture does not require precisely when these flags are set or cleared by the sequence of operations outlined in this section.

The architecture does require that the flags are set as at step 4 when the PE is ready to accept a further read or write without causing an overrun error or an underrun error.

The process outlined in this section represents a simple sequential execution model of Memory access mode. An implementation is free to pipeline, buffer, and reorder instructions and transactions, as long as the following remain true:

- Data items are transferred into and out of the DTR in order and without loss of data, other than as a result of an overrun or an underrun.
- Data Aborts occur in order.
- The constraints of the memory type are met.
- In the list describing [External reads from](#):
 - The MSR equivalent operation at step 3 of the sequence reads the value loaded by step 2.
 - If the list is performed in a loop, for all but the first iteration of this list, the value read by step 1 returns the values written by the MSR equivalent operation at the previous iteration of step 3.
- In the list describing [External writes to](#):
 - The MRS equivalent operation at step 2 of the sequence returns the value written at step 1.
 - The STR equivalent at step 3 of the sequence writes the value read at step 2.
- If the PE cannot accept a read or write, as applicable, during the sequence, then the flags are updated to indicate an overrun or underrun.

See [Flow control of the DCC and ITR registers](#) for more information on overrun and underrun.

E4.3.2.1 Ordering, access sizes and effect on Exclusives monitors

For the purposes of memory ordering, access sizes, and effect on the Exclusives monitor, accesses in Memory access mode are consistent with load/store word instructions executed by the PE.

The simple sequential access model of Memory access mode, as stated in [Memory access mode](#), must also be ordered with respect to instructions executed as a result of External writes to [EDITR](#) in Normal mode both before and after accesses to the DTR registers in Memory access mode.

E4.3.2.2 Data Aborts in Memory access mode

If a memory access generates a Data Abort, then:

- The Data Abort exception is taken. See [Exceptions in Debug state](#):
 - This means [EDSCR.ERR](#) is set to 1, see [Cumulative error flag](#).
 - If the Data Abort occurs on stage 2 of an address translation, then the values returned in the ISV field and in bits[23:14] of the ISS are UNKNOWN.
If EL2 is using AArch32 and this Data Abort is taken to Hyp mode, the ISS is returned by [HSR. ISS encoding for exception from a Data Abort](#) describes the usual encoding of this ISS.
- Register R0 retains the address that generated the abort.
- Register R1 is set to an UNKNOWN value.
- [EDSCR.TXfull](#), for a load, or [EDSCR.RXfull](#), for a store, is set to an UNKNOWN value.
- DTRTX, for a load, or DTRRX, for a store, is set to an UNKNOWN value.
- [EDSCR.ITE](#) is set to 1.

E4.3.2.3 Illegal Execution state exception

If PSTATE.IL is set to 1 when [EDSCR.MA](#) = 1, then on an external write access to [DBGDTRRX_EL0](#) or an external read from [DBGDTRTX_EL0](#), it is CONSTRAINED UNPREDICTABLE whether the PE:

- Takes an Illegal Execution state exception without performing any operations. In this case:
 - [EDSCR.ERR](#) is set to 1, see [Cumulative error flag](#).
 - Register R0 is unchanged.
 - Register R1 is set to an UNKNOWN value.
 - [EDSCR.TXfull](#) or [EDSCR.RXfull](#), as applicable, is set to an UNKNOWN value.
 - DTRTX or DTRRX, as applicable, is set an UNKNOWN value.
 - [EDSCR.ITE](#) is set to 1.
 See also [Exceptions in Debug state](#).
- Ignores PSTATE.IL.

Note

The typical usage model for Memory access mode involves executing instructions in Normal access mode to set up X0 before setting [EDSCR.MA](#) to 1. These instructions generate an Illegal state exception if PSTATE.IL is set to 1.

E4.3.2.4 Alignment constraints

If the address in R0 is not aligned to a multiple of four, the behavior is as follows:

- For each external DTR access a CONSTRAINED UNPREDICTABLE choice of:
 1. The PE makes an unaligned memory access to R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
 2. The PE makes a memory access to $\text{Align}(R[0], 4)$.
 3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
 4. The PE does nothing.
- Following each memory access, if there is no Data Abort, R0 is updated with an UNKNOWN value.
- For external writes to [DBGDTRRX_EL0](#), if the PE writes to memory, an UNKNOWN value is written.
- For external reads of [DBGDTRTX_EL0](#) an UNKNOWN value is returned.
- The RXfull and TXfull flags are left in an UNKNOWN state, meaning that a [DBGDTRTX_EL0](#) read can trigger a TX underrun, and a [DBGDTRTX_EL0](#) write can trigger an RX overrun.

E4.3.3 Memory-mapped accesses to the DCC and ITR

Writes to the flags in [EDSCR](#) by external debug interface accesses to the DCC and the ITR registers are indirect writes, because they are a side-effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see [Register access permissions for memory-mapped accesses](#).

E4.4 Flow control of the DCC and ITR registers

- Ready flags.
- Buffering writes to EDITR.
- Overrun and underrun flags.
- Cumulative error flag.

E4.4.1 Ready flags

In Normal access mode:

- For the DTR registers there are two ready flags:
 - `EDSCR.RXfull` == 1 indicates that `DBGDTRRX_EL0` contains a valid value that has been written by the external debugger and not yet read by software running on the target.
 - `EDSCR.TXfull` == 1 indicates that `DBGDTRTX_EL0` contains a valid value that has been written by software running on the target and not yet read by an external debugger.
- For the ITR register there is a single ready flag:
 - `EDSCR.ITE` == 1 indicates that the PE is ready to accept an instruction to the ITR.

Note

The architecture permits a PE to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, as long as those instructions are discarded if `EDSCR.ERR` is 1, either by an underrun or overrun or by any of the other error conditions described in this architecture, such as an instruction generating an abort.

In Memory access mode:

- `EDSCR.{RXfull, ITE}` == {0, 1} indicates that `DBGDTRRX_EL0` is empty and the PE is ready to accept a word external write to `DBGDTRRX_EL0`.
- `EDSCR.{TXfull, ITE}` == {1, 1} indicates that `DBGDTRTX_EL0` is full and the PE is ready to accept a word external read from `DBGDTRTX_EL0`.

All other values indicate that the PE is not ready, and result in a DTR overrun or underrun error, an ITR overrun error, or both, as defined in [Overrun and underrun flags](#).

`EDSCR.{ITE, RXfull, TXfull}` shows the status of the ITR and DCC registers. It ignores the question of whether a read or write cannot be accepted because, for example, `EDSCR.ERR` is set or the OPTIONAL Software Lock is locked for memory-mapped accesses (`EDLSR.SLK` == 1).

E4.4.2 Buffering writes to EDITR

The architecture permits a processor to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, provided that:

- Those instructions are discarded if `EDSCR.ERR` is set to 1, either by an underrun or an overrun, or by any other error conditions described in this architecture, such as an instruction generating an abort.
- The PE maintains the simple sequential execution model with the order of instructions determined by the order in which the PE accepts the EDITR writes. In particular, the buffered instructions must be executed in the Execution state consistent with a simple sequential execution of the instructions, even if one of the previous instructions is a state changing operation, such as `DCPS` or `DRPS`.

E4.4.3 Overrun and underrun flags

Each of the ready flags has a corresponding overrun or a corresponding underrun flag. These are sticky status flags that are set if the register is accessed using the external debug interface when the corresponding ready flag is not in the ready state.

If the PE is in Debug state and Memory access mode, the corresponding error flag is also set if the PE is not ready to accept an operation because a previous load or store is still in progress. The sticky status flag remains set until cleared by writing 1 to [EDSCR.CSE](#).

Note

The architecture permits a PE to continue to accept and buffer data to write to memory in Memory access mode.

[Table E4-2](#) shows DCC and ITR ready flags and the overrun and underrun flags associated with them.

Table E4-2 DCC and ITR ready flags and the associated overrun/underrun flags

External debug interface access	Overrun/Underrun condition	EDSCR flag
Write DBGDTRRX_EL0	<code>EDSCR.RXfull == '1' (Halted() && EDSCR.MA == '1' && EDSCR.ITE == '0')</code>	RXO
Read DBGDTRTX_EL0	<code>EDSCR.TXfull == '0' (Halted() && EDSCR.MA == '1' && EDSCR.ITE == '0')</code>	TXU
Write EDITR	<code>Halted() && (EDSCR.ITE == '0' EDSCR.MA == '1')</code>	ITO

When an overrun or underrun flag is set to 1, the cumulative error flag, [EDSCR.ERR](#), described in [Cumulative error flag](#), is also set to 1.

In the event of an external write to [DBGDTRRX_EL0](#) or [EDITR](#) generating an overrun, or an external read from [DBGDTRTX_EL0](#) generating an underrun:

- For a write, the written value is ignored.
- For a read, an UNKNOWN value is returned.
- [EDSCR.TXfull](#), [EDSCR.RXfull](#) or [EDSCR.ITE](#), as applicable, are not updated.

There is no overrun or underrun detection on external reads of [DBGDTRRX_EL0](#) or external writes of [DBGDTRTX_EL0](#).

There is no overrun or underrun detection of direct reads and direct writes of the DTR System registers by software:

- If `RXfull == 0`, a direct read of [DBGDTRRXint](#) or [DBGDTR_EL0](#) returns UNKNOWN.
- If `TXfull == 1`, a direct write of:
 - [DBGDTRTXint](#) sets DTRTX to UNKNOWN.
 - [DBGDTR_EL0](#) sets DTRRX and DTRTX to UNKNOWN.

See [DCC accesses in Non-debug state](#) for more information.

E4.4.4 Cumulative error flag

The cumulative error flag, [EDSCR.ERR](#), is set to 1:

- On taking an exception from Debug state.
- On any signaled overrun or underrun in the DCC or ITR.

When [EDSCR.ERR == 1](#):

- External reads of [DBGDTRTX_ELO](#) do not have any side-effects.
- External writes to [DBGDTRRX_ELO](#) are ignored.
- External writes to [EDITR](#) are ignored.
- No further instructions can be issued in Debug state. This includes any instructions previously accepted as external writes to [EDITR](#) that occur in program order after the instruction or access that caused the error.

This allows a debugger to stream data, or, in Debug state, instructions, to the target without having to:

- Check [EDSCR](#).{RXfull, TXfull, ITE} before each access.
- Check [EDSCR](#).{ITO, RXO, TXU} following each access, for overrun or underrun.
- Check PSTATE or other syndrome registers, or both, for an exception following each instruction executed in Debug state that might generate a synchronous exception.

The cumulative error flag remains set until cleared to 0 by writing 1 to [EDRCR.CSE](#). However, the effect of writing 1 to [EDRCR.CSE](#) to clear [EDSCR.ERR](#) is **CONSTRAINED UNPREDICTABLE** when both of the following apply:

- The PE is in Debug state.
- The value of [EDSCR.ITE](#) is 0.

When these conditions apply and a value of 1 is written to [EDRCR.CSE](#), either or both of the following might occur:

- [EDSCR.ERR](#) is not cleared to 0.
- Any instructions in [EDITR](#) that have not been executed might be executed subsequently, rather than being ignored.

Note

This means that a debugger must poll [EDSCR.ITE](#) until it has the value 1, indicating that [EDITR](#) is empty, before writing to [EDRCR.CSE](#) to clear the [EDSCR.ERR](#) flag to 0.

For overruns and underruns, [EDSCR](#).{ITO, RXO, TXU} record the error type.

E4.4.4.1 Pseudocode description of clearing the error flag

The [ClearStickyErrors](#) () pseudocode function is described in [R-profile Architecture Pseudocode](#).

E4.5 Synchronization of DCC and ITR accesses

In addition to the standard synchronization requirements for register accesses, the following subsections describe additional requirements that apply for the DCC and ITR registers:

- [Summary of System register accesses to the DCC.](#)
- [DCC accesses in Non-debug state.](#)
- [Synchronization of DCC interrupt request signals.](#)
- [DCC and ITR access in Debug state.](#)

In these sections, accesses by the external debug interface are referred to as external reads and external writes. Accesses to System registers are referred to as direct reads, direct writes, indirect reads, and indirect writes.

Note

In Synchronization requirements for AArch64 System registers external reads and external writes are described as forms of indirect access. This whole section uses more explicit terminology.

The DTR registers and the DCC flags, TXfull and RXfull, form a communication channel, with one end operating asynchronously to the other. Implementations must respect the ordering of accesses to these registers in order to maintain the correct behavior of the channel.

External reads of, and external writes to [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#) are asynchronous to direct reads of, and direct writes to, [DBGDTRRXint](#), [DBGDTRTXint](#), made by software using System register access instructions. The direct reads and direct writes indirectly write to the DCC flags. The external reads and external writes indirectly read the DCC flags to check for underrun and overrun.

Throughout this section:

- | | |
|------------------|--|
| DCC flags | Means any or all of the following: <ul style="list-style-type: none"> • The EDSCR.{RXfull.TXfull} ready flags. • The EDSCR.RXO overrun flag. • The EDSCR.TXU underrun flag. • The EDSCR.ERR cumulative error flag. |
| ITR flags | Means any or all of the following: <ul style="list-style-type: none"> • The EDSCR.ITE ready flag. • The EDSCR.ITO overrun flag. • The EDSCR.ERR cumulative error flag. |

E4.5.1 Summary of System register accesses to the DCC

System register accesses to the DTR registers are direct reads and writes of those registers, as shown in [Table E4-3](#). Several of these instructions access the same registers using different encodings.

[DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#) are encoded as MRS and MSR accesses respectively to the same System register, even though they access different underlying register values. [DBGDTRRXint](#) and [DBGDTRTXint](#) are similarly encoded as MRC and MCR accesses respectively to the same System register. The encoding means that direct reads and writes using these encodings must be ordered with respect to each other. For more information, see Synchronization requirements for AArch64 System registers and [Synchronization of changes to AArch32 System registers](#).

[Table E4-3](#) shows a summary of System register accesses to the DCC.

Table E4-3 Summary of System register accesses to the DCC

Operation	OS Lock	AArch32 (MRC/MCR)	Description
Read	-	DBGDTRRXint	Direct read of DTRRX. Indirect write to the DCC flags . An STC instruction that reads DBGDTRRXint makes an indirect write to DBGDSCRint.RXfull .
Write	-	DBGDTRTXint	Direct write of DTRTX. Indirect write to the DCC flags . An LDC instruction that writes to DBGDTRTXint using a value read from memory is a direct write to DBGDTRTXint .
Read/write	-	-	Direct read/write of both DTRRX and DTRTX. Indirect write to the DCC flags .
Read	-	DBGDSCRint	Direct read of the DCC flags .
Read/write	-	DBGDTRRXext	Direct read/write of DTRRX.
Read/write	-	DBGDTRTXext	Direct read/write of DTRTX.
Read	Unlocked	DBGDSCRext	Direct read of DCC flags .
Read/write	Locked	DBGDSCRext	Direct read/write of DCC flags .

E4.5.2 DCC accesses in Non-debug state

In Non-debug state DCC accesses are as described in [Normal access mode](#):

- If a direct read of [DBGDSCRint](#) returns $RXfull = 1$, then a following direct read of [DBGDTRRXint](#) returns valid data and indirectly writes 0 to [DBGDSCRint.RXfull](#) as a side-effect.
- If a direct read of [DBGDSCRint](#) returns $TXfull = 0$, then a following direct write to [DBGDTRTXint](#) writes the intended value, and indirectly writes 1 to [DBGDSCRint.TXfull](#) as a side-effect.

No [Context Synchronization event](#) is required between these two instructions. Overrun and underrun detection prevents intervening external reads and external writes affecting the outcome of the second instruction.

The indirect write to the [DCC flags](#) as part of the DTR access instruction is made atomically with the DTR access.

Because a direct read of [DBGDTRRXint](#) is an indirect write to [DBGDSCRint.RXfull](#), it must occur in program order with respect to the direct read of [DBGDSCRint](#), meaning it must not return a speculative value for DTRRX that predates the $RXfull$ flag returned by the read of [DBGDSCRint](#). The direct write to [DBGDTRTXint](#) must not be executed speculatively.

Direct reads of [DBGDTRRXint](#) and [DBGDSCRint](#), must occur in program order with respect to other direct reads of the same register using the same encoding.

The following accesses have an implied order within the atomic access:

- In the simple sequential execution of the program the indirect write of the [DCC flags](#) occurs immediately after the direct DTR access.
- In the simple sequential execution model, for an external read of [DBGDTRRX_EL0](#) or an external write of [DBGDTRTX_EL0](#):
 - The check of the [DCC flags](#) for overrun or underrun occurs immediately before the access.
 - If there is no underrun or overrun, the update of the [DCC flags](#) occurs immediately after the access.
 - If there is underrun or overrun, the update of the DCC underrun or overrun flags occurs immediately after the access.

All observers must observe the same order for accesses.

Note

These requirements do not create order where order does not otherwise exist. It applies only for ordered accesses.

Without explicit synchronization following external writes and external reads:

- The value written by the external write to [DBGDTRRX_EL0](#) that does not overrun, must be observable to direct reads of [DBGDTRRXint](#) in finite time.
- The [DCC flags](#) that are updated as a side-effect of the external write or external read must be observable:
 - To subsequent external reads of [EDSCR](#).
 - To subsequent external reads of [DBGDTRRX_EL0](#) when checking for underrun.
 - To subsequent external writes to [DBGDTRTX_EL0](#) when checking for overrun.
 - To direct reads of [DBGDSCRint](#) in finite time.

However, explicit synchronization is required to guarantee that a direct read of [DBGDSCRint](#) returns up-to-date [DCC flags](#). This means that if a signal is received from another agent that indicates that [DBGDSCRint](#) must be read, an [ISB](#) is required to ensure that the direct read of [DBGDSCRint](#) occurs after the signal has been received. This also synchronizes the value in [DBGDTRRXint](#), if applicable. However, if that signal is an interrupt exception triggered by [COMMIQ](#), [COMMTX](#), or [COMMRX](#), the exception entry is sufficient synchronization. See [Synchronization of DCC interrupt request signals](#).

Explicit synchronization is required following a direct read or direct write:

- To ensure that a value directly written to [DBGDTRTXint](#) is observable to external reads of [DBGDTRTX_EL0](#).
- To ensure that a value directly written to [DBGDTR_EL0](#) is observable to external reads of [DBGDTRTX_EL0](#) and [DBGDTRRX_EL0](#).
- To guarantee that the indirect writes to the [DCC flags](#) that were a side-effect of the direct read or direct write have occurred, and therefore that the updated values are:
 - Observable to external reads of [EDSCR](#).
 - Observable to external reads of [DBGDTRRX_EL0](#) when checking for underrun.
 - Observable to external writes of [DBGDTRTX_EL0](#) when checking for overrun.
 - Returned by a following direct read of [DBGDSCRint](#).

See also [Memory-mapped accesses to the DCC and ITR](#) and [Synchronization of changes to the external debug registers](#).

Note

These ordering rules mean that software:

- Must not read [DBGDTRRXint](#) or [DBGDTR_EL0](#) without first checking [DBGDSCRint.RXfull](#) or if the previously-read value of [DBGDSCRint.RXfull](#) is 0.
It is not sufficient to read both registers and then later decide whether to discard the read value, as there might be an intervening write from the external debug interface.
 - Must not write [DBGDTRTXint](#) or [DBGDTR_EL0](#) without first checking [DBGDSCRint.TXfull](#) or if the previously-read value of [DBGDSCRint.TXfull](#) is 1.
The write to [DBGDTRTXint](#) overwrites the value in [DTRTX](#), and the external debugger might or might not have read this value.
 - Must ensure there is an explicit [Context Synchronization event](#) following a DTR access, even if not immediately returning to read [DBGDSCRint](#) again. This synchronization operation might be an exception return.
-

E4.5.2.1 Derived requirements

The rules for DCC accesses in Non-debug state are as follows:

- Following a direct read of [DBGDTRRXint](#) when [RXfull](#) is 1:
 - If an external write to [DBGDTRRXint](#) checks the [RXfull](#) flag for overrun and observes that the value of [RXfull](#) is 0, the value returned by the previous direct read must not be affected by the external write.

- If an external read of [EDSCR](#) returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by a following external write to [DBGDTRRXint](#), and the following external write does not overrun.
- Following a direct write to [DBGDTRTXint](#), when TXfull is 0:
 - If an external read of [DBGDTRTXint](#) checks the TXfull flag for underrun and observes that the value of TXfull is 1, the value returned by the external read must be the value written by the previous direct write.
 - If an external read of [EDSCR](#) returns a TXfull value of 1, then the value returned by a following external read of [DBGDTRRXint](#) must be the value written by the previous direct read, and the subsequent external read will not underrun.
- Following an external read of [DBGDTRTXint](#) that does not underrun, if a direct read of [DBGDSCRint](#) returns a TXfull value of 0, then the value returned by the external read must not be affected by a following direct write to [DBGDTRTXint](#).
- Following a first external read [DBGDTRRXint](#) and a following second external read of [DBGDTRTXint](#) that does not underrun, if a direct read of [DBGDSCRint](#) returns a TXfull value of 0, then the values returned by the external reads must not be affected by a following direct write to [DBGDTR_EL0](#).
- Following an external write to [DBGDTRRXint](#) that does not overrun, if a direct read of [DBGDSCRint](#) returns an RXfull value of 1, then the value returned by a following direct read of [DBGDTRRXint](#) or [DBGDTR_EL0](#) must be the value written by the previous external write.
- Following a first external write to [DBGDTRTXint](#) and a following second external write to [DBGDTRRXint](#) that does not overrun, if a direct read of [DBGDSCRint](#) returns an RXfull value of 1, then the value returned by a subsequent direct read of [DBGDTR_EL0](#) must return the values written by the previous external writes.

E4.5.3 Synchronization of DCC interrupt request signals

Following an external read or external write access to the DTR registers, the interrupt request signals, **COMMIRQ**, **COMMTX**, and **COMMRX**, must be updated in finite time without explicit synchronization.

The updated values must be observable to a direct read of [DBGDSCRint](#) or [DBGDTRRXint](#), or a direct write of [DBGDTRTXint](#) executed after taking an interrupt exception generated by the interrupt request. The updated values must also be observable to a direct write of [DBGDTRTXint](#) executed after taking an interrupt exception generated by the interrupt request.

Note

The requirement that indirect writes to registers are observable to direct reads in finite time does not imply that all observers will observe the indirect write at the same time. For more information, see [Synchronization of changes to AArch32 System registers](#).

Following a direct read of [DBGDTRRXint](#) or a direct write to [DBGDTRRXint](#), software must execute a [Context Synchronization event](#) to guarantee the interrupt request signals have been updated in finite time. This synchronization operation can be an exception return.

E4.5.4 DCC and ITR access in Debug state

In Debug state, stricter observability rules apply for instructions issued through the ITR, to maintain communication between a debugger and the PE, without requiring excessive explicit synchronization.

In Normal access mode, without explicit synchronization:

- A direct read or direct write of the DTR registers by an instruction written to [EDITR](#) must be observable to an external write or an external read in finite time:
 - A direct read of [DBGDTRRXint](#) must be observable to an external write of [DBGDTRRX_EL0](#).
 - A direct read of [DBGDTR_EL0](#) must be observable to an external write of [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#).
 - A direct write of [DBGDTRTXint](#) must be observable to an external read of [DBGDTRTX_EL0](#).
 - A direct write of [DBGDTR_EL0](#) must be observable to an external read of [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#).

This includes the indirect write to the [DCC flags](#) that occurs atomically with the access as described in [DCC accesses in Non-debug state](#).

The subsequent external write or external read must observe either the old or the new values of both the DTR contents and [DCC flags](#). If the old values are observed, this typically results in overrun or underrun, assuming the old values of the [DCC flags](#) indicate an overrun or underrun condition, as would normally be the case.

This means the debugger can observe the direct read or direct write without explicit synchronization and without explicitly testing the [DCC flags](#) in [EDSCR](#), because it can rely on overrun and underrun tests.

- External reads of [DBGDTRTX_EL0](#) that do not underrun and external writes to [DBGDTRRX_EL0](#) that do not overrun must be observable to an instruction subsequently written to [EDITR](#) on completion of the first external access. This includes the indirect write to the [DCC flags](#).

This means that without explicit synchronization and without the need to first check the [DCC flags](#) in [DBGDSCRint](#):

- If the instruction is a direct read of [DBGDTRRXint](#), it observes the external write.
- If the instruction is a direct write of [DBGDTRTXint](#), it observes the external read.
- Writes to [EDITR](#) that do not overrun commit an instruction for execution immediately. The instruction must complete execution in finite time without requiring any further operation by the debugger.
- After an external write to the [EDITR](#), the [ITR flags](#) that are updated as a side effect of that write must be observable by:
 - An external read of the [EDSCR](#) that follows the external write to the [EDITR](#).
 - When checking for overrun, another external write to the [EDITR](#) that follows the original external write to the [EDITR](#).

In Memory access mode, these requirements shift to the instructions implicitly executed by external reads and external writes of the DTR registers, as described in [Memory access mode](#).

E4.6 Interrupt-driven use of the DCC

Arm recommends implementations provide a level-sensitive DCC interrupt request through the IMPLEMENTATION DEFINED interrupt controller as a Private Peripheral Interrupt for the originating PE.

Note

- In addition to connection to the interrupt controller Arm also recommends **COMMIRQ**, **COMMTX**, and **COMMRX** signals that might be implemented for use by any legacy system peripherals.
 - GICv3 reserves a Private Peripheral Interrupt number for the **COMMIRQ** interrupt.
-

The [DBGDCCINT](#) register provides a first level of interrupt masking within the PE, meaning only a single interrupt source, **COMMIRQ**, is needed at the interrupt controller.

See also [Synchronization of DCC interrupt request signals](#).

E4.7 Pseudocode description of the operation of the DCC and ITR registers

The basic operation of the DCC and ITR registers is shown by the following pseudocode functions. These functions do not cover the behavior when `DBGOSLSR.OSLK == 1`, meaning that the OS Lock is locked:

- `Write_DBGDTR_EL0()`.
- `Write_DBGDTRRX_EL0()`.
- `Write_DBGDTRTX_EL0()`.
- `Write_EDITR()`.
- `CheckForDCCInterrupts()`.

For the definition of the DTR Registers, see [shared/debug/dccanditr/DTR](#).

Chapter E5

The Embedded Cross-Trigger Interface

This chapter describes the Embedded Cross-Trigger interface. It contains the following sections:

- [About the Embedded Cross-Trigger](#)
- [Basic operation on the ECT](#)
- [Cross-triggers on a PE in an Arm R-profile implementation](#)
- [Description and allocation of CTI triggers](#)
- [CTI registers programmers' model](#)
- [Examples](#)

E5.1 About the Embedded Cross-Trigger

The *Embedded Cross-Trigger* (ECT) allows a debugger to:

- Send trigger events to a PE. For example, this might be done to halt the PE.
- Send a trigger event to one or more PEs, or other system components, when a trigger event occurs on another PE or system component. For example, this might be done to halt all PEs when one individual PE halts.

Figure E5-1 shows the logical structure of an ECT.

Figure E5-1 Structure of an Embedded Cross-Trigger

The ECT can deliver many types of trigger events, which are described in the following sections:

- [Debug request trigger event.](#)
- [Restart request trigger event.](#)
- [Cross-halt trigger event.](#)
- [Performance Monitors overflow trigger event.](#)
- [Generic trace external input trigger events.](#)
- [Generic trace external output trigger events.](#)
- Generic CTI interrupt trigger event.

From the introduction of Armv8, an implementation must:

- Include a Cross-Trigger interface, CTI.
- Implement at least the input and output triggers defined in this architecture.

In addition, see .

Arm recommends that this Cross-Trigger interface includes:

- The ability to route trigger events between Trace Units, which typically have advanced event triggering logic.
- An output trigger to the interrupt controller.

Also, Arm recommends that the Embedded Cross-Trigger includes the capability to send and receive IMPLEMENTATION DEFINED system trigger events to and from other system components, including a system counter, using a system CTI. See [Halt-on-debug](#).

Note

The ECT and CTI must only signal trigger events for external debugging. They must not route software events, such as interrupts. For example, the Performance Monitors overflow input trigger is provided to allow entry to Debug state on a counter overflow, and the output trigger to the interrupt controller is provided to generally allow events from the external debug subsystem to be routed to a software agent. However, the combination of the two must not be used as a mechanism to route Performance Monitors overflows to an interrupt controller.

Note

CTI version 1 (CTIv1) is defined by the *CoreSight™ SoC Technical Reference Manual*. CTIv2 extends CTIv1 with the addition of the input channel gate. See Implementation with CTIv2.

E5.1.1 Implementation with a CoreSight CTI

For details of the recommended connections for an A-profile implementation, see Recommended External Debug Interface. See also *CoreSight™ SoC Technical Reference Manual*.

E5.2 Basic operation on the ECT

The ECT comprises a Cross-Trigger Matrix, CTM, and one Cross-Trigger Interface, CTI, for each PE. The ECT might also include other CTIs for other system components. The CTM passes events between the CTI blocks over channels. The CTM can have a maximum of 32 channels.

The main interfaces of the Cross-Trigger interface, CTI, are:

- The input triggers:
 - These are trigger event inputs from the PE to the CTI.
- The output triggers:
 - These are trigger event outputs from the CTI to the PE.
- The input channels:
 - These are channel event inputs from the Cross-Trigger matrix, CTM, to the CTI.
- The output channels:
 - These are channel event outputs from the CTI to the CTM.

Each CTI block has:

- Up to 32 input triggers that come from the PE:
 - The input triggers are numbered 0-31.
- Up to 32 output triggers that go to the PE:
 - The output triggers are numbered 0-31.

If the CTI is not powered up when the Core power domain is powered up, the CTI ignores all input triggers and input channel events, and does not generate any output triggers or output channel events.

[Figure E5-2](#) shows the logical internal structure of a CTI.

Figure E5-2 Structure of a Cross-Trigger interface

Note

- The number of triggers is IMPLEMENTATION DEFINED. Figure E5-2 shows eight input and eight output triggers.
- The number of channels is IMPLEMENTATION DEFINED. Figure E5-2 shows four channels.
- In Figure E5-2 the input channel gate function is a CTIv2 feature.

When the CTI receives an input trigger event, this generates channel events on one or more internal channels, according to the *mapping function* defined by the *Input trigger→output channel mapping registers*, *CTIINEN<n>*.

The CTI also contains an *application trigger* and *channel pulse* to allow a debugger to create channel events directly on internal channels by writing to the CTI control registers.

Channel events on each internal channel are passed to a corresponding output channel that is controlled by a *channel gate*. The channel gate can block propagation of channel events from an internal channel to an output channel.

Note

If the CTM is implemented:

- The gate function must be implemented.
 - If the CTI is CTIv1, the gate function applies to output triggers only.
-

The output channels from a CTI are combined, using a logical OR function, with the output channels from all other CTIs to form the input channels on other CTIs. The input channels of this CTI are the logical OR of the output channels on all other CTIs. This is the *Cross-Trigger Matrix*, CTM. Therefore, the number of input channels must equal the number of output channels.

Note

The number of input triggers and output triggers is not required to be the same.

The internal channels form an internal Cross-Trigger matrix within the CTI. This delivers events directly from the input triggers to the output triggers. Therefore the number of internal channels is the same as the number of input and output channels on the external CTM, and there is a direct mapping between the two.

Channel events received on each input channel are passed to the corresponding internal channel. It is IMPLEMENTATION DEFINED whether the Cross-Trigger gate also blocks propagation of channel events from input channels to internal channels.

Note

If CTIv2 is implemented, the Cross-Trigger gate also blocks propagation of channel events from input channels to internal channels.

When the CTI receives a channel event on an internal channel this generates trigger events on one or more output triggers, according to the mapping function defined by the *Input channel* → *output trigger mapping registers*, [CTIOUTEN<n>](#).

The CTI contains the input and output trigger interfaces to the PE and the interface of the Cross-Trigger matrix. The architecture does not define the signal protocol used on the trigger interfaces, and:

- It is IMPLEMENTATION DEFINED whether the CTI supports multicycle input trigger events.
- It is IMPLEMENTATION DEFINED whether the CTM supports multicycle channel events.

See [Multicycle events](#).

However, an output trigger is asserted until acknowledged. The output trigger can be:

- Self-acknowledging. This means that no further action is required from the debugger.
- Acknowledged by the debugger writing 1 to the corresponding bit of [CTIINTACK](#).

The time taken to propagate a trigger event from the first PE, through its CTI, across the CTM to another CTI, and thereby to a second PE is IMPLEMENTATION DEFINED.

Note

Arm recommends that this path is not longer than the shortest software communication path between those PEs. This is because if the first PE halts, the Cross-halt trigger event can propagate through the ECT and halt the second PE without causing software on the second PE to malfunction because the first PE is in Debug state and is not responding.

E5.2.1 Multicycle events

A multicycle event is one with a continuous state that might persist over many cycles, as opposed to a discrete event. A typical implementation of a multicycle event is a level-based signal interface, whereas a discrete event might be implemented as a pulse signal or message.

CTI support for multicycle trigger events is IMPLEMENTATION DEFINED. Use of multicycle trigger events is deprecated. Of the architecturally defined input trigger events, the Performance Monitors overflow trigger event and Generic trace external output trigger events can be multicycle input triggers.

CTM support for multicycle channel events is IMPLEMENTATION DEFINED. A CTM that does not support multicycle channel events cannot propagate a multicycle trigger event between CTIs.

Note

A full ECT might comprise a mix of CTIs, some of which can support multicycle trigger events. In bridging these components, multicycle channel events become single channel events at the boundary between the CTIs.

E5.2.1.1 An ECT that supports multicycle trigger events

When an ECT supports multicycle trigger events, an input trigger event to the CTI continuously asserts channel events on all output channels mapped to it until either:

- The input trigger event is removed.
- The channel mapping function is disabled.

This means that an input trigger that is asserted for multiple cycles causes any channels that are mapped to it to become active for multiple cycles. Consequently, any output triggers mapped from that channel are asserted for multiple cycles.

Note

The output trigger remains asserted for at least as long as the channel remains active. This means that even if the output trigger is acknowledged, it remains asserted until the channel deactivates.

The CTI does not guarantee that these events have precisely the same duration, as the triggers and channels can cross between clock domains.

[CTIAPPSET](#) and [CTIAPPCLEAR](#) can set a channel active for multiple cycles. [CTIAPPULSE](#) generates a single channel event. [CTICHINSTATUS](#) and [CTICHOUTSTATUS](#) can report whether a channel is active.

E5.2.1.2 An ECT that does not support multicycle trigger events

When an ECT does not support multicycle trigger events, an input trigger event to the CTI generates a single channel event on all output channels mapped to it, regardless of how long the input trigger event is asserted.

This means that an input trigger event that is asserted for multiple cycles generates a single channel event on any channels mapped to it. Consequently any self-acknowledging output triggers mapped from those channels are single trigger events.

Note

A single event is typically a single cycle, but there is no guarantee that this is always the case.

[CTIAPPSET](#) and [CTIAPPCLEAR](#) can only generate a single channel event. [CTIAPPULSE](#) generates a single channel event. If the ECT does not support multicycle channel events, use of [CTIAPPSET](#) and [CTIAPPCLEAR](#) is deprecated, and the debugger must only use [CTIAPPULSE](#). [CTICHINSTATUS](#) and [CTICHOUTSTATUS](#) must be treated as UNKNOWN.

E5.3 Cross-triggers on a PE in an Arm R-profile implementation

An R-profile PE must include a Cross-Trigger interface, and the implementation must include at least the input and output triggers defined in this architecture. The number of channels in the Cross-Trigger matrix is IMPLEMENTATION DEFINED, but there must be a minimum of three. Software can read `CTIDEVID.NUMCHAN` to discover the number of implemented channels.

The CTM must connect to all PEs in the same Inner Shareability domain as the PE that includes the Cross-Trigger interface, but can also connect to additional PEs. Arm strongly recommends that the CTM connects all PEs implementing a CTI in the system. This includes other PEs that can be connected using a CoreSight CTI module.

Note

In a uniprocessor system the CTM is OPTIONAL. In a multiprocessor system the CTM is required. The CTM might be connected other CTI modules for non-PEs, such as triggers for system visibility components. Arm recommends that the CTM is implemented.

Any CTI connected to a PE that is not an Arm PE must implement at least:

- The Debug request trigger event.
- The Restart trigger event.
- The Cross-halt trigger event.

For more information about the CTI, see the *CoreSight™ SoC Technical Reference Manual*. Arm architecture refines the generic CTI by defining roles for each of the implemented input and output triggers.

E5.4 Description and allocation of CTI triggers

Table E5-1 shows the output trigger events defined by the architecture and the related trigger numbers.

Table E5-1 Allocation of CTI output trigger events

Number	Source	Destination	Event description
0	CTI	PE	Debug request trigger event
1	CTI	PE	Restart request trigger event
2	CTI	IRQ controller	Generic CTI interrupt trigger event
3	-	-	Reserved
4 - 7	CTI	Trace unit	OPTIONAL Generic trace external input trigger events
8 - 15	-	-	Reserved

Note
Output triggers from the CTI are inputs to other blocks.

Table E5-2 shows the input trigger events defined by the architecture and the related trigger numbers.

Table E5-2 Allocation of CTI input trigger events

Number	Source	Destination	Event description
0	PE	CTI	Cross-halt trigger event
1	PE	CTI	Performance Monitors overflow trigger event
2	-	-	Reserved
3	-	-	Reserved
4 - 7	Trace unit	CTI	OPTIONAL Generic trace external output trigger events
8 - 10	-	-	Reserved
11 - 15	-	-	IMPLEMENTATION DEFINED.

Note
Input triggers to the CTI are outputs from other blocks.

Table E5-1 and Table E5-2 show the minimum set of trigger events defined by the architecture. However:

- The Generic trace external input and output trigger events are required only if the OPTIONAL trace unit is implemented. If the OPTIONAL trace unit is not implemented, these trigger events are reserved.
- Support for the generic CTI interrupt trigger event is IMPLEMENTATION DEFINED because details of interrupt handling in the system, including any interrupt controllers, are IMPLEMENTATION DEFINED. Details regarding how the CTI interrupt is connected to an interrupt controller and its allocated interrupt number lie outside the scope of the architecture. Arm strongly recommends that implementations provide a means to generate interrupts based on external debug events.
- The other trigger events are required by the architecture.

E5.4.1 Debug request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to force the PE into Debug state. The trigger event is asserted until acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to [CTIINTACK](#)[0].

Note

A debugger must poll [CTITRIGOUTSTATUS](#)[0] until it reads as 0, to confirm that the output trigger has been deasserted before generating any event that must be ordered after the write to [CTIINTACK](#), such as a write to [CTIAPPPULSE](#) to activate another trigger.

If the PE is already in Debug state, the PE ignores the trigger event, but the CTI continues to assert it until it is removed by the debugger. See also [External Debug Request debug event](#).

E5.4.2 Restart request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to request the PE to exit Debug state. If the PE is in Non-debug state, the request is ignored by the PE.

If a Restart request trigger event is received at or about the same time as the PE enters Debug state, it is CONstrained UNPREDICTABLE whether:

- The request is ignored by the PE. In this case the PE enters Debug state and remains in Debug state.
- The PE enters Debug state and then immediately restarts.

Debuggers must program the CTI to send Restart request trigger events only to PEs that are halted. To enable the PE to disambiguate discrete Restart request trigger events, after sending a Restart request trigger event, the debugger must confirm that the PE has restarted and halted before sending another Restart request trigger event. Debuggers can use [EDPRSR](#).{SDR, HALTED} to determine the Execution state of the PE.

Note

Before generating a Restart request trigger event for a PE, a debugger must ensure any Debug request trigger event targeting that PE is cleared. [Debug request trigger event](#) describes how to do this.

The trigger event is self-acknowledging, meaning that the debugger requires no further action to remove the trigger event. The trigger event is acknowledged even if the request is ignored by the PE. See also [Exiting Debug state](#).

E5.4.3 Cross-halt trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted by a PE when it is entering Debug state.

Note

To reduce the latency of halting, Arm recommends that an implementation issues the Cross-halt trigger event early in the committed process of entering Debug state. This means that there is no requirement to wait until all aspects of entry to Debug state have completed before issuing the trigger event. Speculative emission of Cross-halt trigger events is not allowed. The Cross-halt trigger event must not be issued early enough for a subsequent Debug request trigger event, which might be derived from the Cross-halt trigger event, to be recorded in the [EDSCR](#).STATUS field. This applies to Debug request trigger events that are acting as inputs to the PE.

E5.4.4 Performance Monitors overflow trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted each time the PE records a Performance Monitors counter overflow. See [The Performance Monitors Extension](#).

If the CTI supports multicycle trigger events, then the trigger event remains asserted while any of the following are true, and deasserted otherwise:

- An event counter <n> is implemented, the global enable control for the event counter is 1, `PMINTENSET.P[n]` is 1, and `PMOVSSSET.P[n]` is 1. The global enable control is defined in [Enabling PMU counters](#).
- `PMCR.E` is 1, `PMINTENSET.C` is 1, and `PMOVSSSET.C` is 1.

Note

- This does not replace the recommended connection of Performance Monitors overflow trigger event to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI.
 - Events can be counted when `ExternalNoninvasiveDebugEnabled()` == FALSE, and, in Secure state, when `ExternalSecureNoninvasiveDebugEnabled()` == FALSE. Secure software must be aware that overflow trigger events are nevertheless visible to the CTI.
-

If the CTI does not support multicycle trigger events, then the trigger event is asserted whenever a counter overflows, causing the PE to set `PMOVSSSET.P[n]` to 1, or a direct write to a System register means the above conditions become true.

For more information, see [An ECT that supports multicycle trigger events](#).

E5.4.5 Statistical Profiling Extension sample trigger event

If the Statistical Profiling Extension is implemented, and a sample record is written to memory, CTI input trigger 2 is asserted. This trigger might also be directly connected to other IMPLEMENTATION DEFINED debug features.

For more information, see The Statistical Profiling Extension.

E5.4.6 Generic trace external input trigger events

These are output trigger events from the CTI, and input trigger events to the OPTIONAL trace unit, that are used in conjunction with the Generic trace external output trigger events to pass trigger events between:

- The PE and the OPTIONAL trace unit.
- The OPTIONAL trace unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external input trigger events.

The trigger events are self-acknowledging. This means that the debugger does not have to take any further action to remove the events.

E5.4.7 Generic trace external output trigger events

These are input trigger events to the CTI, and output trigger events from the OPTIONAL trace unit, used in conjunction with the Generic trace external input trigger events to pass trigger events between:

- The PE and the OPTIONAL trace unit.
- The OPTIONAL trace unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external output trigger events.

E5.5 CTI registers programmers' model

The CTI registers programmers' model is described in [About the External Debug Registers](#). The following sections contain information specific to the CTI:

- [External debug register resets](#).
- [External debug interface register access permissions](#).
- [Cross-trigger interface registers](#).
- The individual register descriptions in [Cross-Trigger Interface registers](#).

See also [Memory-mapped accesses to the external debug interface](#).

E5.5.1 CTI reset

An External Debug reset resets the CTI. See [External debug register resets](#) for details of CTI register resets. All CTI output triggers and output channels are deasserted on an External Debug reset.

Note

An indirect read of an output trigger might not observe the deasserted state until the processor is Cold reset. For more information, see [Synchronization of changes to the external debug registers](#).

E5.5.2 CTI authentication

The CTI ignores the state of the IMPLEMENTATION DEFINED authentication interface. This means that:

- [CTITRIGINSTATUS](#) shows the status of the input triggers and [CTICHINSTATUS](#) shows the status of the input channels, regardless of the value of [ExternalNoninvasiveDebugEnabled\(\)](#).

Note

The PE does not generate the Cross-halt trigger event and the trace unit does not generate Generic trace external output trigger events when [ExternalNoninvasiveDebugEnabled\(\)](#) == FALSE. However, the PE can generate Performance Monitors overflow trigger events.

- The CTI can generate external triggers regardless of the value of [ExternalInvasiveDebugEnabled\(\)](#) and [ExternalNoninvasiveDebugEnabled\(\)](#).

Note

The destination of the trigger is responsible for authenticating the trigger request:

- The PE ignores Debug request events when [ExternalInvasiveDebugEnabled\(\)](#) is FALSE.
 - It is IMPLEMENTATION DEFINED whether the PE ignores Restart request trigger events when [ExternalInvasiveDebugEnabled\(\)](#) is FALSE.
 - The trace unit ignores Generic trace external input trigger events when [ExternalNoninvasiveDebugEnabled\(\)](#) is FALSE.
 - The behavior of Generic CTI interrupt requests is part of the IMPLEMENTATION DEFINED handling of these interrupts, but it is permissible for an interrupt controller to receive these requests even when [ExternalInvasiveDebugEnabled\(\)](#) is FALSE, meaning software might need to configure the interrupt controller to ignore these requests.
-

E5.6 Examples

The CTI is fully programmable and allows for flexible cross-triggering of events within a PE and between PEs in a multiprocessor system. For example:

- The Cross-halt trigger event and the Debug request trigger event can be used for cross-triggering in a multiprocessor system.
- The Cross-halt trigger event and the Generic interrupt trigger event can be used for event-driven debugging in a multiprocessor system.
- The Performance Monitors overflow trigger event and the Debug request trigger event can force entry to Debug state on overflow of a Performance Monitors event counter, for event-driven profiling.

Note

This does not replace the recommended connection of Performance Monitors overflow trigger events to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI. Arm recommends that the Performance Monitors overflow signal is directly available as a local interrupt source.

- The Generic trace external input and Generic trace external output trigger events can pass trace events into and out of the event logic of the trace unit. They can do this:
 - To pass trace events between Trace Units.
 - In conjunction with the Performance Monitors overflow trigger event, to couple the Performance Monitors to the PE trace unit.
 - In conjunction with the Debug request trigger event, to trigger entry to Debug state on a trace event.
 - In conjunction with other CTIs, to signal a trace trigger event onto a CoreSight trace interconnect.

The following sections describe some examples in more detail:

- [Example E5-1.](#)
- [Example E5-2.](#)
- [Example E5-3.](#)
- [Example E5-4.](#)

Example E5-1 Halting a single PE

To halt a single PE, set:

1. [CTIGATE](#)[0] to 0, so that the CTI does not pass channel events on internal channel 0 to the CTM.
2. [CTIOUTEN0](#)[0] to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 0.

Note

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instance of [CTIOUTEN<n>](#) for which <n> is 0.

3. [CTIAPPULSE](#)[0] to 1, to generate a channel event on channel 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to [CTIINTACK](#)[0], before restarting the PE.

Example E5-2 Halting all PEs in a group when any one PE halts

To program a group of PEs so that when one PE in the group halts, all of the PEs in that group halt, set the following registers for each PE in the group:

1. **CTIGATE**[2] to 1, so that each CTI passes channel events on internal channel 2 to the CTM.
2. **CTIINEN0**[2] to 1, so that each CTI generates a channel event on channel 2 in response to a Cross-halt trigger event.
3. **CTIOUTEN0**[2] to 1, so that each CTI generates a Debug request trigger event in response to a channel event on channel 2.

Note

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instances of **CTIINEN**<n> and **CTIOUTEN**<n> for which <n> is 0.

When a PE has halted, clear the Debug request trigger event by writing a value of 1 to **CTIINTACK**[0], before restarting the PE.

Example E5-3 Synchronously restarting a group of PEs

To restart a group of PEs, for each PE in the group:

1. If the PE was halted because of a Debug request trigger event, the debugger must ensure the trigger event is deasserted. It can do this by:
 - a. Writing 1 to **CTIINTACK**[0] to clear the Debug request trigger event.
 - b. Polling **CTITRIGOUTSTATUS**[0], until it reads as 0, to confirm that the trigger event has been deasserted.
2. Set **CTIGATE**[1] to 1, so that each CTI passes channel events on internal channel 1 to the CTM.
3. Set **CTIOUTEN1**[1] to 1, so that each CTI generates a Restart request trigger event in response to a channel event on channel 1.

Note

This example must use the instance of **CTIOUTEN**<n> for which <n> is 1.

4. Set **CTIAPPPULSE**[1] to 1 on any one PE in the group, to generate a channel event on channel 1.

Example E5-4 Halting a single PE on Performance Monitors overflow

To halt a single PE on a Performance Monitors overflow set:

1. `CTIGATE[3]` to 0, so that the CTI does not pass channel events on internal channel 3 to the CTM.
2. `CTIINEN1[3]` to 1, so that the CTI generates a channel event on channel 3 in response to a Performance Monitors overflow trigger event.

Note

This step of this example must use the instance of `CTIINEN<n>` for which `<n>` is 1.

3. `CTIOUTEN0[3]` to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 3.

Note

This step of this example must use the instance of `CTIOUTEN<n>` for which `<n>` is 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to `CTIINTACK[0]`, before restarting the PE. Clear the overflow status by writing to `PMOVSCLR_EL0`.

Chapter E6

Debug Reset and Powerdown Support

This chapter describes the reset and powerdown support in the Debug architecture. It contains the following sections:

- [About Debug over powerdown](#)
- [Power domains and debug](#)
- [Core power domain power states](#)
- [Powerup request mechanism](#)
- [Emulating low-power states](#)
- [Debug OS Save and Restore sequences](#)
- [Reset and debug](#)

E6.1 About Debug over powerdown

Arm A-profile external debug defines a logical model for the hardware on which a PE executes. This hardware is logically split into the *Core power domain* and the *Debug power domain*, and the model contains descriptions of the states of those domains. See:

- [Power domains and debug.](#)
- [Core power domain power states.](#)

An implementation may allow power domains to be powered up and down independently. Debug over powerdown provides:

- A facility for software executing on the PE to save and restore the PE state on behalf of a self-hosted or external debugger or both. See [Debug OS Save and Restore sequences.](#)
- A facility for an external debugger to request power up of the Core power domain. See [Powerup request mechanism.](#)
- A facility for an external debugger, or software executing on the PE, to request emulation of powerdown of the Core power domain. See [Emulating low-power states.](#)

E6.2 Power domains and debug

Arm A-profile external debug has two logical power domains, each with its own reset:

- The Debug power domain contains the interface between the PE and the external debugger, and is powered up whenever an external debugger is connected to the SoC. It remains powered up while the external debugger is connected. When the Core power domain is completely off or in a low-power state, a debugger is permitted to access a register that is implemented in the Debug power domain. Registers in this domain are reset by an External Debug reset.
- The Core power domain contains the rest of the PE, and might be allowed to power up and power down independently of the Debug power domain.

Note

- The model of two logical power domains has an impact on the reset and access permission requirements of the debug programmers' model.
 - The power domains are described as logical because the architecture defines the requirements but does not require two physical power domains. Any power domain split that meets the requirements of the programmers' model is a valid implementation.
-

The Core power domain contains several types of registers:

- Non-debug logic refers to all registers and logic that are not associated with debug.
- Self-hosted debug logic refers to registers and logic associated solely with the self-hosted debug aspects of the architecture.
- Shared debug logic refers to registers and logic associated with both the self-hosted and external debug aspects of the architecture.
- External debug logic refers to registers and logic associated solely with the external debug aspects of the architecture.

For information about which groups of registers and components are in each power domain, and which registers change power domain if FEAT_DoPD is implemented, see:

- [Access permissions for the External debug interface registers.](#)
- [Cross-trigger interface registers.](#)
- Management register access permissions.
- [Access permissions for external views of the Performance Monitors.](#)

E6.3 Core power domain power states

The Arm architecture does not define the power states of the PE as these are not normally visible to software. However, they are visible to the external debugger. Arm A-profile external debug uses a four logical power states model for the Core power domain. Mechanisms for entering a low-power state describes the architectural mechanisms for entering low-power states.

When the PE enters a low-power state other than Powerdown by executing an instruction, it remains in that low-power state until it receives a wakeup event. See Mechanisms for entering a low-power state for the definition of wakeup events. When halting is allowed, an External Debug Request is a wakeup event. In addition, if the PE enters the Standby state for any reason, it will leave that state to service an External Debug Request debug event.

The four logical power states are as follows:

Normal	The Core power domain is fully powered up and the debug registers are accessible.
Standby	The Core power domain is on, but there are measures to reduce energy consumption. There can be other IMPLEMENTATION DEFINED measures the OS can take to enter standby. The PE preserves the PE state, including the debug logic state. Changing from standby to normal operation does not involve a reset of the PE. Standby is the least invasive OS energy saving state. Standby implies only that the PE is unavailable and does not clear any debug settings. For standby, the Debug architecture requires only the following: • If the external debug interface is accessed, the PE must respond to that access. Arm recommends that, if the PE executed a <code>WFI</code> or <code>WFE</code> instruction to enter standby, then it does not retire that instruction. Standby is transparent, meaning that to software and to an external debugger it is indistinguishable from normal operation.
Retention	The PE state, including debug settings, is preserved in low-power structures, allowing the Core power domain to be at least partially turned off. Changing from low-power retention to normal operation does not involve a reset of the PE. The saved PE state is restored on changing from low-power retention state to normal operation. If software has to use an IMPLEMENTATION DEFINED code sequence before entering, or after leaving, a retention state, this is referred to as a <i>software-visible retention state</i>. It is IMPLEMENTATION DEFINED whether the value of <code>DBGPRCR.CORENPDRQ</code> is set to its Cold reset value on leaving the software-visible retention state. See the description of <code>DBGPRCR.CORENPDRQ</code> for more information. Note • This model of retention does not include implementations where the PE exits the state in response to a debug register access. From the Debug architecture perspective, implementations like this are forms of standby.
Powerdown	These measures must include the OS saving any PE state, including the debug settings, that must be preserved over powerdown. If <code>FEAT_DoubleLock</code> is implemented, it is used during powerdown. Changing from powerdown to normal operation must include: • A Cold reset of the PE after the power level has been restored. • The OS restoring the saved PE state. External Debug Request debug events stay pending and debug registers in the Core power domain cannot be accessed.

An implementation might support enabling and disabling threads, either dynamically or once at reset time. Threads that are disabled in this way must appear to the external debugger as either:

- Powered off, meaning they are either:
 - In a powerdown state.

- In a retention state.
- Held in reset state.

Arm A-profile external debug uses a simpler two states model for the Debug power domain. The two states are:

Off The Debug power domain is turned off.

On The Debug power domain is turned on.

The available power states, including the cross-product of Core power domain and Debug power domain power states is IMPLEMENTATION DEFINED. Implementations are not required to implement all of these states and might include additional states. These additional states must appear to the debugger as one of the logical power states defined by this model. The control of power states is IMPLEMENTATION DEFINED.

———— **Note** —————

As a result, it is IMPLEMENTATION DEFINED whether it is possible for the Debug power domain to be on when the Core power domain is off.

If the Debug power domain is implemented but is not powered up when the Core power domain is powered up, the Reset Catch debug event and the OS Unlock Catch debug event are disabled.

E6.4 Powerup request mechanism

If a powerup request mechanism is implemented, asserting the powerup request requests the power controller to power up the Core power domain, and to emulate any subsequent powerdown requests, until the powerup request mechanism is deasserted.

E6.4.1 Powerup request mechanism

[EDPRCR.COREPURQ](#) is the powerup request mechanism.

The control registers [DBGPRCR.CORENPDRQ](#) and [EDPRCR.COREPURQ](#) provide an interface between the power controller and the PE. They typically map directly to signals in the recommended external debug interface.

On Cold reset, if FEAT_DoPD is not implemented, [DBGPRCR.CORENPDRQ](#) is set to the value of [EDPRCR.COREPURQ](#).

E6.5 Emulating low-power states

[DBGPRCR](#).CORENPDRQ and the powerup request mechanism can request the power controller to emulate states where the Core power domain is completely off or in a low-power state where the Core power domain registers cannot be accessed. This simplifies the requirements on software by sacrificing entirely realistic behavior.

If FEAT_DoPD is not implemented, [EDPRSR](#).{SPD, PU} indicates the Core power domain power state. For more information, see:

- The [DBGPRCR_EL1](#) and [DBGPRCR](#) System register descriptions.
- The [EDPRCR](#) and [EDPRSR](#) external debug register descriptions.
- Recommended External Debug Interface.

The measures to emulate powerdown are IMPLEMENTATION DEFINED. The ability of the debugger to access the state of the PE and the system might be limited as a result of the measures adopted.

In an emulated powerdown state, the debugger must be able to access all debug, PMU, CTI, and trace unit registers that are accessible on the external debug interface and are in one of:

- The Debug power domain.
- The Core power domain.
- When a trace unit with a separate trace unit Core power domain is implemented, and the trace unit Core power domain is powered on, the trace unit Core power domain.

That is, the debugger must be able to read and write to such registers without receiving errors. This allows an external debugger to debug the powerup sequence.

Arm recommends that any IMPLEMENTATION DEFINED registers that are on the external debug interface and in either the Core power domain or the Debug power domain are also accessible in an emulated powerdown state.

If [FEAT_DoubleLock](#) is implemented, `DoubleLockStatus() == FALSE` when [DBGPRCR](#).CORENPDRQ == 1.

Otherwise, the behavior of the PE in emulated powerdown must be similar to that in a real powerdown state. In particular, the PE must not respond to other system stimuli, such as interrupts.

[Example E6-1](#) and [Example E6-2](#) are examples of two approaches to emulating powerdown.

Example E6-1 An example of emulating powerdown

The PE is held in Standby state, isolated from any system stimuli. It is IMPLEMENTATION DEFINED whether the PE can respond to debug stimuli such as an External Debug Request debug event.

If the PE can enter Debug state, then the external debugger is able to use the ITR to execute instructions, such as loads and stores. This causes the external debugger to interact with the system. If the external debugger restarts the PE, the PE leaves Standby state and restarts fetching instructions from memory.

Example E6-2 Another example of emulating powerdown

The PE is held in Warm reset. This limits the ability of an external debugger to access the resources of the PE. For example, the PE cannot be put into Debug state.

On exit from emulated powerdown the PE is reset. However, the debug registers that are only reset by a Cold reset must not be reset. Typically this means that a Warm reset is substituted for the Cold reset. As such, the effect of accessing any register that is reset by a Warm reset while the PE is in the emulated powerdown state will have an IMPLEMENTATION DEFINED effect on that register.

Note

- Warm reset and Cold reset have different effects apart from resetting the debug registers. In particular, RMR_ELx is reset by a Cold reset and controls the reset state on a Warm reset. This means that if a Cold reset is substituted by a Warm reset, the behavior of the reset code might be different.
 - The timing effects of powering down are typically not factored in the powerdown emulation. Examples of these timing effects are clock and voltage stabilization.
 - Emulation does not model the state lost during powerdown, meaning that it might mask errors in the state storage and recovery routines.
-

E6.6 Debug OS Save and Restore sequences

From the introduction of , the following registers provide the OS Save and Restore mechanism:

- The *OS Lock Access Register*, [DBGOSLSR](#), locks the OS Lock to restrict access to debug registers before starting an OS Save sequence, and unlocks the OS Lock after an OS Restore sequence.
- The *OS Lock Status Register*, [DBGOSLSR](#), shows the status of the OS Lock.
- The PE can be configured to generate an [OS Unlock Catch debug event](#) when the OS Lock is unlocked.
- If [FEAT_DoubleLock](#) is implemented, the OS Double Lock locks out an external debug interface entirely. This is only used immediately before a powerdown sequence.

See also:

- [FEAT_DoubleLock](#)
- [Reset and debug](#)
- Example OS Save and Restore sequences

E6.6.1 EDPRSR.{DLK, SPD, PU} and the Core power domain

If FEAT_DoPD is not implemented, a debugger uses [EDPRSR](#).{DLK, SPD, PU} to determine whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read.

Table E6-1 Interpretation of the EDPRSR.{DLK, SPD, PU} bits

EDPRSR			Core power domain			Notes
DLK	SPD	PU	Power	Accesses	State lost	
0	0	1	On	OK	No	-
0	1	1	On	OK	Yes	SPD is cleared to 0 following the read.
1	X	1	On	Error	Not known	FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE. Software locks the OS Double Lock before removing power.
X	1	0	Off	Error	Yes	A Cold reset will be asserted on exiting powerdown state, but not on exiting low-power retention state.
X	0	0	Not known	Error	Not known	

If FEAT_DoPD is implemented, accesses to [EDPRSR](#) return an error when the Core power domain is off or in a retention state, meaning successful reads of [EDPRSR](#) always return 1 for [EDPRSR](#).PU.

When FEAT_Debugv8p4 is implemented, and whenever [FEAT_DoubleLock](#) is not implemented, [EDPRSR](#).DLK is always 0.

If [FEAT_DoubleLock](#) is not implemented, [DoubleLockStatus\(\)](#) always returns FALSE.

If the Core power domain is powered up and [DoubleLockStatus\(\)](#) == TRUE, then:

- When FEAT_Debugv8p2 is not implemented, [EDPRSR](#).{DLK, SPD, PU} can read either {1, UNKNOWN, 1} or {UNKNOWN, 0, 0}.
- When FEAT_Debugv8p2 is implemented, and FEAT_Debugv8p4 is not implemented, [EDPRSR](#).{DLK, SPD, PU} can only read {UNKNOWN, 0, 0}.

E6.6.2 EDPRSR.SPD when the Core domain is in either retention or powerdown state

When the Core power domain is in either the retention or powerdown state, **EDPRSR.SPD** is not cleared following a read of **EDPRSR** and it is IMPLEMENTATION DEFINED whether:

- **EDPRSR.SPD** shows whether the state of the debug registers in the Core power domain has been lost since the last time that **EDPRSR** was read. This means that:
 - When the Core power domain is in the powerdown state, **EDPRSR.SPD** is RAO, this indicates that the state of the debug registers has been lost.
 - When the Core power domain is in the retention state, **EDPRSR.SPD** indicates whether the state of the debug registers was lost before the Core power domain entered retention state.
- **EDPRSR.SPD** is RAZ, and:
 - On leaving the powerdown state, **EDPRSR.SPD** is set to 1 which indicates that the state of the debug registers has been lost.
 - On leaving the retention state, **EDPRSR.SPD** reverts the value it had on entering the retention state.

E6.6.3 EDPRSR.{DLK, R} and reset state

If **FEAT_DoubleLock** is not implemented, **DoubleLockStatus()** always returns FALSE.

If **FEAT_DoubleLock** is implemented and enabled, the behavior of all registers and fields except **EDPRSR.DLK** is the same as their behavior if **FEAT_Debugv8p4** is not implemented.

EDPRSR.R is UNKNOWN when **DoubleLockStatus() == TRUE**. **OSDLR_EL1.DLK** is cleared to 0 by a reset. If the Core power domain is powered up and entered reset state with the OS Double Lock locked, it is CONstrained UNPREDICTABLE whether a read of **EDPRSR** while the PE is in reset state returns:

- **EDPRSR.{DLK, R, PU} == {1, UNKNOWN, 1}** indicating that the OS Double Lock is locked. This is not permitted from Armv8.2.
- **EDPRSR.{DLK, R, PU} == {0, 1, 1}** indicating that the PE is in reset state.
- **EDPRSR.{DLK, R, PU} == {UNKNOWN, UNKNOWN, 0}** indicating that the registers in the Core power domain cannot be accessed because the OS Double Lock is locked.

If the PE was powered up and the OS Double Lock was unlocked when the PE was reset, then **EDPRSR.{DLK, R, PU}** reads as {0, 1, 1} while the PE is in reset state.

On leaving reset state, **EDPRSR.{DLK, R}** reads as {0, 0}.

E6.6.4 Debug registers to save over powerdown

Table E6-2 shows the different requirements for self-hosted debug over powerdown and external debug over powerdown:

- The column labeled Self-hosted lists registers that software must preserve over powerdown so that it can support self-hosted debug over powerdown. This does not require use of the OS Save and Restore mechanism.
- The column labeled External lists registers that software must preserve over powerdown so that it can support external debug over powerdown. This requires use of the OS Save and Restore mechanism:
 - Some external debug registers are not normally accessible to software executing on the PE. Additional debug registers are provided that give software the required access to save and restore these external debug registers when **DBGOSLSR.OSLK** is locked. These registers include **DBGOSECCR**, **DBGDTRRExt**, and **DBGDTRTExt**.
- Some registers might only present in some implementations, or might not be accessible at all Exception levels or in Non-secure state. **DBGVCR32_EL2** and **SDER32_EL3** are only required to support AArch32.

Table E6-2 does not include registers for the OPTIONAL Trace and Performance Monitor extensions.

Table E6-2 Debug registers to save over powerdown

Register in AArch32 state	Self-hosted	External
DBGDSCRExt	Yes	Yes
DBGBVR<n>	Yes	Yes
DBGBCR<n>	Yes	Yes
DBGWVR<n>	Yes	Yes
DBGWCR<n>	Yes	Yes
DBGVCR	Yes	-
HDCR	Yes	-
DBGDCCINT	-	Yes
DBGCLAIMSET , DBGCLAIMCLR	-	Yes
DBGOSECCR	-	Yes
DBGDTRRXext DBGDTRTXext	-	Yes

E6.6.5 OS Save sequence

To preserve the debug logic state over a powerdown, the state must be saved to nonvolatile storage. This means the OS Save sequence must:

1. Lock the OS Lock by writing the key value `0xC5ACCE55` to the [DBGOSLAR](#) in AArch32 state.
2. Execute an `ISB` instruction.
3. Walk through the debug registers listed in [Debug registers to save over powerdown](#) and save the values to the nonvolatile storage.

If the [FEAT_DoubleLock](#) is implemented, before removing power from the Core power domain, software must:

1. Lock the OS Double Lock by writing 1 to [DBGOSDLR.DLK](#) in AArch32 state.
2. Execute a [Context Synchronization event](#).

E6.6.6 OS Restore sequence

After a powerdown, the OS Restore sequence must perform the following steps to restore the debug logic state from the non-volatile storage:

1. Lock the OS Lock, as described in [OS Save sequence](#). The OS Lock is generally locked by the Cold reset, but this step ensures that it is locked.
2. Execute an `ISB` instruction.
3. To ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated:
 - Write 0 to `MDSCR_EL1` if executing in AArch64 state.
 - Write 0 to [DBGDSCRExt](#) if executing in AArch32 state.
4. Write 0 to [DBGDSCRExt](#) to ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated.
5. Walk through the debug registers listed in [Debug registers to save over powerdown](#), and restore the values from the nonvolatile storage. The last register to be restored must be:
 - `MDSCR_EL1` if executing in AArch64 state.
 - [DBGDSCRExt](#) if executing in AArch32 state.

6. Walk through the debug registers listed in [Debug registers to save over powerdown](#), and restore the values from the nonvolatile storage. The last register to be restored must be [DBGDSCRext](#).
7. Execute an `ISB` instruction.
8. Unlock the OS Lock by writing 0 to [DBGOSLAR.OSLK](#).
9. Execute a [Context Synchronization event](#).

Note

The OS Restore sequence overwrites the debug registers with the values that were saved. If there are valid values in these registers immediately before the restore sequence, then those values are lost.

E6.6.7 Debug behavior when the OS Lock is locked

The main purpose of the OS Lock is to prevent updates to debug registers during an OS Save or OS Restore operation. The OS Lock is locked on a Cold reset.

When the OS Lock is locked:

- Access to debug System registers through the System register interface is mainly unchanged except that:
 - Certain registers are read and written without side-effects.
 - Fields in [DBGDSCRext](#) and [DBGOSECCR](#) that are normally read-only become read/write.This allows the state to be saved or restored. For more information, see the relevant register description in [External Debug Register Descriptions](#).
- Access to debug registers by the external debug interface is restricted to prevent an external debugger modifying the registers that are being saved or restored. For more information, see [External debug interface register access permissions summary](#).
- Debug exceptions, other than Breakpoint Instruction exceptions are not generated.
- Breakpoint and Watchpoint debug events are not generated. The OS Lock has no effect on Breakpoint Instruction exceptions and other debug events.

E6.6.8 Debug behavior when the OS Lock is unlocked

When the OS Lock is unlocked, the PE sets [EDES.OSUC](#) to 1 if the OS Unlock Catch debug event is enabled and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. See [OS Unlock Catch debug event](#).

E6.6.9 Debug behavior when the OS Double Lock is locked

If the [FEAT_DoubleLock](#) is implemented, software locks the OS Double Lock immediately before a powerdown sequence.

The OS Double Lock ensures that it is safe to remove core power by forcing the debug interfaces to be quiescent.

When [DoubleLockStatus\(\)](#) == TRUE:

- The external debug interface has only restricted access to the debug registers, so that it is quiescent before removing power. See [External debug interface register access permissions summary](#).
- Debug exceptions, other than Breakpoint Instruction exceptions, are not generated.
- Halting is prohibited. See [Halting allowed and halting prohibited](#).

Note

Pending Halting debug events might be lost when core power is removed.

- No asynchronous debug events are [WF*](#) wakeup events.

If the [FEAT_DoubleLock](#) is not implemented, the PE ensures these conditions are met before allowing power to be removed.

Software must synchronize the update to [DBGOSDLR](#) before it indicates to the system that core power can be removed. The interface between the PE and its power controller is IMPLEMENTATION DEFINED.

Typically software indicates that core power can be removed by entering the Wait For Interrupt state. This means that software must explicitly synchronize the [DBGOSDLR](#) update before issuing the [WFI](#) instruction.

[DBGOSDLR.DLK](#) is ignored and [DoubleLockStatus\(\)](#) == FALSE if either:

- The PE is in Debug state.
- [DBGPRCR.CORENPDRQ](#) is set to 1.

Note

It is possible to enter Debug state with [DBGOSDLR.DLK](#) set to 1. This is because a [Context Synchronization event](#) is required to ensure the OS Double Lock is locked, meaning that Debug state might be entered before the [DBGOSDLR](#) update is synchronized.

Because [DBGOSDLR.DLK](#) is ignored when [DBGPRCR.CORENPDRQ](#) is set to 1, an external debugger can write to [DBGPRCR.CORENPDRQ](#), and the [FEAT_DoubleLock](#) is not always implemented, software must not rely on using the OS Double Lock to disable debug exceptions or to prohibit halting, or both. Arm deprecates use of the OS Double Lock for these purposes, and instead recommends that software:

- Uses the OS Lock to disable debug exceptions during save or restore sequences.
- Uses the debug authentication interface to prohibit halting and external debug access to debug registers at times other than immediately prior to removing power.

As the purpose of the OS Double Lock is to ensure that it is safe to remove core power, if the [FEAT_DoubleLock](#) is implemented, it is important to avoid race conditions that defeat this purpose. Arm recommends that:

- Once the write to [DBGOSDLR.DLK](#) has been synchronized by a [Context Synchronization event](#) and [DoubleLockStatus\(\)](#) == TRUE, a PE must:
 - Not allow a debug event generated before the [Context Synchronization event](#) to cause an entry to Debug state or act as a wakeup event for a [WFI](#) or [WFE](#) instruction after the [Context Synchronization event](#) has completed.
 - Complete any external debug access started before the [Context Synchronization event](#) by the time the [Context Synchronization event](#) completes.

Note

A debug register access might be in progress when software sets [DBGOSDLR.DLK](#) to 1. An implementation must not permit the synchronization of locking the OS Double Lock to stall indefinitely while waiting for that access to complete. This means that any debug register access that is in progress when software sets [DBGOSDLR.DLK](#) to 1 must complete or return an error in finite time.

- If a write to [DBGPRCR](#) or [EDPRCR](#) made when [DBGOSDLR.DLK](#) == 1 changes [DBGPRCR.CORENPDRQ](#) or [EDPRCR.CORENPDRQ](#) from 1 to 0, meaning [DoubleLockStatus\(\)](#) changes from FALSE to TRUE, then before signaling to the system that the CORENPDRQ field has been cleared and emulation of powerdown is no longer requested, meaning the system can remove core power, the PE must ensure that all the requirements for [DoubleLockStatus\(\)](#) == TRUE listed in this section are met.

In a standard OS Save sequence, the OS Lock is locked before the OS Double Lock is locked. This means that writes to CORENPDRQ are ignored by the time the OS Double Lock is locked. However, if [DoubleLockStatus\(\)](#) == FALSE, an external debugger can clear the OS Lock at any time, and then write to [EDPRCR](#).

E6.7 Reset and debug

All registers in the Core power domain are either:

- Reset by both a Cold and a Warm reset.
- Reset only by a Cold reset and are not changed by a Warm reset.

For more information, see [Resets and power domains](#).

All registers in the Debug power domain are reset by an External Debug reset.

[Figure E6-1](#) shows this reset scheme. The following three reset signals are an example implementation of the reset scheme:

- **CORERESET**, which must be asserted for a Warm reset.
- **CPUPORESET**, which must be asserted for a Cold reset.
- **PRESETDBG**, which must be asserted for an External Debug reset.

As shown in the figure, the external debug logic is split between the Debug power domain and the Core power domain.

Figure E6-1 Power and reset domains

For more information about power domains and power states, see [Power domains and debug](#).

When power is first applied to the Debug power domain, **PRESETDBG** must be asserted.

When power is first applied to the Core power domain, **CPUPORESET** must be asserted.

Note

In this scheme, logic in the Warm reset domain is reset by asserting either **CORERESET** or **CPUPORESET**. This implies a particular implementation style that permits these approaches.

CPUPORESET is not normally asserted on moving from a low-power state, where power has not been removed, to a full-power state. This can occur, for example, on exiting a low-power retention state. See also [Emulating low-power states](#) and the [EDPRSR](#) register description.

E6.7.1 External debug interface accesses to registers in reset

If a reset signal is asserted and the external debug interface:

- Writes a register, or indirectly writes a register or register field as a side-effect of an access:

- Then, if the register or register field is reset by that reset signal, it is **CONSTRAINED UNPREDICTABLE** whether the register or register field takes the reset value or the value written. The reset value might be **UNKNOWN**.
- Otherwise, the register or register field takes the value that is written.
- Reads a register, or indirectly reads a register or register field, as part of an access:
 - Then, if the register or register field is reset by that reset signal, the value returned is **UNKNOWN**.
 - Otherwise, the value of the register or register field is returned.

It is **IMPLEMENTATION DEFINED** whether any register can be accessed when External Debug reset is being asserted. The result of these accesses is **IMPLEMENTATION DEFINED**.

Chapter E7

The PC Sample-based Profiling Extension

This chapter describes the OPTIONAL PC Sample-based Profiling Extension that provides a non-invasive external debug component.

It contains the following section:

- [About the PC Sample-based Profiling Extension](#)

E7.1 About the PC Sample-based Profiling Extension

The PC Sample-based Profiling Extension is an **OPTIONAL** extension that provides coarse-grained, non-invasive profiling by an external debugger. See also [Non-invasive behavior](#).

When the PC Sample-based Profiling Extension is implemented, the PE implements a PC sample register and one or more context sample registers as external registers. Reads of the PC sample register return a PC sample value and capture the PE context in the context sample registers. For example, tools can use these samples to populate a statistical model of the performance of software executing on the PE.

Note

Data returned by periodic sampling of PC Sample-based Profiling registers is sufficient to allow tools to estimate the distribution of time spent executing software on the PE.

The delay between an instruction being executed by the PE and its address appearing in the PC Sample Register is not defined, and the architecture does not require that the sampled instruction was recently executed. For example, if a piece of software executes a load instruction that reads the PC Sample Register of the PE it is running on, there is no guaranteed relationship between the address of the load instruction and the value read. The PC Sample Register is intended only for use by an external agent to provide statistical information for software profiling.

It must be possible to sample references to branch targets. It is **IMPLEMENTATION DEFINED** whether references to other instructions can be sampled. The branch target for a conditional branch instruction that fails its condition check is the instruction that follows the conditional branch instruction. The branch target for an exception is the exception vector address.

Note

In the Armv7 PC Sample-based Profiling Extension, an offset was applied to the sampled Program Counter value and this offset and the instruction set state indicated in bits [1:0] of the sampled value. From the introduction of the Armv8 PC Sample-based Profiling Extension, the sampled value is the address of an instruction that has executed, with no offset and no indication of the instruction set state.

- [Controlling the PC Sample-based Profiling Extension](#).
- [Registers implemented by the PC Sample-based Profiling Extension](#).
- [Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN](#).
- [Pseudocode description of PC Sample-based Profiling](#).

E7.1.1 Controlling the PC Sample-based Profiling Extension

PC Sample-based Profiling is controlled by the **IMPLEMENTATION DEFINED** authentication interface [ExternalNoninvasiveDebugEnabled\(\)](#).

PC Sample-based Profiling is allowed if both of the following apply:

The state of the **IMPLEMENTATION DEFINED** authentication interface is visible through `DBGAUTHSTATUS_EL1`. See Recommended authentication interface.

E7.1.1.1 Suspending and activating PC Sample-based Profiling

When all of the following apply, reading `PMPCSR[31:0]` or `PMPCSR[63:0]` makes PC Sample-based Profiling active:

- PC Sample-based Profiling is suspended.
- PC sampling is allowed.

A subsequent external read of `PMPCSR` will observe the updated state.

E7.1.2 Registers implemented by the PC Sample-based Profiling Extension

The PC Sample-based Profiling Extension is implemented by either [FEAT_PCSRv8](#):

- If [FEAT_PCSRv8](#) is implemented then the PC Sample-based Profiling Extension registers are implemented in the external debug register space. [EDDEVID1](#).PCSample identifies when [FEAT_PCSRv8](#) is implemented and which PC Sample-based Profiling Extension registers are implemented.

If [FEAT_PCSRv8](#) is implemented:

- The following external debug registers can be implemented:
 - [EDCIDSR](#).
 - [EDPCSR](#).
 - [EDVIDSR](#).

See [External debug interface registers](#).

E7.1.3 Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN

The architecture permits IMPLEMENTATION DEFINED extensions to external debug to define mechanisms that make the values of the PC Sample-based profiling registers UNKNOWN. However, it requires that any such mechanism is disabled by default. This means that powerup or a hard reset of the PE must leave the PE in a state where the PC Sample-based Profiling Extension, if implemented, exhibits its architecturally-defined behavior.

Note

A mechanism that, when enabled, makes the PC Sample-based profiling registers UNKNOWN might use other sample-based profiling events that are appropriate for a use that is independent of PC Sample-based Profiling.

If no branch instruction has been retired since the PE left Debug state, suspended state, or a state where PC Sample-based profiling is prohibited, then the sampled value is UNKNOWN.

If all of the following apply, then a read of PMPCSR[31:0] or PMPCSR[63:0] is permitted but not required to return 0xFFFF_FFFF for PMPCSR[31:0].

- The PE has not retired any branch instruction since leaving a state where PC Sample-based Profiling was suspended.
- Sampling on reads is not disabled.

This includes a read of PMPCSR[31:0] or PMPCSR[63:0] that indirectly makes PC Sample-based Profiling active.

E7.1.4 Pseudocode description of PC Sample-based Profiling

When [FEAT_PCSRv8](#) is implemented, the functionality is described by the pseudocode functions:

- [CreatePCSample\(\)](#), which populates a variable of type [PCSample](#).
- [Read_EDPCSRlo\(\)](#), which writes a PC sample to the [EDPCSR](#) and associated registers.

Chapter E8

About the External Debug Registers

This chapter provides some additional information about the external debug registers. It contains the following sections:

- [Relationship between external debug and System registers](#)
- [Endianness and supported access sizes](#)
- [Synchronization of changes to the external debug registers](#)
- [Memory-mapped accesses to the external debug interface](#)
- [External debug interface register access permissions](#)
- [External debug interface registers](#)
- [Cross-trigger interface registers](#)
- [External debug register resets](#)

E8.1 Relationship between external debug and System registers

Table E8-1 shows the relationship between external debug registers and System registers. Where no relationship exists, the registers are not listed.

Table E8-1 Equivalence between external debug and System registers

External debug register	System register	
	AArch32	Notes
DBGDTRRX_EL0	DBGDTRRXint	See also Summary of System register accesses to the DCC
DBGDTRTX_EL0	DBGDTRTXint	
OSLAR_EL1	DBGOSLAR	-
DBGBVR<n>_EL1[31:0] DBGBVR<n>_EL1[63:32]	DBGBVR<n> DBGBXVR<n>	-
DBGBCR<n>_EL1[31:0]	DBGBCR<n>	-
DBGWVR<n>_EL1[31:0]	DBGWVR<n>	-
DBGWCR<n>_EL1[31:0]	DBGWCR<n>	-
DBGCLAIMSET_EL1	DBGCLAIMSET	-
DBGCLAIMCLR_EL1	DBGCLAIMCLR	-
DBGAUTHSTATUS_EL1	DBGAUTHSTATUS	Read-only
EDSCR	DBGDSCRext	Only some fields map
EDECCR	DBGOSECCR	Applies when the OS Lock is locked
MIDR_EL1	MIDR	Read-only copies of Processor ID Registers
EDDEVAFF0	MPIDR	Read-only copies of system ID registers

In addition:

- [EDSCR](#).{TXfull, RXfull} are read-only aliases for [DBGDSCRint](#).{TXfull, RXfull}.
- [EDPRCR](#).CORENPDRQ is a read/write alias for [DBGPRCR](#).CORENPDRQ.
- [EDPRSR](#).OSLK is a read-only alias for [DBGOSLSR](#).OSLK.
- If the [FEAT_DoubleLock](#) is implemented, [EDPRSR](#).DLK is a read-only function of [DBGOSDLR](#).DLK.

E8.2 Endianness and supported access sizes

The debug registers, Performance Monitors registers, and CTI registers are implemented as memory-mapped peripherals. The Arm architecture requires memory-mapped peripherals to be little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the debug registers, Performance Monitors registers, and CTI registers, implementations must:

- Comply with the requirements of [Supported access sizes and Endianness](#).
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register, even if all components with direct memory access to the memory-mapped peripheral support making 64-bit accesses.

Note

These requirements mean that a system implementing the debug registers using a 32-bit bus, such as an AMBA APB3, with a wider system interconnect must implement a bridge between the system and the debug bus that can split 64-bit accesses.

For accesses from the external debug interface, the size of an access is determined by the interface. For an access from an ADiv5-compliant Memory Access Port, MEM-AP, this is specified by the MEM-AP CSW register.

E8.3 Synchronization of changes to the external debug registers

This section describes the synchronization requirements for the external debug interface.

For more information on how these requirements affect debug, see:

- [Synchronization and debug exceptions](#) for exceptions taken from AArch32 state.
- [Synchronization and Halting debug events](#).
- [Synchronization of DCC and ITR accesses](#).

This section refers to accesses from the external debug interface as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

Note

[Synchronization of changes to AArch32 System registers](#) define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads, and external writes as indirect writes.

For general information about synchronization, access completion, ordering, and observability, see [Synchronization of memory-mapped registers](#).

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. With the exception of [DBGBCR<n>_EL1](#), [DBGBVR<n>_EL1](#), [DBGWCR<n>_EL1](#), and [DBGWVR<n>_EL1](#), external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

[Synchronization of DCC and ITR accesses](#) describes the synchronization requirements for the DCC and ITR.

Changes to the IMPLEMENTATION DEFINED authentication interface are external writes to the authentication status registers by the Requester of the authentication interface. See [Synchronization and the authentication interface](#).

The external agent must be able to guarantee completion of a write. For example by:

- Marking the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- Reading back the value written.
- Some guaranteed property of the connection between the PE and the external agent.

Note

For an external Debug Access Port, access completion is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, accesses complete in order.

However, the external agent cannot force synchronization of completed writes without halting the PE. Executing an ISB instruction, either in Debug state or in Non-debug state, and exiting from Debug state forces synchronization. If the PE is in Debug state, executing an ISB instruction is guaranteed to explicitly synchronize any external reads, external writes, and changes to the authentication interface that are ordered before the external write to [EDITR](#).

For any given observer, external writes to the following register groups are guaranteed to be observable in the same order in which they complete:

- The breakpoint registers, [DBGBCR<n>_EL1](#) and [DBGBVR<n>_EL1](#).
- The watchpoint registers, [DBGWCR<n>_EL1](#) and [DBGWVR<n>_EL1](#).

This guarantee applies only to external writes to registers within one of these groups. There is no guarantee regarding the ordering of the observability of external writes within these groups with respect to external writes to registers, for example [EDSCR](#), or between breakpoints and watchpoints, including watchpoints linked to context matching breakpoints.

Note

This means that a debugger can rely on the external writes to be observed in the same order in which they complete. It does not mean that a debugger can rely on the external writes being observed in finite time.

In a simple sequential execution an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

If two or more interfaces simultaneously access a register, the behavior must be as if the accesses occurred atomically and in any order. This is described in [Examples of the synchronization of changes to the external debug registers](#).

Note

Where simultaneous writes occur, once an order has been established by the implementation, some registers have behavior that is incompatible with the implementation simply dropping the older write and only performing the actions of the younger write. In these cases, the implementation must ensure that the register update is consistent with both writes having occurred. For example, writing one to write-one-to-clear or write-one-to-set fields in the older write can produce effects that persist even after writing zero to the same field in the younger write. Examples of registers with this behavior include [DBGCLAIMSET_EL1](#), [DBGCLAIMCLR_EL1](#), [PMCR_EL0](#), [PMOVSSET_EL0](#), [PMOVSCCLR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMINTENSET_EL1](#), [PMINTENCLR_EL1](#), [PMSWINC_EL0](#), and [PMZR_EL0](#), all of which are simultaneously accessible through external debug and System register access.

E8.3.1 Synchronization and the authentication interface

Changes to the authentication interface are indirect writes to the state of the PE by the Requester of the authentication interface.

For an external debug interface read of any Authentication Status register, or an indirect read of the authentication interface made in determining the response to a subsequent external debug interface access, a change on the authentication interface must be observable following a subsequent explicit [Context Synchronization event](#), and:

- It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable in finite time.
- It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable following an entry to Debug state.

For a System register read of [DBGAUTHSTATUS_EL1](#), a change on the authentication interface is guaranteed to be observable only after a [Context Synchronization event](#).

Note

- In some systems, the authentication interface is fixed by configuration or is changed under the control of software. These systems can require explicit synchronization for any change to the authentication interface.
 - In other systems, the authentication interface is controlled dynamically by an external agent. In these systems, it is desirable that changes to the authentication interface do not require explicit synchronization by software executing on the PE to be observable by subsequent external debug interface accesses, and are either observable in finite time or are synchronized by entry to Debug state. Otherwise, there are scenarios where a debugger is not able to halt and debug the system.
-

E8.3.2 Examples of the synchronization of changes to the external debug registers

[Example E8-1](#), [Example E8-2](#), and [Example E8-3](#) show the synchronization of changes to the external debug registers.

Example E8-1 Order of synchronization of Breakpoint and Watchpoint register writes

Initially `DBGBVR<n>_EL1` is `0x8000` and `DBGBCR<n>_EL1` is `0x0181`. This means that a breakpoint is enabled on the halfword T32 instruction at address `0x8000`.

A sequence of external writes occurs in the following order:

1. `0x0000` is written to `DBGBCR<n>_EL1`, disabling the breakpoint.
2. `0x9000` is written to `DBGBVR<n>_EL1[31:0]`.
3. `0x0061` is written to `DBGBCR<n>_EL1`, enabling a breakpoint on the halfword at address `0x9002`.

The external writes must be observable to indirect reads in the same order as the external writes complete. This means that at no point is there a breakpoint enabled on either of the halfwords at address `0x8002` and `0x9000`.

Similarly a breakpoint or watchpoint must be disabled:

- If both halves of a 64-bit address have to be updated.
- If any of the `DBGBCR<n>_EL1` or `DBGWCR<n>_EL1` fields are modified at the same time as updating the address.

Example E8-2 Simultaneous accesses to DTR registers

Initially `EDSCR.{TXfull, TXU, ERR}` are 0. Then:

- `0x0DCCDA7A` is directly written to `DBGDTRTX_EL0` by an MSR instruction.
- `DBGDTRTX_EL0` is indirectly read by the external debug interface.

These accesses might happen at the same time and in any order.

If the direct write of `0x0DCCDA7A` to `DBGDTRTX_EL0` is handled first, then:

- The external debug interface read of `DBGDTRTX_EL0` clears `EDSCR.TXfull` to 0.
- `EDSCR.{TXU, ERR}` are unchanged.
- The external debug interface read returns `0x0DCCDA7A`.

If the indirect read of `DBGDTRTX_EL0` by the external debug interface is handled first, then:

- The external debug interface read of `DBGDTRTX_EL0` causes an underrun and as a result `EDSCR.{TXU, ERR}` are both set to 1.
- The external debug interface returns an UNKNOWN value.
- Writing `0x0DCCDA7A` to `DBGDTRTX_EL0` sets `DTRTX` to `0x0DCCDA7A` and `EDSCR.TXfull` to 1.

Example E8-3 Simultaneous writes to CLAIM registers

Initially all CLAIM tag bits are 0. Then:

- 0x01 is written to `DBGCLAIMSET_EL1` by a direct write, followed by an explicit [Context Synchronization event](#).
- 0x02 is written to `DBGCLAIMSET_EL1` by an external write.

These events might happen at the same time and in either order.

After this:

- `DBGCLAIMCLR_EL1` is read by a direct read.
- `DBGCLAIMCLR_EL1` is read by an external read.

In this case, a direct read can return either 0x01 or 0x03, and the external read can return either 0x02 or 0x03.

The only permitted final result for the CLAIM tags is the value 0x03, because this would be the result regardless of whether 0x01 or 0x02 is written first. This is because the external write is guaranteed to be observable to a direct read in finite time. See Synchronization requirements for AArch64 System registers.

It is not possible for a direct read to return 0x01 and the external read to return 0x02, because the writes to `DBGCLAIMCLR_EL1` are serialized.

In the following scenario, there is only one permitted result. Both observers observe the value 0x03, and then, at the same time, two writes occur:

- 0x04 is written to `DBGCLAIMSET_EL1` by a direct write, followed by an explicit [Context Synchronization event](#).
- 0x01 is written to `DBGCLAIMCLR_EL1` by an external write.

In this case, the only permitted final result for the CLAIM tags is the value 0x06.

E8.4 Memory-mapped accesses to the external debug interface

Support for memory-mapped access to the external debug interface is **OPTIONAL**. When memory-mapped access to the external debug interface is supported, the external debug interface is accessed as a little-endian memory-mapped peripheral.

If the external debug interface is CoreSight compliant, then an **OPTIONAL** Software Lock can be implemented for memory-mapped accesses to each component.

The Software Lock is **OPTIONAL** and deprecated. If it is not implemented, the behavior is as if it is unlocked. The Software Locks are controlled by [EDLSR](#) and [EDLAR](#), [PMLSR](#) and [PMLAR](#), and [CTILSR](#) and [CTILAR](#). See Management registers and CoreSight compliance.

With the exception of these registers and the effect of the Software Lock, the behavior of the memory-mapped accesses is the same as for other accesses to the external debug interface.

Note

The recommended memory-mapped accesses to the external debug interface are not compatible with the memory-mapped interface defined in Armv7. In particular:

- The memory map is different.
 - Memory-mapped accesses do not behave differently to Debug Access Port accesses when [DBGOSLSR.OSLK](#) == 1, meaning that the OS Lock is locked.
-

The following sections give more information about these memory-mapped accesses:

- [Register access permissions for memory-mapped accesses.](#)
- [Synchronization of memory-mapped accesses to external debug registers.](#)

See also [Supported access sizes and Endianness](#).

E8.4.1 Register access permissions for memory-mapped accesses

It is **IMPLEMENTATION DEFINED** whether unprivileged memory-mapped accesses are allowed. Privileged software is responsible for controlling memory-mapped accesses using the MPU.

If memory-mapped accesses are made through an ADiv5 interface, the Debug Access Port can block the access using [DBGSWENABLE](#). This is outside the scope of the Arm architecture. See *Arm® Debug Interface Architecture Specification ADiv5.0 to ADiv5.2*.

E8.4.1.1 Effect of the **OPTIONAL** Software Lock on memory-mapped access

For memory-mapped accesses, if other controls permit access to a register, the **OPTIONAL** Software Lock is implemented, and [EDLSR.SLK](#), [PMLSR.SLK](#), or [CTILSR.SLK](#) is set to 1, meaning the Software Lock is locked, then with the exception of the LAR itself:

- If other controls permit access to a register, then writes are ignored. That is:
 - Read/write (RW) registers become read-only, writes ignored (RO/WI).
 - Write-only (WO) registers become writes ignored (WI).
- Reads and writes have no side-effects. A side-effect is where a direct read or a direct write of a register creates an indirect write of the same or another register. When the Software Lock is locked, the indirect write does not occur.
- Writes to [EDLAR](#), [PMLAR](#), and [CTILAR](#) are unaffected.

This behavior must also apply to all **IMPLEMENTATION DEFINED** registers.

For example, if [EDLSR.SLK](#) is set to 1:

- [EDSCR.{TXfull, TXU, ERR}](#) are unchanged by a memory-mapped read from [DBGDTRTX_EL0](#).
- [EDSCR.{RXfull, RXO, ERR}](#) are unchanged by a memory-mapped write to [DBGDTRRX_EL0](#) that is ignored.

- [EDSCR](#).{ITE, ITO, ERR} are unchanged by a memory-mapped write to [EDITR](#) that is ignored.
- [DBGOSLSR](#).OSLK is unchanged by a memory-mapped write to [OSLAR_EL1](#) that is ignored.
- [EDPCSR](#)[63:32], [EDCIDSR](#), and [EDVIDSR](#) are unchanged by a memory-mapped read from [EDPCSR](#)[31:0].

Note

Updating [EDVIDSR](#), [EDCIDSR](#), and [EDPCSR](#)hi are side-effects of reading [EDPCSR](#)lo, such that these registers contain the matching context for [EDPCSR](#)lo. The process that updates [EDPCSR](#)lo with PC samples is not a side-effect of the access. Reads of [EDPCSR](#)lo made when the Software Lock is locked can be used to profile software.

- [PMPCSR](#)[63:32], [PMCID1SR](#)/[PMCID2SR](#), and [PMVIDSR](#) are unchanged by a memory-mapped read from [PMPCSR](#)[31:0].

Note

Updating [PMVIDSR](#), [PMCID1SR](#)/[PMCID2SR](#), and [PMPCSR](#)[31:0] are side-effects of reading [PMPCSR](#)[63:32], such that these registers contain the matching context for [PMPCSR](#)[63:32]. The process that updates [PMPCSR](#)[63:32] with PC samples is not a side-effect of the access. Reads of [PMPCSR](#)[63:32] made when the Software Lock is locked can be used to profile software.

- [EDPRSR](#).{SDR, SPMAD, SDAD, SR, SPD} are unchanged by a memory-mapped read from [EDPRSR](#).
- [EDPRSR](#).SDAD is not set if an error response is returned due to a memory-mapped read or write of any debug register as the result of the value of the EDAD field.
- The CLAIM tags are unchanged by memory-mapped writes to [DBGCLAIMSET_EL1](#) and [DBGCLAIMCLR_EL1](#) which are ignored.

Similarly, if [PMLSR](#).SLK is set to 1, then [EDPRSR](#).SPMAD is not set if an error response is returned to a memory-mapped read or write of any Performance Monitors register due to the value of the EPMAD field.

E8.4.1.2 Behavior of a not permitted memory-mapped access

Where the architecture requires that an external debug interface access generates an error response, a memory-mapped access must also generate an error response. However, it is IMPLEMENTATION DEFINED how the error response is handled, as this depends on the system.

Arm recommends that the error is returned as either:

- A synchronous external Data Abort.
- An SError exception.

E8.4.2 Synchronization of memory-mapped accesses to external debug registers

The synchronization requirements for memory-mapped accesses to the external debug interface is described in [Synchronization of changes to the external debug registers](#) and [Synchronization of memory-mapped registers](#).

The synchronization requirements between different routes to the external debug interface, that is, between Debug Access Port accesses and memory-mapped accesses are IMPLEMENTATION DEFINED.

E8.5 External debug interface register access permissions

Some external accesses to debug registers and Performance Monitor registers are not permitted and return an error response if:

- The Core power domain is powered down or is in low-power state where the registers cannot be accessed.
- `DBGOSLSR.OSLK == 1`. The OS Lock is locked.
- `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`. The OS Double Lock is locked.
- The access is disabled by either the authentication interface or secure monitor.

Not all registers are affected in all of these cases. For more information, see [External debug interface register access permissions summary](#).

E8.5.1 External debug over powerdown and locks

Accessing registers using the external debug interface is not possible when the Debug power domain is off. In this case, all accesses return an error.

External accesses to debug and Performance Monitors registers in the Core power domain are not permitted and return an error response if:

- The Core power domain is off or in low-power state where the registers cannot be accessed.
- `DBGOSLSR.OSLK == 1`, meaning that the OS Lock is locked. This allows software to prevent external debugger modification of the registers while it saves and restores them over powerdown.
- `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`. This means that the OS Double Lock is locked. The OS Double Lock ensures that it is safe to remove Core power by forcing the debug interface to be quiescent.

If `FEAT_DoubleLock` is not implemented, the hardware must provide another method to safely remove Core power.

The OS Lock condition does not apply to the following debug registers:

- `OSLAR_EL1`. This means that an external debugger can override this lock.
- `EDESR`. This means that an external debugger can program a debug event for when software unlocks the OS Lock. See [OS Unlock Catch debug event](#).
- The ID registers that describe the PE to the debugger.

See also [Debug registers to save over powerdown](#).

E8.5.2 External access disabled

Accesses are further controlled by the external authentication interface. An untrusted external debugger cannot program the breakpoint and watchpoint registers to generate spurious debug exceptions. If external invasive debugging is not enabled, these external accesses to the registers are disabled.

The disable applies to the `DBGBVR<n>_EL1`, `DBGBCR<n>_EL1`, `DBGWVR<n>_EL1`, and `DBGWCR<n>_EL1` registers.

The external debug interface cannot access these registers if `ExternalInvasiveDebugEnabled() == FALSE`.

PEs might also provide an OPTIONAL external debug interface to the Performance Monitor registers.

The `AllowExternalPMUAccess()` pseudocode function describes these accessibility rules.

E8.5.3 Behavior of a not permitted access

For an external debug interface access by a Debug Access Port, the Debug Access Port receives the error response and must signal this to the external debugger. For an ADIV5 implementation of a Debug Access Port, the error sets a sticky error flag in the Debug Access Port that the debugger can poll, and that suppresses further accesses until it is explicitly cleared.

When an error is returned because external access is disabled, and this is the highest priority error condition, a sticky error flag in [EDPRSR](#) is indirectly written to 1 as a side-effect of the access:

- For a debug register access when `AllowExternalDebugAccess()` == FALSE, [EDPRSR.SDAD](#) is indirectly written to 1.
- For Performance Monitor register access when `AllowExternalPMUAccess()` == FALSE, [EDPRSR.SPMAD](#) is indirectly written to 1.

The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see [Register access permissions for memory-mapped accesses](#).

If no error is returned, or the error is returned because of a higher priority error condition, the flag in [EDPRSR](#) is unchanged.

See also [Behavior of a not permitted memory-mapped access](#).

For more information, see *Arm® Debug Interface Architecture Specification*.

E8.5.4 External debug interface register access permissions summary

For accesses to:

- IMPLEMENTATION DEFINED registers, see [IMPLEMENTATION DEFINED registers](#).
- OPTIONAL registers for CoreSight compliance, see .
- Reserved, unallocated, or unimplemented registers, writes to read-only registers, and reads of write-only registers, see [Reserved and unallocated registers](#).

For all other external debug interface, CTI, and Performance Monitor registers, [Table E8-3](#), [Table E8-4](#), [Table E8-6](#) and [Table F3-1](#), show the response of the PE to accesses by the external debug interface.

E8.5.5 IMPLEMENTATION DEFINED registers

Register access permissions for IMPLEMENTATION DEFINED debug, Performance Monitors, and CTI registers are IMPLEMENTATION DEFINED, other than when the additional constraints in [Register access permissions for memory-mapped accesses](#) apply to IMPLEMENTATION DEFINED registers.

E8.5.6 Reserved and unallocated registers

The default access requirements for reserved and unallocated registers are described in [Access requirements for reserved and unallocated registers](#).

Note

Reads of WO and writes to RO refers to the default access permissions for a register. For example, when the SLK field is 1, meaning that the relevant registers become RO, a memory-mapped write to a RW register is ignored, and not treated as a reserved access.

The following reserved registers are RES0 in all conditions, other than when debug power is off:

- All reserved CTI registers.
- For the debug registers, and Performance Monitors registers, if the implementation is CoreSight architecture compliant, and either FEAT_DoPD is not implemented or the Core power domain is on, all reserved registers in the range `0xF00 - 0xFFC`. See Management register access permissions.

Otherwise, the architecture defines that:

1. If debug power is off, all register accesses, including reserved accesses, return an error.
2. For reserved debug registers and Performance Monitors registers, if FEAT_DoPD is implemented, and the Core power domain is off or in a low-power state, the response is an error. Otherwise, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0, when any of the following hold:

Off	The Core power domain is either completely off or in a low-power state in which the Core power domain registers cannot be accessed.
DLK	FEAT_DoubleLock is implemented and DoubleLockStatus () == TRUE. The OS Double Lock is locked.
OSLK	DBGOSLSR.OSLK == 1. The OS Lock is locked.

3. In addition, for reserved debug registers in the address ranges 0x400 - 0x4FC and 0x800 - 0x8FC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:

EDAD [AllowExternalDebugAccess](#) () == FALSE. External debug is disabled.

Note

See also [Behavior of a not permitted access](#).

4. In addition, for reserved Performance Monitors registers in the address ranges 0x000 - 0xEFC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:

EPMAD [AllowExternalPMUAccess](#) () == FALSE. External Performance Monitor access is disabled.

Note

See also [Behavior of a not permitted access](#).

5. For reads of WO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a write to the location to return an error.
6. For writes of RO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a read to the location to return an error.
7. For reads and writes of locations for features that are not implemented, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires an access to the location to return an error if the feature is implemented.

E8.6 External debug interface registers

The external debug interface register map is described by:

- [Summary of external debug registers.](#)
- [Cross-trigger interface registers.](#)
- [Performance Monitors external register views.](#)

Table E8-2 Summary of external debug registers

Offset	Name	Description	Access
0x020	EDES	External Debug Event Status Register	RW
0x024	EDECR	External Debug Execution Control Register	RW
0x030	EDWAR	External Debug Watchpoint Address Register	RO
0x080	DBGDTRRX_EL0	Debug Data Transfer Register, Receive	RW
0x084	EDITR	External Debug Instruction Transfer Register	WO
0x088	EDSCR	External Debug Status and Control Register	RW
0x08C	DBGDTRTX_EL0	Debug Data Transfer Register, Transmit	RW
0x090	EDRCR	External Debug Reserve Control Register	WO
0x094	EDACR	External Debug Auxiliary Control Register	RW
0x098	EDECCR	External Debug Exception Catch Control Register	RW
0x300	OSLAR_EL1	OS Lock Access Register	WO
0x310	EDPRCR	External Debug Power/Reset Control Register	RW
0x314	EDPRSR	External Debug Processor Status Register	RO
0x400 + (16 * n)	DBGBVR<n>_EL1	Debug Breakpoint Value Registers	RW
0x408 + (16 * n)	DBGBCR<n>_EL1	Debug Breakpoint Control Registers	RW
0x800 + (16 * n)	DBGWVR<n>_EL1	Debug Watchpoint Value Registers	RW
0x808 + (16 * n)	DBGWCR<n>_EL1	Debug Watchpoint Control Registers	RW

E8.6.1 Access permissions for the External debug interface registers

and show the access permissions for the external debug interface registers in an Arm A-profile Debug implementation. The terms are defined as follows:

Domain This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.

Conditions This lists the conditions under which the access is attempted.

To determine the access permissions for a register, read these columns from left to right, and stop at first column that lists the condition as being true.

The conditions are:

Off The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed [EDPRSR.PU](#) will read as 0.

———— Note ————

When the Core power domain is off, or in a low-power state, a debugger is permitted to access a debug register that is implemented in the external Debug power domain. When the Debug power domain is off, all accesses to the registers in the external Debug power domain return an error.

DLK [FEAT_DoubleLock](#) is implemented and [DoubleLockStatus\(\)](#) == TRUE. The OS Double Lock is locked..

OSLK [DBGOSLSR.OSLK](#) == 1. The OS Lock is locked.

EDAD [AllowExternalDebugAccess\(\)](#) == FALSE. External debug access is disabled for the access. See also [Behavior of a not permitted access](#).

EPMAD [AllowExternalPMUAccess\(\)](#) == FALSE. Access to the external Performance Monitors is disabled for the access. See also [Behavior of a not permitted access](#).

SLK The Software Lock is implemented and [SoftwareLockStatus\(\)](#) == TRUE. This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked for the access. See [Register access permissions for memory-mapped accesses](#).

Default This provides the default access permissions, if there are no conditions that prevent access to the register.

The access permissions are:

- This means that the default access permission applies. See the Default column, or the SLK column, if applicable.
- RO** This means that the register or field is read-only, and:
 - Unless the register description states otherwise, a RO field in an RW register ignores writes.
 - Where the `SLK` control makes a RW register RO, the register ignores writes.
- RW** This means that the register or field is read/write. Individual fields within the register might be RO or WO. See the relevant register description for details.
- RC** This means that a read of the register bit clears the field to 0.
- WO** This means that the register or field is write-only. Unless the register description states otherwise, a WO field in a RW register returns an UNKNOWN value on a read of the register.
- WI** This means that the register or field ignores writes.
- IMP DEF** This means that the access permissions are IMPLEMENTATION DEFINED.

`DBGBVR<n>_EL1` and `DBGWVR<n>_EL1`, are 64-bit registers mapped to pairs of 32-bit locations in the external debug interface. Doubleword accesses to these register are not guaranteed to be 64-bit single copy atomic. Software must take care before altering the values of `DBGBVR<n>_EL1`, `DBGWVR<n>_EL1`, `DBGBCR<n>_EL1`, and `DBGWCR<n>_EL1` to prevent UNPREDICTABLE behavior. See [Endianness and supported access sizes](#) for more information.

If OPTIONAL memory-mapped access to the external debug interface is supported, there might be additional constraints on memory-mapped accesses. See [Register access permissions for memory-mapped accesses](#).

For the reset values for the external debug interface registers, see [[@tbl:CIHCDIDH0](#)].

Table E8-3 Access permissions for the external debug interface registers if FEAT_DoPD is implemented

0xFC8	EDDEVID	Debug	-	-	-	RO	RO

a. Some bits are in the Debug power domain and some bits are in the Core power domain. See register field descriptions for information.

b. Implemented breakpoints and watchpoints only. *n* is the breakpoint or watchpoint number.

c. It is IMPLEMENTATION DEFINED whether an error is returned. See [External debug over powerdown and locks](#). If no error is returned, the access is permitted.

E8.7 Cross-trigger interface registers

The Embedded Cross-Trigger Interface, CTI, is located within its own block of the external debug memory map. There must be one such block for each PE.

If the CTI of a PE does not implement the [CTIDEVAFF0](#) or [CTIDEVAFF1](#) registers it must be located 64KB above the debug registers in the external debug interface.

[Table E8-5](#) shows the CTI register map.

Table E8-5 Summary of the Embedded Cross-Trigger Interface, CTI, registers

Offset	Name	Description	Access
0x000	CTICONTROL	CTI Control register	RW
0x010	CTIINTACK	CTI Output Trigger Acknowledge register	WO
0x014	CTIAPPSET	CTI Application Trigger Set register	RW

0xFC4	CTIDEVID1	Debug	-	-	-	-	RO	RO
0xFC8	CTIDEVID	Debug	-	-	-	-	RO	RO

For the reset values of the CTI registers, see [Table E8-8](#).

E8.8 External debug register resets

Each register or field has a defined reset domain:

- Registers and fields in the Warm reset domain are also reset by a Cold reset and unchanged by an External Debug reset that is not coincident with a Cold reset or a Warm reset.
- Registers and fields in the Cold reset domain are unchanged by a Warm reset or an External Debug reset that is not coincident with a Cold reset.
- Registers and fields in the External Debug reset domain are unchanged by a Cold reset or a Warm reset that is not coincident with an External Debug reset.

A reset might change the value of a register. Specific rules apply to the observability of registers in the External Debug reset domain by indirect reads from the Core power domain when an External Debug reset is asserted without a coincident Cold reset. For more information, see [Synchronization of changes to the external debug registers](#).

[Table E8-7](#) and [Table E8-8](#) show the external debug register and CTI register resets. For other debug registers, see Management register resets.

Note

By reference to [Figure E6-1](#) the power domain can be deduced from the reset domain.

[Table E8-7](#) and [Table E8-8](#) do not include:

- Read-only identification registers, such as Processor ID Registers and [PMCFGR](#), that have a fixed value from reset.
- Read-only status registers, such as [EDSCR.RW](#), that are evaluated each time the register is read and that have no meaningful reset value.
- Write-only registers, such as [EDRCR](#), that only have an effect on writes, and have no meaningful reset value.
- Read/write registers, such as breakpoint and watchpoint registers, and [EDPRCR.CORENPDRQ](#), that alias other registers. The reset values are described by the descriptions of those other registers.
- IMPLEMENTATION DEFINED registers. The reset values and reset domains of these registers are also IMPLEMENTATION DEFINED and might be UNKNOWN.

All other fields in the registers are set to an IMPLEMENTATION DEFINED value that can be UNKNOWN. The register is in the specified reset domain.

Note

An IMPLEMENTATION DEFINED reset value, which can be UNKNOWN, means that hardware is not required to reset the register on the specified reset, but software must not rely on the register being preserved over reset.

Table E8-7 Summary of external debug register resets, debug registers

Register	Reset domain	Field	Value	Description
DBGPRCR	Cold	CORENPDRQ	The value of the powerup request ^a	Debug Power Control Register.
EDES	Warm	SS	EDECR.SS	Halting Step debug event pending
		RC	EDECR.RCE	Reset Catch debug event pending
		OSUC	0	OS Unlock Catch debug event pending
EDECR,	External debug	SS	0	Halting Step debug event enable
		RCE	0	Reset Catch debug event enable

Register	Reset domain	Field	Value	Description
		OSUCE	0	OS Unlock Catch debug event enable
EDWAR	Cold	-	-	All fields
EDSCR	Cold	RXfull	0	DTRRX register full
		TXfull	0	DTRTX register full
		RXO	0	DTRRX overrun
		TXU	0	DTRTX underrun
		INTdis	0	Interrupt disable
		TDA	0	Trap debug register accesses to Debug state
		MA	0	Memory access mode in Debug state
		HDE	0	Halting debug mode enable
		ERR	0	Cumulative error flag
EDECCR	Cold	NSE[2:1]	0b00	Coarse-grained Non-secure Exception Catch
		SE[3,1]	0b00	Coarse-grained Secure Exception Catch
EDPRCR,	External debug	COREPURQ ^a	-	Core powerup request
EDPRSR	Warm	SDR	-	Sticky debug restart
	Cold	SPMAD	0	Sticky EPMAD error
		SDAD	0	Sticky EDAD error
	Warm	SR	1	Sticky reset status
	Cold	SPD	1	Sticky powerdown status

a. On a Cold reset, [DBGPRCR](#).CORENPDRQ resets to the value of [EDPRCR](#).COREPURQ. If an External Debug reset and a Cold reset coincide, both [EDPRCR](#).COREPURQ and [DBGPRCR](#).CORENPDRQ are reset to 0.

[Table E8-5](#) shows the reset values for the CTI registers

Table E8-8 Summary of external debug register resets, CTI registers

Register	Reset domain	Field	Value	Description
CTICONTROL	External debug	GLBEN	0	CTI global enable
CTIAPPSET	External debug	-	-	All fields
CTIINEN<n>	External debug	-	-	All fields
CTIOUTEN<n>	External debug	-	-	All fields
CTIGATE	External debug	-	-	All fields
ASICCTL	IMPLEMENTATION DEFINED	-	IMPLEMENTATION DEFINED	All of register

Chapter E9

External Debug Register Descriptions

This chapter provides a description of the external debug registers. It contains the following sections:

- [About the external debug registers](#)
- [External debug registers](#)
- [External trace registers](#)
- [Cross-Trigger Interface registers](#)

E9.1 About the external debug registers

The following sections describe the registers that are accessible through the external debug interface:

- [External debug registers.](#)
- [External trace registers.](#)
- [Cross-Trigger Interface registers.](#)

E9.2 External debug registers

This section describes the debug registers that are accessible through the external debug interface and are used for external debug.

E9.2.1 DBGAUTHSTATUS_EL1, Debug Authentication Status Register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

When FEAT_DoPD is implemented, DBGAUTHSTATUS_EL1 is in the Core power domain. Otherwise, DBGAUTHSTATUS_EL1 is in the Debug power domain

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGAUTHSTATUS\[31:0\]](#).

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

Bits [31:12]

Reserved, RES0.

HNID, bits [11:10]

Hyp non-invasive debug.

HNID	Meaning
0b00	Separate Hyp enable not implemented.
0b10	Implemented and disabled. ExternalHypNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalHypNoninvasiveDebugEnabled() == TRUE.

Only permitted values for this field are 0b10 and 0b11. All other values are reserved.

HID, bits [9:8]

Hyp invasive debug.

HID	Meaning
0b00	Separate Hyp enable not implemented.
0b10	Implemented and disabled. ExternalHypInvasiveDebugEnabled() == FALSE.

0b11	Implemented and enabled. <code>ExternalHypInvasiveDebugEnabled() == TRUE</code> .
------	---

Only permitted values for this field are 0b10 and 0b11. All other values are reserved.

SNID, bits [7:6]

Secure non-invasive debug.

SNID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. <code>ExternalSecureNoninvasiveDebugEnabled() == FALSE</code> .
0b11	Implemented and enabled. <code>ExternalSecureNoninvasiveDebugEnabled() == TRUE</code> .

For Armv8-R AArch32, the only permitted value for this field is 0b00.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. <code>ExternalSecureInvasiveDebugEnabled() == FALSE</code> .
0b11	Implemented and enabled. <code>ExternalSecureInvasiveDebugEnabled() == TRUE</code> .

For Armv8-R AArch32, the only permitted value for this field is 0b00.

All other values are reserved.

NSNID, bits [3:2]

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. <code>ExternalNoninvasiveDebugEnabled() == FALSE</code> .
0b11	Implemented and enabled. <code>ExternalNoninvasiveDebugEnabled() == TRUE</code> .

For Armv8-R AArch32, the only permitted values for this field are 0b10 and 0b11.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. <code>ExternalInvasiveDebugEnabled()</code> == FALSE.
0b11	Implemented and enabled. <code>ExternalInvasiveDebugEnabled()</code> == TRUE.

For Armv8-R AArch32, the only permitted values for this field are 0b10 and 0b11.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFB8	DBGAUTHSTATUS_EL1

Accesses to this register are RO.

E9.2.2 DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 63

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configuration

DBGBCR<n>_EL1 is in the Core power domain

If breakpoint n is not implemented, then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions

When the E field is zero, all the other fields in the register are ignored.

Bits [63:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type.

Specifies breakpoint type.

BT	Meaning	Applies when
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.	
0b0001	Linked instruction address match. As 0b0000, but linked to a breakpoint that has linking enabled.	
0b0010	Unlinked Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR.	breakpoint n is context-aware
0b0011	As 0b0010, with linking enabled.	breakpoint n is context-aware

BT	Meaning	Applies when
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction.	
0b0101	Linked instruction address mismatch. As 0b0100, but linked to a breakpoint that has linking enabled.	
0b1000	Unlinked VMID match. DBGBVR<n>_EL1 .VMID is a VMID compared against VSCTLR .VMID.	breakpoint n is context-aware
0b1001	As 0b1000, with linking enabled.	breakpoint n is context-aware
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1 .ContextID is a Context ID compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1 .VMID is a VMID compared against VSCTLR .VMID.	breakpoint n is context-aware
0b1011	As 0b1010, with linking enabled.	breakpoint n is context-aware

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number.

For Linked address matching breakpoints, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved [DBGBCR<n>_EL1](#).{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>_EL1](#).SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which halfwords an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions.
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions.
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions.

All other values are reserved.

For more information, see ‘[Using the BAS field in Address Match breakpoints](#)’.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	•	Use for a match anywhere breakpoint.
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions.
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions.
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions.

All other values are reserved.

For more information, see ‘[Using the BAS field in Address Match breakpoints](#)’.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the [DBGBCR<n>_EL1](#).SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see ‘Execution conditions for which a breakpoint generates Breakpoint exceptions’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint n.

E	Meaning
0b0	Breakpoint n disabled.
0b1	Breakpoint n enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

This register is 32-bits wide and offset $0 \times 40C + (16 * n)$ is reserved.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	$0 \times 408 + (16 * n)$	DBGBCR<n>_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 63

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>_EL1](#).

Configuration

DBGBVR<n>_EL1 is in the Core power domain

How this register is interpreted depends on the value of [DBGBCR<n>_EL1.BT](#).

- When [DBGBCR<n>_EL1.BT](#) is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>_EL1.BT](#) is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>_EL1.BT](#) is 0b100x, this register holds a VMID.
- When [DBGBCR<n>_EL1.BT](#) is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>_EL1.BT](#) is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>_EL1.BT](#), this register is RES0.

If breakpoint n is not implemented, then accesses to this register are:

- RES0 when `IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess()`.
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register [DBGXVR<n>\[31:0\]](#).

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When [DBGBCR<n>_EL1.BT](#) IN {'0x0x'}:

RESS[14:8], bits [63:57]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

RESS[7:4], bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

RESS[3:0], bits [52:49]

Extension to RESS[14:8]. For more information, see RESS[14:8].

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When **DBGBCR<n>_EL1.BT** IN {'001x'}:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against the following:

- [CONTEXTIDR](#) when the PE is executing at AArch32.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When **DBGBCR<n>_EL1.BT** IN {'100x'}:

Bits [63:40]

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {'101x'}:

Bits [63:40]

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>_EL1

DBGBVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x400 + (16 * n)	DBGBVR<n>_EL1	63:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.4 DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear Register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.
The architecture does not define any functionality for the CLAIM tag bits.

Note
CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET_EL1](#) register.

Configuration

DBGCLAIMCLR_EL1 is in the Core power domain
An implementation must include eight CLAIM tag bits.
External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR](#)[31:0].
External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMSET](#)[31:0].
External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register [DBGCLAIMSET_EL1](#)[31:0].

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bits [m], for m = 7 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.

CLAIM<m>	Meaning
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is W1C.

Accessing DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA4	DBGCLAIMCLR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.5 **DBGCLAIMSET_EL1, Debug CLAIM Tag Set Register**

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.
The architecture does not define any functionality for the CLAIM tag bits.

———— **Note** —————
CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR_EL1](#) register.

Configuration

DBGCLAIMSET_EL1 is in the Core power domain
An implementation must include eight CLAIM tag bits.
External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMSET](#)[31:0].
External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR](#)[31:0].
External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to External register [DBGCLAIMCLR_EL1](#)[31:0].

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m> , bits [m], for m = 7 to 0

Claim Tag Set. Used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a write: Ignored.
0b1	On a write: Set Claim Tag bit <m> to 1.

Access to this field is RAO/WIS.

Accessing DBGCLAIMSET_EL1

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA0	DBGCLAIMSET_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.6 DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

DBGDTRRX_EL0 is in the Core power domain

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint\[31:0\]](#).

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

DTRRX, bits [31:0]

Update DTRRX.

Writes to this register:

- If RXfull is 0, update the value in DTRRX and set RXfull to 1.
- If RXfull is 1, the written value is ignored and RXO is set to 1.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see ‘[The Debug Communication Channel and Instruction Transfer Register](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

If [EDSCR.ITE](#) == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in Memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x080	DBGDTRRX_EL0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.7 DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

DBGDTRTX_EL0 is in the Core power domain

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXint](#)[31:0].

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

DTRTX, bits [31:0]

Return DTRTX.

Reads of this register:

- If TXfull is 1, return the value in DTRTX and clear TXfull to 0.
- If TXfull is 0, return an UNKNOWN value and set TXU to 1.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see ‘[The Debug Communication Channel and Instruction Transfer Register](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTX_EL0

If [EDSCR](#).ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in Memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x08C	DBGDTRTX_EL0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.8 DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 63

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

Configuration

DBGWCR<n>_EL1 is in the Core power domain

If watchpoint n is not implemented, then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions

Bits [63:29]

Reserved, RES0.

MASK, bits [28:24]

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If programmed with a reserved value, the watchpoint behaves as if one of the following:

- DBGWCR<n>_EL1.MASK has been programmed with a defined value, which might be 0b00000 (no mask), other than for a direct read of DBGWCR<n>_EL1.
- The watchpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number.

For Linked data address watchpoints, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see ‘Execution conditions for which a watchpoint generates Watchpoint exceptions’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see ‘Execution conditions for which a watchpoint generates Watchpoint exceptions’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or doubleword addressed by [DBGWVR<n>_EL1](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where [DBGWVR<n>_EL1](#) addresses a doubleword:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If [DBGWVR<n>_EL1\[2\] == 1](#), only BAS[3:0] is used. Arm deprecates setting [DBGWVR<n>_EL1\[2\] == 1](#).

The valid values for BAS are nonzero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See ‘[Reserved DBGWCR<n>.BAS values](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see ‘[Execution conditions for which a watchpoint generates Watchpoint exceptions](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n.

E	Meaning
0b0	Watchpoint n disabled.
0b1	Watchpoint n enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>_EL1

This register is 32-bits wide and offset $0 \times 80C + (16 * n)$ is reserved.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	$0 \times 808 + (16 * n)$	DBGWCR<n>_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.9 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 63

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>_EL1](#).

Configuration

DBGWVR<n>_EL1 is in the Core power domain

If watchpoint n is not implemented, then accesses to this register are:

- When `IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0`.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>\[31:0\]](#).

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

63				57		56		53		52		49		48												32								
RESS[14:8]										RESS[7:4]					RESS[3:0]					VA[48:2]														
31																															2		1	0
VA[48:2]																														RES0				

RESS[14:8], bits [63:57]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

RESS[7:4], bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

RESS[3:0], bits [52:49]

Extension to RESS[14:8]. For more information, see RESS[14:8].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

Arm deprecates setting [DBGWVR<n>_EL1\[2\] = 1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1

DBGWVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	$0 \times 800 + (16 * n)$	DBGWVR<n>_EL1	63:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.10 EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

Note

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.

For general information about the interpretation of the ID registers, see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

Bits [63:16]

Reserved, RES0.

EL3, bits [15:12]

When EDPFR.EL3 == '0000':

AArch32 EL3 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL3	Meaning
0b0000	EL3 is not implemented or can be executed in AArch64 state.
0b0001	EL3 can be executed in AArch32 state only.

All other values are reserved.

In an Armv8-R AArch32 implementation this field returns the value of 0b0000.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

EL2, bits [11:8]

When **EDPFR.EL2** == '0000':

AArch32 EL2 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL2	Meaning
0b0000	EL2 is not implemented or can be executed in AArch64 state.
0b0001	EL2 can be executed in AArch32 state only.

All other values are reserved.

In an Armv8-R AArch32 implementation this field returns the value of 0b0001.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

PMSA, bits [7:4]

Indicates support for a 32-bit PMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSA	Meaning
0b0000	PMSA-32 not supported.
0b0100	PMSAv8-32 supported.

In Armv8-R AArch32, the only permitted value is 0b0100. All other values are reserved.

Access to this field is RO.

VMSA, bits [3:0]

When **EDAA32PFR.PMSA** != '0000':

Indicates support for a VMSA in addition to a 32-bit PMSA.

VMSA	Meaning
0b0000	VMSA not supported.

All other values are reserved.

Access to this field is RO.

When **EDAA32PFR.PMSA** == '0000':

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMSA	Meaning
0b0000	VMSAv8-64 supported.
0b1111	Memory system architecture described by EDAA32PFR.MSA_frac.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing EDAA32PFR

EDAA32PFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD60	EDAA32PFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are IMPLEMENTATION DEFINED.

E9.2.11 EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Configuration

When FEAT_DoPD is implemented, EDACR is in the Core power domain. Otherwise, it is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain

If this register is implemented, EDDEVID.AuxRegs == 0b0001.

If FEAT_DoPD is implemented, any mechanism to preserve control bits in EDACR over power down is optional and IMPLEMENTATION DEFINED.

If FEAT_DoPD is not implemented and EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, OSLSR_EL1.OSLK == 1, and when the Core is powered off.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

Implementation of this register is OPTIONAL.

Attributes

EDACR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to an architecturally UNKNOWN value.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to an architecturally UNKNOWN value.
 - On a Warm reset, the value of this field is unchanged.

Accessing EDACR

EDACR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x094	EDACR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are IMPLEMENTATION DEFINED.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.12 EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.
For more information, see ‘About the Component Identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDCIDR0 is in the Core power domain. Otherwise, EDCIDR0 is in the Debug power domain

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

When FEAT_ED_PIDR is implemented:

Preamble.
Reads as 0x0D
Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing EDCIDR0

EDCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF0	EDCIDR0

Accesses to this register are RO.

E9.2.13 EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.
For more information, see ‘About the Component Identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDCIDR1 is in the Core power domain. Otherwise, EDCIDR1 is in the Debug power domain

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

When FEAT_ED_PIDR is implemented:
Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.
This field reads as 0x9.
Access to this field is RO.

Otherwise:

Reserved, RAZ.

PRMBL_1, bits [3:0]

When FEAT_ED_PIDR is implemented:
Preamble.
Reads as 0b0000
Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing EDCIDR1

EDCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF4	EDCIDR1

Accesses to this register are RO.

E9.2.14 EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.
For more information, see ‘About the Component Identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDCIDR2 is in the Core power domain. Otherwise, EDCIDR2 is in the Debug power domain

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

When FEAT_ED_PIDR is implemented:

Preamble.
Reads as 0x05
Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing EDCIDR2

EDCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF8	EDCIDR2

Accesses to this register are RO.

E9.2.15 EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.
For more information, see ‘About the Component Identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDCIDR3 is in the Core power domain. Otherwise, EDCIDR3 is in the Debug power domain

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

When FEAT_ED_PIDR is implemented:

Preamble.
Reads as 0xB1
Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing EDCIDR3

EDCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFFC	EDCIDR3

Accesses to this register are RO.

E9.2.16 EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading [EDPCSR](#)[31:0].

Configuration

EDCIDSR is in the Core power domain

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions

CONTEXTIDR, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample is generated:

- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is **CONSTRAINED UNPREDICTABLE** whether EDCIDSR is set to the original or new value if [EDPCSR](#) samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Accessing EDCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register **UNKNOWN**, see ‘[Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN](#)’.

EDCIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A4	EDCIDSR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an **ERROR**.
- Otherwise, accesses to this register are **RO**.

E9.2.17 EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

When FEAT_DoPD is implemented, EDDEVAFF0 is in the Core power domain. Otherwise, EDDEVAFF0 is in the Debug power domain

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the [MPIDR](#).{Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDDEVAFF0

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA8	EDDEVAFF0

Accesses to this register are RO.

E9.2.18 EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

When FEAT_DoPD is implemented, EDDEVAFF1 is in the Core power domain. Otherwise, EDDEVAFF1 is in the Debug power domain

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of [EDDEVAFF0.Aff0](#) for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDDEVAFF1

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFAC	EDDEVAFF1

Accesses to this register are RO.

E9.2.19 EDDEVARCH, External Debug Device Architecture Register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

When FEAT_DoPD is implemented, EDDEVARCH is in the Core power domain. Otherwise, EDDEVARCH is in the Debug power domain

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

When FEAT_ED_PIDR is implemented:

ARCHITECT, bits [31:21]

Defines the architect of the component. For External Debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011

Access to this field is RO.

PRESENT, bit [20]

DEVARCH presence. Indicates that the EDDEVARCH register provides architecture information.

Reads as 0b1

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000

Access to this field is RO.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHVER is EDDEVARCH.ARCHID[15:12].

In Armv8-R AArch32, the only permitted value is 0b0110.

Access to this field is RO.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA05	Armv8-R AArch32 debug architecture.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHPART is EDDEVARCH.ARCHID[11:0].

Armv8-R debug architecture.

Access to this field is RO.

Otherwise:

Bits [31:21]

Reserved, RES0.

PRESENT, bit [20]

DEVARCH presence. Indicates that the EDDEVARCH register does not provide architecture information.

Reads as 0b0

Access to this field is RO.

Bits [19:0]

Reserved, RES0.

Accessing EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

Accesses to this register are RO.

E9.2.20 EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

When FEAT_DoPD is implemented, EDDEVID is in the Core power domain. Otherwise, EDDEVID is in the Debug power domain

Attributes

EDDEVID is a 32-bit register.

Field descriptions

31	28	27	24	23	4	3	0
RES0		AuxRegs		RES0		PCSample	

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR .

All other values are reserved.

Access to this field is RO.

Bits [23:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR , EDCIDSR , and EDVIDSR are implemented.

All other values are reserved.

Access to this field is RO.

Accessing EDDEVID

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

Accesses to this register are RO.

E9.2.21 EDDEVID1, External Debug Device ID Register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

When FEAT_DoPD is implemented, EDDEVID1 is in the Core power domain. Otherwise, EDDEVID1 is in the Debug power domain

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

PCSR0ffset, bits [3:0]

Indicates the offset applied to PC samples returned by reads of [EDPCSR](#).

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSR0ffset	Meaning
0b0000	EDPCSR not implemented.
0b0010	EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

Access to this field is RO.

Accessing EDDEVID1

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC4	EDDEVID1

Accesses to this register are RO.

E9.2.22 EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configuration

When FEAT_DoPD is implemented, EDDEVID2 is in the Core power domain. Otherwise, EDDEVID2 is in the Debug power domain

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing EDDEVID2

EDDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC0	EDDEVID2

Accesses to this register are RO.

E9.2.23 EDDEVTTYPE, External Debug Device Type register

The EDDEVTTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's debug logic.

Configuration

When FEAT_DoPD is implemented, EDDEVTTYPE is in the Core power domain. Otherwise, EDDEVTTYPE is in the Debug power domain

Attributes

EDDEVTTYPE is a 32-bit register.

Field descriptions

When FEAT_ED_PIDR is implemented:

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001

Access to this field is RO.

MAJOR, bits [3:0]

Major type. Indicates this is a debug logic component.

Reads as 0b0101

Access to this field is RO.

Otherwise:

Bits [31:0]

Reserved, RES0.

Accessing EDDEVTYPE

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFCC	EDDEVTYPE

Accesses to this register are RO.

E9.2.24 EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top-level information about the debug system.

Note

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

EDDFR is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

CTX_CMPS, bits [31:28]

Number of context-aware breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPS	Meaning
0b0000..0b1111	The number of context-aware breakpoints, minus 1.

The value of this field is never greater than EDDFR.BRPs.

Access to this field is RO.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0b0001..0b1111	The number of watchpoints, minus 1.

The value 0b0000 is reserved.

Access to this field is RO.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0b0001..0b1111	The number of breakpoints, minus 1.

The value 0b0000 is reserved.

Access to this field is RO.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in ‘Alternative ID scheme used for the Performance Monitors Extension version’

The value of this field is an IMPLEMENTATION DEFINED choice of:

All other values are reserved.

[FEAT_PMUv3](#) implements the functionality identified by the value 0b0001.

Access to this field is RO.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace unit is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceVer	Meaning
0b0000	Trace unit System registers not implemented.

0b0001

Trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a trace unit is implemented. A trace unit might nevertheless be implemented without a System register interface.

Access to this field is RO.

Bits [3:0]

Reserved, UNKNOWN.

Accessing EDDFR

EDDFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD28	EDDFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are IMPLEMENTATION DEFINED.

E9.2.25 EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events. For more information, see [‘Exception Catch debug event’](#).

Configuration

EDECCR is in the Core power domain

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCR](#)[31:0].

Attributes

EDECCR is a 32-bit register.

Field descriptions

Bits [31:17]

Reserved, RES0.

RLE0, bit [16]

Access to this field is RES0.

NSR3, bit [15]

Access to this field is RES0.

Bits [14:8]

Reserved, RES0.

NSE3, bit [7]

Access to this field is RES0.

NSE2, bit [6]

When Non-secure EL2 is implemented:

Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.

NSE2	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL2.

0b1	Exception Catch debug events are enabled for Non-secure EL2.
-----	--

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSE1, bit [5]

When Non-secure EL1 is implemented:

Coarse-grained exception catch for Non-secure EL1. Controls Exception Catch debug events for Non-secure EL1.

NSE1	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL1.
0b1	Exception Catch debug events are enabled for Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSE0, bit [4]

Access to this field is RES0.

Bits [3:2]

Reserved, RES0.

SE1, bit [1]

When Secure EL1 is implemented:

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

SE1	Meaning
0b0	Exception Catch debug events are disabled for Secure EL1.
0b1	Exception Catch debug events are enabled for Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SE0, bit [0]

Access to this field is RES0.

Accessing EDECCR

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.26 EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Configuration

When FEAT_DoPD is implemented, EDECR is in the Core power domain. Otherwise, EDECR is in the Debug power domain

Attributes

EDECR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

SS	Meaning
0b0	Halting step debug event disabled.
0b1	Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in [‘Changing the value of EDECR.SS when not in Debug state’](#).

The reset behavior of this field is:

- On a External debug reset, this field resets to '0'.

RCE, bit [1]

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behavior of this field is:

- On a External debug reset, this field resets to '0'.

OSUCE, bit [0]

OS Unlock Catch Enable.

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On a External debug reset, this field resets to '0'.

Accessing EDECR

EDECR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x024	EDECR

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.27 EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configuration

EDESR is in the Core power domain

Attributes

EDESR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in EDECR.SS.

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

RC	Meaning
0b0	Reading this means that a Reset Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [EDECR.RCE](#).

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

OSUC	Meaning
0b0	Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing EDESR

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is **CONSTRAINED UNPREDICTABLE** whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDESR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x020	EDESR

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.28 EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

The power domain of EDITCTRL is IMPLEMENTATION DEFINED

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- Whichever power domain the register is implemented in, this field resets to 0.
- Otherwise, the value of this field is unchanged.

Accessing EDITCTRL

EDITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xF00	EDITCTRL

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are IMPLEMENTATION DEFINED.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.29 EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configuration

EDITR is in the Core power domain

Attributes

EDITR is a 32-bit register.

Field descriptions

When UsingAArch32():

hw2, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see ‘Behavior in Debug state’.

———— **Note** ————
The hw2 field is displayed on the left. This is not the usual convention for display of T32 instruction halfwords.

hw1, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

———— **Note** ————
The hw1 field is displayed on the right. This is not the usual convention for display of T32 instruction halfwords.

Accessing EDITR

IfEDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x084	EDITR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

E9.2.30 EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

When FEAT_DoPD is implemented, EDLAR is in the Core power domain. Otherwise, EDLAR is in the Debug power domain

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE.

Software uses EDLAR to set or clear the lock, and [EDLSR](#) to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

When Debug Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing EDLAR

EDLAR can be accessed through the memory-mapped interface:

Component	Offset	Instance
Debug	0xFB0	EDLAR

Accesses to this register are WO.

E9.2.31 EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

When FEAT_DoPD is implemented, EDLSR is in the Core power domain. Otherwise, EDLSR is in the Debug power domain

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE.

Software uses [EDLAR](#) to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLK, bit [1]

When Debug Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component’s registers.
0b1	Lock set. Writes to this component’s registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On a External debug reset, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is RO.

Accessing EDLSR

EDLSR can be accessed through the memory-mapped interface:

Component	Offset	Instance
Debug	0xFB4	EDLSR

Accesses to this register are RO.

E9.2.32 EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

EDPCSR is in the Core power domain

If FEAT_Debugv8p1 is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

Attributes

EDPCSR is a 32-bit register.

Field descriptions

EDPCSR, bits [31:0]

PC Sample. The sampled instruction address value.

EDPCSR reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR is permitted but not required to return 0xFFFFFFFF.

EDPCSR reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR.

For the cases where a read of EDPCSR returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting [EDCIDSR](#), and [EDVIDSR](#) to UNKNOWN values.

Otherwise, a read of EDPCSR returns the sampled instruction address value and has the side-effect of indirectly writing to [EDCIDSR](#), and [EDVIDSR](#). The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{E2}.

For a read of EDPCSR from the memory-mapped interface, if [EDLSR.SLK](#) == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and [EDCIDSR](#), and [EDVIDSR](#) are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see ‘[Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN](#)’

In Armv8-R AArch32, EDPCSR is accessed as 32-bit memory mapped address.

EDPCSR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x0A0	EDPCSR	31:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- Otherwise, accesses to this register are RO.

Component	Offset	Instance	Range
Debug	0x0AC	EDPCSR	63:32

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- Otherwise, accesses to this register are RO.

E9.2.33 EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see ‘Principles of the ID scheme for fields in ID registers’.

Configuration

There are no configuration notes.

Attributes

EDPFR is a 64-bit register.

Field descriptions

Bits [63:28]

Reserved, RES0.

GIC, bits [27:24]

System register GIC interface support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface System registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

The table above shows all possible values of this field. The values this field can take in the current implementation are:

- 0b0000
- 0b0001

All other values are reserved.

In Armv8-R AArch32, the only permitted values are 0b0000 and 0b0001. All other values are reserved.

Access to this field is RO.

AdvSIMD, bits [23:20]

Advanced SIMD.

The value of this field is an IMPLEMENTATION DEFINED choice of:

All other values are reserved.

This field must have the same value as the FP field.

[FEAT_AdvSIMD](#) implements the functionality identified by the value 0b0000.

In Armv8-R AArch32, the only permitted values are 0b0000 and 0b1111. All other values are reserved.

Access to this field is RO.

FP, bits [19:16]

The value of this field is an IMPLEMENTATION DEFINED choice of:

All other values are reserved.

This field must have the same value as the AdvSIMD field.

[FEAT_FP](#) implements the functionality identified by the value 0b0000.

In Armv8-R AArch32, the only permitted values are 0b0000 and 0b1111. All other values are reserved.

Access to this field is RO.

EL3, bits [15:12]

AArch64 EL3 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL3	Meaning
0b0000	EL3 is not implemented or cannot be executed in AArch64 state.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in both Execution states.

When the value of [EDAA32PFR.EL3](#) is nonzero, this field must be 0b0000.

All other values are reserved.

In an Armv8-R AArch32 implementation this field returns the value of 0b0000.

Access to this field is RO.

EL2, bits [11:8]

AArch64 EL2 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL2	Meaning
0b0000	EL2 is not implemented or cannot be executed in AArch64 state.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in both Execution states.

EL2	Meaning
-----	---------

When the value of [EDAA32PFR](#).EL2 is nonzero, this field must be 0b0000.

All other values are reserved.

In an Armv8-R AArch32 implementation this field returns the value of 0b0000.

Access to this field is RO.

EL1, bits [7:4]

AArch64 EL1 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL1	Meaning
0b0000	EL1 cannot be executed in AArch64 state. EL1 can be executed in AArch32 state only.
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in both Execution states.

All other values are reserved.

In Armv8-R AArch32, the only permitted values is 0b0000.

Access to this field is RO.

EL0, bits [3:0]

AArch64 EL0 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL0	Meaning
0b0000	EL0 cannot be executed in AArch64 state. EL0 can be executed in AArch32 state only.
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in both Execution states.

All other values are reserved.

In Armv8-R AArch32 implementation, the only permitted values is 0b0000.

Access to this field is RO.

Accessing EDPFR

EDPFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD20	EDPFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are IMPLEMENTATION DEFINED.

E9.2.34 **EDPIDR0, External Debug Peripheral Identification Register 0**

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.
For more information, see ‘About the Peripheral identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDPIDR0 is in the Core power domain. Otherwise, EDPIDR0 is in the Debug power domain

This register is present only when FEAT_ED_PIDR is implemented. Otherwise, direct accesses to EDPIDR0 are RES0.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
 - [EDPIDR1](#).PART_1 contains part number bits [11:8].
 - [EDPIDR0](#).PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
 - [EDPIDR1](#).PART_1 contains part number bits [15:12].
 - [EDPIDR0](#).PART_0 contains part number bits [11:4].
 - [EDPIDR2](#).REVISION contains part number bits [3:0].

When a 12-bit part number is used, [EDPIDR2](#).REVISION indicates revision information.
The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Accessing EDPIDR0

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE0	EDPIDR0

Accesses to this register are RO.

E9.2.35 EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDPIDR1 is in the Core power domain. Otherwise, EDPIDR1 is in the Debug power domain

This register is present only when FEAT_ED_PIDR is implemented. Otherwise, direct accesses to EDPIDR1 are RES0.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

31		8	7	4	3	0	
RES0							
				DES_0		PART_1	

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- [EDPIDR1.DES_0](#): JEP106 identification code bits[3:0].
- [EDPIDR2.DES_1](#): JEP106 identification code bits[6:4].
- [EDPIDR4.DES_2](#): JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value $0 \times 7F$.
- A following 8-bit number, that is not $0 \times 7F$, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code $0 \times 7F \ 0 \times 7F \ 0 \times 7F \ 0 \times 7F \ 0 \times 3B$.

- The continuation code is the number of times $0 \times 7F$ appears before the final number. For example, a component designed by Arm Limited has the code 0×4 .
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code $0 \times 3B$.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
 - [EDPIDR1](#).PART_1 contains part number bits [11:8].
 - [EDPIDR0](#).PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
 - [EDPIDR1](#).PART_1 contains part number bits [15:12].
 - [EDPIDR0](#).PART_0 contains part number bits [11:4].
 - [EDPIDR2](#).REVISION contains part number bits [3:0].

When a 12-bit part number is used, [EDPIDR2](#).REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR1

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE4	EDPIDR1

Accesses to this register are RO.

E9.2.36 EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDPIDR2 is in the Core power domain. Otherwise, EDPIDR2 is in the Debug power domain

This register is present only when FEAT_ED_PIDR is implemented. Otherwise, direct accesses to EDPIDR2 are RES0.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- [EDPIDR2.REVISION](#) indicates the 4-bit revision number.
- [EDPIDR3.REVAND](#) indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- [EDPIDR2.REVISION](#) indicates the 4-bit major revision number.
- [EDPIDR3.REVAND](#) indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- [EDPIDR2.REVISION](#) contains part number bits [3:0].
- [EDPIDR3.REVAND](#) indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- [EDPIDR1.DES_0](#): JEP106 identification code bits[3:0].
- [EDPIDR2.DES_1](#): JEP106 identification code bits[6:4].
- [EDPIDR4.DES_2](#): JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
 - The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.
-

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

Accesses to this register are RO.

E9.2.37 EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDPIDR3 is in the Core power domain. Otherwise, EDPIDR3 is in the Debug power domain

This register is present only when FEAT_ED_PIDR is implemented. Otherwise, direct accesses to EDPIDR3 are RES0.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- [EDPIDR2.REVISION](#) indicates the 4-bit revision number.
- [EDPIDR3.REVAND](#) indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- [EDPIDR2.REVISION](#) indicates the 4-bit major revision number.
- [EDPIDR3.REVAND](#) indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- [EDPIDR2.REVISION](#) contains part number bits [3:0].
- [EDPIDR3.REVAND](#) indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field

is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

[EDPIDR3](#).CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

[EDPIDR3](#).REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR3

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFEC	EDPIDR3

Accesses to this register are RO.

E9.2.38 EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDPIDR4 is in the Core power domain. Otherwise, EDPIDR4 is in the Debug power domain

This register is present only when FEAT_ED_PIDR is implemented. Otherwise, direct accesses to EDPIDR4 are RES0.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. $\log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- [EDPIDR1.DES_0](#): JEP106 identification code bits[3:0].
- [EDPIDR2.DES_1](#): JEP106 identification code bits[6:4].
- [EDPIDR4.DES_2](#): JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
 - The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.
-

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR4

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFD0	EDPIDR4

Accesses to this register are RO.

E9.2.39 **EDPIDR5, External Debug Peripheral Identification Register 5**

The EDPIDR5 characteristics are:

Purpose

Provides information to identify an external debug component.
For more information, see ‘About the Peripheral identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDPIDR5 is in the Core power domain. Otherwise, EDPIDR5 is in the Debug power domain

This register is present only when FEAT_ED_PIDR is implemented. Otherwise, direct accesses to EDPIDR5 are RES0.

Attributes

EDPIDR5 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing EDPIDR5

EDPIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFD4	EDPIDR5

Accesses to this register are RO.

E9.2.40 **EDPIDR6, External Debug Peripheral Identification Register 6**

The EDPIDR6 characteristics are:

Purpose

Provides information to identify an external debug component.
For more information, see ‘About the Peripheral identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDPIDR6 is in the Core power domain. Otherwise, EDPIDR6 is in the Debug power domain

This register is present only when FEAT_ED_PIDR is implemented. Otherwise, direct accesses to EDPIDR6 are RES0.

Attributes

EDPIDR6 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing EDPIDR6

EDPIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFD8	EDPIDR6

Accesses to this register are RO.

E9.2.41 EDPIDR7, External Debug Peripheral Identification Register 7

The EDPIDR7 characteristics are:

Purpose

Provides information to identify an external debug component.
For more information, see ‘About the Peripheral identification scheme’.

Configuration

When FEAT_DoPD is implemented, EDPIDR7 is in the Core power domain. Otherwise, EDPIDR7 is in the Debug power domain
This register is present only when FEAT_ED_PIDR is implemented. Otherwise, direct accesses to EDPIDR7 are RES0.

Attributes

EDPIDR7 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing EDPIDR7

EDPIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFDC	EDPIDR7

Accesses to this register are RO.

E9.2.42 EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Configuration

When FEAT_DoPD is implemented, EDPRCR is in the Core power domain. Otherwise, EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain

External register EDPRCR bit [0] is architecturally mapped to AArch32 System register [DBGPRCR](#)[0].

Attributes

EDPRCR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

COREPURQ	Meaning
0b0	Do not request power up of the Core power domain.
0b1	Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGPWRUPREQ** signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

Note
Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a External debug reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RW.

Bit [2]

Reserved, RES0.

CWRR, bit [1]

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

In an implementation that includes the recommended external debug interface, this bit drives the **DBGSTREQ** signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if any of the following are true:
 - !IsCorePowered()
 - DoubleLockStatus()
 - OSLockStatus()
 - SoftwareLockStatus(addrdesc)
- When !ExternalInvasiveDebugEnabled(), access to this field is RAZ/WI.
- When !ExternalHypInvasiveDebugEnabled(), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR_EL1.CORENPDRQ](#) fields.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGNOPWRDWN** signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see ‘[Core power domain power states](#)’.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any of the following are true:
 - !IsCorePowered()
 - DoubleLockStatus()
 - OSLockStatus()
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RW.

Accessing EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x310	EDPRCR

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.43 EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

When FEAT_DoPD is implemented, EDPRSR is in the Core power domain. Otherwise, EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain

If FEAT_DoPD is implemented, then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

Bits [31:12]

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

SDR	Meaning
0b0	The PE has not restarted since EDPRSR was last read.
0b1	The PE has restarted since EDPRSR was last read.

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If the Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, access to this field is UNKNOWN/WI.
- When `DoubleLockStatus()`, access to this field is UNKNOWN/WI.
- When `SoftwareLockStatus(addrdesc)`, access to this field is RO.
- Otherwise, access to this field is RC/WI.

SPMAD, bit [10]

When FEAT_PMUv3_EXT is implemented:

Sticky EPMAD error.

SPMAD	Meaning
0b0	No external debug interface accesses to the Performance Monitors registers have failed because <code>AllowExternalPMUAccess() == FALSE</code> since EDPRSR was last read.
0b1	At least one external debug interface access to the Performance Monitors registers has failed and returned an error because <code>AllowExternalPMUAccess() == FALSE</code> since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If [FEAT_DoubleLock](#) is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If [FEAT_DoubleLock](#) is implemented, and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, access to this field is UNKNOWN/WI.
- When `DoubleLockStatus()`, access to this field is UNKNOWN/WI.
- When `OSLockStatus()`, access to this field is UNKNOWN/WI.
- When `SoftwareLockStatus(addrdesc)`, access to this field is RO.
- Otherwise, access to this field is RC/WI.

Otherwise:

Reserved, RES0.

EPMAD, bit [9]

When FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable status. Reports whether access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.EPMAD control.

See MDCR_EL3.EPMAD for the list of affected external Performance Monitor registers.

EPMAD	Meaning
0b0	External access to Performance Monitor registers not affected. <code>AllowExternalPMUAccess() == TRUE</code> .

EPMAID	Meaning
0b1	External access to affected Performance Monitor registers is prohibited. <code>AllowExternalPMUAccess() == FALSE</code> .

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any of the following are true:
 - `!IsCorePowered()`
 - `EDPRSR.R == '1'`
- When `DoubleLockStatus()`, access to this field is UNKNOWN/WI.
- When `OSLockStatus()`, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

When FEAT_PMUv3 is implemented:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SDAD, bit [8]

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess() == FALSE`.

SDAD	Meaning
0b0	No external debug interface accesses to the debug registers have failed because <code>AllowExternalDebugAccess() == FALSE</code> since EDPRSR was last read.
0b1	At least one external debug interface access to the debug registers has failed and returned an error because <code>AllowExternalDebugAccess() == FALSE</code> since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If [FEAT_DoubleLock](#) is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If [FEAT_DoubleLock](#) is implemented and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any of the following are true:
 - `!IsCorePowered()`
 - `EDPRSR.R == '1'`
- When `DoubleLockStatus()`, access to this field is UNKNOWN/WI.
- Access to this field is UNKNOWN/WI if all of the following are true:
 - `OSLockStatus()`
 - external debug writes to OSLAR_EL1 do not return an error when `AllowExternalDebugAccess(addrdesc) == FALSE`
- Otherwise, access to this field is RO.

EDAD, bit [7]

External Debug Access Disable status. Reports whether access to breakpoint registers, watchpoint registers, and optionally [OSLAR_EL1](#) by an external debugger is prohibited by the MDCR_EL3.EDAD control.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDAD	Meaning
0b0	External access to debug registers not affected. <code>AllowExternalDebugAccess()</code> == TRUE.
0b1	External access to affected debug registers is prohibited. <code>AllowExternalDebugAccess()</code> == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any of the following are true:
 - `!IsCorePowered()`
 - `EDPRSR.R == '1'`
- When `DoubleLockStatus()`, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

DLK, bit [6]

When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function `DoubleLockStatus()`.

If the Core power domain is powered up and `DoubleLockStatus() == TRUE`, it is IMPLEMENTATION DEFINED whether:

- `EDPRSR.PU` reads as 1, `EDPRSR.DLK` reads as 1, and `EDPRSR.SPD` is UNKNOWN.
- `EDPRSR.PU` reads as 0, `EDPRSR.DLK` is UNKNOWN, and `EDPRSR.SPD` reads as 0.

This field is in the Core power domain.

DLK	Meaning
0b0	<code>DoubleLockStatus()</code> returns FALSE.
0b1	<code>DoubleLockStatus()</code> returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of `OSLSR_EL1.OSLK`.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any of the following are true:
 - !IsCorePowered()
 - EDPRSR.R == '1'
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

HALTED, bit [4]

Halted status bit.

HALTED	Meaning
0b0	PE is in Non-debug state.
0b1	PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

SR, bit [3]

Sticky core Reset status bit.

SR	Meaning
0b0	The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
0b1	The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If [FEAT_DoubleLock](#) is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If [FEAT_DoubleLock](#) is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is UNKNOWN/WI.
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RC/WI.

R, bit [2]

PE Reset status bit.

R	Meaning
0b0	The non-debug logic of the PE is not in reset state.
0b1	The non-debug logic of the PE is in reset state.

If [FEAT_DoubleLock](#) is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see ‘[EDPRSR.{DLK, R} and reset state](#)’.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any of the following are true:
 - !IsCorePowered()
 - DoubleLockStatus()
- Otherwise, access to this field is RO.

SPD, bit [1]

Sticky core Powerdown status bit.

If [FEAT_DoubleLock](#) is implemented and `DoubleLockStatus() == TRUE`, then:

- If [FEAT_Debugv8p2](#) is implemented, this bit reads as 0.
- If [FEAT_Debugv8p2](#) is not implemented, this bit might read as 0 or 1.

For more information, see ‘[EDPRSR.{DLK, SPD, PU} and the Core power domain](#)’.

SPD	Meaning
0b0	If <code>EDPRSR.PU</code> is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If <code>EDPRSR.PU</code> is 1, the state of the debug registers in the Core power domain has not been lost.
0b1	The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of `EDPRSR`:

- If [FEAT_DoubleLock](#) is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If [FEAT_DoubleLock](#) is implemented and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

`EDPRSR.{DLK, SPD, PU}` describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see ‘[EDPRSR.{DLK, SPD, PU} and the Core power domain](#)’.

When [FEAT_DoPD](#) is not implemented and the Core power domain is in either retention or powerdown state, the value of `EDPRSR.SPD` is IMPLEMENTATION DEFINED. For more information, see ‘[EDPRSR.SPD when the Core domain is in either retention or powerdown state](#)’.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, access to this field is RAZ/WI.

- Access to this field is UNKNOWN/WI if all of the following are true:
 - IsCorePowered()
 - DoubleLockStatus()
- Otherwise, access to this field is RC/WI.

PU, bit [0]

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
0b0	Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.
0b1	Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If [FEAT_DoubleLock](#) is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see ‘[EDPRSR.{DLK, R} and reset state](#)’

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see ‘[EDPRSR.{DLK, SPD, PU} and the Core power domain](#)’.

When the Core power domain is powered-up and `DoubleLockStatus() == TRUE`, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

If [FEAT_DoubleLock](#) is implemented, the Core power domain is powered up, and `DoubleLockStatus() == TRUE`, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

Access to this field is RO.

Accessing EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If [FEAT_DoubleLock](#) is not implemented or `DoubleLockStatus() == FALSE`, then:
 - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
 - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- If [FEAT_DoubleLock](#) is implemented and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If [FEAT_DoPD](#) is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x314	EDPRSR

Accesses to this register are RO.

E9.2.44 EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in [EDSCR](#).

Configuration

EDRCR is in the Core power domain

Attributes

EDRCR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

CBRRQ	Meaning
0b0	No action.
0b1	Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

When !ExternalInvasiveDebugEnabled() or !ExternalHypInvasiveDebugEnabled(), access to this field is RAZ/WI.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the [EDSCR](#).PipeAdv bit to 0. The actions on writing to this bit are:

CSPA	Meaning
0b0	No action.

CSPA	Meaning
0b1	Clear the EDSCR .PipeAdv bit to 0.

CSE, bit [2]

Clear Sticky Error. Used to clear the [EDSCR](#) cumulative error bits to 0. The actions on writing to this bit are:

CSE	Meaning
0b0	No action.
0b1	Clear the EDSCR .{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR .ITO bit, to 0.

Bits [1:0]

Reserved, RES0.

Accessing EDRCR

EDRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x090	EDRCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

E9.2.45 EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

EDSCR is in the Core power domain

External register EDSCR bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to AArch32 System register [DBGDSCRext](#)[31:29, 27:26, 23:21, 19, 14, 6].

External register EDSCR bits [30:29] are architecturally mapped to AArch32 System register [DBGDSCRint](#)[30:29].

Attributes

EDSCR is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

When [DBGOSLSR.OSLK](#) is 1, this bit can be indirectly read and written through [DBGDSCRext](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

TXfull, bit [29]

DTRTX full.

When [DBGOSLSR.OSLK](#) is 1, this bit can be indirectly read and written through [DBGDSCRext](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

ITO, bit [28]

ITR overrun. Set to 0 on entry to Debug state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.

- Otherwise, access to this field is RO.

RXO, bit [27]

DTRRX overrun.

When [DBGOSLSR.OSLK](#) is 1, this bit can be indirectly read and written through [DBGDSCRext](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

TXU, bit [26]

DTRTX underrun.

When [DBGOSLSR.OSLK](#) is 1, this bit can be indirectly read and written through [DBGDSCRext](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

PipeAdv, bit [25]

Pipeline Advance. Indicates that software execution is progressing.

PipeAdv	Meaning
0b0	No progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA .
0b1	Progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA .

The architecture does not define precisely when this field is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing. For example, a PE might set this field to 1 each time the PE retires one or more instructions, or at periodic intervals during the progression of an instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

ITE, bit [24]

ITR empty.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

INTdis, bits [23:22]

Interrupt and SError exception disable. Disables taking interrupts and SError exceptions in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts and SError exceptions is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure EL1 are masked.
0b10	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure EL1 are masked.
0b11	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure state are masked.

Note

This control affects both physical and virtual interrupts and SError exceptions.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

- [DBGDSCRext](#).

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values 0b01 and 0b10 is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if EDSCR.INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to '00'.

TDA, bit [21]

Traps accesses to the following debug registers:

- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

TDA	Meaning
0b0	Accesses to debug registers do not generate a Software Access Debug event.
0b1	Accesses to debug registers generate a Software Access Debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

When [DBGOSLSR](#).OSLK is 1, this bit can be indirectly read and written through [DBGDSCRext](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

MA, bit [20]

Memory access mode. Controls the use of Memory access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Bit [19]

Reserved, RES0.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

HDD, bit [15]

Hyp debug disabled.

On entry to Debug state:

- If entering Debug state in Hyp mode, this bit is set to 0.
- Otherwise, this bit is set to the inverse of `ExternalHypInvasiveDebugEnabled()`.

In Debug state, the value of the HDD bit does not change, even if `ExternalHypInvasiveDebugEnabled()` changes.

In Non-debug state, HDD returns the inverse of `ExternalHypInvasiveDebugEnabled()`.

If the authentication signals that control `ExternalHypInvasiveDebugEnabled()` change, a context synchronization event is required to guarantee their effect.

Access to this field is RO.

HDE, bit [14]

Halting debug enable.

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

When [DBGOSLSR.OSLK](#) is 1, this bit can be indirectly read and written through [DBGDSCRext](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Bits [13:10]

Reserved, RES0.

EL, bits [9:8]

Exception level. In Debug state, gives the current Exception level of the PE.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

A, bit [7]

SError exception pending. In Debug state, indicates whether an SError exception is pending:

- If PE is executing at EL0 or EL1, and [HCR](#).{AMO, TGE} is {1, 0}, a virtual SError exception.
- Otherwise, a physical SError exception.

A	Meaning
0b0	No SError exception pending.
0b1	SError exception pending.

A debugger can read EDSCR to check whether an SError exception is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

When [DBGOSLSR](#).OSLK is 1, this bit can be indirectly read and written through [DBGDSCRExt](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

STATUS, bits [5:0]

On entering Debug state, the PE sets this field to indicate the reason for halting.

STATUS	Meaning
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.

STATUS	Meaning
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values are reserved.

The PE resets into Non-debug state. However, if the PE enters Debug state immediately after reset, then the reset value is overwritten with the reason for halting.

Arm deprecates software use of the Halting step, normal and Halting step, exclusive values.

The reset behavior of this field is:

- On a Cold reset, this field resets to '000010'.

Access to this field is RO.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.2.46 EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading [EDPCSR](#)[31:0].

Configuration

EDVIDSR is in the Core power domain

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When [FEAT_PCSRv8](#) is implemented in the external debug registers space, if EL2 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES1.

E2, bit [30]

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL2.

E2	Meaning
0b0	Sample is not from EL2.
0b1	Sample is from EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [29:8]

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample was generated, this field is RES0 if the PE is executing at EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see [‘Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN’](#).

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- Otherwise, accesses to this register are RO.

E9.2.47 EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

EDWAR is in the Core power domain

The value of this register is UNKNOWN if the PE is in Non-debug state, or if `EDSCR.STATUS` is not `0b101011`.

Attributes

EDWAR is a 64-bit register.

Field descriptions

ADDR, bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of `EDWAR[63:32]` is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See ‘Exception syndrome information and preferred return address’.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDWAR

EDWAR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x030	EDWAR

Accessible as follows:

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `OSLockStatus()`, accesses to this register return an ERROR.
- Otherwise, accesses to this register are RO.

E9.2.48 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

The power domain of MIDR_EL1 is IMPLEMENTATION DEFINED

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR](#)[31:0].

Attributes

MIDR_EL1 is a 32-bit register.

Field descriptions

31	24	23	20	19	16	15	4	3	0
Implementer		Variant		Architecture		PartNum		Revision	

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is RO.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture, bits [19:16]

Architecture version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MIDR_EL1

MIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD00	MIDR_EL1

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register are IMPLEMENTATION DEFINED.
- Otherwise, accesses to this register are RO.

E9.2.49 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

OSLAR_EL1 is in the Core power domain

The OS Lock can also be locked or unlocked using [DBGOSLAR](#).

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [EDPRSR.OSLK](#) to check the current status of the lock.

Accessing OSLAR_EL1

OSLAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x300	OSLAR_EL1

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register return an ERROR.
- When AllowExternalDebugAccess(addrdesc) and SoftwareLockStatus(addrdesc), accesses to this register are WI.
- When AllowExternalDebugAccess(addrdesc) and !SoftwareLockStatus(addrdesc), accesses to this register are WO.
- Otherwise, accesses to this register are IMPLEMENTATION DEFINED.

E9.3 External trace registers

This section lists the external Trace unit registers.

E9.4 Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers.

E9.4.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

Note
The architecturally-defined triggers must not be multiplexed.

Configuration

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain

If it is implemented in the Core power domain, then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ASICCTL

ASICCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x144	ASICCTL

Accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess(addrdesc), and SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are IMPLEMENTATION DEFINED.

E9.4.2 CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears the application triggers.

Configuration

CTIAPPCLEAR is in the Debug power domain

External register CTIAPPCLEAR bits [31:0] are architecturally mapped to External register [CTIAPPSET](#)[31:0].

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions

APPCLEAR<x> , bits [x], for x = 31 to 0

Application trigger <x> disable.

Writing to this bit has the following effect:

APPCLEAR<x>	Meaning
0b0	No effect.
0b1	Clear corresponding application trigger to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use [CTIAPPULSE](#).

Accessing this field has the following behavior:

- When $x \geq \text{UInt}(\text{CTIDEVID.NUMCHAN})$, access to this field is RAZ/WI.
- Otherwise, access to this field is RAZ/WIC.

Accessing CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x018	CTIAPPCLEAR

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

E9.4.3 CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

Configuration

CTIAPPPULSE is in the Debug power domain

Attributes

CTIAPPPULSE is a 32-bit register.

Field descriptions

APPPULSE<x> , bits [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

APPPULSE<x>	Meaning
0b0	No effect.
0b1	Channel <x> event pulse generated.

Note

- The CTIAPPPULSE operation does not affect the state of the application trigger. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing this field has the following behavior:

- When $x \geq \text{UInt}(\text{CTIDEVID.NUMCHAN})$, access to this field is RAZ/WI.
- Otherwise, access to this field is WO/UNKNOWN.

Accessing CTIAPPULSE

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x01C	CTIAPPULSE

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

E9.4.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets the application triggers.

Configuration

CTIAPPSET is in the Debug power domain

External register CTIAPPSET bits [31:0] are architecturally mapped to External register CTIAPPCLEAR[31:0].

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

APPSET<x> , bits [x], for x = 31 to 0

Application trigger <x> enable.

APPSET<x>	Meaning
0b0	Reading this means the application trigger is inactive. Writing this has no effect.
0b1	Reading this means the application trigger is active. Writing this sets the corresponding application trigger to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPULSE.

The reset behavior of this field is:

- On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $x \geq \text{UInt}(\text{CTIDEVID.NUMCHAN})$, access to this field is RAZ/WI.
- Otherwise, access to this field is WIS.

Accessing CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0×014	CTIAPPSET

Accessible as follows:

- When `SoftwareLockStatus(addrdesc)`, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.4.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

CTIAUTHSTATUS is in the Debug power domain

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

31	8	7	4	3	2	1	0
RES0							
RAZ				NSNID		NSID	

Bits [31:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If the implemented Security state is Secure state, this field holds the same value as [DBGAUTHSTATUS_EL1.SNID](#).

NSID, bits [1:0]

If the implemented Security state is Secure state, this field holds the same value as [DBGAUTHSTATUS_EL1.SID](#).

Accessing CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFB8	CTIAUTHSTATUS

Accesses to this register are RO.

E9.4.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

Configuration

CTICHINSTATUS is in the Debug power domain

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

CHIN<n> , bits [n], for n = 31 to 0

Input channel <n> status.

CHIN<n>	Meaning
0b0	Input channel <n> is inactive.
0b1	Input channel <n> is active.

If the ECT channels do not support multicycle events, then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing this field has the following behavior:

- When $n \geq \text{UInt}(\text{CTIDEVID.NUMCHAN})$, access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

Accesses to this register are RO.

E9.4.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

Configuration

CTICHOUTSTATUS is in the Debug power domain

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions

CHOUT<n> , bits [n], for n = 31 to 0

Output channel <n> status.

CHOUT<n>	Meaning
0b0	Output channel <n> is inactive.
0b1	Output channel <n> is active.

If the ECT channels do not support multicycle events, then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

Note
The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see [CTIGATE](#).

Accessing this field has the following behavior:

- When $n \geq \text{UInt}(\text{CTIDEVID.NUMCHAN})$, access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTICHOUTSTATUS

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x13C	CTICHOUTSTATUS

Accesses to this register are RO.

E9.4.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see ‘About the Component Identification scheme’.

Configuration

CTICIDR0 is in the Debug power domain

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

When FEAT_CTI_PIDR is implemented:

Preamble.
Reads as 0x0D
Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing CTICIDR0

CTICIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF0	CTICIDR0

Accesses to this register are RO.

E9.4.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see ‘About the Component Identification scheme’.

Configuration

CTICIDR1 is in the Debug power domain

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

When FEAT_CTI_PIDR is implemented:

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

PRMBL_1, bits [3:0]

When FEAT_CTI_PIDR is implemented:

Preamble.

Reads as 0b0000

Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing CTICIDR1

CTICIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF4	CTICIDR1

Accesses to this register are RO.

E9.4.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see ‘About the Component Identification scheme’.

Configuration

CTICIDR2 is in the Debug power domain

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

When FEAT_CTI_PIDR is implemented:

Preamble.
Reads as 0x05
Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing CTICIDR2

CTICIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF8	CTICIDR2

Accesses to this register are RO.

E9.4.11 CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see ‘About the Component Identification scheme’.

Configuration

CTICIDR3 is in the Debug power domain

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

When FEAT_CTI_PIDR is implemented:

Preamble.
Reads as 0xB1
Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing CTICIDR3

CTICIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFFC	CTICIDR3

Accesses to this register are RO.

E9.4.12 CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

CTICLAIMCLR is in the Debug power domain

External register CTICLAIMCLR bits [31:0] are architecturally mapped to External register [CTICLAIMSET](#)[31:0].

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

CLAIM<m>, bits [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in [CTICLAIMSET](#).

An External Debug reset clears the CLAIM tag bits to 0.

Accessing this field has the following behavior:

- When $m \geq \text{NUM_CTI_CLAIM_TAGS}$, access to this field is RAZ/WI.
- Otherwise, access to this field is WIC.

Accessing CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.4.13 CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configuration

CTICLAIMSET is in the Debug power domain

External register CTICLAIMSET bits [31:0] are architecturally mapped to External register [CTICLAIMCLR](#)[31:0].

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

CLAIM<m> , bits [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing this field has the following behavior:

- When $m \geq \text{NUM_CTI_CLAIM_TAGS}$, access to this field is RAZ/WI.
- Otherwise, access to this field is RAO/WIS.

Accessing CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.4.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

Configuration

CTICONTROL is in the Debug power domain

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
0b0	CTI mapping functions and application trigger disabled.
0b1	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is **CONSTRAINED UNPREDICTABLE** which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On a External debug reset, this field resets to '0'.

Accessing CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.4.15 CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF0 is in the Debug power domain

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the [MPIDR](#).{Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVAFF0

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

Accesses to this register are RO.

E9.4.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF1 is in the Debug power domain

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of CTIDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

Accesses to this register are RO.

E9.4.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configuration

CTIDEVARCH is in the Debug power domain

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

If this register is not implemented, **CTIDEVAFF0** and **CTIDEVAFF1** are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

**ARCHITECT, bits [31:21]**

Defines the architect of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011

Access to this field is RO.

PRESENT, bit [20]

DEVARCH presence. Indicates that the CTIDEVARCH register provides architecture information.

Reads as 0b1

Access to this field is RO.

Bits [19:16]

Reserved, RES0.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

Reads as 0x1A14

Access to this field is RO.

Accessing CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFBC	CTIDEVARCH

Accesses to this register are RO.

E9.4.18 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Configuration

CTIDEVID is in the Debug power domain

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

31	26	25	24	23	22	21	16	15	14	13	8	7	5	4	0
RES0				INOUT	RES0	NUMCHAN				RES0	NUMTRIG			RES0	EXTMUXNUM

Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INOUT	Meaning
0b00	CTIGATE does not mask propagation of input events from external channels.
0b01	CTIGATE masks propagation of input events from external channels.

All other values are reserved.

Access to this field is RO.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. For Armv8, valid values are:

- 0b000011 3 channels (0..2) implemented.
- 0b000100 4 channels (0..3) implemented.
- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Upper bound for number of triggers. The indices of all implemented input and output triggers are less than this value.

There is no guarantee that all of the input and output triggers, including the highest numbered, are connected to any components, or that the implementation of input and output triggers is symmetrical.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, [ASICCTL](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVID

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC8	CTIDEVID

Accesses to this register are RO.

E9.4.19 CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID1 is in the Debug power domain

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID1

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC4	CTIDEVID1

Accesses to this register are RO.

E9.4.20 CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID2 is in the Debug power domain

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID2

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC0	CTIDEVID2

Accesses to this register are RO.

E9.4.21 CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE’s cross-trigger interface.

Configuration

CTIDEVTYPE is in the Debug power domain

This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIDEVTYPE are RES0.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001

Access to this field is RO.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Reads as 0b0100

Access to this field is RO.

Accessing CTIDEVTYPE

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFCC	CTIDEVTYPE

Accesses to this register are RO.

E9.4.22 CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Configuration

CTIGATE is in the Debug power domain

Attributes

CTIGATE is a 32-bit register.

Field descriptions

GATE<x> , bits [x], for x = 31 to 0

Channel <x> gate enable.

GATE<x>	Meaning
0b0	Disable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.
0b1	Enable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.

If GATE<x> is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $x \geq \text{UInt}(\text{CTIDEVID.NUMCHAN})$, access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing CTIGATE

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.4.23 CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configuration

CTIINEN<n> is in the Debug power domain

If input trigger n is not implemented or not connected, CTIINEN<n> is RES0.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions

INEN<x> , bits [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

INEN<x>	Meaning
0b0	Input trigger <n> will not generate an event on output channel <x>.
0b1	Input trigger <n> will generate an event on output channel <x>.

The reset behavior of this field is:

- On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	$0x020 + (4 * n)$	CTIINEN<n>

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.4.24 CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

Configuration

CTIINTACK is in the Debug power domain

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

ACK<n>, bits [n], for n = 31 to 0

Acknowledge for output trigger <n>.

If any of the following is true, writes to ACK<n> are ignored:

- $n \geq \text{CTIDEVID.NUMTRIG}$, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by [CTIOUTEN<n>](#), is still active.

Otherwise, if any of the following are true, ACK<n> is RES0:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

ACK<n>	Meaning
0b0	No effect
0b1	Deactivate the trigger.

Accessing this field has the following behavior:

- When $n \geq \text{UInt}(\text{CTIDEVID.NUMTRIG})$, access to this field is RAZ/WI.
- Otherwise, access to this field is WO/UNKNOWN.

Accessing CTIINTACK

A debugger must read [CTITRIGOUTSTATUS](#) to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x010	CTIINTACK

Accessible as follows:

- When `SoftwareLockStatus(addrdesc)`, accesses to this register are WI.
- Otherwise, accesses to this register are WO.

E9.4.25 CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

The power domain of CTIITCTRL is IMPLEMENTATION DEFINED

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions

**Bits [31:1]**

Reserved, RES0.

IME, bit [0]

Integration mode enable. When $\text{IME} = 1$, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to 0.
 - On a Warm reset, the value of this field is unchanged.

Accessing CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xF00	CTIITCTRL

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are IMPLEMENTATION DEFINED.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.4.26 CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILAR is in the Debug power domain

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

When CTI Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing CTILAR

CTILAR can be accessed through the memory-mapped interface:

Component	Offset	Instance
CTI	0xFB0	CTILAR

Accesses to this register are WO.

E9.4.27 CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILSR is in the Debug power domain

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses **CTILAR** to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

**Bits [31:3]**

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLK, bit [1]

When CTI Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On a External debug reset, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is RO.

Accessing CTILSR

CTILSR can be accessed through the memory-mapped interface:

Component	Offset	Instance
CTI	0xFB4	CTILSR

Accesses to this register are RO.

E9.4.28 CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configuration

CTIOUTEN<n> is in the Debug power domain

If output trigger n is not implemented or not connected, CTIOUTEN<n> is RES0.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

OUTEN<x>, bits [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

OUTEN<x>	Meaning
0b0	An event on input channel <x> will not cause output trigger <n> to be asserted.
0b1	An event on input channel <x> will cause output trigger <n> to be asserted.

The reset behavior of this field is:

- On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $x \geq \text{UInt}(\text{CTIDEVID.NUMCHAN})$, access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	$0x0A0 + (4 * n)$	CTIOUTEN<n>

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

E9.4.29 CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR0 is in the Debug power domain
This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIPIDR0 are RES0.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
 - CTIPIDR1.PART_1 contains part number bits [11:8].
 - CTIPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
 - CTIPIDR1.PART_1 contains part number bits [15:12].
 - CTIPIDR0.PART_0 contains part number bits [11:4].
 - CTIPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, CTIPIDR2.REVISION indicates revision information.
The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Accessing CTIPIDR0

CTIPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE0	CTIPIDR0

Accesses to this register are RO.

E9.4.30 CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR1 is in the Debug power domain

This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIPIDR1 are RES0.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions

31		8	7	4	3	0	
RES0						DES_0	PART_1

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- **CTIPIDR1**.DES_0: JEP106 identification code bits[3:0].
- **CTIPIDR2**.DES_1: JEP106 identification code bits[6:4].
- **CTIPIDR4**.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
 - CTIPIDR1.PART_1 contains part number bits [11:8].
 - CTIPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
 - CTIPIDR1.PART_1 contains part number bits [15:12].
 - CTIPIDR0.PART_0 contains part number bits [11:4].
 - CTIPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, CTIPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR1

CTIPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE4	CTIPIDR1

Accesses to this register are RO.

E9.4.31 CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR2 is in the Debug power domain

This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIPIDR2 are RES0.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- [CTIPIDR2.REVISION](#) indicates the 4-bit revision number.
- [CTIPIDR3.REVAND](#) indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- [CTIPIDR2.REVISION](#) indicates the 4-bit major revision number.
- [CTIPIDR3.REVAND](#) indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- [CTIPIDR2.REVISION](#) contains part number bits [3:0].
- [CTIPIDR3.REVAND](#) indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- CTIPIDR1.DES_0: JEP106 identification code bits[3:0].
- CTIPIDR2.DES_1: JEP106 identification code bits[6:4].
- CTIPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
 - The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.
-

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR2

CTIPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE8	CTIPIDR2

Accesses to this register are RO.

E9.4.32 CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR3 is in the Debug power domain

This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIPIDR3 are RES0.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- [CTIPIDR2.REVISION](#) indicates the 4-bit revision number.
- [CTIPIDR3.REVAND](#) indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- [CTIPIDR2.REVISION](#) indicates the 4-bit major revision number.
- [CTIPIDR3.REVAND](#) indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- [CTIPIDR2.REVISION](#) contains part number bits [3:0].
- [CTIPIDR3.REVAND](#) indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field

is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

CTIPIDR3.CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

CTIPIDR3.REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR3

CTIPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFEC	CTIPIDR3

Accesses to this register are RO.

E9.4.33 CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR4 is in the Debug power domain

This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIPIDR4 are RES0.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. $\log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- CTIPIDR1.DES_0: JEP106 identification code bits[3:0].
- CTIPIDR2.DES_1: JEP106 identification code bits[6:4].
- CTIPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
 - The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.
-

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR4

CTIPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFD0	CTIPIDR4

Accesses to this register are RO.

E9.4.34 CTIPIDR5, CTI Peripheral Identification Register 5

The CTIPIDR5 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR5 is in the Debug power domain
This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIPIDR5 are RES0.

Attributes

CTIPIDR5 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing CTIPIDR5

CTIPIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFD4	CTIPIDR5

Accesses to this register are RO.

E9.4.35 CTIPIDR6, CTI Peripheral Identification Register 6

The CTIPIDR6 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR6 is in the Debug power domain
This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIPIDR6 are RES0.

Attributes

CTIPIDR6 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing CTIPIDR6

CTIPIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFD8	CTIPIDR6

Accesses to this register are RO.

E9.4.36 CTIPIDR7, CTI Peripheral Identification Register 7

The CTIPIDR7 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR7 is in the Debug power domain
This register is present only when FEAT_CTI_PIDR is implemented. Otherwise, direct accesses to CTIPIDR7 are RES0.

Attributes

CTIPIDR7 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing CTIPIDR7

CTIPIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFDC	CTIPIDR7

Accesses to this register are RO.

E9.4.37 CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Configuration

CTITRIGINSTATUS is in the Debug power domain

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

TRIN<n> , bits [n], for n = 31 to 0

Trigger input <n> status.

TRIN<n>	Meaning
0b0	Input trigger n is inactive.
0b1	Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicyle events can be observed as active.

Accessing this field has the following behavior:

- When $n \geq \text{UInt}(\text{CTIDEVID.NUMTRIG})$, access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTITRIGINSTATUS

CTITRIGINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x130	CTITRIGINSTATUS

Accesses to this register are RO.

E9.4.38 CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

Configuration

CTITRIGOUTSTATUS is in the Debug power domain

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions

TROUT<n> , bits [n], for n = 31 to 0

Trigger output <n> status.

If n is less than CTIDEVID.NUMTRIG, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

TROUT<n>	Meaning
0b0	Output trigger n is inactive.
0b1	Output trigger n is active.

Otherwise when n is less than CTIDEVID.NUMTRIG, it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing this field has the following behavior:

- When $n \geq \text{UInt}(\text{CTIDEVID.NUMTRIG})$, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all of the following are true:
 - Any of the following are true:
 - Output trigger $\langle n \rangle$ is not implemented or not connected
 - All of the following are true:
 - Output trigger $\langle n \rangle$ is self-acknowledging
 - CTI does not implement multicycle channel events
 - an implementation implements $\text{TROUT}\langle n \rangle$
- Otherwise, access to this field is RO.

Accessing CTITRIGOUTSTATUS

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0×134	CTITRIGOUTSTATUS

Accesses to this register are RO.

Part F
**Memory-mapped Components of the Arm
Architecture**

Chapter F1

Requirements for Memory-mapped Components

This chapter provides some additional information about memory-mapped components defined by the Armv8 and Armv9 architectures. Arm also recommends that memory-mapped components designed to support the Armv8 and Armv9 architectures use this section as guidance, other than where a conflicting behavior is required by some other standard that the component is designed to support. It contains the following sections:

- [Supported access sizes and Endianness](#)
- [Synchronization of memory-mapped registers](#)
- [Access requirements for reserved and unallocated registers](#)

F1.1 Supported access sizes and Endianness

The information in this section applies to all accesses to memory-mapped components of the Armv8 and later architectures, unless a register or component description explicitly states otherwise.

The memory access sizes that are supported by any peripheral are IMPLEMENTATION DEFINED by the peripheral.

All memory-mapped peripherals defined in the Arm architecture must be little-endian.

An implementation of a memory-mapped component that is compatible with the Armv8 and later architectures must support the following:

- Word-aligned 32-bit accesses to access 32-bit registers.
- If the system includes any component with direct memory access to the memory-mapped component which needs to access the component but does not support making 64-bit accesses, word-aligned 32-bit accesses to either half of a 64-bit register. This includes, but is not limited to:
 - A PE that implements a 32-bit ISA that does not include 64-bit memory operations. For example, Armv8-M T32.
 - A Debug Access Port that cannot make 64-bit accesses.
 - A PE that supports AArch32 at any Exception level.Arm deprecates support for 32-bit accesses to either half of 64-bit registers.

Note

Although AArch32 implementations might make 64-bit accesses for LDP and STP instructions, this is not architecturally required. To guarantee ordering of accesses, portable AArch32 software should use LDR and STR. For compatibility with such software, the memory-mapped component should treat the PE that supports AArch32 as not making 64-bit accesses using portable code.

- Doubleword-aligned 64-bit accesses to access 64-bit registers that are mapped to a doubleword-aligned pair of adjacent 32-bit locations.

Unless otherwise specified, all registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte accesses.
- Halfword accesses.
- Unaligned word accesses. These accesses are not word single-copy atomic.
- Unaligned doubleword accesses. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair that forms a 64-bit register.
- Quadword accesses or higher accesses.
- Exclusive accesses.

For unsupported accesses, it is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether:

- The access generates an External abort or not.
- The defined side-effects of a read occur or not. A read returns an IMPLEMENTATION DEFINED value that might be UNKNOWN.
- A write is ignored or sets the accessed register or registers to UNKNOWN values.
- The access generates a fault handling interrupt or not.

Such accesses are often due to software faults. That is, software has accessed a location in a way that the component does not support.

For memory-mapped accesses from a PE that complies with an Arm architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory that is accessed, determine the size of the access that is made by an instruction. [Example F1-1](#) shows this.

Example F1-1 Access sizes for memory-mapped accesses

Two Load Doubleword instructions that are made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

The Arm architecture does not require the size of each element that is accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Unless otherwise specified by the component, any access to a memory-mapped component of the Arm architecture is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory type, and only single register load and store instructions, to create memory accesses that are supported by the peripheral. For more information, see Memory types and attributes.

F1.2 Synchronization of memory-mapped registers

This section describes the synchronization requirements for the memory-mapped accesses to System registers.

This section refers to accesses to external system control registers as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

Note

[Synchronization of changes to AArch32 System registers](#) define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads and external writes as indirect writes.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. Unless otherwise stated, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible as external system control registers.

Unless required to be observable to all observers in finite time, without explicit synchronization, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a Context synchronization event.
- The Context synchronization event was executed after the write completed.

The order and synchronization of direct reads and direct writes of System registers is defined by [Synchronization of changes to AArch32 System registers](#).

The external agent must be able to guarantee completion of a write. For example, the agent can:

- Mark the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- If the register is read/write and reads are not destructive, read back the value written.
- Use some guaranteed property of the connection between the PE and the external agent.

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the Context synchronization event, and relying on the memory ordering rules provided by the memory model.

External reads and external write complete in the order in which they arrive at the PE. For accesses to different register locations, the external agent must create this order. The agent can:

- Mark the memory as Device-nGnRnE or Device-nGnRE.
- Use the appropriate memory barriers.
- Rely on some guaranteed property of the connection between the PE and the external agent.

However, the external agent cannot force the synchronization of completed writes.

In a simple sequential execution, an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a

memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.

For example, some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means the simultaneous writes must be merged.

F1.3 Access requirements for reserved and unallocated registers

This section describes the access requirements for reserved and unallocated memory-mapped components.

The following information relates to certain types of reserved accesses:

- Reads and writes of unallocated locations. These accesses are reserved for the architecture.
- Reads and writes of locations for features that are not implemented, including:
 - OPTIONAL features that are not implemented.
 - Breakpoints and watchpoints that are not implemented.
 - Performance Monitors counters that are not implemented.
 - CTI triggers that are not implemented.
 - Error records that are not implemented.

These accesses are reserved.

- Reads of WO locations. These accesses are reserved for the architecture.
- Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses are normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture. Software must treat reserved accesses as RES0.

Chapter F2

System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the Generic Timer. It contains the following sections:

- [About the Generic Timer specification](#)
- [Memory-mapped counter module](#)
- [Memory-mapped timer components](#)

Note

- [Generic Timer memory-mapped register descriptions](#) describes the System level Generic Timer registers. These registers are memory-mapped.
 - Additional Information for Implementations of the Generic Timer gives additional information, that does not form part of the architectural definition of a system level implementation of the Generic Timer.
 - [The Generic Timer in AArch32 state](#) gives a general description of the AArch32 state view of the Generic Timer, and describes the AArch32 System register interface to the Generic Timer.
-

F2.1 About the Generic Timer specification

[The Generic Timer in AArch32 state](#) describes the Arm Generic Timer and its implementation as seen from AArch32 state. These chapters include the definition of the low-latency System register interface to the Generic Timer. However, the Arm Generic Timer architecture also defines a memory-mapped component, that comprises:

- A memory-mapped counter module, that controls the generation of the Count value used by the Generic Timer. This memory-mapped counter module is required in any Arm Generic Timer implementation that requires software control of the Count value of the Generic Timer.
- Optional memory-mapped timer modules. These give a standardized way of providing timers for programmable system components other than PEs that implement the Arm architecture.

[The full set of Generic Timer components](#) summarizes them as seen from AArch32 state. [The system level components of the Generic Timer](#) summarizes the system level components.

F2.1.1 Registers in the system level implementation of the Generic Timer

Registers that control components of the system level implementation of the Generic Timer are grouped into *frames*. This specification defines the registers in each frame, and their offsets within the frame. The system defines the position of each frame in the memory map. This means the base addresses for each frame are IMPLEMENTATION DEFINED.

Note

The final 12 words of the first or only 4KB block of a register memory frame is an ID block.

Each frame must be in its own memory page, or memory protection region, and must be aligned to the size of the translation granule or protection granule.

Note

When a system level implementation of the Generic Timer is accessed by a PE:

- Using a PMSA, each frame is in its own memory protection region, aligned to the size of the memory protection granule.
-

The following sections give more information about the requirements for the system level Generic Timer component:

- [Supported access sizes](#).
- [Power and reset domains for the system level implementation of the Generic Timer](#).

F2.1.1.1 Supported access sizes

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the memory-mapped Generic Timer registers implementations must:

- Comply with the requirements of [Supported access sizes and Endianness](#).
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register, even if all components with direct memory access to the Generic Timer support making 64-bit accesses.

F2.1.1.2 Power and reset domains for the system level implementation of the Generic Timer

The power and reset domains of the system level implementation of the Generic Timer are IMPLEMENTATION DEFINED as part of the system implementation. In register descriptions, they are called Timer resets to indicate they can be outside the PE power and reset domains defined by the remainder of this manual.

The Arm architecture requires that the [CNTCR](#).{FCREQ, EN} and [CNTSR](#).FCACK fields reset to 0. These Timer reset values apply only on powerup of the power domain in which the registers are implemented or a reset of the reset domain in which they are implemented.

Every other register, or register field, of a system level implementation of the Generic Timer resets to a value that is architecturally UNKNOWN if it has a meaningful reset value. These Timer resets apply on powerup of the power domain in which the register is implemented, and on a reset of the reset domain in which it is implemented.

F2.1.2 The system level components of the Generic Timer

Each system level component has one or two register frames. The possible system level components are:

The memory-mapped counter module, required

This module controls the system counter. It has two frames:

- A control frame, [CNTControlBase](#).
- A status frame, [CNTReadBase](#).

[Memory-mapped counter module](#) describes this component.

The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, [CNTCTLBase](#).

[The CNTCTLBase frame](#) describes this frame.

Memory-mapped timers, optional

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the [CNTBase \$N\$](#) frame.
- Optionally provides an unprivileged view of the timer in the [CNTEL0Base \$N\$](#) frame.

N is the timer number, and the corresponding frame number, in the range 0-7.

[The CNTBase \$N\$ and CNTEL0Base \$N\$ frames](#) describes these frames.

F2.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. The [CNTControlBase](#) frame holds the registers for the memory-mapped counter, and provides:

- An RW control register, [CNTCR](#), that provides:
 - An enable bit for the system counter.
 - An enable bit for Halt-on-debug. For more information, see [Halt-on-debug](#).
 - A field that can be written to request a change to the [Counter resolution](#). This mechanism means that, for example, if the [Counter resolution](#) is halved then the increment to the counter at each tick of the clock is doubled.
For more information, see [Control of counter resolution and increment](#).

Writes to this register are rare.

- A RO status register, [CNTSR](#), that provides:
 - A bit that indicates whether the system counter is halted because of an asserted Halt-on-debug signal.
 - A field that indicates whether a requested change to the [Counter resolution](#) has completed.
- Two contiguous 32-bit RW registers that hold the current system counter value, [CNTCV](#). If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.
The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.
Writes to these registers are rare.
- A *Frequency modes table* of one or more 32-bit entries, where:
 - The first entry in the table defines the *base frequency* of the system counter. It is IMPLEMENTATION DEFINED whether the base frequency indicates the effective frequency of the counter, or the maximum [Counter resolution](#).
Arm recommends that the base frequency indicates the maximum [Counter resolution](#).
 - Each subsequent entry in the table defines an alternative frequency of the system counter, that must be an exact divisor of the base frequency.

A 32-bit zero entry immediately follows the last table entry.

This table can be RO or RW. For more information, see [The Frequency modes table](#).

In an implementation with multiple physical address spaces, [CNTControlBase](#) is only accessible by accesses from the most secure physical address space. For example, in a system with Secure and Non-secure memory maps, [CNTControlBase](#) is only accessible by Secure accesses.

In addition, the [CNTReadBase](#) frame includes a read-only copy of the system counter value, [CNTCV](#), as two contiguous 32-bit RO registers. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

[Counter module control and status register summary](#) describes [CNTReadBase](#) and [CNTControlBase](#) memory maps, and the registers in each frame.

F2.2.1 Control of counter resolution and increment

The system counter has a fixed *base frequency*, and must maintain the required counter accuracy, meaning Arm recommends that it does not gain or lose more than ten seconds in a 24-hour period, see The system counter. However, the counter can operate at a lower resolution than the base frequency, using a correspondingly larger increment. For example, it can increment by a value four times larger when running at a quarter of the base frequency. Any lower resolution operation, and any switching between resolutions, must not reduce the accuracy of the counter.

Control of the system [Counter resolution](#) and increment is provided only through the memory-mapped counter module. The following sections describe this control:

- [The Frequency modes table.](#)
- [Changing the system counter and increment.](#)

F2.2.1.1 The Frequency modes table

The Frequency modes table starts at offset `0x20` in the `CNTControlBase` frame.

Table entries are 32-bits, and each entry specifies a selected frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

When the system counter is operating at a lower frequency than the base frequency, the increment applied at each counter update is increased by the ratio of the base frequency and the selected frequency.

Note

Where the [Effective frequency](#) and the base frequency are not the same, the increment is not solely defined by the ratio of the base frequency and the selected frequency. For example, a counter with an [Effective frequency](#) of 1GHz and a base frequency of 125MHz will increment by a value of 8 on each tick of the base frequency. If the Frequency modes table provides an additional selected frequency of 31.25MHz, then when this frequency is selected the counter increments by 32 on each tick of the selected frequency.

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the Frequency modes table is in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the `CNTControlBase` memory map shows the table region as RO or RW.

A system might provide an IMPLEMENTATION DEFINED mechanism for selecting the current power mode and resolution of the counter, and such a mechanism is independent of the memory-mapped counter module. If such a mechanism is provided, typically the frequency modes table only includes a single entry to indicate the base frequency.

Arm strongly recommends that the Frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED, up to this limit.

Note

- Arm considers it likely that implementations will require significantly fewer entries than the architectural limit.
 - In the `CNTControlBase` frame, the offset range `0x0C0-0x0FC` can be used for IMPLEMENTATION DEFINED registers. If any registers are defined in this space, then the Frequency modes table cannot extend beyond offset `0x0B8`, with a zero word at offset `0x0BC`. This means that if any IMPLEMENTATION DEFINED registers are defined the maximum number of entries in the table is 40, including the zero-word end marker.
-

F2.2.1.2 Changing the system counter and increment

The value of the `CNTCR.FCREQ` field specifies which entry in the Frequency modes table specifies the selected frequency.

Changing the value of `CNTCR.FCREQ` requests a change to the selected frequency. To ensure the frequency change does not affect the overall accuracy of the counter, a change is made as follows:

- When changing from a higher frequency to a lower frequency, the counter:
 1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
 2. Switches to operating at the lower frequency.
- When changing from a lower frequency to a higher frequency, the counter:
 1. Waits until the end of the current lower-frequency cycle.
 2. Makes the counter increment required for operation at that lower frequency.
 3. Switches to operating at the higher frequency.

When the frequency has changed, [CNTSR](#) is updated to indicate the new selected frequency. Therefore, a system component that is waiting for a frequency change can poll [CNTSR](#) to detect the change.

F2.2.2 Halt-on-debug

The [CNTCR](#) register provides an enable bit for an OPTIONAL Halt-on-debug signal.

When the [CNTCR.HDBG](#) bit is set to 1, and the Halt-on-debug signal is implemented and asserted, the system counter is halted. Otherwise, the system counter ignores the state of this signal.

Where the system counter implements a Halt-on-debug signal and the system supports halting the system counter, Arm recommends that the Halt-on-debug signal can be controlled by a debugger using the Embedded Cross-Trigger (ECT) using a system-level cross-trigger interface that includes:

- A debug request output trigger event that asserts the Halt-on-debug signal.
- A restart request output trigger event that deasserts the Halt-on-debug signal.

For more information, see [About the Embedded Cross-Trigger](#).

Note

Software must use the Halt-on-debug enable bit to ensure that the timers cannot be halted maliciously in an attempt to prohibit progress.

For more information about Halt-on-debug, contact Arm.

F2.2.3 Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory *frames*:

- A control frame, with base address [CNTControlBase](#).
- A status frame, with base address [CNTReadBase](#).

Each of these register memory frames is in its own memory page or [memory protection region](#), and the frame base address points to the start of this region. Each base address must be aligned to the size of the translation granule or protection granule.

Note

Each frame of a memory-mapped Generic Timer takes the name of its base address.

In each register memory frame, the memory at offset `0xFD0-0xFFF` is reserved for twelve 32-bit IMPLEMENTATION DEFINED ID registers, see the [CounterID<n>](#) register descriptions for more information.

Note

The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the counter is little-endian.

In an implementation with multiple physical address spaces, [CNTControlBase](#) is only accessible by accesses from the most secure physical address space. For example, in a system with Secure and Non-secure memory maps, [CNTControlBase](#) is only accessible by Secure accesses.

Table F2-1 shows the [CNTControlBase](#) control registers, in order of their offsets from the [CNTControlBase](#) base address, for an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, and also has fewer than 39 [CNTFID<n>](#) registers. The [Frequency modes table](#) describes how this memory map differs if more [CNTFID<n>](#) registers are implemented.

[Generic Timer memory-mapped register descriptions](#) describes each of these registers.

Table F2-1 CNTControlBase memory map

Offset	Name	Type	Description
0x000	CNTCR	RW	Counter Control Register.
0x004	CNTSR	RO	Counter Status Register.
0x008	CNTCV[31:0]	RW	Counter Count Value register.
0x00C	CNTCV[63:32]	RW	
0x010	CNTSCR^a	RW	Counter Scale Register.
0x014-0x018	-	RES0	Reserved.
0x01C	CNTID^a	RO	Counter Identification Register.
0x020	CNTFID0	RO or RW	Frequency modes table, and end marker. For more information, see The Frequency modes table .
0x020+4 <i>n</i>	CNTFID<n>	RO or RW	
0x024+4 <i>n</i>	-	RO or RW, RAZ	
(0x028+4 <i>n</i>)- 0x0BC	-	RO, RES0	Reserved.
0x0C0-0x0FC	-	IMPLEMENTATION DEFINED	Reserved for IMPLEMENTATION DEFINED registers.
0x100-0xFCC	-	RO, RES0	Reserved.
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11.

a. Implemented only if FEAT_CNTSC is implemented.

Table F2-2 shows the [CNTReadBase](#) control registers, in order of their offsets from the [CNTReadBase](#) base address. [Generic Timer memory-mapped register descriptions](#) describes each of these registers.

Table F2-2 CNTReadBase memory map

Offset	Name	Type	Description
0x000	CNTCV[31:0]	RO	Counter Count Value register
0x004	CNTCV[63:32]	RO	
0x008-0xFCC	-	RES0	Reserved
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11

F2.3 Memory-mapped timer components

This part of the Arm Generic Timer specification defines an optional memory-mapped timer component. This can be implemented as part of any programmable system component that does not incorporate a System register mapped Arm Generic Timer, to provide that system component with the timer functionality of an Arm Generic Timer.

The memory map consists of up to eight timer *frames*. The base address of a frame is `CNTBaseN`, where *N* numbers from 0 up to a maximum permitted value of 7.

Each `CNTBaseN` timer frame:

- Provides its own set of timers and associated interrupts.
- Is implemented in its own memory page or [memory protection region](#).
- Is implemented at a base address, identified as `CNTBaseN`, that is aligned to the size of the translation granule or [memory protection region](#).

For each implemented `CNTBaseN` frame the system can optionally provide an unprivileged view of the frame, described as the EL0 view of the frame. The base address of this second view of the `CNTBaseN` frame is `CNTELOBaseN`.

Note

In the naming of the registers associated with a `CNTBaseN` or `CNTELOBaseN` frame, the value of *N* is represented as `<n>`, for example `CNTACR<n>`.

If a `CNTELOBaseN` frame is implemented:

- Is implemented in its own memory page or [memory protection region](#) and is aligned to the size of the translation granule or [memory protection region](#).
- All registers visible in `CNTBaseN`, except for `CNTVOFF` and `CNTELOACR`, can be visible in `CNTELOBaseN`.
 - Control fields in `CNTELOACR` determine whether each register is visible.
- The offsets of all visible registers are the same as their offsets in the `CNTBaseN` frame.

In addition to the implemented `CNTBaseN` and `CNTELOBaseN` frames, the system must provide a single control frame at base address `CNTCTLBase`. `CNTCTLBase` must be implemented in its own memory page or [memory protection region](#) and is aligned to the size of the translation granule or [memory protection region](#).

The system defines the position of each frame in the memory map. This means the values of each of the `CNTBaseN`, `CNTELOBaseN`, and `CNTCTLBase` base addresses is IMPLEMENTATION DEFINED.

Note

The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the memory-mapped timers are little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:

- [The CNTCTLBase frame.](#)
- [The CNTBaseN and CNTELOBaseN frames.](#)

Note

Providing a complete set of features in a system level implementation gives an implementation example for a system level Generic Timer implementation that provides equivalent features to a System registers Generic Timer implementation in a PE that includes all of the Exception levels.

F2.3.1 The CNTCTLBase frame

The `CNTCTLBase` frame contains:

- An identification register for the features of the memory-mapped counter and timer implementation.

- Access controls for each [CNTBaseN](#) frame.
- A virtual offset register for frames that implement a virtual timer.

[Table F2-3](#) shows the [CNTCTLBase](#) registers, in order of their offsets from the [CNTCTLBase](#) base address.

Note

[CNTFRQ](#) and [CNTVOFF](#) registers are also implemented in a System register interface to the Generic Timer.

[Generic Timer memory-mapped register descriptions](#) describes each of these registers.

Table F2-3 CNTCTLBase memory map

Offset	Register	Type	Security ^a	Description
0x000	CNTFRQ^b	RW	Restricted	Counter Frequency register.
0x004	CNTNSAR	RW	Restricted	Counter Non-Secure Access register.
0x008	CNTTIDR	RO	No restrictions	Counter Timer ID register.
0x00C- 0x03F	-	RES0	-	Reserved.
0x040+4N ^c	CNTACR<n>	RW	Programmable ^d	Counter Access Control register <i>N</i> .
0x060- 0x07F	-	RES0	-	Reserved.
0x080+8N ^c	CNTVOFF<n>[31:0]^b	RW ^e	Programmable ^d	Virtual Offset register <i>N</i> . If the CNTBaseN frame has virtual timer capability then CNTVOFF<n> is implemented as an RW register, otherwise its location is RAZ/WI.
0x084+8N ^c	CNTVOFF<n>[63:32]^b	RW ^e		
0x0C0-0x0FC	-	RES0	-	Reserved.
0x100-0x7FC	-	-	-	IMPLEMENTATION DEFINED.
0x800-0xFBC	-	RES0	-	Reserved.
0xFC0-0xFCF	-	-	-	IMPLEMENTATION DEFINED.
0xFD0- 0xFFC	CounterID<n>	RO	No restrictions	Counter ID registers 0-11.

a. Access security restrictions in an implementation with multiple Security states. See the individual register descriptions and [CNTNSAR](#) for details on the restrictions. In an implementation that supports only a single Security state all registers are accessible as shown in the *Type* column.

b. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in [Generic Timer registers](#) and [Generic Timer registers](#). The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.

c. Implemented for each value of *N* from 0 to 7 for which a [CNTBaseN](#) frame is implemented.

d. The [CNTNSAR](#) determines the Non-secure accessibility of the [CNTACR<n>](#) and the [CNTVOFF<n>](#) in the [CNTCTLBase](#) frame. For more information, see the register descriptions.

e. Address is reserved, RAZ/WI if register not implemented.

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the [CNTVOFF](#) register that defines the virtual offset between the physical count and the virtual count. If a memory-mapped Generic Timer component does not distinguish between real time and virtual time, then it can implement [CNTVOFF](#) as RAZ/WI. Otherwise [CNTVOFF](#) is an RW register, and Arm strongly recommends that the system only permits access to [CNTVOFF](#) from EL2 or higher.

F2.3.2 The CNTBaseN and CNTEL0BaseN frames

Each [CNTBaseN](#) frame, or {[CNTBaseN](#), [CNTEL0BaseN](#)} pair of frames, provides a memory-mapped counter and timer, see:

- The CNTBaseN frame.
- The CNTEL0BaseN frame.
- CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames.

F2.3.2.1 The CNTBaseN frame

Table F2-4 shows the CNTBaseN registers, in order of their offsets from the CNTBaseN base address. Whether a frame includes a virtual timer is IMPLEMENTATION DEFINED. If it does not, then memory at offsets 0x030-0x03C is RAZ/WI. Except for CNTEL0ACR and the CounterID<n> registers, equivalent registers are also implemented in a System register interface to the timer component of a Generic Timer.

Generic Timer memory-mapped register descriptions describes each of these registers.

Table F2-4 CNTBaseN memory map

Offset	Register	Type	Description
0x000	CNTPCT[31:0] ^a	RO	Physical Count register.
0x004	CNTPCT[63:32] ^a	RO	
0x008	CNTVCT[31:0] ^a	RO	Virtual Count register.
0x00C	CNTVCT[63:32] ^a	RO	
0x010	CNTRFQ ^a	RO ^c	Counter Frequency register.
0x014	CNTEL0ACR	RW ^b	Counter EL0 Access Control Register, optional in the CNTBaseN memory map.
0x018	CNTVOFF[31:0] ^a	RO ^c	Virtual Offset register. If CNTVOFF in the CNTCTLBase frame is an RW register, a read of this register returns the value of that register. Otherwise is RAZ.
0x01C	CNTVOFF[63:32] ^a	RO ^c	
0x020	CNTP_CVAL[31:0] ^a	RW	Physical Timer CompareValue register.
0x024	CNTP_CVAL[63:32] ^a	RW	
0x028	CNTP_TVAL ^a	RW	Physical TimerValue register.
0x02C	CNTP_CTL ^a	RW	Physical Timer Control register.
0x030	CNTV_CVAL[31:0] ^a	RW ^b	Virtual Timer CompareValue register, optional in the CNTBaseN memory map.
0x034	CNTV_CVAL[63:32] ^a	RW ^b	
0x038	CNTV_TVAL ^a	RW ^b	Virtual TimerValue register, optional in the CNTBaseN memory map.
0x03C	CNTV_CTL ^a	RW ^b	Virtual Timer Control register, optional in the CNTBaseN memory map.
0x040-0xFFC	-	RES0	Reserved.
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11.

a. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in Generic Timer registers and Generic Timer registers. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.

b. Address is reserved, RAZ/WI if register not implemented.

c. The CNTCTLBase frame includes an RW view of this register.

F2.3.2.2 The CNTEL0BaseN frame

For any value of N, the layout of the registers in the CNTEL0BaseN frame is identical to the CNTBaseN frame, except that, in the CNTEL0BaseN frame:

- CNTVOFF is never visible, and the memory at 0x018-0x01C is RAZ/WI.

- **CNTELOACR** is never visible, and the memory at 0x014 is RAZ/WI.
- If implemented in the **CNTBaseN** frame, **CNTELOACR** controls whether **CNTPCT**, **CNTVCT**, **CNTRFQ**, the Physical Timer, and the Virtual Timer registers are visible in the **CNTELOBaseN** frame.
If **CNTELOACR** is not implemented then these registers are not visible in the **CNTELOBaseN** frame, and their addresses in that frame are RAZ/WI.

If an implementation supports 64-bit atomic accesses, then **CNTPCT**, **CNTVCT**, **CNTVOFF**, **CNTP_CVAL**, and **CNTV_CVAL** must be accessible as atomic 64-bit values.

F2.3.2.3 CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames

In the **CNTCTLBase** frame:

CNTTIDR controls:

- Whether each **CNTBaseN** frame is implemented.
- If a **CNTBaseN** frame is implemented, whether:
 - That **CNTBaseN** frame has virtual timer capability.
 - A corresponding **CNTELOBaseN** frame is implemented.

CNTNSAR controls:

Whether all the following are accessible by Non-secure accesses:

- **CNTACR<n>**.
- **CNTVOFF<n>**.
- Each implemented **CNTBaseN** frame, and any corresponding **CNTELOBaseN** frame.

The **CNTACR<n>** registers control:

For each implemented **CNTBaseN** frame, the accessibility of the following registers in that frame:

- **CNTP_CTL**, **CNTP_CVAL**, and **CNTP_TVAL**.
- **CNTV_CTL**, **CNTV_CVAL**, and **CNTV_TVAL**.
- **CNTVOFF**.
- **CNTRFQ**.
- **CNTPCT**.
- **CNTVCT**.

For **CNTACR<n>**, the value of <n> corresponds to the value of *N* for the controlled **CNTBaseN** frame.

The **CNTVOFF<n>** registers provide:

For each implemented **CNTBaseN** frame that has virtual capability, the RW copy of the **CNTVOFF** register for that frame.

Note

In a **CNTBaseN** frame that has virtual timer capability the **CNTVOFF** register is RO.

For **CNTVOFF<n>**, the value of <n> corresponds to the value of *N* for the controlled **CNTBaseN** frame.

Chapter F3

Recommended External Interface to the Performance Monitors

This chapter describes the recommended external interface to the Performance Monitors. It contains the following section:

- [About the external interface to the Performance Monitors registers](#)

Note

[Performance Monitors external register descriptions](#) describes the external view of the Performance Monitors registers.

F3.1 About the external interface to the Performance Monitors registers

Arm recommends that:

- An implementation provides the OPTIONAL external debug interface to the Performance Monitors registers, [FEAT_PMUv3_EXT](#).

Note

A debugger can use this interface to access counters in the Performance Monitors.

- The implementation includes the OPTIONAL support for memory-mapped access to the External debug interface.

Note

— Software running on any PE in a system can use this interface to access counters in the Performance Monitors.

— Privileged software should use the MPU to control access to this interface.

- The external debug interface is implemented as defined in Recommended External Debug Interface.

The following sections describe the memory-mapped views of the Performance Monitors registers:

- [Differences in the external views of the Performance Monitors registers](#).
- [Access permissions for external views of the Performance Monitors](#).

In this section, unless the context explicitly indicates otherwise, any reference to *a memory-mapped view* applies equally to a register view using:

- An access through an external debug interface.
- A memory-mapped access.

F3.1.1 Supported access sizes

[External Performance Monitors registers summary](#) gives the memory map of these registers.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the external interface to the Performance Monitors registers implementations must:

- Comply with the requirements of [Supported access sizes and Endianness](#).
- When [FEAT_PMUv3_EXT32](#) is implemented, support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register, even if all components with direct memory access to the PMU support making 64-bit accesses.

Permitted word-aligned 32-bit accesses are single-copy atomic at word granularity.

F3.1.2 Differences in the external views of the Performance Monitors registers

An external view of the Performance Monitors registers accesses the same registers as the System registers interface described in [Performance Monitors Extension registers](#), except that:

- The PMSELR is accessible only in the System registers interface.
- The following registers are accessible only in external views:
 - [PMAUTHSTATUS](#).
 - [PMCCR](#).
 - [PMCFGR](#).
 - [PMCIDR0](#).
 - [PMCIDR1](#).
 - [PMCIDR2](#).

- [PMCIDR3](#).
- [PMDEVARCH](#).
- [PMDEVTYPE](#).
- [PMEVFILT2R<n>](#).
- [PMIIDR](#).
- [PMLAR](#).
- [PMLSR](#).
- [PMPCCTL](#).
- [PMPCSR](#).
- [PMPIDR0](#).
- [PMPIDR1](#).
- [PMPIDR2](#).
- [PMPIDR3](#).
- [PMPIDR4](#).
- [PMPIDR5](#).
- [PMPIDR6](#).
- [PMPIDR7](#).

[Performance Monitors external register descriptions](#) describes these registers.

- The following registers are accessible only in the external view when [FEAT_PMUv3_EXT32](#) is implemented:
 - [PMCID1SR](#).
 - [PMCID2SR](#).
 - [PMDEVAFF0](#).
 - [PMDEVAFF1](#).
 - [PMVIDSR](#).

[Performance Monitors external register descriptions](#) describes these registers.

- The following controls do not affect the external views:
 - [PMSELR](#).
 - [PMUSERENR](#).
 - [HDCR](#). {TPM, TPMCR, HPMN}.

Instead, see the register descriptions in [External System Control Register Descriptions](#).

- The [PMSWINC_ELO](#) register is OPTIONAL in the external view when [FEAT_PMUv3_EXT32](#) is implemented.

F3.1.3 Access permissions for external views of the Performance Monitors

IDZGKJ For more information, see [External debug interface register access permissions](#).

IYMBZZ The following table shows the access permissions for the Performance Monitors registers in a Debug implementation for Armv8-R implementations.

The table uses the following terms:

DLK	When FEAT_DoubleLock is implemented and locked, DoubleLockStatus() == TRUE, accesses to some registers produce an error. Applies to both interfaces.
EPMAD	When AllowExternalPMUAccess() == FALSE, external debug access is disabled for the access. See also Behavior of a not permitted memory-mapped access .
Error	Indicates that the access gives an error response.
Def	This shows the default access permissions, if none of the conditions in this list prevent access to the register.
Off	The Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed, and EDPRSR.PU will read as zero.

Note
If debug power is off, then all external debug interface accesses return an error.

OSLK	When the OS Lock is locked, OSLSR_EL1.OSLK is 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface.
SLK	This indicates the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the optional Software Lock is locked. See Register access permissions for memory-mapped accesses . For all other accesses, this column is ignored.
-	Indicates that the control has no effect on the behavior of the access: - If no other control affects the behavior, the Default access behavior applies. - However, another control might determine the behavior.

Table F3-1 Access permissions for the Performance Monitors registers when FEAT_PMuV3_EXT32 is implemented

Offset	Register	Domain	Off	DLK	OSLK	EPMAD	Def	SLK
0x000+8xn 0x004+8xn	PMEVCNTR<n>_EL0[31:0] ^a PMEVCNTR<n>_EL0[63:32] ^a	Core	Error	Error	Error	Error	RW	RO

a. Implemented event counters only. *n* is the counter number.

b. See IMPLEMENTATION DEFINED registers.

c. The default access permissions for this location are RAZ/WI.

Chapter F4

External System Control Register Descriptions

This chapter describes the external system control registers. It excludes the External debug registers that are described in [External Debug Register Descriptions](#). It contains the following sections:

- [About the external system control register descriptions](#)
- [External Performance Monitors registers summary](#)
- [Performance Monitors external register descriptions](#)
- [Generic Timer memory-mapped registers overview](#)
- [Generic Timer memory-mapped register descriptions](#)

F4.1 About the external system control register descriptions

This chapter describes the external system control registers other than the external debug registers. That is, it describes:

An external view of the Performance Monitors registers

Arm recommends that implementations provide access to the Performance Monitors registers through the OPTIONAL External debug interface, and provide the OPTIONAL memory-mapped interface to this interface:

- [External Performance Monitors registers summary](#) lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
- [Performance Monitors external register descriptions](#) describes each of the memory-mapped registers.

[Recommended External Interface to the Performance Monitors](#) describes the recommended interface to these registers.

Note

[The Performance Monitors Extension](#) describes the Performance Monitors. The following section describes the System register interfaces to the Performance Monitors, [Performance Monitors registers](#), for accesses from an Exception level that is using AArch32.

The registers for the system level Generic Timer component

Any implementation that includes the Generic Timer must include the memory-mapped system level component described in [System Level Implementation of the Generic Timer](#). In this chapter:

- [Generic Timer memory-mapped registers overview](#) gives an overview of the registers, referring to [System Level Implementation of the Generic Timer](#) for more information.
- [Generic Timer memory-mapped register descriptions](#) describes each of the memory-mapped registers.

Note

[The Generic Timer in AArch32 state](#) describes the Generic Timer component that is accessible using the System registers. The following section describes the System register interfaces to that component, [Generic Timer registers](#), for accesses from an Exception level that is using AArch32.

Note

[External Debug Register Descriptions](#) describes the external debug registers.

F4.2 External Performance Monitors registers summary

When an implementation provides access to the Performance Monitors registers through the External debug interface, that interface provides access to:

- Performance Monitors registers.
- A read-only configuration register, [PMCFGR](#).
- The OPTIONAL CoreSight registers for the Performance Monitors, if they are implemented.

The locations of the registers are defined as offsets from a system-defined base address. [Performance Monitors external register views](#) defines this memory map.

F4.2.1 Performance Monitors external register views

The following tables show the external view of the Performance Monitors registers:

- [Table F4-1](#) when [FEAT_PMUv3_EXT32](#) is implemented.

All other entries are reserved.

Note	
•	Counters that are reserved because HDCR.HPMN has been changed from its reset value remain visible in any external view.
•	The registers that relate to an implemented event counter, PMNx, are PMEVCNTR<n> and PMEVTYPER<n>.
•	Tables in this section only list the Armv8 registers. For encoding information of the registers introduced by Armv9, see the individual register descriptions in this chapter.

Each entry in the Name column links to the register description in [Performance Monitors external register descriptions](#).

Table F4-1 Performance Monitors external register views when FEAT_PMUv3_EXT32 is implemented

Name	Type	Description	Offset

a. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.

b. OPTIONAL.

c. CoreSight interface registers.

d. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.

F4.3 Performance Monitors external register descriptions

This section describes the external view of the Performance Monitors registers. [External Performance Monitors registers summary](#) lists these registers in offset order.

F4.3.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configuration

This register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

This register is present only when FEAT_PMuV3_EXT is implemented and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMAUTHSTATUS are RES0.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions

Bits [31:12]

Reserved, RES0.

HNID, bits [11:10]

Holds the same value as [DBGAUTHSTATUS_EL1.HNID](#).

HID, bits [9:8]

Hyp invasive debug.

HID	Meaning
0b00	Not implemented.

All other values are reserved.

Access to this field is RO.

SNID, bits [7:6]

Holds the same value as [DBGAUTHSTATUS_EL1.SNID](#).

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented.

All other values are reserved.

Access to this field is RO.

NSNID, bits [3:2]

Holds the same value as [DBGAUTHSTATUS_EL1.NSNID](#).

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented.

All other values are reserved.

Access to this field is RO.

Accessing PMAUTHSTATUS

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0x`FB8` from PMU

Accesses to this register are RO.

F4.3.2 PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

Configuration

PMCCFILTR_EL0 is in the Core power domain.

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

This register is present only when FEAT_PMuV3_EXT is implemented and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are RES0.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting cycles in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL1.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL1 is further controlled by PMCCFILTR_EL0.NSK.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

U, bit [30]

EL0 filtering. Controls counting cycles in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL0.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL0 is further controlled by PMCCFILTR_EL0.NSU.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [29:28]

Reserved, RES0.

NSH, bit [27]

EL2 filtering. Controls counting cycles in EL2.

NSH	Meaning
0b0	The PE does not count cycles in EL2.
0b1	This mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [26:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

Accesses to this register use the following encodings:

When FEAT_PMu3_EXT32 is implemented

[31:0] Accessible at offset 0x47C from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.3 PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see ‘Time as measured by the Performance Monitors cycle counter’.

[PMCCFILTR_EL0](#) determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

PMCCNTR_EL0 is in the Core power domain.

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register [PMCCNTR](#)[63:0].

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are RES0.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR_EL0](#).{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR_EL0](#).C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[63:0] Accessible at offset 0x0F8 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.4 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see ‘[The PMU event number space and common events](#)’.

Use of this register is deprecated.

Note

This view of the register was previously called PMCEID0_EL0.

Configuration

PMCEID0 is in the Core power domain.

When FEAT_PMUv3_EXT32 is implemented, External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0](#)[31:0].

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are RES0.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

ID<n> , bits [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.

0b1

The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Note

`AllowExternalPMUAccess()` has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xE20 from PMU

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `!AllowExternalPMUAccess(addrdesc)`, accesses to this register generate an error response.
- When `OSLockStatus()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

F4.3.5 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0×020 to $0 \times 03F$.

For more information about the Common events and the use of the PMCEID n registers, see ‘[The PMU event number space and common events](#)’.

Use of this register is deprecated.

Note

This view of the register was previously called PMCEID1_EL0.

Configuration

PMCEID1 is in the Core power domain.

When FEAT_PMUv3_EXT32 is implemented, External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1](#)[31:0].

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are RES0.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

ID<n> , bits [n], for n = 31 to 0

ID[n] corresponds to Common event ($0 \times 0020 + n$).

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.

0b1

The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Note

`AllowExternalPMUAccess()` has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xE24 from PMU

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `!AllowExternalPMUAccess(addrdesc)`, accesses to this register generate an error response.
- When `OSLockStatus()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

F4.3.6 PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

PMCFGR is in the Core power domain.

This register is present only when FEAT_PMuV3_EXT is implemented and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMCFGR are RES0.

Attributes

PMCFGR is a 32-bit register.

Field descriptions

NCG, bits [31:28]

Defines the number of counter groups implemented, minus one.

NCG	Meaning
0b0000	One counter group implemented.

All other values are reserved.

Access to this field is RO.

Bits [27:23]

Reserved, RES0.

SS, bit [22]

Snapshot supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SS	Meaning
0b0	Snapshot mechanism not supported. The locations 0x600-0x7FC and 0xE30-0xE3C are IMPLEMENTATION DEFINED.

SS	Meaning
0b1	Snapshot mechanism supported. Locations 0x600-0x7FC and 0xE30-0xE3C contain IMPLEMENTATION DEFINED snapshot registers.

A PMU might include an IMPLEMENTATION DEFINED snapshot mechanism, including one using the IMPLEMENTATION DEFINED registers 0x600-0x7FC and 0xE30-0xE3C.

Access to this field is RO.

Bits [21:20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.

Reads as 0b0

Access to this field is RO.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

Reads as 0b0

Access to this field is RO.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

Reads as 0b0

Access to this field is RO.

EX, bit [16]

Export supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EX	Meaning
0b0	PMCR_EL0.X is RES0.
0b1	PMCR_EL0.X is read/write.

Access to this field is RO.

CCD, bit [15]

Cycle counter has prescale.

In Armv8-R AArch32 this is RES1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCD	Meaning
0b0	PMCR_EL0.D is RES0.
0b1	PMCR_EL0.D is read/write.

Access to this field is RO.

CC, bit [14]

Dedicated cycle counter (counter 31) supported.

Reads as 0b1

Access to this field is RO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8.0, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8.0, the counters are a doubleword-aligned addresses.

Reads as 0b111111

Access to this field is RO.

N, bits [7:0]

Number of counters accessible, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

N	Meaning
0x00	Only PMCCNTR_EL0 accessible.
0x01..0x1F	Number of counters accessible, 2 to 32, minus one.

All other values are reserved.

The count includes the cycle counter, [PMCCNTR_EL0](#).

When the Effective value of [HDCR.EPMAD](#) is 1, this field reads as the value of [HDCR.HPMN](#).

For example, if [PMCFGR.N](#) == 0x07, then:

- There are eight counters in total.
- This comprises 7 event counters and the cycle counter.

The maximum number of event counters is 31.

Access to this field is RO.

Accessing PMCFGR

Note

[AllowExternalPMUAccess\(\)](#) has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMuV3_EXT32 is implemented

[31:0] Accessible at offset 0xE00 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

F4.3.7 PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Component Identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCIDR0 are RES0.

Attributes

PMCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

When FEAT_PMU_PIDR is implemented:

Preamble.

Reads as 0x0D

Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing PMCIDR0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFF0 from PMU

Accesses to this register are RO.

F4.3.8 PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.
For more information, see ‘About the Component Identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCIDR1 are RES0.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

When FEAT_PMU_PIDR is implemented:
Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

PRMBL_1, bits [3:0]

When FEAT_PMU_PIDR is implemented:

Preamble.

Reads as 0b0000

Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing PMCIDR1

Accesses to this register use the following encodings:

When FEAT_PMuV3_EXT is implemented

Accessible at offset 0xFF4 from PMU

Accesses to this register are RO.

F4.3.9 PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Component Identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCIDR2 are RES0.

Attributes

PMCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

When FEAT_PMU_PIDR is implemented:

Preamble.

Reads as 0x05

Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing PMCIDR2

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFF8 from PMU

Accesses to this register are RO.

F4.3.10 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Component Identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCIDR3 are RES0.

Attributes

PMCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

When FEAT_PMU_PIDR is implemented:

Preamble.

Reads as 0xB1

Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing PMCIDR3

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFFC from PMU

Accesses to this register are RO.

F4.3.11 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear Register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Allows software to disable the following counters:

- The cycle counter [PMCCNTR_EL0](#).
- The event counters [PMEVCNTR<n>_EL0](#).

Reading from this register shows which counters are enabled.

Configuration

PMCNTENCLR_EL0 is in the Core power domain.

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR](#)[31:0].

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET](#)[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are RES0.

Attributes

PMCNTENCLR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR_EL0](#) disable. On writes, allows software to disable [PMCCNTR_EL0](#). On reads, returns the [PMCCNTR_EL0](#) enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m>, bits [m], for m = 30 to 0

[PMEVCNTR<m>_EL0](#) disable. On writes, allows software to disable [PMEVCNTR<m>_EL0](#). On reads, returns the [PMEVCNTR<m>_EL0](#) enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{NUM_PMU_COUNTERS}$, access to this field is RAZ/WI.
- When `SoftwareLockStatus(addrdesc)`, access to this field is RO.
- Otherwise, access to this field is WIC.

Accessing PMCNTENCLR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xC20 from PMU

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `!AllowExternalPMUAccess(addrdesc)`, accesses to this register generate an error response.
- When `OSLockStatus()`, accesses to this register generate an error response.
- When `SoftwareLockStatus(addrdesc)`, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.12 PMCNTESET_EL0, Performance Monitors Count Enable Set Register

The PMCNTESET_EL0 characteristics are:

Purpose

Allows software to enable the following counters:

- The cycle counter [PMCCNTR_EL0](#).
- The event counters [PMEVCNTR<n>_EL0](#).

Reading from this register shows which counters are enabled.

Configuration

PMCNTESET_EL0 is in the Core power domain.

External register PMCNTESET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTECLR](#)[31:0].

External register PMCNTESET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTESET](#)[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTESET_EL0 are RES0.

Attributes

PMCNTESET_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR_EL0](#) enable. On writes, allows software to enable [PMCCNTR_EL0](#). On reads, returns the [PMCCNTR_EL0](#) enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is WIS.

P<m>, bits [m], for m = 30 to 0

[PMEVCNTR<m>_EL0](#) enable. On writes, allows software to enable [PMEVCNTR<m>_EL0](#). On reads, returns the [PMEVCNTR<m>_EL0](#) enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{NUM_PMU_COUNTERS}$, access to this field is RAZ/WI.
- When `SoftwareLockStatus(addrdesc)`, access to this field is RO.
- Otherwise, access to this field is WIS.

Accessing PMCNTENSET_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xC00 from PMU

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `!AllowExternalPMUAccess(addrdesc)`, accesses to this register generate an error response.
- When `OSLockStatus()`, accesses to this register generate an error response.
- When `SoftwareLockStatus(addrdesc)`, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.13 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Configures and controls the Performance Monitors counters.

Configuration

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

External register PMCR_EL0 bits [10:0] are architecturally mapped to AArch32 System register PMCR[10:0].

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are RES0.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions

31	11	10	7	6	5	4	3	2	1	0
RAZ/WI										
RES0										
LC										
DP										
X										
D										
C										
P										
E										

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bits [10:7]

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by PMOVSLR_EL0.C.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

Arm deprecates use of PMCR_EL0.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_ELO is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_ELO is disabled in prohibited regions:

The conditions when this field disables the cycle counter are the same as when event counting by an event counter in the first range is prohibited. For more information about event counter ranges, see [HDCR.HPMN](#).

For more information, see ‘[Prohibiting event and cycle counting](#)’.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If [FEAT_ETMv4](#) is implemented, this field does affect the use of PMU events as an External Input by the trace unit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_ELO counts every clock cycle.

0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.
-----	--

If the Effective value of PMCR_EL0.LC is 1, then this field is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

C, bit [2]

Cycle counter reset. The effects of writing to this field are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note
Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow field. The value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset.

P	Meaning
0b0	No action.
0b1	Reset all event counters PMEVCNTR<n>_EL0 to zero.

Writes to this field do not affect the cycle counter [PMCCNTR_EL0](#).

Note
Resetting the event counters does not change the event counter overflow fields.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

E	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0 .

The counters affected by this field are:

- The event counters in the first range. For more information about event counter ranges, see [HDCR.HPMN](#).
- The cycle counter [PMCCNTR_EL0](#).

Other event counters are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PMCR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xE04 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.14 PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMuV3_EXT32 is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the [MPIDR](#).{Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMDEVAFF0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xFA8 from PMU

Accesses to this register are RO.

F4.3.15 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT32 is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of [PMDEVAFF0.Aff0](#) for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMDEVAFF1

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xFAC from PMU

Accesses to this register are RO.

F4.3.16 PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMuV3_EXT is implemented. Otherwise, direct accesses to PMDEVARCH are RES0.

Attributes

PMDEVARCH is a 32-bit register.

Field descriptions

**ARCHITECT, bits [31:21]**

Defines the architect of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011

Access to this field is RO.

PRESENT, bit [20]

DEVARCH presence. Indicates that the PMDEVARCH register provides architecture information.

Reads as 0b1

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000

Access to this field is RO.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0010	Performance Monitors Extension version 3, PMUv3.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12].

Access to this field is RO.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA16	Armv8-A PE performance monitors, including the 32-bit programmers' model extension.

[FEAT_PMUv3_EXT32](#) implements the functionality described by the value 0xA16.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHPART is PMDEVARCH.ARCHID[11:0].

Access to this field is RO.

Accessing PMDEVARCH

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFBC from PMU

Accesses to this register are RO.

F4.3.17 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE’s performance monitor interface.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMU_PIDR is implemented. Otherwise, direct accesses to PMDEVTYPE are RES0.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001

Access to this field is RO.

MAJOR, bits [3:0]

Major type.

MAJOR	Meaning
0b0110	Performance monitor component.

FEAT_PMUv3 implements the functionality described by the value 0b0110.

Access to this field is RO.

Accessing PMDEVTYPE

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFCC from PMU

Accesses to this register are RO.

F4.3.18 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter <n>, which counts events, where <n> is 0 to 30.

Configuration

PMEVCNTR<n>_EL0 is in the Core power domain.

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are RES0.

Attributes

PMEVCNTR<n>_EL0 is a 32-bit register.

Field descriptions

EVCNT, bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset $0 \times 000 + (8 * n)$ from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.19 PMEVFILT2R<n>, Performance Monitors Event Filter Registers, n = 0 - 63

The PMEVFILT2R<n> characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED configuration controls for PMU counters.

Each PMEVFILT2R<n> register can provide additional configuration controls for a PMU counter, where:

- For values of n less than 31, if event counter n is implemented, then the controls are for PMU event counter <n>.
- For n equal to 31, the controls are for the cycle counter, [PMCCNTR_ELO](#);
- For all other values of n, PMEVFILT2R<n> is not implemented.

Although this mapping is recommended, it is not required and the function of each register is IMPLEMENTATION DEFINED.

Configuration

PMEVFILT2R<n> is in the Core power domain.

If PMEVFILT2R<n> is not implemented:

- When `IsCorePowered()` && `!DoubleLockStatus()` && `!OSLockStatus()` && `AllowExternalPMUAccess()`, accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

This register is present only when FEAT_PMUv3_EXT is implemented, FEAT_PMUv3 is implemented, and an implementation implements PMEVFILT2R<n>. Otherwise, direct accesses to PMEVFILT2R<n> are RES0.

Attributes

PMEVFILT2R<n> is a 32-bit register.

Field descriptions

31	IMPLEMENTATION DEFINED	0
----	------------------------	---

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing PMEVFILT2R<n>

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset $0 \times 800 + (4 * n)$ from PMU

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `!AllowExternalPMUAccess(addrdesc)`, accesses to this register generate an error response.
- When `OSLockStatus()`, accesses to this register generate an error response.
- When `SoftwareLockStatus(addrdesc)`, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.20 **PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30**

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

- When `IsCorePowered()` && `!DoubleLockStatus()` && `!OSLockStatus()` && `AllowExternalPMUAccess()`, accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are RES0.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting events in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL1.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL1 is further controlled by PMEVTYPER<n>_EL0.NSK.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting events in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL0.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL0 is further controlled by PMEVTYPER<n>_EL0.NSU.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [29:28]

Reserved, RES0.

NSH, bit [27]

EL2 filtering. Controls counting events in EL2.

NSH	Meaning
0b0	The PE does not count events in EL2.
0b1	This mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [26]

Reserved, RES0.

MT, bit [25]

When an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Unless otherwise stated:

- If the event counts PE cycles when a stall condition is true and a second condition is true, then the counter counts Processor cycles when the stall condition is true for all of these PEs, and the second condition is true for any of these PEs.

- If the event counts PE cycles when any other condition is true, then the counter counts Processor cycles when the condition is true for any of these PEs.
- Otherwise, the event counts by the sum of the count across all of these PEs.

For the stall events, the stall condition means the applicable condition described by the STALL, STALL_FRONTEND, or STALL_BACKEND event.

The second condition is any condition in addition to this.

For example, for the STALL_FRONTEND_L1I event, the stall condition is STALL_FRONTEND, and the second condition is when there is a demand instruction miss in the first level of instruction cache.

For the STALL, STALL_FRONTEND, and STALL_BACKEND events themselves, the second condition is the null TRUE condition.

See ‘Multithreaded implementations’ and ‘Cycle event counting in multithreaded implementations’.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:10]

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMU.PMEVCNTR<n>_EL0.

The ranges of event numbers allocated to each type of event are shown in ‘Allocation of the PMU event number space’.

If PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x400 + (4 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.21 PMIIDR, Performance Monitors Implementation Identification Register

The PMIIDR characteristics are:

Purpose

Provides discovery information about the Performance Monitor component.

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented and an implementation implements PMIIDR. Otherwise, direct accesses to PMIIDR are RES0.

Attributes

PMIIDR is a 32-bit register.

Field descriptions

31	20	19	16	15	12	11	0
ProductID		Variant		Revision		Implementer	

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

Matches the part number represented in the Peripheral ID registers PMPIDRn, if those registers are present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by PMIIDR.ProductID, or the major revision of the component.

When defining a major revision, PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the most significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If this field is increased, PMIIDR.Revision should be set to 0b0000.

Arm recommends this field matches the [PMPIDR2.REVISION](#) field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Component minor revision.

PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the least significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If PMIIDR.Variant field is increased, this field should be set to 0b0000, otherwise the value in this field should be increased.

Arm recommends this field matches the [PMPIDR3.REVAND](#) field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the PMU.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for PMIIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

If [PMPIDR4](#) is implemented, [PMPIDR4.DES_2](#) matches bits [11:8] of this field.

If [PMPIDR2](#) is implemented, [PMPIDR2.DES_1](#) matches bits [6:4] of this field.

If [PMPIDR1](#) is implemented, [PMPIDR1.DES_0](#) matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMIIDR

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xE08 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

F4.3.22 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear Register

The PMINTENCLR_EL1 characteristics are:

Purpose

Allows software to disable the generation of interrupt requests on overflows from the following counters:

- The cycle counter [PMCCNTR_EL0](#).
- The event counters [PMEVCNTR<n>_EL0](#).

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

PMINTENCLR_EL1 is in the Core power domain.

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR](#)[31:0].

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET](#)[31:0].

This register is present only when FEAT_PMuV3_EXT is implemented and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are RES0.

Attributes

PMINTENCLR_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Interrupt request on unsigned overflow of [PMCCNTR_EL0](#) disable. On writes, allows software to disable the interrupt request on unsigned overflow of [PMCCNTR_EL0](#). On reads, returns the interrupt request on unsigned overflow of [PMCCNTR_EL0](#) enable status.

C	Meaning
0b0	Interrupt request on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is WIC.

P<m> , bits [m], for m = 30 to 0

Interrupt request on unsigned overflow of [PMEVCNTR<m>_EL0](#) disable. On writes, allows software to disable the interrupt request on unsigned overflow of [PMEVCNTR<m>_EL0](#). On reads, returns the interrupt request on unsigned overflow of [PMEVCNTR<m>_EL0](#) enable status.

P<m>	Meaning
0b0	Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{NUM_PMU_COUNTERS}$, access to this field is RAZ/WI.
- When `SoftwareLockStatus(addrdesc)`, access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing PMINTENCLR_EL1

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xC60 from PMU

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `!AllowExternalPMUAccess(addrdesc)`, accesses to this register generate an error response.
- When `OSLockStatus()`, accesses to this register generate an error response.
- When `SoftwareLockStatus(addrdesc)`, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.23 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set Register

The PMINTENSET_EL1 characteristics are:

Purpose

Allows software to enable the generation of interrupt requests on overflows from the following counters:

- The cycle counter [PMCCNTR_EL0](#).
- The event counters [PMEVCNTR<n>_EL0](#).

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

PMINTENSET_EL1 is in the Core power domain.

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET](#)[31:0].

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR](#)[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET_EL1 are RES0.

Attributes

PMINTENSET_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Interrupt request on unsigned overflow of [PMCCNTR_EL0](#) enable. On writes, allows software to enable the interrupt request on unsigned overflow of [PMCCNTR_EL0](#). On reads, returns the interrupt request on unsigned overflow of [PMCCNTR_EL0](#) enable status.

C	Meaning
0b0	Interrupt request on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is WIS.

P<m> , bits [m], for m = 30 to 0

Interrupt request on unsigned overflow of [PMEVCNTR<m>_EL0](#) enable. On writes, allows software to enable the interrupt request on unsigned overflow of [PMEVCNTR<m>_EL0](#). On reads, returns the interrupt request on unsigned overflow of [PMEVCNTR<m>_EL0](#) enable status.

P<m>	Meaning
0b0	Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{NUM_PMU_COUNTERS}$, access to this field is RAZ/WI.
- When `SoftwareLockStatus(addrdesc)`, access to this field is RO.
- Otherwise, access to this field is WIS.

Accessing PMINTENSET_EL1

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset `0xC40` from PMU

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `!AllowExternalPMUAccess(addrdesc)`, accesses to this register generate an error response.
- When `OSLockStatus()`, accesses to this register generate an error response.
- When `SoftwareLockStatus(addrdesc)`, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.24 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented, FEAT_PMUv3 is implemented, and an implementation implements PMITCTRL. Otherwise, direct accesses to PMITCTRL are RES0.

Attributes

PMITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to 0.
 - On a Warm reset, the value of this field is unchanged.

Accessing PMITCTRL

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xF00 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.25 PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and [PMLSR](#) to check the current status of the lock.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMLAR are RES0.

Attributes

PMLAR is a 32-bit register.

Field descriptions

When PMU Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing PMLAR

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0x`FB0` from PMU

Accesses to this register are WO.

F4.3.26 PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses **PMLAR** to set or clear the lock, and **PMLSR** to check the current status of the lock.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMLSR are RES0.

Attributes

PMLSR is a 32-bit register.

Field descriptions

**Bits [31:3]**

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required.

Reads as 0b0

Access to this field is RO.

SLK, bit [1]

When PMU Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.

0b1

Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On a External debug reset, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is RO.

Accessing PMLSR

Accesses to this register use the following encodings:

When FEAT_PMuV3_EXT is implemented

Accessible at offset 0xFB4 from PMU

Accesses to this register are RO.

F4.3.27 PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSLR_EL0 characteristics are:

Purpose

Allows software to clear the unsigned overflow flags for the following counters to 0:

- The cycle counter [PMCCNTR_EL0](#).
- The event counters [PMEVCNTR<n>_EL0](#).

Reading from this register shows the current unsigned overflow flag values.

Configuration

PMOVSLR_EL0 is in the Core power domain.

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSRR\[31:0\]](#).

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSET\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSLR_EL0 are RES0.

Attributes

PMOVSLR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Unsigned overflow flag for [PMCCNTR_EL0](#) clear. On writes, allows software to clear the unsigned overflow flag for [PMCCNTR_EL0](#) to 0. On reads, returns the unsigned overflow flag for [PMCCNTR_EL0](#) overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

[PMCR_EL0.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is WIC.

P<m> , bits [m], for m = 30 to 0

Unsigned overflow flag for [PMEVCNTR<m>_EL0](#) clear. On writes, allows software to clear the unsigned overflow flag for [PMEVCNTR<m>_EL0](#) to 0. On reads, returns the unsigned overflow flag for [PMEVCNTR<m>_EL0](#) overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing PMOVSLR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xC80 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.28 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set Register

The PMOVSSET_EL0 characteristics are:

Purpose

Allows software to set the unsigned overflow flags for the following counters to 1:

- The cycle counter [PMCCNTR_EL0](#).
- The event counters [PMEVCNTR<n>_EL0](#).

Reading from this register shows the current unsigned overflow flag values.

Configuration

PMOVSSET_EL0 is in the Core power domain.

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSRR\[31:0\]](#).

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSET\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are RES0.

Attributes

PMOVSSET_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Unsigned overflow flag for [PMCCNTR_EL0](#) set. On writes, allows software to set the unsigned overflow flag for [PMCCNTR_EL0](#) to 1. On reads, returns the unsigned overflow flag for [PMCCNTR_EL0](#) overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

[PMCR_EL0.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is WIS.

P<m> , bits [m], for m = 30 to 0

Unsigned overflow flag for [PMEVCNTR<m>_EL0](#) set. On writes, allows software to set the unsigned overflow flag for [PMEVCNTR<m>_EL0](#) to 1. On reads, returns the unsigned overflow flag for [PMEVCNTR<m>_EL0](#) overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $m \geq \text{NUM_PMU_COUNTERS}$, access to this field is RAZ/WI.
- When `SoftwareLockStatus(addrdesc)`, access to this field is RO.
- Otherwise, access to this field is WIS.

Accessing PMOVSSET_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xCC0 from PMU

- When `DoubleLockStatus()`, or `!IsCorePowered()`, or `!AllowExternalPMUAccess(addrdesc)`, accesses to this register generate an error response.
- When `OSLockStatus()`, accesses to this register generate an error response.
- When `SoftwareLockStatus(addrdesc)`, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

F4.3.29 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMuV3_EXT is implemented and FEAT_PMu_PIDR is implemented. Otherwise, direct accesses to PMPIDR0 are RES0.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
 - [PMPIDR1.PART_1](#) contains part number bits [11:8].
 - [PMPIDR0.PART_0](#) contains part number bits [7:0].
- For a component with a 16-bit part number:
 - [PMPIDR1.PART_1](#) contains part number bits [15:12].
 - [PMPIDR0.PART_0](#) contains part number bits [11:4].
 - [PMPIDR2.REVISION](#) contains part number bits [3:0].

When a 12-bit part number is used, [PMPIDR2.REVISION](#) indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR0

Accesses to this register use the following encodings:

When FEAT_PMuV3_EXT is implemented

Accessible at offset 0xFE0 from PMU

Accesses to this register are RO.

F4.3.30 PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMU_PIDR is implemented. Otherwise, direct accesses to PMPIDR1 are RES0.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions

31		8	7	4	3	0	
RES0							
DES_0							
PART_1							

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- **PMPIDR1.DES_0**: JEP106 identification code bits[3:0].
- **PMPIDR2.DES_1**: JEP106 identification code bits[6:4].
- **PMPIDR4.DES_2**: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value $0 \times 7F$.
- A following 8-bit number, that is not $0 \times 7F$, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code $0 \times 7F \ 0 \times 7F \ 0 \times 7F \ 0 \times 7F \ 0 \times 3B$.

- The continuation code is the number of times $0 \times 7F$ appears before the final number. For example, a component designed by Arm Limited has the code 0×4 .
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code $0 \times 3B$.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
 - [PMPIDR1](#).PART_1 contains part number bits [11:8].
 - [PMPIDR0](#).PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
 - [PMPIDR1](#).PART_1 contains part number bits [15:12].
 - [PMPIDR0](#).PART_0 contains part number bits [11:4].
 - [PMPIDR2](#).REVISION contains part number bits [3:0].

When a 12-bit part number is used, [PMPIDR2](#).REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR1

Accesses to this register use the following encodings:

When FEAT_PMuV3_EXT is implemented

Accessible at offset 0xFE4 from PMU

Accesses to this register are RO.

F4.3.31 PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMU_PIDR is implemented. Otherwise, direct accesses to PMPIDR2 are RES0.

Attributes

PMPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- [PMPIDR2.REVISION](#) indicates the 4-bit revision number.
- [PMPIDR3.REVAND](#) indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- [PMPIDR2.REVISION](#) indicates the 4-bit major revision number.
- [PMPIDR3.REVAND](#) indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- [PMPIDR2.REVISION](#) contains part number bits [3:0].
- [PMPIDR3.REVAND](#) indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- **PMPIDR1.DES_0**: JEP106 identification code bits[3:0].
- **PMPIDR2.DES_1**: JEP106 identification code bits[6:4].
- **PMPIDR4.DES_2**: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
 - The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.
-

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR2

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFE8 from PMU

Accesses to this register are RO.

F4.3.32 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMU_PIDR is implemented. Otherwise, direct accesses to PMPIDR3 are RES0.

Attributes

PMPIDR3 is a 32-bit register.

Field descriptions

31	8	7	4	3	0	
RES0					REVAND	CMOD

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- [PMPIDR2.REVISION](#) indicates the 4-bit revision number.
- [PMPIDR3.REVAND](#) indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- [PMPIDR2.REVISION](#) indicates the 4-bit major revision number.
- [PMPIDR3.REVAND](#) indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- [PMPIDR2.REVISION](#) contains part number bits [3:0].
- [PMPIDR3.REVAND](#) indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field

is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

[PMPIDR3](#).CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

[PMPIDR3](#).REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR3

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFEC from PMU

Accesses to this register are RO.

F4.3.33 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMU_PIDR is implemented. Otherwise, direct accesses to PMPIDR4 are RES0.

Attributes

PMPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. $\log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- **PMPIDR1.DES_0**: JEP106 identification code bits[3:0].
- **PMPIDR2.DES_1**: JEP106 identification code bits[6:4].
- **PMPIDR4.DES_2**: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
 - The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.
-

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR4

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFD0 from PMU

Accesses to this register are RO.

F4.3.34 PMPIDR5, Performance Monitors Peripheral Identification Register 5

The PMPIDR5 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMU_PIDR is implemented. Otherwise, direct accesses to PMPIDR5 are RES0.

Attributes

PMPIDR5 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing PMPIDR5

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFD4 from PMU

Accesses to this register are RO.

F4.3.35 PMPIDR6, Performance Monitors Peripheral Identification Register 6

The PMPIDR6 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMU_PIDR is implemented. Otherwise, direct accesses to PMPIDR6 are RES0.

Attributes

PMPIDR6 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing PMPIDR6

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFD8 from PMU

Accesses to this register are RO.

F4.3.36 PMPIDR7, Performance Monitors Peripheral Identification Register 7

The PMPIDR7 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMU_PIDR is implemented. Otherwise, direct accesses to PMPIDR7 are RES0.

Attributes

PMPIDR7 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing PMPIDR7

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFDC from PMU

Accesses to this register are RO.

F4.3.37 PMSWINC_EL0, Performance Monitors Software Increment Register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see ‘SW_INCR’.

Configuration

PMSWINC_EL0 is in the Core power domain.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

When FEAT_PMUv3_EXT32 is implemented, External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC](#)[31:0].

This register is present only when FEAT_PMUv3_EXT32 is implemented and an implementation implements PMSWINC_EL0.

Attributes

PMSWINC_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

RES0

Bit [31]

Reserved, RES0.

P<m> , bits [m], for m = 30 to 0

Event counter software increment bit for [PMEVCNTR<m>_EL0](#).

P<m>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter m.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(addrdesc), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

Accessing PMSWINC_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xCA0 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

F4.4 Generic Timer memory-mapped registers overview

The Generic Timer memory-mapped registers are implemented as multiple register frames, with each register frame having its own base address, as follows:

- A single CNTCTLBase register frame, at base address CNTCTLBase.
- Between one and seven CNTBaseN register frames, each with its own base address CNTBaseN.
- For each CNTBaseN register frame, if required, a CNTEL0BaseN register frame, at base address CNTEL0BaseN, that provides an EL0 view of the CNTBaseN register frame.

For more information, see:

- [Memory-mapped timer components](#).
- [The CNTBaseN and CNTEL0BaseN frames](#). This section includes the memory map of the CNTBaseN and CNTEL0BaseN register frames.
- [The CNTCTLBase frame](#). This section includes the memory map of the CNTCTLBase register frame.

Note

Providing a complete set of features in a system level implementation gives an implementation example for a system level implementation of the Generic Timer.

F4.5 Generic Timer memory-mapped register descriptions

This section describes the Generic Timer registers. [Generic Timer memory-mapped registers overview](#) gives an overview of these registers, and includes links to their memory maps.

F4.5.1 CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configuration

It is IMPLEMENTATION DEFINED whether CNTACR<n> is implemented in the Core power domain or in the Debug power domain

For more information, see ‘Power and reset domains for the system level implementation of the Generic Timer’.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions

Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame <n>.

RWPT	Meaning
0b0	No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the EL1 Physical Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#), in frame <n>.

RWVT	Meaning
0b0	No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the Virtual Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to [CNTVOFF](#), in frame <n>.

RVOFF	Meaning
0b0	No access to CNTVOFF in frame <n>. The register is RES0.
0b1	Read-only access to CNTVOFF in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to [CNTFRQ](#), in frame <n>.

RFRQ	Meaning
0b0	No access to CNTFRQ in frame <n>. The register is RES0.
0b1	Read-only access to CNTFRQ in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to [CNTVCT](#), in frame <n>.

RVCT	Meaning
0b0	No access to CNTVCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTVCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to CNTPCT, in frame <n>.

RPCT	Meaning
0b0	No access to CNTPCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTPCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTACR<n>

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	$0 \times 040 + (4 * n)$	CNTACR<n>

Accesses to this register are RW.

F4.5.2 CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the [counter resolution](#), and controls counter behavior during debug.

Configuration

It is IMPLEMENTATION DEFINED whether CNTCR is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

Attributes

CNTCR is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see [‘The Frequency modes table’](#). An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behavior of this field is:

- On a Timer reset, this field resets to the expression 0x0.

Bits [7:2]

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

HDBG	Meaning
0b0	System counter ignores Halt-on-debug.
0b1	Asserted Halt-on-debug signal halts system counter update.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

EN	Meaning
0b0	System counter disabled.
0b1	System counter enabled.

The reset behavior of this field is:

- On a Timer reset, this field resets to '0'.

Accessing CNTCR

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTCR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

Accesses to this register are RW.

F4.5.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configuration

It is IMPLEMENTATION DEFINED whether CNTCV is implemented in the Core power domain or in the Debug power domain

For more information, see ‘Power and reset domains for the system level implementation of the Generic Timer’.

Attributes

CNTCV is a 64-bit register.

Field descriptions

CountValue, bits [63:0]

Indicates the counter value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTCV

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure physical address spaces, this register is implemented only in the Secure physical address space.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

For the instance of the register in the CNTReadBase frame, this register is accessible in all physical address spaces.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	0x008	CNTCV	63:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

Accesses to this register are RO.

F4.5.4 CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the [CNTPCT](#), [CNTVCT](#), [CNTFRQ](#), EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Configuration

It is IMPLEMENTATION DEFINED whether CNTEL0ACR is implemented in the Core power domain or in the Debug power domain

For more information, see ‘[Power and reset domains for the system level implementation of the Generic Timer](#)’.

Implementation of this register is OPTIONAL.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions

Bits [31:10]

Reserved, RES0.

EL0PTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the [CNTP_CVAL](#), [CNTP_TVAL](#), and [CNTP_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0PTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame, then they are accessible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0VTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame, then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for [CNTVCT](#) and [CNTFRQ](#).

EL0VCTEN	Meaning
0b0	CNTVCT is not visible in the second view. If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTVCT and CNTFRQ are visible in the current frame, then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for [CNTPCT](#) and [CNTFRQ](#).

EL0PCTEN	Meaning
0b0	CNTPCT is not visible in the second view. If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTPCT and CNTFRQ are visible in the current frame, then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

‘[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#)’ describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers [CNTFRQ](#), [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#), [CNTPCT](#), [CNTV_CTL](#), [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTVCT](#) are not visible and accesses are RAZ/WI in that frame.

CNTEL0ACR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

Accesses to this register are RW.

F4.5.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFID0 is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see [‘The Frequency modes table’](#).

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTFID0 can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

Accesses to this register are IMPLEMENTATION DEFINED.

F4.5.6 CNTFID<n>, Counter Frequency IDs, $n > 0$, $n = 1 - 1003$

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter frequencies.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFID<n> is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see [‘The Frequency modes table’](#).

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space $0x0C0-0x0FC$, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

Frequency, bits [31:0]

A system counter frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is increased by the ratio of the base frequency and the selected frequency.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes these registers, is implemented only in the Secure physical address space.

CNTFID<n> can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	$0 \times 020 + (4 * n)$	CNTFID<n>

Accesses to this register are IMPLEMENTATION DEFINED.

F4.5.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the effective frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFRQ is implemented in the Core power domain or in the Debug power domain

For more information see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

ClockFreq, bits [31:0]

Clock frequency. Indicates the effective frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

[‘CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames’](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RFRQ](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:

- CNTFRQ is accessible in the corresponding CNTBaseN frame.
- Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x010	CNTFRQ

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x010	CNTFRQ

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x000	CNTFRQ

Accesses to this register are RO.

F4.5.8 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Configuration

It is IMPLEMENTATION DEFINED whether CNTNSAR is implemented in the Core power domain or in the Debug power domain

For more information, see ‘[Power and reset domains for the system level implementation of the Generic Timer](#)’.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

**Bits [31:8]**

Reserved, RES0.

NS<n> , bits [n], for n = 7 to 0

Non-secure access to frame n.

NS<n>	Meaning
0b0	Secure access only. Behaves as RES0 to Non-secure accesses.
0b1	Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTNSAR

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

Accesses to this register are RW.

F4.5.9 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

It is IMPLEMENTATION DEFINED whether CNTPCT is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

Attributes

CNPCT is a 64-bit register.

Field descriptions

PhysicalCount, bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT

CNPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

[‘CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames’](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNPCT is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RPCT](#) is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNPCT is accessible in that frame if both:
 - CNPCT is accessible in the corresponding CNTBaseN frame.
 - The value of [CNTEL0ACR.EL0PCTEN](#) is 1.

- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNTPCT can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x000	CNTPCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x004	CNTPCT	63:32

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x000	CNTPCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x004	CNTPCT	63:32

Accesses to this register are RO.

F4.5.10 CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTP_CTL is implemented in the Core power domain or in the Debug power domain

For more information, see ‘[Power and reset domains for the system level implementation of the Generic Timer](#)’.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0, then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

‘[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#)’ describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
 - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.ELOPTEN](#) is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTELOBaseN	0x02C	CNTP_CTL

Accesses to this register are RW.

F4.5.11 CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTP_CVAL is implemented in the Core power domain or in the Debug power domain

For more information, see ‘[Power and reset domains for the system level implementation of the Generic Timer](#)’.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTP_CTL.IMASK](#) is 0.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

‘[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#)’ describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
 - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x020	CNTP_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x024	CNTP_CVAL	63:32

Accesses to this register are RW.

F4.5.12 CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTP_TVAL is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTPCT](#)).

On a write of this register, CompareValue is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

[‘CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames’](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
 - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x028	CNTP_TVAL

Accesses to this register are RW.

F4.5.13 CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter resolution status information.

Configuration

It is IMPLEMENTATION DEFINED whether CNTSR is implemented in the Core power domain or in the Debug power domain

For more information, see ‘Power and reset domains for the system level implementation of the Generic Timer’.

Attributes

CNTSR is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

FCACK, bits [17:8]

Frequency Change Acknowledge. Indicates the currently selected entry in the Frequency modes table, see ‘The Frequency modes table’.

The reset behavior of this field is:

- On a Timer reset, this field resets to the expression 0x000000.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

DBGH	Meaning
0b0	Counter is not halted.
0b1	Counter is halted.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing CNTSR

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTSR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x004	CNTSR

Accesses to this register are RO.

F4.5.14 CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the physical address space, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

Configuration

It is IMPLEMENTATION DEFINED whether CNTTIDR is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

Attributes

CNTTIDR is a 32-bit register.

Field descriptions

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
Frame7	Frame6	Frame5	Frame4	Frame3	Frame2	Frame1	Frame0								

Frame<n>, bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

Bit[2]	Meaning
0b0	Frame<n> does not have a second view. The CNTEL0ACR register in the first view of the frame is RES0.
0b1	Frame<n> has a second view, CNTEL0Base<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#).
- This CNTCTLBase frame implements the virtual timer offset register [CNTVOFF<n>](#).

The possible values of bit[1] are:

Bit[1]	Meaning
0b0	Frame<n> does not have virtual capability. The virtual time and offset registers are RES0.
0b1	Frame<n> has virtual capability. The virtual time and offset registers are implemented.

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
0b0	Frame<n> is not implemented. All registers associated with the frame are RES0.
0b1	Frame<n> is implemented.

Accessing CNTTIDR

In a system that recognizes two Security states, this register is accessible by both Secure and Non-secure accesses.

CNTTIDR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x008	CNTTIDR

Accesses to this register are RO.

F4.5.15 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configuration

It is IMPLEMENTATION DEFINED whether CNTVCT is implemented in the Core power domain or in the Debug power domain

For more information, see ‘[Power and reset domains for the system level implementation of the Generic Timer](#)’.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

VirtualCount, bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

‘[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#)’ describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RVCT](#) is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
 - CNTVCT is accessible in the corresponding CNTBaseN frame.
 - The value of [CNTEL0ACR.EL0VCTEN](#) is 1.

- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x008	CNTVCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x00C	CNTVCT	63:32

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x008	CNTVCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x00C	CNTVCT	63:32

Accesses to this register are RO.

F4.5.16 CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configuration

It is IMPLEMENTATION DEFINED whether CNTVOFF is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

[‘CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames’](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RVOFF](#) is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF register must be accessible as an atomic 64-bit value.

CNTVOFF can be accessed through the memory-mapped interface:

Component	Frame	Offset	Range
Timer	CNTBaseN	0x018	31:0

Accesses to this register are RO.

Component	Frame	Offset	Range
Timer	CNTBaseN	0x01C	63:32

Accesses to this register are RO.

F4.5.17 CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

Configuration

It is IMPLEMENTATION DEFINED whether CNTVOFF<n> is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

Implementation of this register is OPTIONAL.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions

VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF<n>

In the CNTCTBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see [‘CNTCTBase status and control fields for the CNTBaseN and CNTEL0BaseN frames’](#).

Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- [CNTNSAR.NS<n>](#) determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using [CNTVOFF](#).

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n> can be accessed through the memory-mapped interface:

Component	Frame	Offset	Range
Timer	CNTCTLBase	$0x080 + (8 * n)$	31:0

Accesses to this register are RW.

Component	Frame	Offset	Range
Timer	CNTCTLBase	$0x084 + (8 * n)$	63:32

Accesses to this register are RW.

F4.5.18 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTV_CTL is implemented in the Core power domain or in the Debug power domain

For more information, see ‘Power and reset domains for the system level implementation of the Generic Timer’.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0, then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

‘[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#)’ describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
 - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0VTEN](#) is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x03C	CNTV_CTL

Accesses to this register are RW.

F4.5.19 CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTV_CVAL is implemented in the Core power domain or in the Debug power domain

For more information, see ‘[Power and reset domains for the system level implementation of the Generic Timer](#)’.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTV_CTL.IMASK](#) is 0.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

‘[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#)’ describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
 - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x030	CNTV_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x034	CNTV_CVAL	63:32

Accesses to this register are RW.

F4.5.20 CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTV_TVAL is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTVCT](#)).

On a write of this register, CompareValue is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- If [CNTV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

[‘CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames’](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
 - CNTV_TVAL is accessible in the corresponding CNTBaseN frame.
 - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x038	CNTV_TVAL

Accesses to this register are RW.

F4.5.21 CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Configuration

It is IMPLEMENTATION DEFINED whether CounterID<n> is implemented in the Core power domain or in the Debug power domain

For more information, see [‘Power and reset domains for the system level implementation of the Generic Timer’](#).

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions

31	IMPLEMENTATION DEFINED	0
----	------------------------	---

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing CounterID<n>

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure physical address spaces, the frame is implemented only in the Secure physical address space, meaning these registers are implemented only in the Secure physical address space.

For the CNTReadBase frame, these registers are accessible in all physical address spaces.

For the CNTBaseN frames, [‘CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames’](#) describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

CounterID<n> can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	$0 \times \text{FD0} + (4 * n)$	CounterID<n>

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTReadBase	$0 \times \text{FD0} + (4 * n)$	CounterID<n>

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTBaseN	$0 \times \text{FD0} + (4 * n)$	CounterID<n>

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	$0 \times \text{FD0} + (4 * n)$	CounterID<n>

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	$0 \times \text{FD0} + (4 * n)$	CounterID<n>

Accesses to this register are RO.

Part G
Architectural Pseudocode

Chapter G1

R-profile Architecture Pseudocode

This chapter contains pseudocode that describes many features of the R-profile architecture. It contains the following sections:

- [Pseudocode for AArch32 operation](#)
- [Shared pseudocode](#)

G1.1 Pseudocode for AArch32 operation

This section holds the pseudocode for execution in AArch32 state. Functions that are listed in this section are identified as `AArch32.FunctionName` or `FunctionName`. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example `aarch32/debug/BreakpointMatch`.

Note

Many AArch32 pseudocode functions have not been updated to show the constraints on the Armv7 UNPREDICTABLE behaviors that are described in [Architectural Constraints on UNPREDICTABLE Behaviors](#). Where AArch32 pseudocode shows something to be UNPREDICTABLE, check [Architectural Constraints on UNPREDICTABLE Behaviors](#) for possible constraints on the permitted behavior.

The top-level sections of the AArch32 pseudocode hierarchy are:

- [aarch32/debug](#).
- [aarch32/exceptions](#).
- [aarch32/functions](#).
- [aarch32/translation](#).

G1.1.1 aarch32/debug

This section includes the following pseudocode functions:

- [AArch32_VCRMatch](#)
- [AArch32_SelfHostedSecurePrivilegedInvasiveDebugEnabled](#)
- [ExternalHypInvasiveDebugEnabled](#)
- [ExternalHypNoninvasiveDebugEnabled](#)
- [AArch32_BreakpointMatch](#)
- [AArch32_BreakpointValueMatch](#)
- [AArch32_ReservedBreakpointType](#)
- [AArch32_StateMatch](#)
- [AArch32_GenerateDebugExceptions](#)
- [AArch32_GenerateDebugExceptionsFrom](#)
- [AArch32_IncrementCycleCounter](#)
- [AArch32_IncrementEventCounter](#)
- [AArch32_PMUCycle](#)
- [AArch32_EnterHypModeInDebugState](#)
- [AArch32_EnterModeInDebugState](#)
- [AArch32_WatchpointByteMatch](#)
- [AArch32_WatchpointMatch](#)

G1.1.1.1 AArch32_VCRMatch

```
// AArch32_VCRMatch()
// =====

func AArch32_VCRMatch(vaddress : bits(32)) => boolean
begin

    var match : boolean;
    if UsingAArch32() && ELUsingAArch32(EL1) && PSTATE.EL != EL2 then
        // Each bit position in this string corresponds to a bit in DBGVCR and an exception vector.
        var match_word : bits(32) = Zeros{};

        let ss : SecurityState = CurrentSecurityState();
```

```

    if vaddress[31:5] == ExcVectorBase() [31:5] then
        if HaveEL(EL3) && ss == SS_NonSecure then
            match_word[UInt(vaddress[4:2]) + 24] = '1'; // Non-secure vectors
        else
            match_word[UInt(vaddress[4:2]) + 0] = '1'; // Secure vectors (or no EL3)
        end;
    end;
    // Mask out bits not corresponding to vectors.
    var mask : bits(32);
    if !HaveEL(EL3) then
        mask = '00000000'::'00000000'::'00000000'::'11011110'; // DBGVCR[31:8] are RES0
    elsif !ELUsingAArch32(EL3) then
        mask = '11011110'::'00000000'::'00000000'::'11011110'; // DBGVCR[15:8] are RES0
    else
        mask = '11011110'::'00000000'::'11011100'::'11011110';
    end;

    match_word = match_word AND DBGVCR() AND mask;
    match = !IsZero(match_word);

    // Check for UNPREDICTABLE case - match on Prefetch Abort and Data Abort vectors
    if !IsZero(match_word[28:27,12:11,4:3]) && DebugTarget() == PSTATE.EL then
        match = ConstrainUnpredictableBool(Unpredictable_VCMATCHDAPA);
    end;

    if !IsZero(vaddress[1:0]) && match then
        match = ConstrainUnpredictableBool(Unpredictable_VCMATCHHALF);
    end;
else
    match = FALSE;
end;

return match;
end;

```

G1.1.1.2 AArch32_SelfHostedSecurePrivilegedInvasiveDebugEnabled

```

// AArch32_SelfHostedSecurePrivilegedInvasiveDebugEnabled()
// =====

func AArch32_SelfHostedSecurePrivilegedInvasiveDebugEnabled() => boolean
begin
    // The definition of this function is IMPLEMENTATION DEFINED.
    // In the recommended interface, AArch32_SelfHostedSecurePrivilegedInvasiveDebugEnabled returns
    // the state of the (DBGEN AND SPIDEN) signal.
    if !HaveEL(EL3) && NonSecureOnlyImplementation() then return FALSE; end;
    return DBGEN == HIGH && SPIDEN == HIGH;
end;

```

G1.1.1.3 ExternalHypInvasiveDebugEnabled

```

// ExternalHypInvasiveDebugEnabled()
// =====

// In the recommended interface, ExternalHypInvasiveDebugEnabled returns the state
// of the (DBGEN AND HIDDEN) signal.

func ExternalHypInvasiveDebugEnabled() => boolean
begin
    return ExternalInvasiveDebugEnabled() && HIDDEN == HIGH;
end;

```

G1.1.1.4 ExternalHypNoninvasiveDebugEnabled

```
// ExternalHypNoninvasiveDebugEnabled()
// =====
// In the recommended interface, ExternalHypNoninvasiveDebugEnabled returns the
// state of the (DBGGEN OR NIDEN) AND (HIDEN OR HNIDEN) signal.

func ExternalHypNoninvasiveDebugEnabled() => boolean
begin
    return ExternalNoninvasiveDebugEnabled() && (HIDEN == HIGH || HNIDEN == HIGH);
end;
```

G1.1.1.5 AArch32_BreakpointMatch

```
// AArch32_BreakpointMatch()
// =====
// Breakpoint matching in an AArch32 translation regime.

func AArch32_BreakpointMatch(n : integer, vaddress : bits(32), accdesc : AccessDescriptor,
                             size : integer) => BreakpointInfo
begin
    assert ELUsingAArch32(S1TranslationRegime());
    assert n < NumBreakpointsImplemented();

    var brkptinfo : BreakpointInfo;
    let enabled : boolean = DBGBCR(n).E == '1';
    let isbreakpnt : boolean = TRUE;
    let linked : boolean = DBGBCR(n).BT == '0x01';
    let linked_to : boolean = FALSE;
    let linked_n : integer{} = UInt(DBGBCR(n).LBN);

    let state_match : boolean = AArch32_StateMatch(DBGBCR(n).SSC, DBGBCR(n).HMC, DBGBCR(n).PMC,
                                                    linked, linked_n, isbreakpnt, accdesc);
    var (value_match, value_mismatch) = AArch32_BreakpointValueMatch(n, vaddress, linked_to);

    if size == 4 then // Check second halfword
        // If the breakpoint address and BAS of an Address breakpoint match the address of the
        // second halfword of an instruction, but not the address of the first halfword, it is
        // CONSTRAINED UNPREDICTABLE whether this breakpoint generates a Breakpoint debug
        // event.
        let (match_i, mismatch_i) = AArch32_BreakpointValueMatch(n, vaddress + 2, linked_to);

        if !value_match && match_i then
            value_match = ConstrainUnpredictableBool(Unpredictable_BPMATCHHALF);
        end;

        if value_mismatch && !mismatch_i then
            value_mismatch = ConstrainUnpredictableBool(Unpredictable_BPMISMATCHHALF);
        end;
    end;

    if vaddress[1] == '1' && DBGBCR(n).BAS == '1111' then
        // The above notwithstanding, if DBGBCR(n).BAS == '1111', then it is CONSTRAINED
        // UNPREDICTABLE whether or not a Breakpoint debug event is generated for an instruction
        // at the address DBGBCR(n)+2.
        if value_match then
            value_match = ConstrainUnpredictableBool(Unpredictable_BPMATCHHALF);
        end;

        if !value_mismatch then
            value_mismatch = ConstrainUnpredictableBool(Unpredictable_BPMISMATCHHALF);
        end;
    end;

    brkptinfo.match = value_match && state_match && enabled;
    brkptinfo.mismatch = value_mismatch && state_match && enabled;
```

```
    return brkptinfo;
end;
```

G1.1.1.6 AArch32_BreakpointValueMatch

```
// AArch32_BreakpointValueMatch()
// =====
// The first result is whether an Address Match or Context breakpoint is programmed on the
// instruction at "address". The second result is whether an Address Mismatch breakpoint is
// programmed on the instruction, that is, whether the instruction should be stepped.

func AArch32_BreakpointValueMatch(n_in : integer, vaddress : bits(32),
                                  linked_to : boolean) => (boolean, boolean)
begin

    // "n" is the identity of the breakpoint unit to match against.
    // "vaddress" is the current instruction address, ignored if linked_to is TRUE and for Context
    // matching breakpoints.
    // "linked_to" is TRUE if this is a call from StateMatch for linking.
    var n : integer = n_in;
    var c : Constraint;

    // If a non-existent breakpoint then it is CONSTRAINED UNPREDICTABLE whether this gives
    // no match or the breakpoint is mapped to another UNKNOWN implemented breakpoint.
    if n >= NumBreakpointsImplemented() then
        (c, n) = ConstrainUnpredictableInteger(0, NumBreakpointsImplemented() - 1,
                                              Unpredictable_BPNOTIMPL);
        assert c IN {Constraint_DISABLED, Constraint_UNKNOWN};
        if c == Constraint_DISABLED then return (FALSE, FALSE); end;
    end;

    // If this breakpoint is not enabled, it cannot generate a match.
    // (This could also happen on a call from StateMatch for linking).
    if DBGBCR(n).E == '0' then return (FALSE, FALSE); end;

        (c, bt) = ConstrainUnpredictableBits{4}(Unpredictable_RESBPTYPE);
    end;
end;

```

```

    assert c IN {Constraint_DISABLED, Constraint_UNKNOWN};
    if c == Constraint_DISABLED then
        return (c, ARBITRARY : bits(4));
    // Otherwise the value returned by ConstrainsUnpredictableBits must be a not-reserved value
    end;
end;

return (Constraint_NONE, bt);
end;

```

G1.1.1.8 AArch32_StateMatch

```

// AArch32_StateMatch()
// =====
// Determine whether a breakpoint or watchpoint is enabled in the current mode and state.

func AArch32_StateMatch(ssc_in : bits(2), hmc_in : bit, pxc_in : bits(2), linked_in : boolean,
    linked_n_in : integer, isbreakpnt : boolean,
    accdesc : AccessDescriptor) => boolean
begin
    // "ssc_in","hmc_in","pxc_in" are the control fields from the DBGBCR(n) or DBGWCR(n) register.
    // "linked_in" is TRUE if this is a linked breakpoint/watchpoint type.
    // "linked_n_in" is the linked breakpoint number from the DBGBCR(n) or DBGWCR(n) register.
    // "isbreakpnt" is TRUE for breakpoints, FALSE for watchpoints.
    // "accdesc" describes the properties of the access being matched.
    var hmc : bit = hmc_in;
    var ssc : bits(2) = ssc_in;
    var pxc : bits(2) = pxc_in;
    var linked : boolean = linked_in;
    var linked_n : integer = linked_n_in;

    // If parameters are set to a reserved type, behaves as either disabled or a defined type
    var c : Constraint;
    (c, ssc, hmc, pxc) = CheckValidStateMatch(ssc, hmc, pxc, isbreakpnt);
    if c == Constraint_DISABLED then return FALSE; end;
    // Otherwise the hmc,ssc,pxc values are either valid or the values returned by
    // CheckValidStateMatch are valid.

    let pl2_match : boolean = HaveEL(EL2) && ((hmc == '1' && (ssc::pxc != '1000')) || ssc == '11');
    let pl1_match : boolean = pxc[0] == '1';
    let pl0_match : boolean = pxc[1] == '1';
    let ssu_match : boolean = isbreakpnt && hmc == '0' && pxc == '00' && ssc != '11';

    var priv_match : boolean;
    if ssu_match then

// AArch32_TranslateAddress()
// =====
// Main entry point for translating an address

func AArch32_TranslateAddress(va : bits(32), accdesc : AccessDescriptor,
                              aligned : boolean, size : integer) => AddressDescriptor
begin
    let regime : Regime = TranslationRegime(PSTATE.EL);

    var result : AddressDescriptor = AArch32_FullValidate(va, size, accdesc, aligned);

    if !IsFault(result) && accdesc.acctype != AccessType_IFETCH then
        // For an instruction fetch, CheckDebug will be called
    end;
end;

```

```
        // after the instruction is read from memory
        result.fault = AArch32_CheckDebug(va, accdesc, size);
    end;

    // Update virtual address for abort functions
    result.vaddress = ZeroExtend(64)(va);

    return result;
end;
```

G1.1.4.21 AArch32_S1DCacheEnabled

```
// AArch32_S1DCacheEnabled()
// =====
// Determine cacheability of stage 1 data accesses

func AArch32_S1DCacheEnabled(regime : Regime) => boolean
begin
    case regime of
        when Regime_EL2 => return HSCTLR().C == '1';
        when Regime_EL10 =>
            return SCTLRL().C == '1';
    end;
end;
```

G1.1.4.22 AArch32_S1ICacheEnabled

```
// AArch32_S1ICacheEnabled()
// =====
// Determine cacheability of stage 1 instruction fetches

func AArch32_S1ICacheEnabled(regime : Regime) => boolean
begin
    case regime of
        when Regime_EL2 => return HSCTLR().I == '1';
        when Regime_EL10 =>
            return SCTLRL().I == '1';
    end;
end;
```

G1.2 Shared pseudocode

This section holds the pseudocode that is common to execution in AArch64 state and in AArch32 state. Functions listed in this section are identified only by a `FunctionName`, without an `AArch32.` prefix. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example `shared/debug/DebugTarget`.

The top-level sections of the shared pseudocode hierarchy are:

- [shared/debug](#).
- [shared/exceptions](#).
- [shared/functions](#).
- [shared/trace](#).
- [shared/translation](#).

G1.2.1 shared/debug

This section includes the following pseudocode functions:

- [ClearStickyErrors](#)
- [DebugTarget](#)

G1.2.3.164 Hint_Prefetch

```
// Hint_Prefetch()
// =====
// Signals the memory system that memory accesses of type HINT to or from the specified address are
// likely in the near future. The memory system may take some action to speed up the memory
// accesses when they do occur, such as pre-loading the specified address into one or more
// caches as indicated by the innermost cache level target (0=L1, 1=L2, etc) and non-temporal hint
// stream. Any or all prefetch hints may be treated as a NOP. A prefetch hint must not cause a
// synchronous abort due to Alignment or Translation faults and the like. Its only effect on
// software-visible state should be on caches and TLBs associated with address, which must be
// accessible by reads, writes or execution, as defined in the translation regime of the current
// Exception level. It is guaranteed not to access Device memory.
// A Prefetch_EXEC hint must not result in an access that could not be performed by a speculative
// instruction fetch, therefore if all associated MMUs are disabled, then it cannot access any
// memory location that cannot be accessed by instruction fetches.

Architectural Constraints on UNPREDICTABLE Behaviors

This chapter describes the architectural constraints on UNPREDICTABLE behaviors in the Armv8 and later architectures. It contains the following sections:

- [AArch32 CONSTRAINED UNPREDICTABLE behaviors](#)

H1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

From the introduction of Armv8, the architecture defines architecturally required constraints on many behaviors that are UNPREDICTABLE in Armv7. The following sections define those constraints:

- [Overview of the constraints on Armv7 UNPREDICTABLE behaviors.](#)
- [Using R13 by instruction.](#)
- [Using R15 by instruction.](#)
- [Branching into an IT block.](#)
- [Branching to an unaligned PC.](#)
- [Loads and Stores to unaligned locations.](#)
- [CONSTRAINED UNPREDICTABLE behavior associated with IT instructions and PSTATE.IT.](#)
- [Unallocated System register access instructions.](#)
- [SBZ or SBO fields T32 and A32 in instructions.](#)
- [UNPREDICTABLE cases in immediate constants in T32 data-processing instructions.](#)
- [UNPREDICTABLE cases in immediate constants in Advanced SIMD instructions.](#)
- [CONSTRAINED UNPREDICTABLE behaviors due to caching of System register control or data values.](#)
- [CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization](#)
- [Handling of System register control fields for Advanced SIMD and floating-point operation.](#)
- [Mapping of non-idempotent memory locations using the Normal memory type.](#)

- [CONSTRAINED UNPREDICTABLE behavior in Debug state.](#)

H1.1.1 Overview of the constraints on Armv7 UNPREDICTABLE behaviors

The term UNPREDICTABLE describes a number of cases where the architecture has a feature that software must not use. For execution in AArch32 state, where previous versions of the architecture define behavior as UNPREDICTABLE, from the introduction of Armv8-R the architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

Note

Software designed to be compatible with the Armv8-R and later architectures must not rely on these CONSTRAINED UNPREDICTABLE cases.

H1.1.2 Using R13 by instruction

In prior versions of the architecture, the use of R13 by instruction as a named register specifier was described as UNPREDICTABLE in the pseudocode. From the introduction of the Armv8-R architecture, the use of R13 as a named register specifier is not UNPREDICTABLE, unless this is specifically stated, and R13 can be used in the regular form. Bits[1:0] of R13 are not treated as SBZP in the Armv7 architecture or RES0 in the Armv8 and later architectures, but can hold any values programmed into them.

H1.1.3 Using R15 by instruction

All uses of R15 by instruction as a named register specifier for a source register that are described as CONSTRAINED UNPREDICTABLE in the pseudocode or in other places in this Manual must do one of the following:

- Cause the instruction to be treated as UNDEFINED.
- Cause the instruction to execute as a NOP.
- Read the Program Counter with the standard offset that applies for the current instruction set.
- Read the Program Counter with the standard offset that applies for the current instruction set with alignment to a word boundary.
- Read 0. This is Arm preferred behavior.
- Read or return an UNKNOWN value for the source register specified as R15.

All uses of R15 as a named register specifier for a destination register that are described as CONSTRAINED UNPREDICTABLE in the pseudocode or in other places in this reference manual must do one of the following:

- Cause the instruction to be treated as UNDEFINED.
- Cause the instruction to execute as a NOP.
- Ignore the write.
- Branch to an UNKNOWN location in either A32 or T32 state.

Instructions that are CONSTRAINED UNPREDICTABLE when the base register is R15 and the instruction specifies a writeback of the base register, are treated as having R15 as both a source register and a destination register.

For instructions that have two destination registers, for example `LDRD`, `MRRC`, and many of the multiply instructions, if `Rt`, `Rt2`, `RdLo`, or `RdHi` is R15, then the other destination register of the pair is UNKNOWN if the CONSTRAINED UNPREDICTABLE behavior for the write to R15 is either to ignore the write or to branch to an UNKNOWN location.

For instructions that affect any or all of `PSTATE.{N, Z, C, V}`, `PSTATE.Q`, and `PSTATE.GE` when the register specifier is not R15, any flags affected by an instruction that is CONSTRAINED UNPREDICTABLE when the register specifier is R15 become UNKNOWN.

In addition, for `MRC` instructions that use R15 as the destination register descriptor, and therefore target `APSR_nzcv` where these are described as being CONSTRAINED UNPREDICTABLE, `PSTATE.{N, Z, C, V}` becomes UNKNOWN.

H1.1.4 Branching into an IT block

Branching into an IT block leads to CONSTRAINED UNPREDICTABLE behavior. Execution starts from the address determined by the branch, but each instruction in the IT block is:

- Executed as if it were not in an IT block. This means that it is executed unconditionally.
- Executed as if it had passed its [Condition code check](#) within an IT block.
- Executed as a NOP. That is, it behaves as if it had failed the [Condition code check](#).

H1.1.5 Branching to an unaligned PC

In A32 state, when branching to an address that is not word-aligned and is defined to be CONSTRAINED UNPREDICTABLE, one of the following behaviors must occur:

- The unaligned location is forced to be aligned.

- The unaligned address generates a Prefetch Abort on the first instruction using the unaligned PC value. If that instruction is executed at EL0 and [HCR.TGE](#) is 1 the exception is taken to EL2. If the instruction is executed at EL0 when the applicable TGE bit is 0 the exception is taken to EL1. If the instruction is executed at an Exception level that is higher than EL0 the exception is taken to the Exception level at which the instruction was executed. In all cases, the exception is generated only if the first instruction using the unaligned PC value is architecturally executed.

If the exception that results from a branch to an unaligned PC value it is reported as a Prefetch Abort exception, see [Prefetch Abort exception reporting a PC alignment fault exception](#).

Note

Because bit[0] is used for interworking, it is impossible to specify a branch to A32 state when the bottom bit of the target address is 1. Therefore the bottom bit of [IFAR](#), [HIFAR](#), or [FAR_ELx](#) is 0 for all these cases.

H1.1.6 Loads and Stores to unaligned locations

Some unaligned loads and stores in the Armv8-A and later architectures are described as CONSTRAINED UNPREDICTABLE to do one of the following:

- Take an alignment fault.
- Perform the specified load or store to the unaligned memory location.

H1.1.7 CONSTRAINED UNPREDICTABLE behavior associated with IT instructions and PSTATE.IT

A number of instructions in the architecture are described as being CONSTRAINED UNPREDICTABLE either:

- Anywhere within an IT block.
- As an instruction within an IT block, other than the last instruction within an IT block.

Unless otherwise stated in this manual, when these instructions are committed for execution, one of the following occurs:

- An UNDEFINED exception results.
- The instructions are executed as if they had passed the [Condition code check](#).
- The instructions execute as NOPs. This means that they behave as if they had failed the [Condition code check](#).

The behavior might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

Many instructions that are CONSTRAINED UNPREDICTABLE in an IT block are branch instructions or other non-sequential instructions that change the PC. Where these instructions are not treated as UNDEFINED within an IT block, the remaining iterations of the [PSTATE.IT](#) state machine must be treated in one of the following ways:

- [PSTATE.IT](#) is cleared to 0.
- [PSTATE.IT](#) advances for either a sequential or a nonsequential change of the PC in the same way as it does for instructions that are not CONSTRAINED UNPREDICTABLE that cause a sequential change of the PC.

Note

This does not apply to an instruction that is the last instruction in an IT block.

The instructions addressed by the updated PC must do one of the following:

- Execute as if they had passed the [Condition code check](#) for the remaining iterations of the [PSTATE.IT](#) state machine.

- Execute as NOPs. That is, they behave as if they had failed the [Condition code check](#) for the remaining iterations of the [PSTATE.IT](#) state machine.
- Execute as if they were unconditional, or, if the instructions are part of another IT block, in accordance with the behavior described in [Branching into an IT block](#).

The behavior might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

For exception returns or Debug state exits that cause [PSTATE.IT](#) to be set to a reserved value in T32 state or that return to A32 state with a nonzero value in [PSTATE.IT](#), the [PSTATE.IT](#) bits are forced to 0b00000000. The reserved values are:

```
PSTATE.IT[7:4] != '0000' && PSTATE.IT[3:0] == '0000'
PSTATE.IT[2:0] != '000' && (SCTLR().ITD == '1' || SCTLR_ELx().ITD == '1')
```

Exception returns or Debug state exits that set [PSTATE.IT](#) to a non-reserved value in T32 state can occur when the flow of execution returns to a point:

- Outside an IT block, but with the [PSTATE.IT](#) bits set to a value other than 0b00000000.
- Inside an IT block, but with a different value of the [PSTATE.IT](#) bits than if the IT block had been executed without an exception return or Debug state exit.

In this case, the instructions at the target of the exception return or Debug state exit must do one of the following:

- Execute as if they passed the [Condition code check](#) for the remaining iterations of the [PSTATE.IT](#) state machine.
- Execute as NOPs. That is, they behave as if they failed the [Condition code check](#) for the remaining iterations of the [PSTATE.IT](#) state machine.
- Execute as if they were unconditional, or as if the instruction were part of another IT block, in accordance with the behavior in [Branching into an IT block](#).

The remaining iterations of the [PSTATE.IT](#) state machine must behave in one of the following ways:

- The [PSTATE.IT](#) state machine advances as if it were in an IT block.
- The [PSTATE.IT](#) bits are ignored.
- The [PSTATE.IT](#) bits are forced to 0b00000000.

H1.1.8 Unallocated System register access instructions

From the introduction of the Armv8-R architecture, accesses to unallocated System register encodings are UNDEFINED.

This includes:

- Reads using encodings that are defined as WO.
- Writes using encodings that are defined as RO.
- MCR or MRC accesses to using a set of {coproc, CRn, opc1, CRm, opc2} values that the Armv7 architecture defined as UNPREDICTABLE.
- MCRR and MRRC instructions with unallocated values of opc1 or CRm that are described as UNPREDICTABLE are UNDEFINED in the Armv8-A and later architectures.

H1.1.9 SBZ or SBO fields T32 and A32 in instructions

Many of the T32 and A32 instructions have (0) or (1) in the instruction decode to indicate *Should-Be-Zero*, SBZ, or *Should-Be-One*, SBO. If the instruction bit pattern of an instruction is executed with these fields not having the *should be* values, one of the following must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

- The instruction operates as if the bit had the *should-be* value.
- Any destination registers of the instruction become UNKNOWN.

The exceptions to this rule are:

- LDM, LDMIA, LDMFD.
- LDMDB, LDMEA.
- LDR (literal).
- LDRB (literal).
- LDRD (immediate).
- LDRD (register).
- LDRD (literal).
- LDRH (literal).
- LDRSB (literal).
- LDRSH (literal).
- POP.
- PUSH.
- SDIV.
- STM, STMIA, STMEA.
- STMDB, STMFD.
- UDIV.

H1.1.10 UNPREDICTABLE cases in immediate constants in T32 data-processing instructions

The description of immediate constants in T32 data processing [Modified immediate constants in T32 instructions](#) include constant values that were UNPREDICTABLE in Armv7. [Instruction encodings](#) describes 32-bit T32 instructions as {hw1, hw2}, where hw1 is the left-hand halfword in the 32-bit encoding diagram for the instruction. The UNPREDICTABLE cases are those where both:

- $hw2[7:0] == 0b0000000$.
- $hw1[10] == 0$ and either:
 - $hw2[14:12] == 0b001$.
 - $hw2[14:12] == 0b010$.
 - $hw2[14:12] == 0b011$.

From the introduction of the Armv8 architecture, the CONSTRAINED UNPREDICTABLE behavior is that these encodings produce the value $0b0000000$.

H1.1.11 UNPREDICTABLE cases in immediate constants in Advanced SIMD instructions

The description of immediate constants in [Modified immediate constants in T32 and A32 Advanced SIMD instructions](#) include constant values that were UNPREDICTABLE in Armv7. The UNPREDICTABLE cases are those where:

- The bits that the encoding diagram shows as *abcd* are all 0.
In the A32 encoding these are bits[24, 18:6, 3:0]. In the T32 encoding they are bits {hw1[12, 2:0], hw2[3:0]}.
- The bits that the encoding diagram shows as *cmode*[3:1] are one of {0b001, 0b010, 0b011, 0b101, 0b110}.
In the A32 encoding these are bits[11:9]. In the T32 encoding they are bits hw2[11:9].

From the introduction of the Armv8 architecture, the CONSTRAINED UNPREDICTABLE behavior is that these encodings produce an immediate constant value of zero.

H1.1.12 CONSTRAINED UNPREDICTABLE behaviors due to caching of System register control or data values

The Arm architecture allows copies of System register control or data values to be cached in a cache or TLB. This can lead to CONSTRAINED UNPREDICTABLE behavior if the cache or TLB has not been correctly invalidated following a change of the control or data values.

Unless explicitly stated otherwise, the behavior of the PE is consistent with one of:

- The old data or control value.
- The new data or control value.
- An amalgamation of the old and new data or control values.

H1.1.13 CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization

The Arm architecture requires that changes to System registers must be synchronized before they take effect. This can lead to CONSTRAINED UNPREDICTABLE behavior if the synchronization has not been performed.

In these cases, the behavior of the PE is consistent with the unsynchronized control value being either the old value or the new value.

Where multiple control values are updated but not yet synchronized, each control value might independently be the old value or the new value.

In addition, where the unsynchronized control value applies to different areas of functionality, or what an implementation has constructed as different areas of functionality, those areas might independently treat the control value as being either the old value or the new value.

The choice between these behaviors might, in some implementations, vary for each use of a control value.

H1.1.14 Unallocated values with register fields of CP15 registers and Translation Table entries

Unless stated elsewhere, all unallocated or reserved values of fields with allocated values within CP15 registers and Translation Table entries be have in one in one of the following ways:

- The encoding maps onto any of the allocated values but otherwise does not cause UNPREDICTABLE behavior.
- The encodings cause effects that could be achieved by a combination of more than one of the allocated encodings.
- The encodings cause the field to have no functional effect.

H1.1.15 Handling of System register control fields for Advanced SIMD and floating-point operation

For historical reasons described in [Background to the System register interface](#), each of the [CPACR](#), [HCPTR](#), and [NSACR](#) has a pair of control fields that were defined to have identical functionality for controlling Advanced SIMD and floating-point operation. These fields are:

- [CPACR](#).{cp10, cp11}.
- [HCPTR](#).{TCP10, TCP11}.
- [NSACR](#).{cp10, cp11}.

The architecture requires that both fields in one of these pairs are programmed to the same value. If this is not done, then the CONSTRAINED UNPREDICTABLE behavior is that behavior is the same as if the cp11 or TCP11 control field was equal to the cp10 or TCP10 field. This is in all respects except for the value read back by a direct read of the register.

After a register write that writes different values to the two fields of a pair, a direct read of the register might return an UNKNOWN value for the cp11 or TCP11 field.

Note

This means that, when different values are written to the {cp10, cp11} fields in a single register, the architecture permits but does not require that a read of that register returns the value written to the cp11 field.

H1.1.15.1 CONSTRAINED UNPREDICTABLE CPACR and NSACR settings

If [CPACR](#).cp<n> contains the encoding '10', then one of the following behaviors must occur:

- The encoding maps onto any of the allocated values, but otherwise does not cause UNPREDICTABLE behavior.
- The encoding causes effects that could be achieved by a combination of more than one of the allocated encodings.

Note

In Armv7, [CPACR](#) had a D32DIS bit, and [NSACR](#) had an NSD32DIS bit. There is no [CPACR](#).D32DIS or [NSACR](#).NSD32DIS in Armv8-A and later architectures, and the corresponding bits in the two registers are RES0.

H1.1.16 Mapping of non-idempotent memory locations using the Normal memory type

If non-idempotent memory locations are mapped using the Normal memory type, the state of the non-idempotent memory location may become corrupted in the following circumstances:

- Speculative read accesses may cause accesses to the non-idempotent memory locations that would not occur as part of a simple sequential execution.
- Writes to non-idempotent memory locations might be merged or split. In this case, the number and size of writes seen by the memory location might not be the number and size that occur as part of a simple sequential execution.

H1.1.17 The Performance Monitors Extension

I_{WKXBB}

The following subsections describe CONSTRAINED UNPREDICTABLE behaviors when accessing the Performance Monitors Extension in AArch32 state:

- [CONSTRAINED UNPREDICTABLE](#) accesses to [PMXEVTYPER](#) or [PMXEVCNTR](#).
- [CONSTRAINED UNPREDICTABLE](#) accesses to [PMEVCNTR](#)<n> and [PMEVTYPER](#)<n>.
- [CONSTRAINED UNPREDICTABLE](#) behavior caused by [HDCR](#).HPMN.

H1.1.17.1 CONSTRAINED UNPREDICTABLE accesses to PMXEVTYPER or PMXEVCNTR

R_{XSVNC}

If [PMSELR](#).SEL is greater than the number of event counters accessible at the current Exception level, then accesses to [PMXEVTYPER](#) or [PMXEVCNTR](#) can cause CONSTRAINED UNPREDICTABLE behavior. This occurs when any of the following is true:

- If [PMSELR](#).SEL is not equal to 31, and [PMSELR](#).SEL is greater than or equal to [PMCR](#).N, and the PE is executing in EL2.

Note

If EL2 is implemented and enabled in the current Security state, [HDCR](#).HPMN, or [MDCR](#).EL2.HPMN, identifies the number of accessible counters at EL0 or EL1. Otherwise, the number of accessible counters is the number of accessible event counters.

Accesses from EL0 to [PMXEVCNTR](#) are permitted when the values of [PMUSERENR](#).{ER, EN} are both 1.

Accesses from EL0 to [PMXEVTYPER](#) are permitted when value of [PMUSERENR](#).EN is 1.

I_{HNSSP}

If [PMSELR](#).SEL is equal to 31, the PE does one of the following:

- Accesses to [PMXEVCNTR](#) are UNDEFINED.
- Accesses to [PMXEVCNTR](#) behave as RAZ/WI.
- Accesses to [PMXEVCNTR](#) execute as NOPs.
- Accesses to [PMXEVCNTR](#) behave as if [PMSELR](#).SEL contains an UNKNOWN value that is less than the number of counters accessible at the current Exception level and Security state.
- If an access to [PMXEVCNTR](#) from EL1 or a permitted access from EL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2.

I_{GRBHK}

H1.1.17.2 CONSTRAINED UNPREDICTABLE accesses to PMEVCNTR<n> and PMEVTYPER<n>

If <n> is greater than the number of event counters available in the current Exception level and state, reads and writes of [PMEVCNTR<n>](#) and [PMEVTYPER<n>](#) are CONSTRAINED UNPREDICTABLE, and the PE does one of the following:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, for an access to [PMEVCNTR<n>](#) or [PMEVTYPER<n>](#) from EL1 or a permitted access from EL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2.
Accesses from EL0 are permitted to [PMEVTYPER<n>](#) when the value of [PMUSERENR.EN](#) is 1.

Note

At EL0 and EL1 [HDCR.HPMN](#) identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of accessible event counters.

R_{ZLPGP}

H1.1.17.3 CONSTRAINED UNPREDICTABLE behavior caused by HDCR.HPMN

If NUM_PMU_COUNTERS is nonzero, and [HDCR.HPMN](#) is 0, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of [HDCR.HPMN](#) is UNKNOWN.
- Either:
 - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if [HDCR.HPMN](#) is set to an UNKNOWN nonzero value less than or equal to NUM_PMU_COUNTERS.
 - All counters are reserved for EL2 use, meaning no counters are accessible from EL1 and EL0.

H1.1.18 Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED

When a CONSTRAINED UNPREDICTABLE instruction is treated as UNDEFINED, this generates an exception:

- If this exception is taken to an Exception level that is using AArch64, then ESR_ELx is UNKNOWN.
- If this exception is taken to EL2 and EL2 is using AArch32, then the [HSR](#) is unknown.

Note

The value written to ESR or HSR must be consistent with a value that could be created as the result of an exception from the same Exception level that generated the exception, but resulted from a situation that is not CONSTRAINED UNPREDICTABLE at that Exception level. This is to avoid a possible privilege violation.

H1.1.19 Out of range VA

If the PE executes an instruction for which the instruction address, size, and alignment mean it contains the bytes 0xFFFF_FFFF and 0x0000_0000, then the bytes that wrap around and appear to be from 0x0000_0000 onwards come from an UNKNOWN address.

If the PE executes a load or store instruction for which the calculated address, total access size, and alignment mean it accesses bytes 0xFFFF_FFFF and 0x0000_0000, then the bytes that wrap around and appear to be from 0x0000_0000 onwards come from an UNKNOWN address.

H1.1.20 Instruction fetches from Device memory

Instruction fetches from Device memory are CONSTRAINED UNPREDICTABLE.

If a location in memory has the Device attribute and is not marked as execute-never, then an implementation might perform speculative instruction accesses to this memory location when address translation is enabled.

If a branch causes the Program Counter to point to a location in memory with the Device attribute that is not marked as execute-never for the current Exception level for instruction fetches, then an implementation must perform one of the following behaviors:

- It treats the instruction fetch as if it were to a memory location with the Normal, Non-cacheable attribute.
- It generates a Permission fault.

H1.1.21 Multi-access instructions that load the PC from Device memory

Multi-access instructions that load the PC from Device memory when address translation is enabled are UNPREDICTABLE in AArch32 state. From the introduction of the Armv8-A architecture in AArch32 state an implementation must perform one of the following behaviors:

- It loads the PC from the memory location as if the memory location had the Normal Non-cacheable attribute.
- It generates a Permission fault.

H1.1.22 Programming CSSELR.Level for a cache level that is not implemented

If CSSELR.Level is programmed to a cache level that is not implemented, then a read of CSSELR returns an UNKNOWN value in CSSELR.Level.

If CSSELR.Level is programmed to a cache level that is not implemented, then on a read of CCSIDR an implementation must perform one of the following behaviors:

- The CCSIDR read is treated as a NOP.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

H1.1.23 Crossing a page boundary with different memory types or Shareability attributes

If a single load or store instruction generates multiple memory accesses, such that the total set of accesses crosses a page boundary to a memory location that has a different memory type, Normal or Device, or Shareability attribute results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation must perform one of the following behaviors:

- Each memory access generated by the instruction uses the memory type and Shareability attribute associated with its own address.
- The instruction generates an alignment fault caused by the memory type.
For the Non-secure PL1&0 translation regime:
 - If the stage 1 translation causes the mismatch, the resulting exception is taken to PL1.
 - If the stage 2 translation causes the mismatch, the resulting exception is taken to PL2.
 - If both stages of translation cause the mismatch, the resulting exception can be taken to either PL1 or PL2.
- The instruction executes as a NOP.

H1.1.24 Crossing a 4KB boundary with a Device access

A memory access from a load or store instruction to Device memory that crosses a 4KB boundary results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation must perform one of the following behaviors:

- All memory accesses generated by the instruction are performed as if the presence of the boundary had no effect on the memory accesses.
- All memory accesses generated by the instruction are performed as if the presence of the boundary had no effect on the memory accesses, except that there is no guarantee of ordering between memory accesses.
- The instruction generates an Alignment fault caused by the memory type.
For the Non-secure PL1&0 translation regime:
 - If the stage 1 translation causes the boundary to be crossed, the resulting exception is taken to PL1.
 - If the stage 2 translation causes the boundary to be crossed, the resulting exception is taken to PL2.

- If both stages of translation cause the boundary to be crossed, the resulting exception can be taken to either PL1 or PL2.
- The instruction executes as a NOP.

Note

The boundary referred to is between two Device memory regions that are both of 4KB and aligned to 4KB.

H1.1.25 UNPREDICTABLE behaviors with Load-Exclusive/Store-Exclusive pairs

[Load-Exclusive and Store-Exclusive instruction usage restrictions](#) defines a Load-Exclusive/Store-Exclusive pair, and identifies various CONSTRAINED UNPREDICTABLE behaviors associated with using Load-Exclusive/Store-Exclusive pairs. These cases were UNPREDICTABLE in Armv7. In summary, these cases are:

- The target virtual address of a `StoreExcl` instruction is different from the virtual address of the preceding `LoadExcl` instruction in the same thread of execution.
- The transaction size of a `StoreExcl` instruction is different from the transaction size of the preceding `LoadExcl` instruction in the same thread of execution.
- The memory attributes for a `StoreExcl` instruction are different from the memory attributes for the preceding `LoadExcl` instruction in the same thread of execution, either:
 - Because the translation of the accessed address changes between the `LoadExcl` instruction and the `StoreExcl` instruction.
 - Because the `LoadExcl` instruction and the `StoreExcl` instruction use different virtual addresses, with different attributes, that point to the same physical address.

In addition, the effect of a data or unified cache invalidate, clean, or clean and invalidate instruction on a local or global Exclusives monitor that is in the Exclusive Access state is CONSTRAINED UNPREDICTABLE.

See the descriptions in [Load-Exclusive and Store-Exclusive instruction usage restrictions](#) for the permitted behavior in each of these cases, and any constraints that might apply to whether the case is CONSTRAINED UNPREDICTABLE.

Note

Additional CONSTRAINED UNPREDICTABLE cases can apply to Load-Exclusive and Store-Exclusive instructions, see [CONSTRAINED UNPREDICTABLE behavior for T32 and A32 System instructions in the base instruction set](#).

H1.1.26 CONSTRAINED UNPREDICTABLE behavior for T32 and A32 instruction encodings

The T32 and A32 instruction sets include encodings that result in CONSTRAINED UNPREDICTABLE behavior when they are decoded.

H1.1.26.1 CONSTRAINED UNPREDICTABLE behavior of CRC32 instruction encodings

In the T32 and A32 instruction sets, there are encodings of the CRC32 and CRC32C instructions that result in CONSTRAINED UNPREDICTABLE behavior. These encodings are listed in the following places in the T32 and A32 instruction sets:

- [Cyclic Redundancy Check](#) for the A32 instruction set, with `sz = 11`.
- [Data-processing \(two source registers\)](#) for the T32 instruction set, with `op1 = 10x` and `op2 = 11`.

The CONSTRAINED UNPREDICTABLE behavior for these encodings is described in CRC32 and CRC32C.

H1.1.26.2 CONSTRAINED UNPREDICTABLE behavior of other A32 instruction encodings

In the A32 instruction set, there are encodings that result in CONSTRAINED UNPREDICTABLE behavior. These encodings are listed in:

- [Miscellaneous](#).
- [Memory hints and barriers](#).

- [Barriers.](#)

The CONSTRAINED UNPREDICTABLE behavior is that an implementation must treat the encodings in one of the following ways:

- The instruction encoding is UNDEFINED.
- The instruction encoding executes as a NOP.

H1.1.27 Out of range values of the Set/Way/Index fields in cache maintenance instructions

In the cache maintenance by set/way instructions [DCCISW](#), [DCCSW](#), and [DCISW](#), if any set/way/index argument is larger than the value supported by the implementation, then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

H1.1.28 CONSTRAINED UNPREDICTABLE behavior for T32 and A32 System instructions in the base instruction set

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different T32 and A32 System instructions.

Note

If an instruction can result in CONSTRAINED UNPREDICTABLE behavior that is not specific to that particular instruction, see the relevant section in this appendix for a description of the CONSTRAINED UNPREDICTABLE behavior.

H1.1.28.1 SRS (T32)

For a description of this instruction and the encoding, see [SRS](#), [SRSDA](#), [SRSDb](#), [SRSIA](#), [SRSIB](#).

H1.1.28.1.1 CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If the instruction specifies an illegal mode field, then one of the following behaviors must occur:
 - The instruction is UNDEFINED.
 - The instruction executes as a NOP.
 - R13 of the current mode is used.
 - The store occurs to an UNKNOWN address, and if the instruction specifies writeback, any general-purpose register that can be accessed without privilege violation from the current Exception level become UNKNOWN.

H1.1.28.2 SRS (A32)

For a description of this instruction and the encoding, see [SRS](#), [SRSDA](#), [SRSDb](#), [SRSIA](#), [SRSIB](#).

H1.1.28.2.1 CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If the instruction specifies an illegal mode field, then one of the following behaviors must occur:
 - The instruction is UNDEFINED.
 - The instruction executes as a NOP.
 - R13 of the current mode is used.
 - The store occurs to an UNKNOWN address, and if the instruction specifies writeback, any general-purpose register that can be accessed without privilege violation from the current Exception level become UNKNOWN.

H1.1.28.3 SUBS PC, LR and related instructions (T32)

For a description of this instruction and the encoding, see the exception return form of [SUB, SUBS \(immediate\)](#).

H1.1.28.3.1 CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If this instruction is executed in User mode or in System mode, then one of the following behaviors must occur:
 - The instruction is UNDEFINED.
 - The instruction executes as a NOP.
- If the instruction transfers an illegal mode encoding to [PSTATE.M](#), then this invokes the illegal exception return.

Note

An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

For encoding T5:

- If `hw1[3:0]` are not `0b1110`, and the instruction is executed when not in Hyp mode, System mode, or User mode, then one of the following behaviors must occur:
 - The instruction is UNDEFINED.
 - The instruction is treated as a NOP.
 - The instruction is treated as if `hw1[3:0]` are `0b1110`.
 - The Program Counter is set using the value in the register specified by `hw1[3:0]`.

H1.1.28.4 SUBS PC, LR and related instructions (A32)

For a description of this instruction and the encoding, see the exception return forms of [MOV, MOVS \(register\)](#) and [SUB, SUBS \(immediate\)](#).

H1.1.28.4.1 CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If this instruction is executed in User mode or in System mode, then one of the following behaviors must occur:
 - The instruction is UNDEFINED.
 - The instruction executes as a NOP.
- If the instruction transfers an illegal mode encoding to [PSTATE.M](#), then this invokes the illegal exception return.

Note

An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

H1.1.29 CONSTRAINED UNPREDICTABLE behavior, T32 and A32 Advanced SIMD and floating-point instructions

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different T32 and A32 Advanced SIMD and floating-point instructions listed in [Alphabetical list of Advanced SIMD and floating-point instructions](#).

Note

- The pseudocode used in this section to describe cases that can result in CONSTRAINED UNPREDICTABLE behavior does not necessarily match the encoding-specific pseudocode for a specific instruction.
 - If an instruction can result in CONSTRAINED UNPREDICTABLE behavior that is not specific to that particular instruction, see the relevant section in this appendix for a description of the CONSTRAINED UNPREDICTABLE behavior.
-

H1.1.29.1 VCVT (between floating-point and fixed-point)

For a description of this instruction and the encoding, see [VCVT \(between floating-point and fixed-point, floating-point\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.2 VLD1 (multiple single elements)

For a description of this instruction and the encoding, see [VLD1 \(multiple single elements\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.3 VLD1 (single element to all lanes)

For a description of this instruction and the encoding, see [VLD1 \(single element to all lanes\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.4 VLD2 (multiple 2-element structures)

For a description of this instruction and the encoding, see [VLD2 \(multiple 2-element structures\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.5 VLD2 (single 2-element structure to one lane)

For a description of this instruction and the encoding, see [VLD2 \(single 2-element structure to one lane\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.6 VLD2 (single 2-element structure to all lanes)

For a description of this instruction and the encoding, see [VLD2 \(single 2-element structure to all lanes\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.7 VLD3 (multiple 3-element structures)

For a description of this instruction and the encoding, see [VLD3 \(multiple 3-element structures\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.8 VLD3 (single 3-element structure to one lane)

For a description of this instruction and the encoding, see [VLD3 \(single 3-element structure to one lane\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.9 VLD3 (single 3-element structure to all lanes)

For a description of this instruction and the encoding, see [VLD3 \(single 3-element structure to all lanes\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.10 VLD4 (multiple 4-element structures)

For a description of this instruction and the encoding, see [VLD4 \(multiple 4-element structures\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.11 VLD4 (single 4-element structure to one lane)

For a description of this instruction and the encoding, see [VLD4 \(single 4-element structure to one lane\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.12 VLD4 (single 4-element structure to all lanes)

For a description of this instruction and the encoding, see [VLD4 \(single 4-element structure to all lanes\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.13 VLDM

For a description of this instruction and the encoding, see [VLDM](#), [VLDMDB](#), [VLDMIA](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.14 VMOV (between two general-purpose registers and two single-precision registers)

For a description of this instruction and the encoding, see [VMOV \(between two general-purpose registers and two single-precision registers\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.15 VMOV (between two general-purpose registers and a doubleword floating-point register)

For a description of this instruction and the encoding, see [VMOV \(between two general-purpose registers and a doubleword floating-point register\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.16 VST1 (multiple single elements)

For a description of this instruction and the encoding, see [VST1 \(multiple single elements\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.17 VST2 (multiple 2-element structures)

For a description of this instruction and the encoding, see [VST2 \(multiple 2-element structures\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.18 VST2 (single 2-element structure from one lane)

For a description of this instruction and the encoding, see [VST2 \(single 2-element structure from one lane\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.19 VST3 (multiple 3-element structures)

For a description of this instruction and the encoding, see [VST3 \(multiple 3-element structures\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.20 VST3 (single 3-element structure from one lane)

For a description of this instruction and the encoding, see [VST3 \(single 3-element structure from one lane\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.21 VST4 (multiple 4-element structures)

For a description of this instruction and the encoding, see [VST4 \(multiple 4-element structures\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.22 VST4 (single 4-element structure from one lane)

For a description of this instruction and the encoding, see [VST4 \(single 4-element structure from one lane\)](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.29.23 VSTM

For a description of this instruction and the encoding, see [VSTM](#), [VSTMDB](#), [VSTMIA](#).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

H1.1.30 CONSTRAINED UNPREDICTABLE behavior of EL2 features

The following sections, and the instruction descriptions, describe CONSTRAINED UNPREDICTABLE behavior that can occur in an implementation that includes EL2 where EL2 can use AArch32:

- [ERET in User mode or System mode](#).
- [Illegal entry into, or exit from, Hyp mode](#).
- [Stage 1 default memory type](#).
- [Trapping of general exceptions to Hyp mode](#).
- [MSR \(banked register\) and MRS \(banked register\)](#).

H1.1.30.1 ERET in User mode or System mode

If ERET is executed in User mode or System mode, it behaves as described in [SUBS PC, LR and related instructions \(T32\)](#).

H1.1.30.2 Illegal entry into, or exit from, Hyp mode

Illegal entry to Hyp mode or exit from Hyp mode might be due to modifying [PSTATE.M](#) when in Hyp mode.

Attempting to change into Hyp mode or out of Hyp mode using the [MSR](#) or [CPS](#) instruction invokes the illegal exception return by not changing the mode, and setting [PSTATE.IL](#) to 1.

SRS using the Hyp mode SP from modes other than Hyp mode is handled as described in [SRS \(T32\)](#) and [SRS \(A32\)](#).

H1.1.30.3 Stage 1 default memory type

If [HCR.DC](#) = 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with:

- [SCTLR.M](#) = 0, regardless of the actual value of [SCTLR.M](#), other than for the value returned by an explicit read of [SCTLR.M](#).
- [HCR.VM](#) = 1, regardless of the actual value of [HCR.VM](#), other than for an explicit read of this bit.

H1.1.30.4 Trapping of general exceptions to Hyp mode

Attempting to perform an exception return to a PL1 mode when `HCR.TGE == 1` invokes an illegal exception return.

Attempting to change from Monitor mode to a PL1 mode when `HCR.TGE == 1` by executing a `CPS` or `MSR` instruction generates an Illegal Execution state exception, by not changing the mode, and setting `PSTATE.IL` to 1.

Because taking an exception into Non-secure PL1 modes leads to a CONSTRAINED UNPREDICTABLE situation, the following additional properties apply when `HCR.TGE == 1`:

- All exceptions that would be routed to EL1 are routed to EL2.
- `SCTLR.M` is treated as being 0, regardless of its actual value, other than for an explicit read of this bit.
- `HCR.FMO`, `HCR.IMO`, and `HCR.AMO` are treated as being 1, regardless of their actual value, other than for an explicit read of these bits.
- All virtual interrupts are disabled.
- Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.

H1.1.30.5 MSR (banked register) and MRS (banked register)

If the target register specified by the `{R, SYSm}` fields of the instruction encoding is not accessible from the PE mode in which the instruction was executed (see [Usage restrictions on the banked register transfer instructions](#)), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- For MRS (banked register) instructions, the destination general-purpose register becomes UNKNOWN.
- For MSR (banked register) instructions, if the register specified could be accessed from the current mode by other mechanisms, then this register is UNKNOWN. Otherwise, the instruction is a NOP.

If the instruction was executed specifying an unallocated `{R, SYSm}` field value or an unimplemented register (see [Encoding the register argument in the banked register transfer instructions](#)), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- An allocated MRS (banked register) or MSR (banked register) instruction is executed.

H1.1.31 Reserved values in System and memory-mapped registers and translation table entries

Unless otherwise stated, all unallocated or reserved values of fields with allocated values within the AArch32 System registers, memory-mapped registers, and translation table entries behave in one of the following ways:

- The encoding maps onto any of the allocated values, but otherwise does not cause CONSTRAINED UNPREDICTABLE behavior.
- The encoding causes effects that could be achieved by a combination of more than one of the allocated encodings.
- The encoding causes the field to have no functional effect.

Note

These constraints are identical to those for the equivalent AArch64 definitions, as given in Reserved values in System and memory-mapped registers and translation table entries.

Unless otherwise stated, when a direct write of a System register or memory-mapped register writes an unallocated value to a field, if that value is unallocated in all contexts then a subsequent read of the field returns an UNKNOWN value.

H1.1.32 CONSTRAINED UNPREDICTABLE behavior in Debug state

[Behavior in Debug state](#) of this manual describes the CONSTRAINED UNPREDICTABLE behaviors that are specifically associated with Debug state.

Appendix H2

Recommendations for Reporting Memory Attributes on an Interconnect

This appendix describes the Arm recommendations for reporting the memory attributes that are assigned by the PE. It contains the following section:

- [Arm recommendations for reporting memory attributes on an interconnect](#)

H2.1 Arm recommendations for reporting memory attributes on an interconnect

The Arm architecture defines the architectural interface between software and the PE hardware. This means the mechanisms by which different memory type and Cacheability attributes are presented on an interface to an interconnect fabric such as AMBA[®] AXI are, strictly, outside the scope of the architecture. This appendix describes an approach for the interface between a PE implementation and an interconnect fabric that Arm strongly recommends, but these recommendations do not form part of the Arm architecture.

H2.1.1 Effect of microarchitectural choices on memory attributes

Implementations of the Arm architecture permit considerable variability in the presentation of memory attributes on the interconnect fabric, particularly in cases where the PE implementation does not provide optimized support for a memory type. For example, an implementation might treat Write-Through locations as Non-cacheable at some level of cache, because functionally this is consistent with the definition of Write-Through, but for the particular implementation the performance trade-off does not merit the hardware directly providing Write-Through capability. However, in such implementations, the assigned memory attributes are not changed by the microarchitectural choices. The microarchitecture simply implements different ways of handling some memory attributes.

Therefore, Arm strongly recommended that where any or all of the following memory attributes are presented on the interface between a PE and an interconnect fabric, the attributes that are presented are completely consistent with the attributes defined by the translation system:

- The memory type, Normal or Device.
- The Early Write Acknowledgment attribute.
- The ordering requirements.
- The Shareability.
- The Cacheability, including where practicable, the allocation hints.

H2.1.1.1 Effect when memory accesses are forced to be Non-cacheable

Arm also strongly recommends that the effects of forcing accesses to Normal memory to be Non-cacheable, as described in Enabling and disabling the caching of memory accesses for AArch64 and in [Enabling and disabling the caching of memory accesses in AArch32 state](#) for AArch32, are reflected on the interconnect by the memory type and attributes used for memory transactions generated while the cache is disabled.

Appendix H3

Legacy Instruction Syntax for AArch32 Instruction Sets

This appendix describes the legacy instruction syntax in the Arm instruction sets, and their *Unified Assembler Language* (UAL) equivalents. It contains the following section:

- [Legacy Instruction Syntax](#)

H3.1 Legacy Instruction Syntax

Early versions of the Arm Architecture defined an assembly language for A32 (ARM) instructions, and a separate assembly language for T32 (Thumb) instructions. UAL is based on the A32 assembly language, with some changes to the instruction syntax. The appendix describes those changes. The pre-UAL mnemonics are compatible with UAL, and might be supported by an assembler.

The original T32 assembly language is not compatible with UAL, and is not described in the manual.

H3.1.1 Pre-UAL instruction syntax for the A32 base instructions

Table H3-1 lists the syntax for the A32 base instructions that have changed after UAL was introduced.

Table H3-1 Pre-UAL instruction syntax for the A32 base instructions

Pre-UAL syntax	UAL equivalent	See
ADC<c>S	ADCS<c>	ADC, ADCS (immediate), ADC, ADCS (register), ADC, ADCS (register-shifted register)

LDR<c>D	LDRD<c>	LDRD (immediate), LDRD (literal), LDRD (register)
LDR<c>H	LDRH<c>	LDRH (immediate), LDRH (literal), LDRH (register)

Pre-UAL syntax	UAL equivalent	See
LDR<c>SB	LDRSB<c>	LDRSB (immediate), LDRSB (literal), LDRSB (register)
LDR<c>SH	LDRSH<c>	LDRSH (immediate), LDRSH (literal), LDRSH (register)
LDR<c>T	LDRT<c>	LDRT
MLA<c>S	MLAS<c>	MLA, MLAS
LSLS <Rd>, <Rn>, #0	MOVS <Rd>, <Rm>	MOV, MOVS (immediate), MOV, MOVS (register)
MOV<c>S	MOVS<c>	
MUL<c>S	MULS<c>	MUL, MULS
MVN<c>S	MVNS<c>	MVN, MVNS (immediate), MVN, MVNS (register), MVN, MVNS (register-shifted register)
ORR<c>S	ORRS<c>	ORR, ORRS (immediate), ORR, ORRS (register), ORR, ORRS (register-shifted register)
QADDSUBX	QASX	QASX
QSUBADDX	QSAX	QSAX
RSB<c>S	RSBS<c>	RSB, RSBS (immediate), RSB, RSBS (register), RSB, RSBS (register-shifted register)
RSC<c>S	RSCS<c>	RSC, RSCS (immediate), RSC, RSCS (register), RSC, RSCS (register-shifted register)
SADDSUBX	SASX	SASX
SBC<c>S	SBCS<c>	SBC, SBCS (immediate), SBC, SBCS (register), SBC, SBCS (register-shifted register)
SHADDSUBX	SHASX	SHASX
SHSUBADDX	SHSAX	SHSAX
SMI<c>	SMC<c>	SMC
SMLAL<c>S	SMLALS<c>	SMLAL, SMLALS
SMULL<c>S	SMULLS<c>	SMULL, SMULLS
SSUBADDX<c>	SSAX<c>	SSAX
STC<c>L	STCL<c>	STC
STM<c>EA, STM<c>IA	STM<c>	STM, STMIA, STMEA
STM<c>DA, STM<c>ED	STMDA<c>	STMDA, STMED
STM<c>DB, STM<c>FD	STMDB<c>	STMDB, STMFD
STM<c>IB, STM<c>FA	STMIB<c>	STMIB, STMFA
STR<c>B	STRB<c>	STRB (immediate), STRB (register)
STR<c>BT	STRBT<c>	STRBT
STR<c>D	STRD<c>	STRD (immediate), STRD (register)

Pre-UAL syntax	UAL equivalent	See
STR<c>H	STRH<c>	STRH (immediate), STRH (register)
STR<c>T	STRT<c>	STRT
SUB<c>S	SUBS<c>	SUB, SUBS (immediate), SUB, SUBS (register), SUB, SUBS (register-shifted register), SUB, SUBS (SP minus immediate), SUB, SUBS (SP minus register)
SWI	SVC	SVC
UADDSUBX	UASX	UASX
UHADDSUBX	UHASX	UHASX
UHSUBADDX	UHSAX	UHSAX
UMLAL<c>S	UMLALS<c>	UMLAL, UMLALS
UMULL<c>S	UMULLS<c>	UMULL, UMULLS
UQADDSUBX	UQASX	UQASX
UQSUBADDX	UQSAX	UQSAX
USUBADDX	USAX	USAX
UEXT8	UXTB	UXTB
UEXT16	UXTH	UXTH

H3.1.2 Pre-UAL instruction syntax for the A32 floating-point instructions

Table H3-2 lists the syntax for A32 floating-point instructions that have changed after UAL was introduced.

Table H3-2 Pre-UAL instruction syntax for A32 floating-point instructions

Pre-UAL syntax	UAL equivalent	See
FABSD	VABS.F64	VABS
FABSS	VABS.F32	
FADDD	VADD.F64	VADD (floating-point)
FADDS	VADD.F32	
FCMPEZD	VCMPE.F64	VCMPE
FCMPEZS	VCMPE.F32	
FCMPZD	VCMP.F64	VCMP,
FCMPZS	VCMP.F32	
FCONSTD <Dd>, #<imm8>	VMOV.F64 <Dd>, #<fpimm>	VMOV (immediate) For more information, see FCONST.
FCONSTS <Sd>, #<imm8>	VMOV.F32 <Sd>, #<fpimm>	
FCPYD	VMOV.F64	VMOV (register)
FCPYS	VMOV.F32	
FCVTDS	VCVT.F64.F32	VCVT (between double-precision and single-precision)

Pre-UAL syntax	UAL equivalent	See
FCVTS	VCVT.F32.F64	
FDIVD	VDIV.F64	VDIV
FDIVS	VDIV.F32	
FLDD	VLDR.F64	VLDR (immediate) VLDR (literal)
FLDMD, FLDMIAD	VLDM.F64	VLDM, VLDMDB, VLDMIA
FLDMS	VLDM.F32	
FLDS	VLDR.F32	VLDR (immediate) VLDR (literal)
FMACD	VMLA.F64	VMLA (floating-point)
FMACS	VMLA.F32	
FMDHR <Dd>, <Rt>	VMOV <Dd[1]>, <Rt>	VMOV (general-purpose register to scalar)
FMDLR <Dd>, <Rt>	VMOV <Dd[0]>, <Rt>	
FMDRR	VMOV	VMOV (between two general-purpose registers and a doubleword floating-point register)
FMRDH <Rt>, <Dd>	VMOV <Rt>, <Dd[1]>	VMOV (scalar to general-purpose register)
FMRDL <Rt>, <Dd>	VMOV <Rt>, <Dd[0]>	
FMRRD	VMOV	VMOV (between two general-purpose registers and a doubleword floating-point register)
FMRRS	VMOV	VMOV (between two general-purpose registers and two single-precision registers)
FMRS	VMOV	VMOV (between general-purpose register and single-precision)
FMRX	VMRS	VMRS
FMSCD	VNMLS.F64	VNMLS
FMSCS	VNMLS.F32	
FMSR	VMOV	VMOV (between general-purpose register and single-precision)
FMSRR	VMOV	VMOV (between two general-purpose registers and two single-precision registers)
FMSTAT	VMRS APSR_nzcv, FPSCR	VMRS
FMULD	VMUL.F64	VMUL (floating-point)
FMULS	VMUL.F32	
FMXR	VMSR	VMSR
FNEGD	VNEG.F64	VNEG
FNEGS	VNEG.F32	
FNMACD	VMLS.F64	VNMLS
FNMACS	VMLS.F32	
FNMSCD	VNMLA.F64	VNMLA
FNMSCS	VNMLA.F32	
FNMULD	VNMUL.F64	VNMUL
FNMULS	VNMUL.F32	
FSHTOD	VCVT.F64.S16	VCVT (between floating-point and fixed-point, floating-point)
FSHTOS	VCVT.F32.S16	
FSITOD	VCVT.F64.S32	VCVT (between floating-point and integer, Advanced SIMD), VCVTR

Pre-UAL syntax	UAL equivalent	See
FSITOS	VCVT.F32.S32	
FSLTOD	VCVT.F64.S32	VCVT (between floating-point and fixed-point, floating-point)
FSLTOS	VCVT.F32.S32	
FSQRTD	VSQRT.F64	VSQRT
FSQRTS	VSQRT.F32	
FSTD	VSTR	VSTR
FSTMD, FSTMIA	VSTM.F64	VSTM, VSTMDB, VSTMIA
FSTMS	VSTM.F32	
FSTS	VSTR	VSTR
FSUBD	VSUB.F64	VSUB (floating-point)
FSUBS	VSUB.F32	
FTOSHD	VCVT.S16.F64	VCVT (between floating-point and fixed-point, floating-point)
FTOSHS	VCVT.S16.F23	
FTOSID	VCVT.S32.F64	VCVT (between floating-point and integer, Advanced SIMD)
FTOSIS	VCVT.S32.F32	
FTOSIZD	VCVTR.S32.F64	VCVTR
FTOSIZS	VCVTR.S32.F32	
FTOSLD	VCVT.S32.F64	VCVT (between floating-point and fixed-point, floating-point)
FTOSLS	VCVT.S32.F32	
FTOUHD	VCVT.U16.F64	
FTOUHS	VCVT.U16.F32	
FTOUID	VCVT.U32.F64	VCVT (between floating-point and integer, Advanced SIMD)
FTOUIS	VCVT.U32.F32	
FTOUIZD	VCVTR.U32.F64	VCVTR
FTOUIZS	VCVTR.U32.F32	
FTOULD	VCVT.U32.F64	VCVT (between floating-point and fixed-point, floating-point)
FTOULS	VCVT.U32.F32	
FUHTOD,	VCVT.F64.U16	
FUHTOS	VCVT.F64.U16	
FUITOD	VCVT.F64.U32	VCVT (between floating-point and integer, Advanced SIMD)
FUITOS	VCVT.F32.U32	
FULTOD	VCVT.F64.U32	VCVT (between floating-point and fixed-point, floating-point)
FULTOS	VCVT.F32.U32	

H3.1.3 FCONST

The syntax of FCONST is

FCONST<dest>{<c>} <Fd>, #<imm8>

where:

<dest> Specifies the destination data type. It must be one of:

S	Single-precision floating-point.				
D	Double-precision floating-point.				
<c>	This is an optional field. It specifies the condition under which the instruction is executed. See Conditional execution for the range of available conditions and their encoding. If <c> is omitted, it defaults to <i>always</i> (AL).				
<Fd>	Specifies the destination register. It must be one of: <table> <tr> <td><Dd></td><td>64-bit name of the SIMD&FP destination register.</td></tr> <tr> <td><Sd></td><td>32-bit name of the SMID&FP destination register.</td></tr> </table>	<Dd>	64-bit name of the SIMD&FP destination register.	<Sd>	32-bit name of the SMID&FP destination register.
<Dd>	64-bit name of the SIMD&FP destination register.				
<Sd>	32-bit name of the SMID&FP destination register.				
<imm8>	Specifies the immediate value used to generate the floating-point constant.				
FCONSTD{<c>} <Dd>, #<imm8> maps to VMOV.F64 <Dd>, #<fpimm>					
FCONSTS{<c>} <Sd>, #<imm8> maps to VMOV.F32 <Sd>, #<fpimm>					

Appendix H4

Arm Pseudocode Definition

The *Architecture Specification Language* (ASL) is defined in *Arm[®] Architecture Specification Language Reference* (ARM DDI 0626).

This appendix provides further information about the pseudocode used in this manual. It contains the following sections:

- [About the Arm pseudocode](#)
- [Pseudocode for instruction descriptions](#)

H4.1 About the Arm pseudocode

The Arm pseudocode provides precise descriptions of some areas of the Arm architecture. This includes description of the decoding and operation of all valid instructions. [Pseudocode for instruction descriptions](#) gives general information about this instruction pseudocode, including its limitations.

H4.1.1 General limitations of Arm pseudocode

The pseudocode statements `IMPLEMENTATION_DEFINED`, `SEE`, `UNDEFINED`, and `UNPREDICTABLE` indicate behavior that differs from that indicated by the pseudocode being executed. If one of them is encountered:

- Earlier behavior indicated by the pseudocode is only specified as occurring to the extent required to determine that the statement is executed.
- No subsequent behavior indicated by the pseudocode occurs.

H4.2 Pseudocode for instruction descriptions

Each instruction description includes pseudocode that provides a precise description of what the instruction does, subject to the limitations described in [General limitations of Arm pseudocode](#) and [Limitations of the instruction pseudocode](#).

In the instruction pseudocode, instruction fields are referred to by the names shown in the encoding diagram for the instruction. [Instruction encoding diagrams and instruction pseudocode](#) gives more information about the pseudocode provided for each instruction.

Appendix H5

Registers Index

This appendix provides indexes to the register descriptions in this manual. It contains the following sections:

- [Alphabetical index of AArch32 registers and System instructions](#)
- [Functional index of AArch32 registers and System instructions](#)
- [Alphabetical index of memory-mapped registers](#)
- [Functional index of memory-mapped registers](#)

H5.1 Alphabetical index of AArch32 registers and System instructions

This section is an index of AArch32 registers and System instructions in alphabetical order.

Table H5-1 Alphabetical index of AArch32 Registers

Register	Description, see
ACTLR	Auxiliary Control Register
ACTLR2	Auxiliary Control Register 2
ADFSR	Auxiliary Data Fault Status Register
AIDR	Auxiliary ID Register
AIFSR	Auxiliary Instruction Fault Status Register
AMAIR0	Auxiliary Memory Attribute Indirection Register 0
AMAIR1	Auxiliary Memory Attribute Indirection Register 1
APSR	Application Program Status Register
ATS12NSOPR	Address Translate Stages 1 and 2 Non-secure Only PL1 Read
ATS12NSOPW	Address Translate Stages 1 and 2 Non-secure Only PL1 Write
ATS12NSOUR	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read
ATS12NSOUW	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write
ATS1CPR	Address Translate Stage 1 Current state PL1 Read
ATS1CPW	Address Translate Stage 1 Current state PL1 Write
ATS1CUR	Address Translate Stage 1 Current state Unprivileged Read
ATS1CUW	Address Translate Stage 1 Current state Unprivileged Write
ATS1HR	Address Translate Stage 1 Hyp mode Read
ATS1HW	Address Translate Stage 1 Hyp mode Write
BPIALL	Branch Predictor Invalidate All
BPIALLIS	Branch Predictor Invalidate All, Inner Shareable
BPIMVA	Branch Predictor Invalidate by VA
CCSIDR	Current Cache Size ID Register
CLIDR	Cache Level ID Register
CNTFRQ	Counter-timer Frequency register
CNTHCTL	Counter-timer Hyp Control register
CNTHP_CTL	Counter-timer Hyp Physical Timer Control register
CNTHP_CVAL	Counter-timer Hyp Physical CompareValue register
CNTHP_TVAL	Counter-timer Hyp Physical Timer TimerValue register
CNTKCTL	Counter-timer Kernel Control register
CNTP_CTL	Counter-timer Physical Timer Control register
CNTP_CVAL	Counter-timer Physical Timer CompareValue register
CNTP_TVAL	Counter-timer Physical Timer TimerValue register
CNTPCT	Counter-timer Physical Count register

Register	Description, see
CNTV_CTL	Counter-timer Virtual Timer Control register
CNTV_CVAL	Counter-timer Virtual Timer CompareValue register
CNTV_TVAL	Counter-timer Virtual Timer TimerValue register
CNTVCT	Counter-timer Virtual Count register
CNTVOFF	Counter-timer Virtual Offset register
CONTEXTIDR	Context ID Register

VSCTLR	Virtualization System Control Register

H5.2 Functional index of AArch32 registers and System instructions

This section is an index of the AArch32 registers and System instructions, divided by functional group. Each of the following sections lists the registers for a functional group:

- [Special-purpose registers.](#)
- [ID registers.](#)
- [Performance monitors System registers.](#)
- [Debug System registers.](#)
- [Generic timer registers.](#)
- [Cache maintenance System instructions.](#)
- [Address translation System instructions.](#)
- [TLB maintenance System instructions.](#)
- [Legacy feature registers and System instructions.](#)
- [Base System registers.](#)

H5.2.1 Special-purpose registers

This section is an index to the registers in the Processor state registers functional group.

Table H5-2 Special-purpose registers

Register	Description, see
APSR	Application Program Status Register
CPSR	Current Program Status Register
DLR	Debug Link Register
DSPSR	Debug Saved Program Status Register
ELR_hyp	Exception Link Register (Hyp mode)
SPSR	Saved Program Status Register
SPSR_abt	Saved Program Status Register (Abort mode)
SPSR_fiq	Saved Program Status Register (FIQ mode)
SPSR_hyp	Saved Program Status Register (Hyp mode)
SPSR_irq	Saved Program Status Register (IRQ mode)
SPSR_svc	Saved Program Status Register (Supervisor mode)
SPSR_und	Saved Program Status Register (Undefined mode)

H5.2.2 ID registers

This section is an index to the registers in the Identification registers functional group.

Table H5-3 ID registers

Register	Description, see
CCSIDR	Current Cache Size ID Register
CLIDR	Cache Level ID Register
CSSELR	Cache Size Selection Register
CTR	Cache Type Register
FPSID	Floating-Point System ID register
ID_AFR0	Auxiliary Feature Register 0
ID_DFR0	Debug Feature Register 0
ID_ISAR0	Instruction Set Attribute Register 0
ID_ISAR1	Instruction Set Attribute Register 1
ID_ISAR2	Instruction Set Attribute Register 2
ID_ISAR3	Instruction Set Attribute Register 3
ID_ISAR4	Instruction Set Attribute Register 4
ID_ISAR5	Instruction Set Attribute Register 5
ID_MMFR0	Memory Model Feature Register 0
ID_MMFR1	Memory Model Feature Register 1
ID_MMFR2	Memory Model Feature Register 2
ID_MMFR3	Memory Model Feature Register 3
ID_MMFR4	Memory Model Feature Register 4
ID_PFR0	Processor Feature Register 0
ID_PFR1	Processor Feature Register 1
MIDR	Main ID Register
MPIDR	Multiprocessor Affinity Register
MVFR0	Media and VFP Feature Register 0
MVFR1	Media and VFP Feature Register 1
MVFR2	Media and VFP Feature Register 2
REVIDR	Revision ID Register
TCMTR	TCM Type Register
TLBTR	TLB Type Register
VMPIDR	Virtualization Multiprocessor ID Register
VPIDR	Virtualization Processor ID Register

H5.2.3 Performance monitors System registers

This section is an index to the System registers in the Performance Monitors registers functional group.

Table H5-4 Performance monitors registers

Register	Description, see
PMCCFILTR	Performance Monitors Cycle Count Filter Register
PMCCNTR	Performance Monitors Cycle Count Register
PMCEID0	Performance Monitors Common Event Identification register 0
PMCEID1	Performance Monitors Common Event Identification register 1
PMCNTENCLR	Performance Monitors Count Enable Clear register
PMCNTENSET	Performance Monitors Count Enable Set register
PMCR	Performance Monitors Control Register
PMINTENCLR	Performance Monitors Interrupt Enable Clear register
PMINTENSET	Performance Monitors Interrupt Enable Set register
PMOVSr	Performance Monitors Overflow Flag Status Register
PMOVSSET	Performance Monitors Overflow Flag Status Set register
PMSCLR	Performance Monitors Event Counter Selection Register
PMSWINC	Performance Monitors Software Increment register
PMUSERENR	Performance Monitors User Enable Register
PMXEVCNTR	Performance Monitors Selected Event Count Register
PMXEVTPER	Performance Monitors Selected Event Type Register

H5.2.4 Debug System registers

This section is an index to the System registers in the Debug registers functional group.

Table H5-5 Debug registers

Register	Description, see
DBGAUTHSTATUS	Debug Authentication Status register
DBGCLAIMCLR	Debug CLAIM Tag Clear register
DBGCLAIMSET	Debug CLAIM Tag Set register
DBGDCCINT	DCC Interrupt Enable Register
DBGDEVID	Debug Device ID register 0
DBGDEVID1	Debug Device ID register 1
DBGDEVID2	Debug Device ID register 2
DBGDIDR	Debug ID Register
DBGDRAR	Debug ROM Address Register
DBGDSAR	Debug Self Address Register
DBGDSCRExt	Debug Status and Control Register, External View
DBGDSCRInt	Debug Status and Control Register, Internal View
DBGDTRRXext	Debug OS Lock Data Transfer Register, Receive, External View

Register	Description, see
DBGDTRRXint	Debug Data Transfer Register, Receive
DBGDTRTXext	Debug OS Lock Data Transfer Register, Transmit
DBGDTRTXint	Debug Data Transfer Register, Transmit
DBGOSDLR	Debug OS Double Lock Register
DBGOSECCR	Debug OS Lock Exception Catch Control Register
DBGOSLAR	Debug OS Lock Access Register
DBGOSLSR	Debug OS Lock Status Register
DBGPRCR	Debug Power Control Register
DBGVCR	Debug Vector Catch Register
DBGWFAR	Debug Watchpoint Fault Address Register
HDCR	Hyp Debug Control Register

H5.2.5 Generic timer registers

This section is an index to the registers in the Generic Timer registers functional group.

Table H5-6 Generic timer registers

Register	Description, see
CNTRQ	Counter-timer Frequency register
CNTHCTL	Counter-timer Hyp Control register
CNTHP_CTL	Counter-timer Hyp Physical Timer Control register
CNTHP_CVAL	Counter-timer Hyp Physical CompareValue register
CNTHP_TVAL	Counter-timer Hyp Physical Timer TimerValue register
CNTKCTL	Counter-timer Kernel Control register
CNTP_CTL	Counter-timer Physical Timer Control register
CNTP_CVAL	Counter-timer Physical Timer CompareValue register
CNTP_TVAL	Counter-timer Physical Timer TimerValue register
CNTPCT	Counter-timer Physical Count register
CNTV_CTL	Counter-timer Virtual Timer Control register
CNTV_CVAL	Counter-timer Virtual Timer CompareValue register
CNTV_TVAL	Counter-timer Virtual Timer TimerValue register
CNTVCT	Counter-timer Virtual Count register
CNTVOFF	Counter-timer Virtual Offset register

H5.2.6 Cache maintenance System instructions

This section is an index to the System instructions in the Cache maintenance instructions functional group.

Table H5-7 Cache maintenance system instructions

System instruction	Description, see
BPIALL	Branch Predictor Invalidate All
BPIALLIS	Branch Predictor Invalidate All, Inner Shareable
BPIMVA	Branch Predictor Invalidate by VA
DCCIMVAC	Data Cache line Clean and Invalidate by VA to PoC
DCCISW	Data Cache line Clean and Invalidate by Set-Way
DCCMVAC	Data Cache line Clean by VA to PoC
DCCMVAU	Data Cache line Clean by VA to PoU
DCCSW	Data Cache line Clean by Set-Way
DCIMVAC	Data Cache line Invalidate by VA to PoC
DCISW	Data Cache line Invalidate by Set-Way
ICIALLU	Instruction Cache Invalidate All to PoU
ICIALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
ICIMVAU	Instruction Cache line Invalidate by VA to PoU

H5.2.7 Address translation System instructions

This section is an index to the System instructions in the Address translation instructions functional group.

Table H5-8 Address translation system instructions

System instruction	Description, see
ATS12NSOPR	Address Translate Stages 1 and 2 Non-secure Only PL1 Read
ATS12NSOPW	Address Translate Stages 1 and 2 Non-secure Only PL1 Write
ATS12NSOUR	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read
ATS12NSOUW	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write
ATS1CPR	Address Translate Stage 1 Current state PL1 Read
ATS1CPW	Address Translate Stage 1 Current state PL1 Write
ATS1CUR	Address Translate Stage 1 Current state Unprivileged Read
ATS1CUW	Address Translate Stage 1 Current state Unprivileged Write
ATS1HR	Address Translate Stage 1 Hyp mode Read
ATS1HW	Address Translate Stage 1 Hyp mode Write

H5.2.8 TLB maintenance System instructions

This section is an index to the System instructions in the TLB maintenance instructions functional group.

Table H5-9 TLB maintenance system instructions

System instruction	Description, see
DTLBIALL	Data TLB Invalidate All
DTLBIASID	Data TLB Invalidate by ASID match
DTLBIMVA	Data TLB Invalidate by VA
ITLBIALL	Instruction TLB Invalidate All
ITLBIASID	Instruction TLB Invalidate by ASID match
ITLBIMVA	Instruction TLB Invalidate by VA
TLBIALL	TLB Invalidate All
TLBIALLH	TLB Invalidate All, Hyp mode
TLBIALLHIS	TLB Invalidate All, Hyp mode, Inner Shareable
TLBIALLIS	TLB Invalidate All, Inner Shareable
TLBIALLNSNH	TLB Invalidate All, Non-Secure Non-Hyp
TLBIALLNSNHIS	TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable
TLBIASID	TLB Invalidate by ASID match
TLBIASIDIS	TLB Invalidate by ASID match, Inner Shareable
TLBIIPAS2	TLB Invalidate by Intermediate Physical Address, Stage 2
TLBIIPAS2IS	TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable
TLBIIPAS2L	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level
TLBIIPAS2LIS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable
TLBIMVA	TLB Invalidate by VA
TLBIMVAA	TLB Invalidate by VA, All ASID
TLBIMVAAIS	TLB Invalidate by VA, All ASID, Inner Shareable
TLBIMVAAL	TLB Invalidate by VA, All ASID, Last level
TLBIMVAALIS	TLB Invalidate by VA, All ASID, Last level, Inner Shareable
TLBIMVAH	TLB Invalidate by VA, Hyp mode
TLBIMVAHIS	TLB Invalidate by VA, Hyp mode, Inner Shareable
TLBIMVAIS	TLB Invalidate by VA, Inner Shareable
TLBIMVAL	TLB Invalidate by VA, Last level
TLBIMVALH	TLB Invalidate by VA, Last level, Hyp mode
TLBIMVALHIS	TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable
TLBIMVALIS	TLB Invalidate by VA, Last level, Inner Shareable

H5.2.9 Prediction restriction instructions

This section is an index to the registers in the Prediction restriction instructions functional group.

Table H5-10 Cache maintenance system instructions

Description, see

H5.2.10 Legacy feature registers and system instructions

This section is an index to the registers in the Legacy feature registers functional group.

Table H5-11 Legacy feature registers and system instructions

Register	Description, see
CP15DMB	Data Memory Barrier System instruction
CP15DSB	Data Synchronization Barrier System instruction
CP15ISB	Instruction Synchronization Barrier System instruction
FCSEIDR	FCSE Process ID register
JIDR	Jazelle ID Register
JMCR	Jazelle Main Configuration Register
JOSCR	Jazelle OS Control Register

H5.2.11 Base System registers

This section is an index to the System registers in the Base System registers functional group.

Table H5-12 Base System registers

Register	Description, see
CPACR	Architectural Feature Access Control Register
FCSEIDR	FCSE Process ID register
JIDR	Jazelle ID Register
JMCR	Jazelle Main Configuration Register
JOSCR	Jazelle OS Control Register
SCTLR	System Control Register

H5.3 Alphabetical index of memory-mapped registers

This section is an index of memory-mapped registers in alphabetical order.

Table H5-13 Alphabetical index of Memory-Mapped Registers

Register	Description, see
ASICCTL	CTI External Multiplexer Control register
CNTCR	Counter Control Register
CNTCV	Counter Count Value register
CNTEL0ACR	Counter-timer EL0 Access Control Register
CNTFID0	Counter Frequency ID
CNTFRQ	Counter-timer Frequency
CNTNSAR	Counter-timer Non-secure Access Register
CNTP_CTL	Counter-timer Physical Timer Control
CNTP_CVAL	Counter-timer Physical Timer Compare Value
CNTP_TVAL	Counter-timer Physical Timer Timer Value
CNTPCT	Counter-timer Physical Count
CNTSR	Counter Status Register
CNTTIDR	Counter-timer Timer ID Register
CNTV_CTL	Counter-timer Virtual Timer Control
CNTV_CVAL	Counter-timer Virtual Timer Compare Value
CNTV_TVAL	Counter-timer Virtual Timer Timer Value
CNTVCT	Counter-timer Virtual Count
CNTVOFF	Counter-timer Virtual Offset
CTIAPPCLEAR	CTI Application Trigger Clear register
CTIAPPULSE	CTI Application Pulse register
CTIAPPSET	CTI Application Trigger Set register
CTIAUTHSTATUS	CTI Authentication Status register
CTICHINSTATUS	CTI Channel In Status register
CTICHOUTSTATUS	CTI Channel Out Status register
CTICIDR0	CTI Component Identification Register 0
CTICIDR1	CTI Component Identification Register 1
CTICIDR2	CTI Component Identification Register 2
CTICIDR3	CTI Component Identification Register 3
CTICLAIMCLR	CTI CLAIM Tag Clear register
CTICLAIMSET	CTI CLAIM Tag Set register
CTICONTROL	CTI Control register
CTIDEVAFF0	CTI Device Affinity register 0
CTIDEVAFF1	CTI Device Affinity register 1
CTIDEVARCH	CTI Device Architecture register

Register	Description, see
CTIDEVID	CTI Device ID register 0
CTIDEVID1	CTI Device ID register 1
CTIDEVID2	CTI Device ID register 2
CTIDEVTYPE	CTI Device Type register
CTIGATE	CTI Channel Gate Enable register
CTIINTACK	CTI Output Trigger Acknowledge register
CTIITCTRL	CTI Integration mode Control register
CTILAR	CTI Lock Access Register
CTILSR	CTI Lock Status Register
CTIPIDR0	CTI Peripheral Identification Register 0
CTIPIDR1	CTI Peripheral Identification Register 1
CTIPIDR2	CTI Peripheral Identification Register 2
CTIPIDR3	CTI Peripheral Identification Register 3
CTIPIDR4	CTI Peripheral Identification Register 4
CTIPIDR5	CTI Peripheral Identification Register 5
CTIPIDR6	CTI Peripheral Identification Register 6
CTIPIDR7	CTI Peripheral Identification Register 7
CTITRIGINSTATUS	CTI Trigger In Status register
CTITRIGOUTSTATUS	CTI Trigger Out Status register
DBGAUTHSTATUS_EL1	Debug Authentication Status Register
DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear Register
DBGCLAIMSET_EL1	Debug CLAIM Tag Set Register
DBGDTRRX_EL0	Debug Data Transfer Register, Receive
DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
EDAA32PFR	External Debug Auxiliary Processor Feature Register
EDACR	External Debug Auxiliary Control Register
EDCIDR0	External Debug Component Identification Register 0
EDCIDR1	External Debug Component Identification Register 1
EDCIDR2	External Debug Component Identification Register 2
EDCIDR3	External Debug Component Identification Register 3
EDCIDSR	External Debug Context ID Sample Register
EDDEVAFF0	External Debug Device Affinity register 0
EDDEVAFF1	External Debug Device Affinity register 1
EDDEVARCH	External Debug Device Architecture Register
EDDEVID	External Debug Device ID register 0
EDDEVID1	External Debug Device ID Register 1
EDDEVID2	External Debug Device ID register 2
EDDEVTYPE	External Debug Device Type register
EDDFR	External Debug Feature Register
EDECCR	External Debug Exception Catch Control Register

Register	Description, see
EDECR	External Debug Execution Control Register
EDESR	External Debug Event Status Register
EDITCTRL	External Debug Integration mode Control register
EDITR	External Debug Instruction Transfer Register
EDLAR	External Debug Lock Access Register
EDLSR	External Debug Lock Status Register
EDPCSR	External Debug Program Counter Sample Register
EDPFR	External Debug Processor Feature Register
EDPIDR0	External Debug Peripheral Identification Register 0
EDPIDR1	External Debug Peripheral Identification Register 1
EDPIDR2	External Debug Peripheral Identification Register 2
EDPIDR3	External Debug Peripheral Identification Register 3
EDPIDR4	External Debug Peripheral Identification Register 4
EDPIDR5	External Debug Peripheral Identification Register 5
EDPIDR6	External Debug Peripheral Identification Register 6
EDPIDR7	External Debug Peripheral Identification Register 7
EDPRCR	External Debug Power-Reset Control Register
EDPRSR	External Debug Processor Status Register
EDRCR	External Debug Reserve Control Register
EDSCR	External Debug Status and Control Register
EDVIDSR	External Debug Virtual Context Sample Register
EDWAR	External Debug Watchpoint Address Register
ERRCIDR0	Component Identification Register 0
ERRCIDR1	Component Identification Register 1
ERRCIDR2	Component Identification Register 2
ERRCIDR3	Component Identification Register 3
ERRDEVAFF	Device Affinity Register
ERRDEVARCH	Device Architecture Register
ERRDEVID	Device Configuration Register
ERRPIDR0	Peripheral Identification Register 0
ERRPIDR1	Peripheral Identification Register 1
ERRPIDR2	Peripheral Identification Register 2
ERRPIDR3	Peripheral Identification Register 3
ERRPIDR4	Peripheral Identification Register 4
GICC_ABPR	CPU Interface Aliased Binary Point Register
GICC_AEOIR	CPU Interface Aliased End Of Interrupt Register
GICC_AHPPIR	CPU Interface Aliased Highest Priority Pending Interrupt Register
GICC_AIAR	CPU Interface Aliased Interrupt Acknowledge Register
GICC_BPR	CPU Interface Binary Point Register

Register	Description, see
GICC_CTLR	CPU Interface Control Register
GICC_DIR	CPU Interface Deactivate Interrupt Register
GICC_EOIR	CPU Interface End Of Interrupt Register
GICC_HPIR	CPU Interface Highest Priority Pending Interrupt Register
GICC_IAR	CPU Interface Interrupt Acknowledge Register
GICC_IIDR	CPU Interface Identification Register
GICC_PMR	CPU Interface Priority Mask Register
GICC_RPR	CPU Interface Running Priority Register
GICC_STATUSR	CPU Interface Status Register
GICD_CLRSPI_NSR	Clear Non-secure SPI Pending Register
GICD_CLRSPI_SR	Clear Secure SPI Pending Register
GICD_CTLR	Distributor Control Register
GICD_IIDR	Distributor Implementer Identification Register
GICD_SETSPI_NSR	Set Non-secure SPI Pending Register
GICD_SETSPI_SR	Set Secure SPI Pending Register
GICD_SGIR	Software Generated Interrupt Register
GICD_STATUSR	Error Reporting Status Register
GICD_TYPER	Interrupt Controller Type Register
GICD_TYPER2	Interrupt Controller Type Register 2
GICH_EISR	End Interrupt Status Register
GICH_ELRSR	Empty List Register Status Register
GICH_HCR	Hypervisor Control Register
GICH_MISR	Maintenance Interrupt Status Register
GICH_VMCR	Virtual Machine Control Register
GICH_VTR	Virtual Type Register
GICM_CLRSPI_NSR	Clear Non-secure SPI Pending Register
GICM_CLRSPI_SR	Clear Secure SPI Pending Register
GICM_IIDR	Distributor Implementer Identification Register
GICM_SETSPI_NSR	Set Non-secure SPI Pending Register
GICM_SETSPI_SR	Set Secure SPI Pending Register
GICM_TYPER	Distributor MSI Type Register
GICR_CLRLPIR	Clear LPI Pending Register
GICR_CTLR	Redistributor Control Register
GICR_ICACTIVER0	Interrupt Clear-Active Register 0
GICR_ICENABLER0	Interrupt Clear-Enable Register 0
GICR_ICFGR0	Interrupt Configuration Register 0
GICR_ICFGR1	Interrupt Configuration Register 1
GICR_ICPENDR0	Interrupt Clear-Pending Register 0
GICR_IGROUPR0	Interrupt Group Register 0
GICR_IGRPMODR0	Interrupt Group Modifier Register 0

Register	Description, see
GICR_IIDR	Redistributor Implementer Identification Register
GICR_INVALLR	Redistributor Invalidate All Register
GICR_INVLPIR	Redistributor Invalidate LPI Register
GICR_ISACTIVER0	Interrupt Set-Active Register 0
GICR_ISENBALER0	Interrupt Set-Enable Register 0
GICR_ISPENDR0	Interrupt Set-Pending Register 0
GICR_MPAMIDR	Report maximum PARTID and PMG Register
GICR_NSACR	Non-secure Access Control Register
GICR_PARTIDR	Set PARTID and PMG Register
GICR_PENDBASER	Redistributor LPI Pending Table Base Address Register
GICR_PROPBASER	Redistributor Properties Base Address Register
GICR_SETLPIR	Set LPI Pending Register
GICR_STATUSR	Error Reporting Status Register
GICR_SYNCR	Redistributor Synchronize Register
GICR_TYPER	Redistributor Type Register
GICR_VPENDBASER	Virtual Redistributor LPI Pending Table Base Address Register
GICR_VPROPBASER	Virtual Redistributor Properties Base Address Register
GICR_WAKER	Redistributor Wake Register
GICV_ABPR	Virtual Machine Aliased Binary Point Register
GICV_AEOIR	Virtual Machine Aliased End Of Interrupt Register
GICV_AHPPIR	Virtual Machine Aliased Highest Priority Pending Interrupt Register
GICV_AIAR	Virtual Machine Aliased Interrupt Acknowledge Register
GICV_BPR	Virtual Machine Binary Point Register
GICV_CTLR	Virtual Machine Control Register
GICV_DIR	Virtual Machine Deactivate Interrupt Register
GICV_EOIR	Virtual Machine End Of Interrupt Register
GICV_HPPIR	Virtual Machine Highest Priority Pending Interrupt Register
GICV_IAR	Virtual Machine Interrupt Acknowledge Register
GICV_IIDR	Virtual Machine CPU Interface Identification Register
GICV_PMR	Virtual Machine Priority Mask Register
GICV_RPR	Virtual Machine Running Priority Register
GICV_STATUSR	Virtual Machine Error Reporting Status Register
GITS_CBASER	ITS Command Queue Descriptor
GITS_CREADR	ITS Read Register
GITS_CTLR	ITS Control Register
GITS_CWRITER	ITS Write Register
GITS_IIDR	ITS Identification Register
GITS_MPAMIDR	Report maximum PARTID and PMG Register

Register	Description, see
GITS_PARTIDR	Set PARTID and PMG Register
GITS_STATUSR	ITS Error Reporting Status Register
GITS_TRANSLATER	ITS Translation Register
GITS_TYPER	ITS Type Register
GITS_UMSIR	ITS Unmapped MSI register
MIDR_EL1	Main ID Register
OSLAR_EL1	OS Lock Access Register
PMAUTHSTATUS	Performance Monitors Authentication Status register
PMCCFILTR_EL0	Performance Monitors Cycle Counter Filter Register
PMCCNTR_EL0	Performance Monitors Cycle Counter
PMCEID0	Performance Monitors Common Event Identification register 0
PMCEID1	Performance Monitors Common Event Identification register 1
PMCFGR	Performance Monitors Configuration Register
PMCIDR0	Performance Monitors Component Identification Register 0
PMCIDR1	Performance Monitors Component Identification Register 1
PMCIDR2	Performance Monitors Component Identification Register 2
PMCIDR3	Performance Monitors Component Identification Register 3
PMCNTENCLR_EL0	Performance Monitors Count Enable Clear Register
PMCNTENSET_EL0	Performance Monitors Count Enable Set Register
PMCR_EL0	Performance Monitors Control Register
PMDEVAFF0	Performance Monitors Device Affinity register 0
PMDEVAFF1	Performance Monitors Device Affinity register 1
PMDEVARCH	Performance Monitors Device Architecture register
PMDEVTYPE	Performance Monitors Device Type register
PMIIDR	Performance Monitors Implementation Identification Register
PMINTENCLR_EL1	Performance Monitors Interrupt Enable Clear Register
PMINTENSET_EL1	Performance Monitors Interrupt Enable Set Register
PMITCTRL	Performance Monitors Integration mode Control register
PMLAR	Performance Monitors Lock Access Register
PMLSR	Performance Monitors Lock Status Register
PMOVSCLR_EL0	Performance Monitors Overflow Flag Status Clear register
PMOVSSET_EL0	Performance Monitors Overflow Flag Status Set Register
PMPIDR0	Performance Monitors Peripheral Identification Register 0
PMPIDR1	Performance Monitors Peripheral Identification Register 1
PMPIDR2	Performance Monitors Peripheral Identification Register 2

Register	Description, see
PMPIDR3	Performance Monitors Peripheral Identification Register 3
PMPIDR4	Performance Monitors Peripheral Identification Register 4
PMPIDR5	Performance Monitors Peripheral Identification Register 5
PMPIDR6	Performance Monitors Peripheral Identification Register 6
PMPIDR7	Performance Monitors Peripheral Identification Register 7
PMSWINC_EL0	Performance Monitors Software Increment Register

H5.4 Functional index of memory-mapped registers

This section is an index of the memory-mapped registers, divided by functional group. Each of the following sections lists the registers for a functional group:

- [ID registers.](#)
- [Memory-mapped Performance monitors registers.](#)
- [Generic timer registers.](#)
- [Debug registers.](#)
- [Cross-trigger interface registers.](#)

H5.4.1 ID registers

This section is an index to the registers in the Identification registers functional group.

Table H5-14 ID registers

Register	Description, see
EDAA32PFR	External Debug Auxiliary Processor Feature Register
EDDFR	External Debug Feature Register
EDPFR	External Debug Processor Feature Register
MIDR_EL1	Main ID Register

H5.4.2 Memory-mapped Performance monitors registers

This section is an index to the memory-mapped registers in the Performance Monitors registers functional group.

Table H5-15 Performance monitors registers

Register	Description, see
PMAUTHSTATUS	Performance Monitors Authentication Status register
PMCCFILTR_EL0	Performance Monitors Cycle Counter Filter Register
PMCCNTR_EL0	Performance Monitors Cycle Counter
PMCEID0	Performance Monitors Common Event Identification register 0
PMCEID1	Performance Monitors Common Event Identification register 1
PMCFGR	Performance Monitors Configuration Register
PMCIDR0	Performance Monitors Component Identification Register 0
PMCIDR1	Performance Monitors Component Identification Register 1
PMCIDR2	Performance Monitors Component Identification Register 2

Register	Description, see
PMCIDR3	Performance Monitors Component Identification Register 3
PMCNTENCLR_EL0	Performance Monitors Count Enable Clear Register
PMCNTENSET_EL0	Performance Monitors Count Enable Set Register
PMCR_EL0	Performance Monitors Control Register
PMDEVAFF0	Performance Monitors Device Affinity register 0
PMDEVAFF1	Performance Monitors Device Affinity register 1
PMDEVARCH	Performance Monitors Device Architecture register
PMDEVTYPE	Performance Monitors Device Type register
PMIIDR	Performance Monitors Implementation Identification Register
PMINTENCLR_EL1	Performance Monitors Interrupt Enable Clear Register
PMINTENSET_EL1	Performance Monitors Interrupt Enable Set Register
PMITCTRL	Performance Monitors Integration mode Control register
PMLAR	Performance Monitors Lock Access Register
PMLSR	Performance Monitors Lock Status Register
PMOVSCLR_EL0	Performance Monitors Overflow Flag Status Clear register
PMOVSSET_EL0	Performance Monitors Overflow Flag Status Set Register
PMPIDR0	Performance Monitors Peripheral Identification Register 0
PMPIDR1	Performance Monitors Peripheral Identification Register 1
PMPIDR2	Performance Monitors Peripheral Identification Register 2
PMPIDR3	Performance Monitors Peripheral Identification Register 3
PMPIDR4	Performance Monitors Peripheral Identification Register 4
PMPIDR5	Performance Monitors Peripheral Identification Register 5
PMPIDR6	Performance Monitors Peripheral Identification Register 6
PMPIDR7	Performance Monitors Peripheral Identification Register 7
PMSWINC_EL0	Performance Monitors Software Increment Register

H5.4.3 Generic timer registers

This section is an index to the registers in the Generic timer registers functional group.

Table H5-16 Generic timer registers

Register	Description, see
CNTCR	Counter Control Register
CNTCV	Counter Count Value register
CNTEL0ACR	Counter-timer EL0 Access Control Register
CNTFID0	Counter Frequency ID
CNTFRQ	Counter-timer Frequency

Register	Description, see
CNTNSAR	Counter-timer Non-secure Access Register
CNTP_CTL	Counter-timer Physical Timer Control
CNTP_CVAL	Counter-timer Physical Timer Compare Value
CNTP_TVAL	Counter-timer Physical Timer Timer Value
CNTPCT	Counter-timer Physical Count
CNTSR	Counter Status Register
CNTTIDR	Counter-timer Timer ID Register
CNTV_CTL	Counter-timer Virtual Timer Control
CNTV_CVAL	Counter-timer Virtual Timer Compare Value
CNTV_TVAL	Counter-timer Virtual Timer Timer Value
CNTVCT	Counter-timer Virtual Count
CNTVOFF	Counter-timer Virtual Offset

H5.4.4 Memory-mapped Debug registers

This section is an index to the memory-mapped registers in the Debug registers functional group.

Table H5-17 Debug registers

Register	Description, see
DBGAUTHSTATUS_EL1	Debug Authentication Status Register
DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear Register
DBGCLAIMSET_EL1	Debug CLAIM Tag Set Register
DBGDTRRX_EL0	Debug Data Transfer Register, Receive
DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
EDACR	External Debug Auxiliary Control Register
EDCIDR0	External Debug Component Identification Register 0
EDCIDR1	External Debug Component Identification Register 1
EDCIDR2	External Debug Component Identification Register 2
EDCIDR3	External Debug Component Identification Register 3
EDCIDS	External Debug Context ID Sample Register
EDDEVAFF0	External Debug Device Affinity register 0
EDDEVAFF1	External Debug Device Affinity register 1
EDDEVARCH	External Debug Device Architecture Register
EDDEVID	External Debug Device ID register 0
EDDEVID1	External Debug Device ID Register 1

Register	Description, see
EDDEVID2	External Debug Device ID register 2
EDDEVTYPE	External Debug Device Type register
EDECCR	External Debug Exception Catch Control Register
EDECR	External Debug Execution Control Register
EDESR	External Debug Event Status Register
EDITCTRL	External Debug Integration mode Control register
EDITR	External Debug Instruction Transfer Register
EDLAR	External Debug Lock Access Register
EDLSR	External Debug Lock Status Register
EDPCSR	External Debug Program Counter Sample Register
EDPIDR0	External Debug Peripheral Identification Register 0
EDPIDR1	External Debug Peripheral Identification Register 1
EDPIDR2	External Debug Peripheral Identification Register 2
EDPIDR3	External Debug Peripheral Identification Register 3
EDPIDR4	External Debug Peripheral Identification Register 4
EDPIDR5	External Debug Peripheral Identification Register 5
EDPIDR6	External Debug Peripheral Identification Register 6
EDPIDR7	External Debug Peripheral Identification Register 7
EDPRCR	External Debug Power-Reset Control Register
EDPRSR	External Debug Processor Status Register
EDRCR	External Debug Reserve Control Register
EDSCR	External Debug Status and Control Register
EDVIDSR	External Debug Virtual Context Sample Register
EDWAR	External Debug Watchpoint Address Register
OSLAR_EL1	OS Lock Access Register

H5.4.5 Cross-trigger interface registers

This section is an index to the registers in the Cross-Trigger Interface registers functional group.

Table H5-18 Cross-trigger interface registers

Register	Description, see
ASICCTL	CTI External Multiplexer Control register
CTIAPPCLEAR	CTI Application Trigger Clear register
CTIAPPULSE	CTI Application Pulse register
CTIAPPSET	CTI Application Trigger Set register
CTIAUTHSTATUS	CTI Authentication Status register
CTICHINSTATUS	CTI Channel In Status register
CTICHOUTSTATUS	CTI Channel Out Status register
CTICIDR0	CTI Component Identification Register 0
CTICIDR1	CTI Component Identification Register 1
CTICIDR2	CTI Component Identification Register 2
CTICIDR3	CTI Component Identification Register 3
CTICLAIMCLR	CTI CLAIM Tag Clear register
CTICLAIMSET	CTI CLAIM Tag Set register
CTICONTROL	CTI Control register
CTIDEVAFF0	CTI Device Affinity register 0
CTIDEVAFF1	CTI Device Affinity register 1
CTIDEVARCH	CTI Device Architecture register
CTIDEVID	CTI Device ID register 0
CTIDEVID1	CTI Device ID register 1
CTIDEVID2	CTI Device ID register 2
CTIDEVTYPE	CTI Device Type register
CTIGATE	CTI Channel Gate Enable register
CTIINTACK	CTI Output Trigger Acknowledge register
CTIITCTRL	CTI Integration mode Control register
CTILAR	CTI Lock Access Register
CTILSR	CTI Lock Status Register
CTIPIDR0	CTI Peripheral Identification Register 0
CTIPIDR1	CTI Peripheral Identification Register 1
CTIPIDR2	CTI Peripheral Identification Register 2
CTIPIDR3	CTI Peripheral Identification Register 3
CTIPIDR4	CTI Peripheral Identification Register 4
CTIPIDR5	CTI Peripheral Identification Register 5
CTIPIDR6	CTI Peripheral Identification Register 6
CTIPIDR7	CTI Peripheral Identification Register 7
CTITRIGINSTATUS	CTI Trigger In Status register
CTITRIGOUTSTATUS	CTI Trigger Out Status register

Glossary

A32 instruction A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch32 and is in A32 state. A32 instructions must be word-aligned.

A32 instructions were previously called ARM instructions.

See also [A32 state](#), [A64 instruction](#), [T32 instruction](#).

A32 state The AArch32 Instruction set state in which the PE executes A32 instructions.

A32 state was previously called ARM state.

See also [T32 instruction](#), [T32 state](#).

A64 instruction A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch64. A64 instructions must be word-aligned. See also [A32 instruction](#), [T32 instruction](#).

AArch32 The 32-bit Execution state. In AArch32 state, addresses are held in 32-bit registers, and instructions in the base instruction sets use 32-bit registers for their processing. AArch32 state supports the T32 and A32 instruction sets.

See also [AArch64](#), [A32 instruction](#), [T32 instruction](#).

AArch64 The 64-bit Execution state. In AArch64 state, addresses are held in 64-bit registers, and instructions in the base instruction set can use 64-bit registers for their processing. AArch64 state supports the A64 instruction set.

See also [AArch32](#), [A64 instruction](#).

Abort An exception caused by an illegal memory access. Aborts can be caused by the external memory system or the MMU.

Active element An Active element is an SVE vector element or predicate element that is a source register element or destination register element used by an SVE instruction. When the corresponding element in the instruction's Governing predicate is TRUE, the element is Active. If an instruction is unpredicated, all of the vector elements or predicate elements are implicitly Active.

Addressing mode Means a method for generating the memory address used by a load/store instruction.

Advanced SIMD A feature of the Arm architecture that provides SIMD operations on a register file of SIMD and floating-point registers. Where an implementation supports both Advanced SIMD and floating-point instructions, these instructions operate on the same register file.

- Aligned** A data item stored at an address that is exactly divisible by the highest power of 2 that divides exactly into its size in bytes. Aligned halfwords, words and doublewords therefore have addresses that are divisible by 2, 4 and 8 respectively.
- An aligned access is one where the address of the access is aligned to the size of each element of the access.
- AMBA** Advanced Microcontroller Bus Architecture. The AMBA family of protocol specifications is the Arm open standard for on-chip buses. AMBA provides solutions for the interconnection and management of the functional blocks that make up a *System-on-Chip* (SoC). Applications include the development of embedded systems with one or more processors or signal processors and multiple peripherals.
- Analysis of the trace element stream** Refers to the process of:
- Tracing elements that carry information that a trace analyzer requires to enable it to analyze the trace successfully.
 - Tracing elements that either directly indicate program execution, or carry information about program execution.
- A trace element stream might also contain trace elements that contain timing information. This term is distinct from analysis of program execution.
- Architecturally executed** An instruction is architecturally executed only if it would be executed in a simple sequential execution of the program. When such an instruction has been executed and retired, it has been *architecturally executed*. Any instruction that, in a simple sequential execution of a program, is treated as a NOP because it fails its condition code check, is an architecturally executed instruction.
- In a PE that performs speculative execution, an instruction is not architecturally executed if the PE discards the results of a speculative execution.
- See also [Condition code check](#), [Simple sequential execution](#).
- Architecturally mapped** Where this manual describes a register as being *architecturally mapped* to another register, this indicates that, in an implementation that supports both of the registers, the two registers access the same state.
- Architecturally resolved** The architectural state (S) associated with an operation (O) is architecturally resolved when S is determined to be identical to the architectural state of O that is visible to the programmer through the execution of the program.
- Architecturally UNKNOWN** An architecturally UNKNOWN value is a value that is not defined by the architecture but must meet the requirements of the definition of [UNKNOWN](#). Implementations can define the value of the field, but are not required to do so.
- See also [IMPLEMENTATION DEFINED](#).
- Architecturally Allowed Execution** An *Architecturally Allowed Execution* must satisfy the [External visibility requirement](#).
- ARM core registers** Some older documentation uses *ARM core registers* to refer to the following set of registers for execution in AArch32 state:
- The 13 general-purpose registers, R0-R12, that software can use for processing.
 - SP, the *stack pointer*, that can also be referred to as R13.
 - LR, the *link register*, that can also be referred to as R14.
 - PC, the *Program Counter*, that can also be referred to as R15.
- See also [General-purpose registers](#).
- ARM instruction** See [A32 instruction](#).
- Associativity** See [Cache associativity](#).
- Asynchronous accumulation** Faults that are accumulated in a status register, where the update to the register is asynchronous to the instruction that causes the fault.

Atomicity	Describes either single-copy atomicity or multi-copy atomicity. Atomicity in the Arm architecture defines these forms of atomicity for the Arm architecture. See also Multi-copy atomicity and Single-copy atomicity . Might also refer to poison-atomicity. See Poison atomicity .
Availability	Readiness for correct service.
Banked register	A register that has multiple instances, with the instance that is in use depending on the PE mode, Security state, or other PE state.
Baseboard Management Controller	A PE dedicated to system control and monitoring.
Base register	A register specified by a load/store instruction that is used as the base value for the address calculation for the instruction. Depending on the instruction and its addressing mode, an offset can be added to or subtracted from the base register value to form the virtual address that is sent to memory.
Base register writeback	Describes writing back a modified value to the base register used in an address calculation.
Behaves as if	Where this manual indicates that a PE <i>behaves as if</i> a certain condition applies, all descriptions of the operation of the PE must be re-evaluated taking account of that condition, together with any other conditions that affect operation.
Big-endian memory	Means that, for example: • A byte or halfword at a word-aligned address is the most significant byte or halfword in the word at that address. • A byte at a halfword-aligned address is the most significant byte in the halfword at that address. See also Endianness , Little-endian memory .
Blocking	Describes an operation that does not permit following instructions to be executed before the operation completes. A non-blocking operation can permit following instructions to be executed before the operation completes, and in the event of encountering an exception does not signal an exception to the PE. This enables implementations to retire following instructions while the non-blocking operation is executing, without the need to retain precise PE state.
Branch History Buffer (BHB)	The Branch History Buffer is an internal structure that stores branch instruction information including the history of previously executed branches.
Branch prediction	Is where a PE selects a future execution path to fetch along. For example, after a branch instruction, the PE can choose to speculatively fetch either the instruction following the branch or the instruction at the branch target. See also Prefetching .
Breakpoint	A debug event triggered by the execution of a particular instruction, specified by one or both of the address of the instruction and the state of the PE when the instruction is executed.
Built-in self test (BIST)	A mechanism that permits a machine to test itself.
Burst	A group of transfers that form a single transaction.
BWA	BandWidth Allocation.
BWPBM	BandWidth Portion Bit Map.
Byte	An 8-bit data item.
CE	See Corrected Error .
Cache associativity	The number of locations in a cache set to which an address can be assigned. Each location is identified by its <i>way</i> value.
Cache level	The position of a cache in the cache hierarchy. In the Arm architecture, the lower numbered levels are those closest to the PE. For more information, see Terms used in describing the cache maintenance instructions.

- Cache line** The basic unit of storage in a cache. Its size in words is always a power of two, usually 4 or 8 words. A cache line must be aligned to a suitable memory boundary. A *memory cache line* is a block of memory locations with the same size and alignment as a cache line. Memory cache lines are sometimes loosely called cache lines.
- Cache lockdown** Enables critical software and data to be loaded into the cache so that the cache lines containing them are not subsequently reallocated. It alleviates the delays caused by accessing a cache in a worst-case situation. This ensures that all subsequent accesses to the software and data concerned are cache hits and so complete quickly.
- Cache miss** A memory access that cannot be processed at high speed because the data it addresses is not in the cache.
- Cache sets** Areas of a cache, divided up to simplify and speed up the process of determining whether a cache hit occurs. The number of cache sets is always a power of two.
- Cache way** A cache way consists of one cache line from each cache set. The cache ways are indexed from 0 to (Associativity-1). Each cache line in a cache way is chosen to have the same index as the cache way. For example, cache way *n* consists of the cache line with index *n* from each cache set.
- Coherence order** See [Coherent](#).
- Coherent** Data accesses from a set of observers to a byte in memory are coherent if accesses to that byte in memory by the members of that set of observers are consistent with there being a single total order of all writes to that byte in memory by all members of the set of observers. This single total order of all to writes to that memory location is the *coherence order* for that byte in memory.
- Commit window** The Commit window defines the range of *P0 elements* that are committed by a *Commit element*. The oldest *P0 element* in the Commit window is the first *P0 element* committed when a *Commit element* occurs. By default, the Commit window starts on the oldest uncommitted *P0 element* and moves forward to the next uncommitted *P0 element*, with each *P0 element* committed by a *Commit element*. The Commit Window Move element moves the start of the Commit window by a number of *P0 elements*, to allow a *Commit element* to commit *P0 elements* that are younger than the oldest uncommitted *P0 elements*, leaving these older *P0 elements* uncommitted.
- Completer** An agent in a computing system that responds to and completes a memory transaction that was initiated by a Requester.
See also [Requester](#).
- Constructive instruction encoding** A constructive instruction encoding is an instruction encoding where the destination register is encoded independently of the source registers.
- Condition code check** The process of determining whether a conditional instruction executes normally or is treated as a *NOP*. For an instruction that includes a condition code field, that field is compared with the condition flags to determine whether the instruction is executed normally. For a T32 instruction in an IT block, the value of *PSTATE.IT* determines whether the instruction is executed normally.
See also [Condition code field](#), [Condition flags](#), [Conditional execution](#).
- Condition code field** A 4-bit field in an instruction that specifies the condition under which the instruction executes.
See also [Condition code check](#).
- Condition flags** The N, Z, C, and V bits of *PSTATE*, an *SPSR*, or *FPSCR*. See the register descriptions for more information.
See also [Condition code check](#), [PSTATE](#).
- Conditional execution** When a conditional instruction starts executing, if the condition code check returns *TRUE*, the instruction executes normally. Otherwise, it is treated as a *NOP*.
See also [Condition code check](#).
- CONSTRAINED UNPREDICTABLE** Where an instruction can result in *UNPREDICTABLE* behavior, the Armv8 and later architectures specify a narrow range of permitted behaviors. This range is the range of *CONSTRAINED UNPREDICTABLE* behavior. All implementations that are compliant with the architecture must follow the *CONSTRAINED UNPREDICTABLE* behavior.

Execution at Non-secure EL1 or EL0 of an instruction that is **CONSTRAINED UNPREDICTABLE** can be implemented as generating a trap exception that is taken to EL2, provided that at least one instruction that is not **UNPREDICTABLE** and is not **CONSTRAINED UNPREDICTABLE** causes a trap exception that is taken to EL2.

In body text, the term **CONSTRAINED UNPREDICTABLE** is shown in SMALL CAPITALS.

See also [UNPREDICTABLE](#).

Containable error See [Contained error](#).

Contained error An error that is not uncontained or uncontainable.

Context switch The saving and restoring of computational state when switching between different threads or processes. In this manual, the term context switch describes any situation where the context is switched by an operating system and might or might not include changes to the address space.

Context Synchronization event One of:

- Performing an ISB operation. An ISB operation is performed when an **ISB** instruction is executed and does not fail its condition code check.
- Exception entry.
- Return from an exception.
 - Exit from Debug state.
- Executing a **DCPS** instruction.
- Executing a **DRPS** instruction.

The effects of a Context synchronization event are:

- All unmasked interrupts that are pending at the time of the Context synchronization event are taken before the first instruction after the Context synchronization event.
- If halting is allowed, all Halting debug events that are pending at the time of the Context synchronization event are taken before the first instruction after the Context synchronization event.
- No instructions appearing in program order after an instruction that causes a Context synchronization event will have performed any part of their functionality until the Context synchronization event has occurred.
- All direct and indirect writes to System registers that are made before the Context synchronization event affect any instruction, including a direct read, that appears in program order after the instruction causing the Context synchronization event.
- All completed changes to the translation tables for entries that, before the change, were not permitted to be cached in a TLB, affect all instruction fetches that appear in program order after the instruction causing the Context synchronization event.
- The following invalidations, if completed before the Context synchronization event will affect all instructions that appear in program order after the Context synchronization event:
 - Instruction caches.
 - Branch predictors.
- All Non-cacheable writes that are completed before the Context synchronization event affect all instructions that appear in program order after an instruction causing a Context synchronization event.
- Changes to the Debug external authentication interfaces that are made before the Context synchronization event affect any instruction that appears in program order after the instruction causing the Context synchronization event.
- Ensuring that the **TSB** instruction is executed in the necessary order with respect to other instructions.
- See also:
 - Synchronization and debug exceptions.
 - [Synchronization and Halting debug events](#).
 - [Synchronization of memory-mapped registers](#).
 - **CONSTRAINED UNPREDICTABLE** behavior due to inadequate context synchronization.

Note

- The architecture requires that instructions that generate Context synchronization events do not appear to be executed speculatively, except that the performance monitor counters are permitted to reveal such speculation.
 - *Context synchronization events* were previously described as *context synchronization operations*.
-

Conventional memory Memory locations from which generic OSs and application runtimes expect to create allocations for general software use.

Core See [Processing element \(PE\)](#).

CoreSight Address Translation Unit A form of System MMU for trace streams.

Corrected error An error that is detected by hardware and that hardware has corrected.

Counter resolution See [Counter resolution](#).

CPBM Cache-Portion Bit Map.

CSU Cache-Storage Usage.

Data independent timing (DIT) The time that it takes to execute a piece of code where the time is not a function of the data being operated on. For more information, see [About PSTATE.DIT](#) and [About the DIT bit](#).

Debugger In most of this manual, *debugger* refers to any agent that is performing debug. However, some chapters or parts of this manual require a more rigorous definition, and define debugger locally. See:

- [Definition of a debugger in the context of self-hosted debug.](#)
- [Definition of a debugger in the context of self-hosted debug.](#)
- [Definition and constraints of a debugger in the context of external debug.](#)

Deferred error An error that has not been silently propagated but does not require immediate action at the producer. The error might have passed from the producer to a consumer.

Deprecated Something that is present in the Arm architecture for backward compatibility.

Features that are deprecated but are not **OPTIONAL** are present in current implementations of the Arm architecture, but might not be present, or might be deprecated and **OPTIONAL**, in future versions of the Arm architecture.

Arm strongly recommends software to avoid using deprecated features. Where a feature is deprecated for performance reasons, Arm strongly recommends software to avoid using that feature because of the likelihood of the significant negative impact on performance.

See also [OPTIONAL](#).

Destructive instruction encoding A destructive instruction encoding is an instruction encoding where one of the source registers is also used as the destination register.

Detected error An error that has been detected and signaled to a consumer.

Detected Uncorrected error A detected error that has not been corrected and causes failure.

Digital signal processing (DSP) Algorithms for processing signals that have been sampled and converted to digital form. DSP algorithms often use saturated arithmetic.

Direct branch Branch instructions whose target is relative to the PC of the branch and the offset is determined solely from the opcode of the executed instruction.

See also [Indirect branch](#).

Direct Memory Access (DMA) An operation that accesses main memory directly, without the PE performing any accesses to the data concerned.

Direct read A direct read of a System register is a read performed by a System register access instruction in which the contents of the System Register addressed by {op1, Crm, Crn, op2}

For more information, see [Direct read](#).

See also [Direct write](#), [Indirect read](#), [Indirect write](#).

Direct write A direct write of a System register is a write performed by a System register access instruction.

For more information, see [Direct write](#).

See also [Direct read](#), [Indirect read](#), [Indirect write](#).

DMA See [Direct Memory Access \(DMA\)](#).

DNM See [Do-Not-Modify \(DNM\)](#).

Domain In the Arm architecture, *domain* is used in the following contexts.

Shareability domain Defines a set of observers for which the Shareability attributes make the data or unified caches transparent for data accesses.

Power domain Defines a block of logic with a single, common, power supply.

Memory regions domain

When using the Short-descriptor translation table format, defines a collection of Sections, Large pages and Small pages of memory, that can have their access permissions switched rapidly by writing to the *Domain Access Control Register* (DACR). Arm deprecates any use of memory regions domains.

Do-Not-Modify (DNM) Means the value must not be altered by software. DNM fields read as UNKNOWN values, and must only be written with the value read from the same field on the same PE.

Double-precision value Consists of two consecutive 32-bit words that are interpreted as a basic double-precision floating-point number according to the *IEEE Standard for Floating-point Arithmetic*.

Doubleword A 64-bit data item. Doublewords are normally at least word-aligned in Arm systems.

Doubleword-aligned Means that the address is divisible by 8.

Downstream The direction from Requesters to Completers.

DSB Data Synchronization Barrier.

DSP See [Digital signal processing \(DSP\)](#).

Effective value A register control field, meaning a field in a register that controls some aspect of the behavior, can be described as having an *Effective value*:

- In some cases, the description of a control *a* specifies that when control *a* is active it causes a register control field *b* to be treated as having a fixed value for all purposes other than direct reads, or direct reads and direct writes, of the register containing control field *b*. When control *a* is active that fixed value is described as the *Effective value* of register control field *b*. For example, when the value of [HCR.DC](#) is 1, the *Effective value* of [HCR.VM](#) is 1, regardless of its actual value.

In other cases, in some contexts a register control field *b* is not implemented or is not accessible, but behavior of the PE is as if control field *b* was implemented and accessible, and had a particular value. In this case, that value is the *Effective value* of register control field *b*.

Note

Where a register control field is introduced in a particular version of the architecture, and is not implemented in an earlier version of the architecture, typically it will have an *Effective value* in that earlier version of the architecture.

- Otherwise, the *Effective value* of a register control field is the value of that field.

Endianness An aspect of the system memory mapping.

See also [Big-endian memory](#) and [Little-endian memory](#).

Error Correction Code (ECC) A code capable of detecting and correcting a number of errors.

Exception Handles an event. For example, an exception could handle an external interrupt or an undefined instruction.

Exception vector A fixed address that contains the address of the first instruction of the corresponding exception handler.

Executing processing element (PEe) The name given to an example PE that executes a specified instruction.

See also [Processing element \(PE\)](#).

Execution stream The stream of instructions that would have been executed by sequential execution of the program.

External abort An abort that is generated by the external memory system.

Fault An event that causes the program to deviate from the intended behavior, for example an invalid translation.

Field Replaceable Unit (FRU) A component or unit in a system that can be replaced without return to base.

First active element The First active element of an SVE vector or predicate register is the lowest numbered element that is an Active element.

Flat address mapping Is where the physical address for every access is equal to its virtual address.

Flush-to-zero mode A processing mode that optimizes the performance of some floating-point algorithms by replacing the denormalized operands and Intermediate results with zeros, without significantly affecting the accuracy of their final results.

FRU See [Field Replaceable Unit \(FRU\)](#).

General-purpose registers The registers that the base instructions use for processing:

- In AArch64 state the general-purpose registers are:
 - W0-W30 when accessed as 32-bit registers.
 - X0-X30 when accessed as 64-bit registers.
- In AArch32 state the general-purpose registers are R0-R14, that can also be described as R0-R12, SP, LR.

Note

Older documentation defines the AArch32 general-purpose registers as R0-R12, and the Arm core registers as R0-R12, SP, LR, and PC.

See also [High registers](#), [Low registers](#).

Generic Interrupt Controller (GIC) Arm system architecture interrupt controller for IRQ and FIQ interrupt exceptions.

Governing predicate The predicate register that is used to determine the Active elements of a predicated instruction is known as the Governing predicate for that instruction.

GIC See [Generic Interrupt Controller \(GIC\)](#).

Halfword A 16-bit data item. Halfwords are normally halfword-aligned in Arm systems.

Halfword-aligned Means that the address is divisible by 2.

High registers In AArch32 state, the general-purpose registers R8-R14. Most 16-bit T32 instructions cannot access the high registers.

Note

In some contexts, *high registers* refers to R8-R15, meaning R8-R14 and the PC.

See also [General-purpose registers](#), [Low registers](#).

High vectors	An alternative location for the exception vectors. The high vector address range is near the top of the address space, rather than at the bottom.
ICN	InterConnect Network.
IGNORED	Indicates that the architecture guarantees that the bit or field is not interpreted or modified by hardware. In body text, the term IGNORED is shown in SMALL CAPITALS.
Immediate and offset fields	Are unsigned unless otherwise stated.
Immediate value	A value that is encoded directly in the instruction and used as numeric data when the instruction is executed. Many instructions can be used with an immediate argument.
IMP	An abbreviation used in diagrams to indicate that one or more bits have IMPLEMENTATION DEFINED behavior.
IMPLEMENTATION DEFINED	Means that the behavior is not architecturally defined, but must be defined and documented by individual implementations. In body text, the term IMPLEMENTATION DEFINED is shown in SMALL CAPITALS.
IMPLEMENTATION SPECIFIC	Means that the behavior is not architecturally defined, and might not be documented by an individual implementation. Used when there are several implementation options available and the option chosen does not affect software compatibility. In body text, the term IMPLEMENTATION SPECIFIC is shown in SMALL CAPITALS.
Imprecise exception	An exception that is not precise.
Index register	A register specified in some load and store instructions. The value of this register is used as an offset to be added to or subtracted from the base register value to form the virtual address that is sent to memory. Some instruction forms permit the index register value to be shifted before the addition or subtraction.
Indirect branch	Branch instructions that are not direct branches. See also Direct branch .
Indirect read	An Indirect System Register Read is a System Register Read which is not a Direct System Register Read Effect. For example, when an instruction uses a System register value to establish operating conditions, that use of the System register is an indirect read of the System register. For more information, including additional examples of indirect reads, see Indirect read . See also Direct read , Direct write , Indirect write .
Indirect write	An indirect write of a System register occurs when the contents of a register are updated by some mechanism other than a Direct write to that register. For example, an indirect write to a register might occur as a side-effect of executing an instruction that does not perform a direct write to the register, or because of some operation performed by an external agent. For more information, see Indirect write . See also Direct read , Direct write , Indirect read .
Inline literals	These are constant addresses and other data items held in the same area as the software itself. They are automatically generated by compilers, and can also appear in assembler code.
Intermediate physical address (IPA)	An implementation of virtualization, the address to which a Guest OS maps a VA. A hypervisor might then map the IPA to a PA. Typically, the Guest OS is unaware of the translation from IPA to PA. See also Physical address (PA) , Virtual address (VA) .
Interrupt	In a PE context, an asynchronous exception. There are three interrupt exceptions: IRQ, FIQ, and SError. IRQ and FIQ are always precise. In a system architecture context, an asynchronous event sent to a PE or GIC for processing as an interrupt exception.

Interworking	A method of working that permits branches between software using the T32 and A32 instruction sets.
IPA	See Intermediate physical address (IPA) .
kvm	Kernel-based Virtual Machine, an open-source software package that implements a type-2 hypervisor within Linux.
Latent error	An error that is present in a system but not yet detected.
Last active element	The Last active element of an SVE vector or predicate register is the highest numbered element that is an Active element.
Level	See Cache level .
Level of Coherence (LoC)	The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of coherency. For more information, see Terms used in describing the cache maintenance instructions. See also Cache level , Point of coherency (PoC) .
Level of Unification, Inner Shareable (LoUIS)	The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for the Inner Shareable Shareability domain. For more information, see Terms used in describing the cache maintenance instructions. See also Cache level , Point of unification (PoU) .
Level of Unification, uniprocessor (LoUU)	For a PE, the last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for that PE. For more information, see Terms used in describing the cache maintenance instructions. See also Cache level , Point of unification (PoU) .
Line	See Cache line .
Little-endian memory	Means that, for example: • A byte or halfword at a word-aligned address is the least significant byte or halfword in the word at that address. • A byte at a halfword-aligned address is the least significant byte in the halfword at that address. See also Big-endian memory , Endianness .
Load/store architecture	An architecture where data-processing operations only operate on register contents, not directly on memory contents.
LoC	See Level of Coherence (LoC) .
LoUIS	See Level of Unification, Inner Shareable (LoUIS) .
LoUU	See Level of Unification, uniprocessor (LoUU) .
Lockdown	See Cache lockdown .
Low registers	In AArch32 state, general-purpose registers R0-R7. Unlike the high registers, all T32 instructions can access the Low registers. See also General-purpose registers , High registers .
MBWU	Memory BandWidth Usage.
Memory barrier	See Memory barriers.
Memory coherency	The problem of ensuring that when a memory location is read, either by a data read or an instruction fetch, the value actually obtained is always the value that was most recently written to the location. This can be difficult when there are multiple possible physical locations, such as main memory and at least one of a write buffer and one or more levels of cache.

Memory element	An item of data in memory that is transferred to or from a vector element by an SVE load or store instruction. Each memory element has an access size and a type. The memory element access size is specified by each load and store instruction independently of the vector element size.
Memory Management Unit (MMU)	Provides detailed control of the part of a memory system that provides a single stage of address translation. Most of the control is provided using translation tables that are held in memory, and define the attributes of different regions of the physical memory map.
Memory Protection Unit (MPU)	A hardware unit whose registers provide simple control of a limited number of protection regions in memory.
Merging predication	When a predicated SVE instruction specifies merging predication, the Inactive elements of the destination register remain unchanged.
Memory system component	MSC. A function, unit, or design block in a memory system that can have partitionable resources. MSCs consist of all units that handle load or store requests issued by any MPAM Requester. These can include cache memories, interconnects, memory management units, memory channel controllers, queues, buffers, and rate adapters. An MSC can contain one or more resources that each can have zero or more resource partitioning controls. For example, a PE can contain several caches, each of which might have zero or more resource partitioning controls.
Memory system resource	A resource that affects the performance of software's use of the memory system and is either local to an MSC (such as cache-memory capacity) or non-local (such as memory bandwidth, which is present over an entire path, from Requester to Completer, that can pass through multiple MSCs).
MMR	Memory-mapped Register.
Microarchitecturally-finished	An operation that has finished all of its operational pseudocode, although the results of any memory accesses, including translation table walks and updates, are not yet coherent with other observers.
Microarchitecturally-unfinished	An operation that has not completed all of its operational pseudocode.
Miss	See Cache miss .
MMU	See Memory Management Unit (MMU) .
MPU	See Memory Protection Unit (MPU) .
Multi-copy atomicity	The form of atomicity described in Requirements for multi-copy atomicity. See also Atomicity , Single-copy atomicity .
NaN	Not a Number. A floating-point value that can be used when neither a numeric value nor an infinity is appropriate. A NaN can be a <i>quiet</i> NaN, that propagate through most floating-point operations, or a <i>signaling</i> NaN, that causes an Invalid Operation floating-point exception when used. For more information, see the <i>IEEE Standard for Floating-point Arithmetic</i> . See also Quiet NaN , Signaling NaN .
Natural eviction	A natural eviction is an eviction that occurs in the course of the normal operation of the memory system, rather than because of an operation that explicitly causes an eviction from the cache, such as the execution of a cache maintenance instruction. Typically, a natural eviction occurs when the caching algorithm requires data to be cached but the cache does not have room for that data.
Non-fault load	SVE provides a Non-fault option for some SVE vector load instructions. This option causes all memory access faults to be suppressed. Instead, the FFR is updated to indicate which of the Active elements were not successfully loaded.
Observer	An observer is one of: • The mechanism inside a PE that generates Implicit Translation Table Descriptor (TTD) Memory Effects. • The mechanism inside a PE that generates Implicit Instruction Memory Read Effects. • The mechanism inside a PE that generates Explicit Memory Effects, Tag Memory Effects, Barrier Effects, Instruction Fetch Barrier Effects, TLBI Effects, DC Effects, IC Effects, Fault Effects, or GCS Effects.

- The mechanism inside a PE that generates Memory Effects for SPE.
- The mechanism inside a PE that generates Memory Effects for TRBE.
- The mechanism inside a PE that generates Memory Effects for HDBSS.
- The mechanism inside a PE that generates Memory Effects for HACDBS.
- Any mechanism outside the PE that can generate Memory Effects, for example, a peripheral device, an SMMU, or a GIC.

Obsolete Obsolete indicates something that is no longer supported by Arm. When an architectural feature is described as obsolete, this indicates that the architecture has no support for that feature, although an earlier version of the architecture did support it.

Offset addressing Means that the memory address is formed by adding or subtracting an offset to or from the base register value.

OPTIONAL When applied to a feature of the architecture, OPTIONAL indicates a feature that is not required in an implementation of the Arm architecture:

- If a feature is OPTIONAL and deprecated, this indicates that the feature is being phased out of the architecture. Arm expects such a feature to be included in a new implementation only if there is a known backward-compatibility reason for the inclusion of the feature. A feature that is OPTIONAL and deprecated might not be present in future versions of the architecture.
- A feature that is OPTIONAL but not deprecated is, typically, a feature added to a version of the Arm architecture after the initial release of that version of the architecture. Arm recommends that such features are included in all new implementations of the architecture.

In body text, these meanings of the term OPTIONAL are shown in SMALL CAPITALS.

Note

Do not confuse these Arm-specific uses of OPTIONAL with other uses of *optional*, where it has its usual meaning. These include:

- Optional arguments in the syntax of many instructions.
 - Behavior determined by an implementation choice, for example the optional byte order reversal in an Armv7-R implementation, where the [SCTLR.IE](#) bit indicates the implemented option.
-

See also [Deprecated](#).

Other-multi-copy atomic This is a Memory Write effect from an observer that, if observed by a different observer, is then observed by all other observers that access the location coherently.

PA See [Physical address \(PA\)](#).

PCIe See [Peripheral Component Interconnect Express \(PCI Express or PCIe\)](#).

PE See [Processing element \(PE\)](#).

Peripheral Component Interconnect Express (PCI Express or PCIe) A high-speed serial computer expansion bus standard maintained and developed by the PCI Special Interest Group.

PEe The executing processing element. See [Executing processing element](#).

PFA See Predictive Failure Analysis (PFA).

Physical address (PA) An address that identifies a location in the physical memory map.

See also [Intermediate physical address \(IPA\)](#), [Virtual address \(VA\)](#).

Point of coherency (PoC) See Terms used in describing the cache maintenance instructions for the AArch64 state and [Terminology for Clean, Invalidate, and Clean and Invalidate instructions](#) for the AArch32 state.

Point of Deep Persistence (PoDP) See Terms used in describing the cache maintenance instructions.

Point of encryption (PoE) See Terms used in describing the cache maintenance instructions.

Point of persistence (PoP) See Terms used in describing the cache maintenance instructions.

Point of physical aliasing (PoPA) See Terms used in describing the cache maintenance instructions.

Point of physical storage (PoPS) See Terms used in describing the cache maintenance instructions.

Point of unification (PoU) See Terms used in describing the cache maintenance instructions for the AArch64 state and [Terminology for Clean, Invalidate, and Clean and Invalidate instructions](#) for the AArch32 state.

Poison atomicity The form of atomicity described in Clearing Deferred errors from poisoned Locations.

See also [Atomicity](#).

Poison granule A region of naturally-aligned memory affected by poison.

See Error propagation for information on poison.

Post-indexed addressing Means that the memory address is the base register value, but an offset is added to or subtracted from the base register value and the result is written back to the base register.

Precise exception An exception where the exception handler receives the state of the PE and the state of the memory system consistent with the PE having executed all of the instructions up to, but not including, the point in the instruction stream where the exception was taken. The state of the PE and the state of the memory do not include instructions that occurred after this point.

Prefetching Prefetching refers to speculatively fetching instructions or data from the memory system. In particular, instruction prefetching is the process of fetching instructions from memory before the instructions that precede them, in simple sequential execution of the program, have finished executing. Prefetching an instruction does not mean that the instruction has to be executed.

In this manual, references to instruction or data fetching apply also to prefetching, unless the context explicitly indicates otherwise.

Note

The Prefetch Abort exception can be generated on any instruction fetch, and is not limited to speculative instruction fetches.

See also [Simple sequential execution](#).

Prefixed instruction The instruction that immediately follows a MOVPRFX instruction in program order.

Pre-indexed addressing Means that the memory address is formed in the same way as for offset addressing, but the memory address is also written back to the base register.

Processing element (PE) The abstract machine defined in the Arm architecture, as documented in an Arm Architecture Reference Manual. A PE implementation compliant with the Arm architecture must conform with the behaviors described in the corresponding Arm Architecture Reference Manual.

Protection region A memory region whose position, size, and other properties are defined by Memory Protection Unit registers.

Protection Unit See [Memory Protection Unit \(MPU\)](#).

Pseudo-instruction UAL assembler syntax that assembles to an instruction encoding that is expected to disassemble to a different assembler syntax, and is described in this manual under that other syntax. For example, `MOV <Rd>, <Rm>, LSL #<n>` is a pseudo-instruction that is expected to disassemble as `LSL <Rd>, <Rm>, #<n>`.

PSTATE An abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

See also [Condition flags](#).

Quadword A 128-bit data item. Quadwords are normally at least word-aligned in Arm systems.

Quadword-aligned Means that the address is divisible by 16.

Quiet NaN	A NaN that propagates unchanged through most floating-point operations. See also NaN, Signaling NaN.
RAO	See Read-As-One (RAO) .
RAZ	See Read-As-Zero (RAZ) .
RAO/SBOP	In versions of the Arm architecture before Armv8, Read-As-One, Should-Be-One-or-Preserved on writes. From the introduction of the Armv8 architecture, RES1 replaces this description. See also UNK/SBOP, Read-As-One (RAO), RES1, Should-Be-One-or-Preserved (SBOP).
RAO/WI	Read-As-One, Writes Ignored. Hardware must implement the field as Read-As-One, and must ignore writes to the field. Software can rely on the field reading as all 1s, and on writes being ignored. This description can apply to a single bit that reads as 1, or to a field that reads as all 1s. See also Read-As-One (RAO).
RAZ/SBZP	In versions of the Arm architecture before Armv8, Read-As-Zero, Should-Be-Zero-or-Preserved on writes. From the introduction of the Armv8 architecture, RES0 replaces this description. See also UNK/SBZP, Read-As-Zero (RAZ), RES0, Should-Be-Zero-or-Preserved (SBZP).
RAZ/WI	Read-As-Zero, Writes Ignored. Hardware must implement the field as Read-As-Zero, and must ignore writes to the field. Software can rely on the field reading as all 0s, and on writes being ignored. This description can apply to a single bit that reads as 0, or to a field that reads as all 0s. See also Read-As-Zero (RAZ).
Read-allocate cache	A cache in which a cache miss on reading data causes a cache line to be allocated into the cache.
Read-As-One (RAO)	Hardware must implement the field as reading as all 1s. Software: • Can rely on the field reading as all 1s. • Must use a SBOP policy to write to the field. This description can apply to a single bit that reads as 1, or to a field that reads as all 1s. See also RAO/SBOP, RAO/WI, RES1.
Read-As-Zero (RAZ)	Hardware must implement the field as reading as all 0s. Software: • Can rely on the field reading as all 0s • Must use a SBZP policy to write to the field. This description can apply to a single bit that reads as 0, or to a field that reads as all 0s. See also RAZ/SBZP, RAZ/WI, RES0.
Read-to-Clear (RC)	A read of the field clears the field to 0 once the read is complete.
Read, modify, write	In a read, modify, write instruction sequence, a value is read to a general-purpose register, the relevant fields updated in that register, and the new value written back.
Recoverable error	A contained error that must be corrected to allow the correct operation of the system or smaller parts of the system to continue.

Reliability	Continuity of correct service.
Requester	An agent in a computing system that is capable of initiating memory transactions. See also Completer .
RES0	A reserved bit. Used for fields in register descriptions, and for fields in architecturally-defined data structures that are held in memory, for example in translation table descriptors. Within the architecture, there are some cases where a register bit or field: • Is RES0 in some defined architectural context. • Has different defined behavior in a different architectural context. Note • RES0 is not used in descriptions of instruction encodings. • Where an AArch32 System register is Architecturally mapped to an AArch64 System register, and a bit or field in that register is RES0 in one Execution state and has defined behavior in the other Execution state, this is an example of a bit or field with behavior that depends on the architectural context.

This means the definition of RES0 for fields in read/write registers is:

If a bit is RES0 in all contexts

For a bit in a read/write register, it is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired to 0. In this case:
 - Reads of the bit always return 0.
 - Writes to the bit are ignored.
2. The bit can be written. In this case:
 - An indirect write to the register sets the bit to 0.
 - A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.

If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
 - A direct write to the bit must update a storage location associated with the bit.
 - The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RES0 bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a bit-by-bit basis.

If a bit is RES0 only in some contexts

For a bit in a read/write register, when the bit is described as RES0:

- An indirect write to the register sets the bit to 0.
- A read of the bit must return the value last successfully written to the bit, by either a direct or an indirect write, regardless of the use of the register when the bit was written.

If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
- A direct write to the bit must update a storage location associated with the bit.

- While the use of the register is such that the bit is described as **RES0**, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

Considering only contexts that apply to a particular implementation, if there is a context in which a bit is defined as **RES0**, another context in which the same bit is defined as **RES1**, and no context in which the bit is defined as a functional bit, then it is **IMPLEMENTATION DEFINED** whether:

- Writes to the bit are ignored, and reads of the bit return an **UNKNOWN** value.
- The value of the bit can be written, and a read returns the last value written to the bit.

The **RES0** description can apply to bits or fields that are read-only, or are write-only:

- For a read-only bit, **RES0** indicates that the bit reads as 0, but software must treat the bit as **UNKNOWN**.
- For a write-only bit, **RES0** indicates that software must treat the bit as **SBZ**.

A bit that is **RES0** in a context is reserved for possible future use in that context. To preserve forward compatibility, software:

- Must not rely on the bit reading as 0.
- Must use an **SBZP** policy to write to the bit.

The definition of a **RES0** field in an architecturally-defined data structure that is held in memory is:

- A read of a **RES0** bit returns the value last written.
- The value of a **RES0** bit has no effect on the operation of the PE or any other hardware implementing the architecture such as the GIC or the SMMU, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.
- For an implicit memory write effect to the field by a PE or for a write to the field by any other hardware implementing the architecture such as the GIC or the SMMU, each bit defined as **RES0** is set to 0.
- For a write to the data structure by a PE, or any other hardware implementing the architecture such as the GIC or the SMMU, if the write is specified to only update specific fields, the hardware preserves the value of other **RES0** bits in the same data structure. This applies, for example, to Hardware updates to the translation tables.

This **RES0** description can apply to a single bit, or to a field for which each bit of the field must be treated as **RES0**.

In body text, the term **RES0** is shown in **SMALL CAPITALS**.

See also [Read-As-Zero \(RAZ\)](#), [RES0H](#), [RES1](#), [Should-Be-Zero-or-Preserved \(SBZP\)](#), [UNKNOWN](#).

RES0H

A reserved bit or field with **SBZP**. This behavior uses the hardwired to 0 subset of the **RES0** definition.

See also [Read-As-Zero \(RAZ\)](#), [RES0](#), [RES1](#), [Should-Be-Zero-or-Preserved \(SBZP\)](#).

RES1

A reserved bit. Used for fields in register descriptions, and for fields in architecturally-defined data structures that are held in memory, for example in translation table descriptors.

Within the architecture, there are some cases where a register bit or field:

- Is **RES1** in some defined architectural context.
- Has different defined behavior in a different architectural context.

Note

- **RES1** is not used in descriptions of instruction encodings.
 - Where an AArch32 System register is [Architecturally mapped](#) to an AArch64 System register, and a bit or field in that register is **RES1** in one Execution state and has defined behavior in the other Execution state, this is an example of a bit or field with behavior that depends on the architectural context.
-

This means the definition of RES1 for fields in read/write registers is:

If a bit is RES1 in all contexts

For a bit in a read/write register, it is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired to 1. In this case:
 - Reads of the bit always return 1.
 - Writes to the bit are ignored.
2. The bit can be written. In this case:
 - An indirect write to the register sets the bit to 1.
 - A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.

If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
 - A direct write to the bit must update a storage location associated with the bit.
 - The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RES1 bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a bit-by-bit basis.

If a bit is RES1 only in some contexts

For a bit in a read/write register, when the bit is described as RES1:

- An indirect write to the register sets the bit to 1.
- A read of the bit must return the value last successfully written to the bit, regardless of the use of the register when the bit was written.

Note

As indicated in this list, this value might be written by an indirect write to the register.

If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.

- A direct write to the bit must update a storage location associated with the bit.
- While the use of the register is such that the bit is described as RES1, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

Considering only contexts that apply to a particular implementation, if there is a context in which a bit is defined as RES0, another context in which the same bit is defined as RES1, and no context in which the bit is defined as a functional bit, then it is IMPLEMENTATION DEFINED whether:

- Writes to the bit are ignored, and reads of the bit return an UNKNOWN value.
- The value of the bit can be written, and a read returns the last value written to the bit.

The RES1 description can apply to bits or fields that are read-only, or are write-only:

- For a read-only bit, RES1 indicates that the bit reads as 1, but software must treat the bit as UNKNOWN.
- For a write-only bit, RES1 indicates that software must treat the bit as SBO.

A bit that is RES1 in a context is reserved for possible future use in that context. To preserve forward compatibility, software:

- Must not rely on the bit reading as 1.
- Must use an SBOP policy to write to the bit.

The definition of a RES1 field in an architecturally-defined data structure that is held in memory is:

- A read of a RES1 bit returns the value last written.
- The value of a RES1 bit has no effect on the operation of the PE or any other hardware implementing the architecture such as the GIC or the SMMU, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.
- For an implicit memory write effect to the field by a PE or for a write to the field by any other hardware implementing the architecture such as the GIC or the SMMU, each bit defined as RES1 is set to 1.
- For a write to the data structure by a PE, or any other hardware implementing the architecture such as the GIC or the SMMU, if the write is specified to only update specific fields, the hardware preserves the value of other RES1 bits in the same data structure. This applies, for example, to Hardware updates to the translation tables.

This RES1 description can apply to a single bit, or to a field for which each bit of the field must be treated as RES1.

In body text, the term RES1 is shown in SMALL CAPITALS.

See also [Read-As-One \(RAO\)](#), [RES0](#), [RES0H](#), [Should-Be-One-or-Preserved \(SBOP\)](#), [UNKNOWN](#).

Reserved

Unless otherwise stated:

- Instructions that are reserved or that access reserved registers have UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior.
- Bit positions described as reserved are:
 - In an RW or WO register, RES0.
 - In an RO register, UNK.

See also [CONSTRAINED UNPREDICTABLE](#), [RES0](#), [RES0H](#), [RES1](#), [UNDEFINED](#), [UNK](#), [UNPREDICTABLE](#).

Resource partition The collection of MPAM resource control settings associated with a software environment and identified by the combination of a physical PARTID space and a partition number.

RESS Reserved, Sign extended. A register value is extended by copying the sign bit into all of the reserved bits to the left of the most significant bit of the field. The values of these bits are identical to the most significant bit of the value being extended.

Within the architecture, a register bit or field can be treated:

- As RESS in few defined architectural contexts.
- In a different defined behavior in other architectural contexts.

This means the definition of RESS for fields in read/write registers is:

If a field [Q:P] is RESS in all contexts

For a bit in a read/write register, it is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired as a sign-extension of bit [P-1]. In this case:
 - Reads of the bit always return the value of bit [P-1].
 - Writes to the bit are ignored.
2. The bit can be written. In this case:

- An indirect write to the register sets the bit to the same value as bit [P-1].
- A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.
If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
- A direct write to the bit must update a storage location associated with the bit.
- The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RESS bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a bit-by-bit basis.

If a field [Q:P] is RESS only in some contexts

For a bit in a read/write register, when the bit is described as RESS:

- An indirect write to the register sets the bit to the same value as bit [P-1].
- A read of the bit must return the value last successfully written to the bit, regardless of the use of the register when the bit was written.

Note

As indicated in this list, this value might be written by an indirect write to the register.

If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.

- A direct write to the bit must update a storage location associated with the bit.
- While the use of the register is such that the bit is described as RESS, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

Considering only contexts that apply to a particular implementation, if there is a context in which a bit is defined as RES0, another context in which the same bit is defined as RES1, and no context in which the bit is defined as a functional bit, then it is IMPLEMENTATION DEFINED whether:

- Writes to the bit are ignored, and reads of the bit return an UNKNOWN value.
- The value of the bit can be written, and a read returns the last value written to the bit.

The RESS description can apply to bits or fields that are read-only, or are write-only:

- For a read-only bit, RESS indicates that the bit reads as the value of bit [P-1], but software must treat the bit as UNKNOWN.
- For a write-only bit, RESS indicates that software must treat the bit as **SB0** or **SBZ** as necessary.

A bit that is RESS in a context is reserved for possible future use in that context. To preserve forward compatibility, software:

- Must not rely on the bit reading as [P-1].
- Must use a **SBOP** or **SBZP** policy to write to the bit.

This RESS description can apply to a single bit, or to a field for which each bit of the field must be treated as RESS.

- Rewind point** A rewind point is a point in the program flow to which execution can return if all subsequent execution is found to have been incorrectly speculatively executed.
- RISC** Reduced Instruction Set Computer.
- Rounding error** The value of the rounded result of an arithmetic operation minus the exact result of the operation.
- Rounding mode** Specifies how the exact result of a floating-point operation is rounded to a value that is representable in the destination format. The rounding modes are defined by the *IEEE Standard for Floating-point Arithmetic*, see [Floating-point standards, and terminology](#).
- Saturated arithmetic** Integer arithmetic in which a result that would be greater than the largest representable number is set to the largest representable number, and a result that would be less than the smallest representable number is set to the smallest representable number. Signed saturated arithmetic is often used in DSP algorithms. It contrasts with the normal signed integer arithmetic used in Arm processors, in which overflowing results wrap around from $+2^{31}-1$ to -2^{31} or vice versa.
- SBO** See [Should-Be-One \(SBO\)](#).
- SBOP** See [Should-Be-One-or-Preserved \(SBOP\)](#).
- SBZ** See [Should-Be-Zero \(SBZ\)](#).
- SBZP** See [Should-Be-Zero-or-Preserved \(SBZP\)](#).
- Scalar base register** A scalar base register refers to an AArch64 general-purpose register, X0-X30, or the current stack pointer, SP.
- Scalar index register** A scalar index register refers to an AArch64 general-purpose register, X0-X30, or for certain instructions, XZR.
- Security hole** A mechanism by which execution at the current level of privilege can achieve an outcome that cannot be achieved at the current or a lower level of privilege using instructions that are not UNPREDICTABLE and are not CONSTRAINED UNPREDICTABLE. The Arm architecture forbids security holes.
- See also [CONSTRAINED UNPREDICTABLE](#), [UNPREDICTABLE](#).
- Self-modifying code** Code that writes one or more instructions to memory and then executes them. When using self-modifying code, you must use cache maintenance and barrier instructions to ensure synchronization. For more information, see [Caches and memory hierarchy](#).
- SError exception** An asynchronous exception in the Arm architecture.
- Serviceability** The ability to undergo modifications and repairs.
- Service failure mode** A mode entered to reduce the severity of an error.
- Set** See [Cache sets](#).
- Should-Be-One (SBO)** Hardware must ignore writes to the field.
- Arm strongly recommends that software writes the field as all 1s. If software writes a value that is not all 1s, it must expect an UNPREDICTABLE or CONSTRAINED UNPREDICTABLE result.
- This description can apply to a single bit that should be written as 1, or to a field that should be written as all 1s.
- See also [CONSTRAINED UNPREDICTABLE](#), [UNPREDICTABLE](#).
- Should-Be-One-or-Preserved (SBOP)** From the introduction of the Armv8 architecture, the description [Should-Be-One-or-Preserved \(SBOP\)](#) is superseded by [RES1](#).
- Hardware must ignore writes to the field.
- When writing this field, software must either write all 1s to this field or, if the register is being restored from a previously read state, write the previously read value to this field. If this is not done, then the result is unpredictable.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

See also [CONSTRAINED UNPREDICTABLE](#), [UNPREDICTABLE](#).

Should-Be-Zero (SBZ) Hardware must ignore writes to the field.

Arm strongly recommends that software writes the field as all 0s. If software writes a value that is not all 0s, it must expect an UNPREDICTABLE or CONSTRAINED UNPREDICTABLE result.

This description can apply to a single bit that should be written as 0, or to a field that should be written as all 0s.

See also [CONSTRAINED UNPREDICTABLE](#), [UNPREDICTABLE](#).

Should-Be-Zero-or-Preserved (SBZP) From the introduction of the Armv8 architecture, the description [Should-Be-Zero-or-Preserved \(SBZP\)](#) is superseded by [RES0](#).

Hardware must ignore writes to the field.

When writing this field, software must either write all 0s to this field or, if the register is being restored from a previously read state, write the previously read value to this field. If this is not done, then the result is unpredictable.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

See also [CONSTRAINED UNPREDICTABLE](#), [UNPREDICTABLE](#).

Signaling NaN An Invalid Operation floating-point exception occurs whenever any floating-point operation receives a signaling NaN as an operand. Signaling NaNs can be used in debugging, to track down some uses of uninitialized variables.

See also [NaN](#), [Quiet NaN](#).

Signed immediate and offset fields Are encoded in two's complement notation unless otherwise stated.

Silent Data Corruption (SDC) An error that is not detected by hardware or software.

SIMD Single-Instruction, Multiple-Data.

The SIMD instructions in AArch32 state are:

- The instructions summarized in [Parallel addition and subtraction instructions](#).
- The Advanced SIMD instructions summarized in [Advanced SIMD and floating-point instructions](#), when operating on vectors.

Simple sequential execution The behavior of an implementation that fetches, decodes and completely executes each instruction before proceeding to the next instruction. Such an implementation performs no speculative accesses to memory, including to instruction memory. The implementation does not pipeline any phase of execution. In practice, this is the theoretical execution model that the architecture is based on, and Arm does not expect this model to correspond to a realistic implementation of the architecture.

Single-copy atomicity The form of atomicity described in Properties of single-copy atomic accesses.

See also [Atomicity](#), [Multi-copy atomicity](#).

Single-precision value A 32-bit word that is interpreted as a basic single-precision floating-point number according to the *IEEE Standard for Floating-point Arithmetic*.

SMMU System Memory Management Unit.

Spatial locality The observed effect that after a program has accessed a memory location, it is likely to also access nearby memory locations in the near future. Caches with multi-word cache lines exploit this effect to improve performance.

Special-purpose register One of a specified set of registers for which all direct and indirect reads and writes to the register appear to occur in program order relative to other instructions, without the need for any explicit synchronization.

- Special purpose registers specifies the AArch64 Special-purpose registers.
- [AArch32 general-purpose registers, the PC, and the Special-purpose registers](#) lists the AArch32 Special-purpose registers.

Speculative A speculative operation is any of the following:

- An operation performed by the PE before the PE has determined that the operation is required to be performed in a simple sequential execution.
- An operation performed by the PE that is not required to be performed in a simple sequential execution.
- An operation performed by the PE before the PE has architecturally resolved the architectural state of inputs or outputs of the operation.

Examples of speculative operations are:

- Operations that are generated by instructions that appear in the Execution stream after a branch that is not architecturally resolved.
- Operations that are generated by instructions that appear in the Execution stream after an instruction where a synchronous exception condition has not been architecturally resolved.
- Operations that are generated by conditional instructions for which the conditions for the instruction have not been architecturally resolved.
- Operations that are generated by instructions that appear in the Execution stream after the point at which a precise asynchronous exception will be taken.
- Operations generated by instructions for which one or more of the arguments come from a register that has not been architecturally resolved.
- Operations generated by the hardware that are not directly generated by any instructions appearing in the Execution stream.
- A memory effect (M2) that appears in program order after a memory effect (M1) where all of the following apply:
 - M1 is locally-ordered-before M2.
 - M1 has not been architecturally resolved.
- Read accesses generated for a translation table walk for which the granule protection check for the address being accessed has not been architecturally resolved.

See also [Execution stream](#).

SPI Shared Peripheral Interrupt.

Superpriority An attribute that is used to denote virtual and physical IRQ and FIQ interrupts as non-maskable. IRQ and FIQ interrupts with Superpriority can be taken under certain conditions where usually they would be masked by the PSTATE.{I, F} bits.

System Control Processor A PE dedicated to system control and monitoring.

T32 instruction One or two halfwords that specify an operation to be performed by a PE that is executing in an Exception level that is using AArch32 and is in T32 state. T32 instructions must be halfword-aligned.

T32 instructions were previously called Thumb instructions.

See also [A32 instruction](#), [A64 instruction](#), [T32 state](#).

T32 state The AArch32 Instruction set state in which the PE executes T32 instructions.

T32 state was previously called Thumb state.

See also [A32 state](#), [T32 instruction](#).

Temporal locality The observed effect that after a program has accesses a memory location, it is likely to access the same memory location again in the near future. Caches exploit this effect to improve performance.

Thumb instruction See [T32 instruction](#).

Unaligned An unaligned access is an access where the address of the access is not aligned to the size of an element of the access.

Unaligned memory accesses Are memory accesses that are not, or might not be, appropriately halfword-aligned, word-aligned, or doubleword-aligned.

Unallocated Except where otherwise stated in this manual, an instruction encoding is unallocated if the architecture does not assign a specific function to the entire bit pattern of the instruction, but instead describes it as **CONSTRAINED UNPREDICTABLE**, **UNDEFINED**, **UNPREDICTABLE**, or as an unallocated hint instruction.

A bit in a register is unallocated if the architecture does not assign a function to that bit.

See also [CONSTRAINED UNPREDICTABLE](#), [UNDEFINED](#), [UNPREDICTABLE](#).

Uncontainable error See [Uncontained error](#).

Uncontained error An error that has been, or might have been, silently propagated.

Uncorrected error An error caused by a fault which was not removed.

UNDEFINED Indicates cases where an attempt to execute a particular encoding bit pattern generates an exception, that is taken to the current Exception level, or to the default Exception level for taking exceptions if the **UNDEFINED** encoding was executed at EL0. This applies to:

- Any encoding that is not allocated to any instruction.
- Any encoding that is defined as never accessible at the current Exception level.
- Some cases where an enable, disable, or trap control means an encoding is not accessible at the current Exception level.

If the generated exception is taken to an Exception level that is using AArch32 then it is taken as an Undefined Instruction exception.

Note

On reset, the default Exception level for taking exceptions from EL0 is EL1. However, an implementation might include controls that can change this, effectively making EL1 inactive. See the description of the Exception model for more information

In body text, the term **UNDEFINED** is shown in SMALL CAPITALS.

See also [Undefined Instruction exception](#).

Undetected error See [Latent error](#).

Unified cache Is a cache used for both processing instruction fetches and processing data loads and stores.

Unindexed addressing Means addressing in which the base register value is used directly as the virtual address to send to memory, without adding or subtracting an offset. In most types of load/store instruction, unindexed addressing is performed by using offset addressing with an immediate offset of 0.

UNK An abbreviation indicating that software must treat a field as containing an UNKNOWN value.

Hardware must implement the bit as read as 0, or all 0s for a multi-bit field. Software must not rely on the field reading as zero.

See also [UNKNOWN](#).

UNK/SBOP Hardware must implement the field as Read-As-One, and must ignore writes to the field.

Software must not rely on the field reading as all 1s, and except for writing back to the register it must treat the value as if it is UNKNOWN. Software must use an SBOP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

See also [Read-As-One \(RAO\)](#), [Should-Be-One-or-Preserved \(SBOP\)](#), [UNKNOWN](#).

UNK/SBZP Hardware must implement the bit as Read-As-Zero, and must ignore writes to the field.

Software must not rely on the field reading as all 0s, and except for writing back to the register must treat the value as if it is UNKNOWN. Software must use an SBZP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

See also [Read-As-Zero \(RAZ\)](#), [Should-Be-Zero-or-Preserved \(SBZP\)](#), [UNKNOWN](#).

UNKNOWN An UNKNOWN value does not contain valid data, and can vary from implementation to implementation. An UNKNOWN value must not return information that cannot be accessed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE, are not CONSTRAINED UNPREDICTABLE, and do not return UNKNOWN values.

An UNKNOWN value can vary from moment to moment, and instruction to instruction, unless it has previously been assigned, other than at reset, to one of the following registers:

- Any of the general-purpose registers.
- Any of the Advanced SIMD and floating-point registers.
- Any of the Scalable Vector Extension registers.
- Any of the PSTATE N, Z, C, or V flags.

An UNKNOWN value must not be documented or promoted as having a defined value or effect.

In body text, the term UNKNOWN is shown in SMALL CAPITALS.

See also [CONSTRAINED UNPREDICTABLE](#), [UNDEFINED](#), [UNK](#), [UNPREDICTABLE](#).

UNPREDICTABLE Means the behavior cannot be relied upon. UNPREDICTABLE behavior must not perform any function that cannot be performed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE.

UNPREDICTABLE behavior must not be documented or promoted as having a defined effect.

An instruction that is UNPREDICTABLE can be implemented as UNDEFINED.

Execution at Non-secure EL1 or EL0 of an instruction that is UNPREDICTABLE can be implemented as generating a trap exception that is taken to EL2, provided that at least one instruction that is not UNPREDICTABLE and is not CONSTRAINED UNPREDICTABLE causes a trap exception that is taken to EL2.

In body text, the term UNPREDICTABLE is shown in SMALL CAPITALS.

See also [CONSTRAINED UNPREDICTABLE](#), [UNDEFINED](#).

Upstream The direction from Completers to Requesters.

VA See [Virtual address \(VA\)](#).

VFP In Armv7, an extension to the Arm architecture, that provides single-precision and double-precision floating-point arithmetic.

Vector A one-dimensional array of vector elements of the same size and data type.

Vector element Individual subdivisions of a vector register that can be 8, 16, 32, 64 or 128 bits in size. The vector element size and data type is specified independently by each instruction.

Virtual address (VA) An address generated by an Arm PE. This means it is an address that might be held in the program counter of the PE. For a PMSA implementation, the virtual address is identical to the physical address.

See also [Intermediate physical address \(IPA\)](#), [Physical address \(PA\)](#).

VM Virtual Machine.

VMM Virtual Machine Monitor. An alias for “hypervisor”.

Virtual PARTID A PARTID in MPAM that can be used by a virtual machine (VM). Virtual PARTIDs are mapped into physical PARTIDs using the virtual partition mapping entries in the MPAMVPM0 - MPAMVPM7 registers.

Watchpoint A debug event triggered by an access to memory, specified in terms of the address of the location in memory being accessed.

Way	See Cache way .
WI	Writes Ignored. In a register that software can write to, a WI attribute applied to a bit or field indicates that the bit or field ignores the value written by software and retains the value it had before that write. See also RAO/WI, RAZ/WI, RES0, RES1.
Word	A 32-bit data item. Words are normally word-aligned in Arm systems.
Word-aligned	Means that the address is divisible by 4.
Write-allocate cache	A cache in which a cache miss on storing data causes a cache line to be allocated into the cache.
Write-back cache	A cache in which when a cache hit occurs on a write access, the data is only written to the cache. Data in the cache can therefore be more up-to-date than data in the next level of cache or memory. Any such data is written back to the next level of cache or memory when the cache line is cleaned. Another common term for a write-back cache is a <i>copy-back cache</i>.
Write-One-to-Clear (W1C)	Writes of 0 to the bit are ignored. A write of 1 clears the bit to 0.
Write-One-to-Set (W1S)	Writes of 0 to the bit are ignored. A write of 1 sets the bit to 1.
Write-Through cache	A cache in which when a cache hit occurs on a write access, the data is written both to the cache and to the next level of cache or memory.
Write buffer	A block of high-speed memory that optimizes stores to main memory.
