Memory access mode. Controls the use of Memory access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Bit [19]

Reserved, RES0.

NS, bit [18]

Non-secure status. In Debug state, gives the current Security state:

NS	Meaning
0b0	Secure state.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS	Meaning
0b1	Non-secure state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Bit [17]

Reserved, RES0.

SDD, bit [16]

When FEAT_Secure is implemented:

Secure debug disabled.

On entry to Debug state, SDD is set to 0.

In Debug state, the value of the SDD bit does not change, even if `ExternalSecureInvasiveDebugEnabled()` changes.

In Non-debug state, SDD returns the inverse of `ExternalSecureInvasiveDebugEnabled()`. If the authentication signals that control `ExternalSecureInvasiveDebugEnabled()` change, then a context synchronization event is required to guarantee their effect.

Access to this field is RO.

Otherwise:

Reserved, RES1.

Bit [15]

Reserved, RES0.

HDE, bit [14]

Halting debug enable.

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RW	Meaning
0b1111	Any of the following: • The PE is in Non-debug state. • The PE is at EL0 using AArch64. • The PE is not at EL0, and EL1 is using AArch64. If implemented and enabled in the current Security state, EL2 and EL3 are using AArch64.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is RAO/WI.
- Otherwise, access to this field is RO.

EL, bits [9:8]

Exception level. In Debug state, gives the current Exception level of the PE.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

A, bit [7]

SError exception pending. In Debug state, indicates whether an SError exception is pending:

- If EL2 is enabled in the current Security state, the PE is executing at EL0 or EL1, and HCR_EL2.{AMO, TGE} is {1, 0}, a virtual SError exception.
- Otherwise, if FEAT_E3DSE is implemented, the PE is executing at EL0, EL1, or EL2, and SCR_EL3.EnDSE is 1, a delegated SError exception.
- Otherwise, a physical SError exception.

A	Meaning
0b0	No SError exception pending.
0b1	SError exception pending.

A debugger can read EDSCR to check whether an SError exception is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

STATUS, bits [5:0]

On entering Debug state, the PE sets this field to indicate the reason for halting.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

STATUS	Meaning
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values are reserved.

The PE resets into Non-debug state. However, if the PE enters Debug state immediately after reset, then the reset value is overwritten with the reason for halting.

The reset behavior of this field is:

- On a Cold reset, this field resets to '000010'.

Access to this field is RO.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.2.41 EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

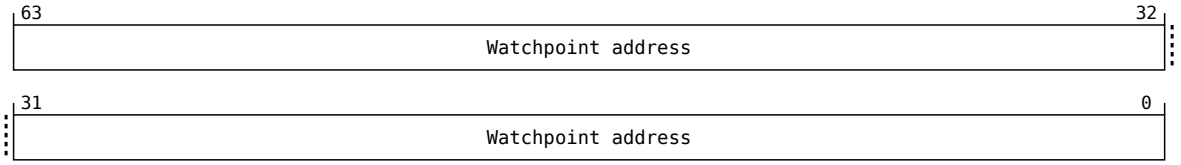
EDWAR is in the Core power domain

The value of this register is UNKNOWN if the PE is in Non-debug state, or if EDSCR.STATUS is not `0b101011`.

Attributes

EDWAR is a 64-bit register.

Field descriptions



ADDR, bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See 'Exception syndrome information and preferred return address'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDWAR

EDWAR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x030`	EDWAR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register return an ERROR.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.2.42 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

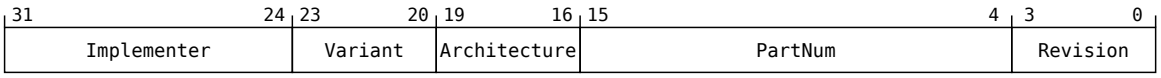
The power domain of MIDR_EL1 is IMPLEMENTATION DEFINED

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register MIDR_EL1[31:0].

Attributes

MIDR_EL1 is a 32-bit register.

Field descriptions



Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is RO.

Variant, bits [23:20]

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture, bits [19:16]

Architecture version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MIDR_EL1

MIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD00	MIDR_EL1

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register are IMPLEMENTATION DEFINED.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.2.43 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

OSLAR_EL1 is in the Core power domain

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

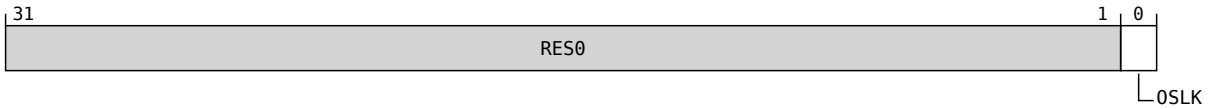
If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use EDPRSR.OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x300	OSLAR_EL1

Accessible as follows:

- When (DoubleLockStatus() || (!IsCorePowered())) || ((!AllowExternalDebugAccess(addrdesc)) && IsFeatureImplemented(FEAT_Debugv8p2)), accesses to this register return an ERROR.
- When AllowExternalDebugAccess(addrdesc) and SoftwareLockStatus(), accesses to this register are WI.
- When AllowExternalDebugAccess(addrdesc) and !SoftwareLockStatus(), accesses to this register are WO.
- Otherwise, accesses to this register are IMPLEMENTATION DEFINED.

Non-Confidential

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4 Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

Note

The architecturally-defined triggers must not be multiplexed.

Configuration

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain

If it is implemented in the Core power domain, then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

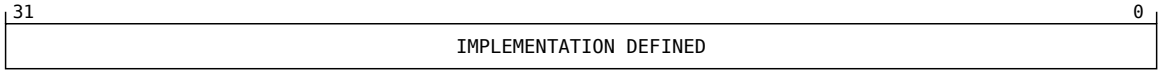
This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ASICCTL

ASICCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x144	ASICCTL

Accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess(addrdesc), and SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are IMPLEMENTATION DEFINED.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.2 CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears the application triggers.

Configuration

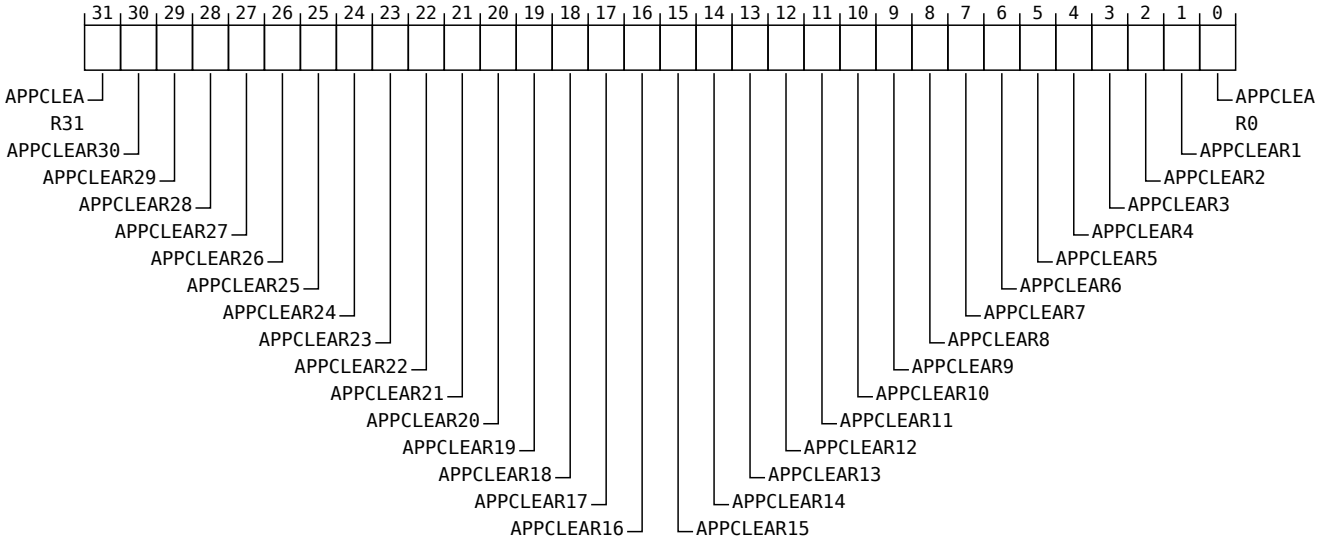
CTIAPPCLEAR is in the Debug power domain

External register CTIAPPCLEAR bits [31:0] are architecturally mapped to External register CTIAPPSET[31:0].

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions



APPCLEAR<x> , bits [x], for x = 31 to 0

Application trigger <x> disable.

Writing to this bit has the following effect:

APPCLEAR<x>	Meaning
0b0	No effect.
0b1	Clear corresponding application trigger to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPPULSE.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RAZ/W1C.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x018	CTIAPPCLEAR

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.3 CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

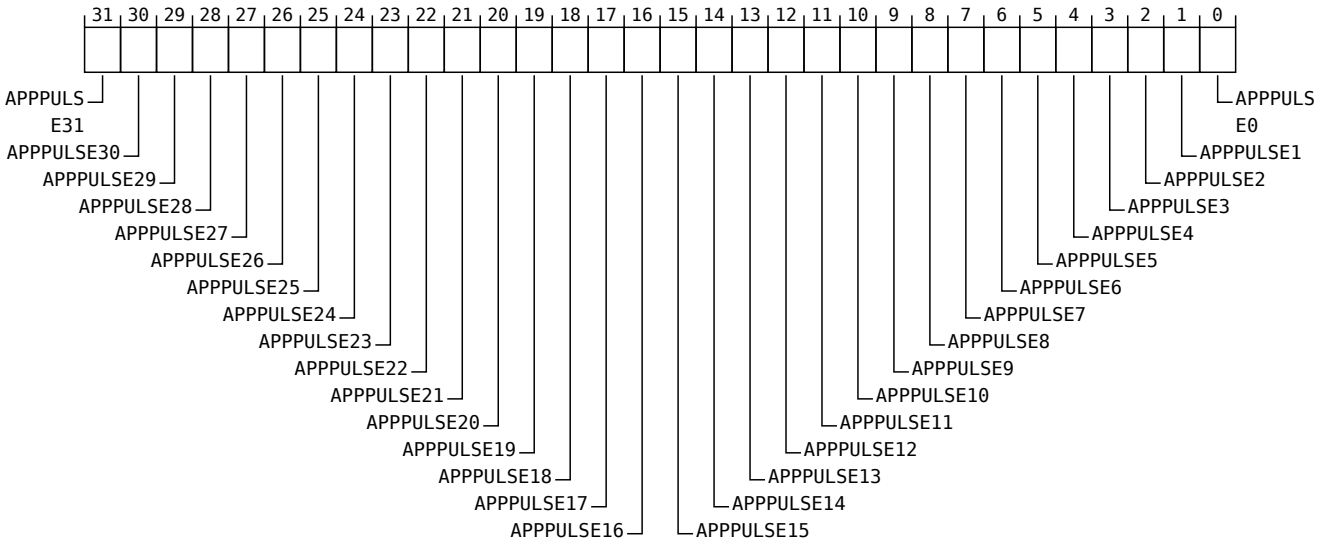
Configuration

CTIAPPPULSE is in the Debug power domain

Attributes

CTIAPPPULSE is a 32-bit register.

Field descriptions



APPPULSE<x> , bits [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

APPPULSE<x>	Meaning
0b0	No effect.
0b1	Channel <x> event pulse generated.

Note

- The CTIAPPPULSE operation does not affect the state of the application trigger. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/UNKNOWN.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CTIAPPPULSE

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x01C	CTIAPPPULSE

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets the application triggers.

Configuration

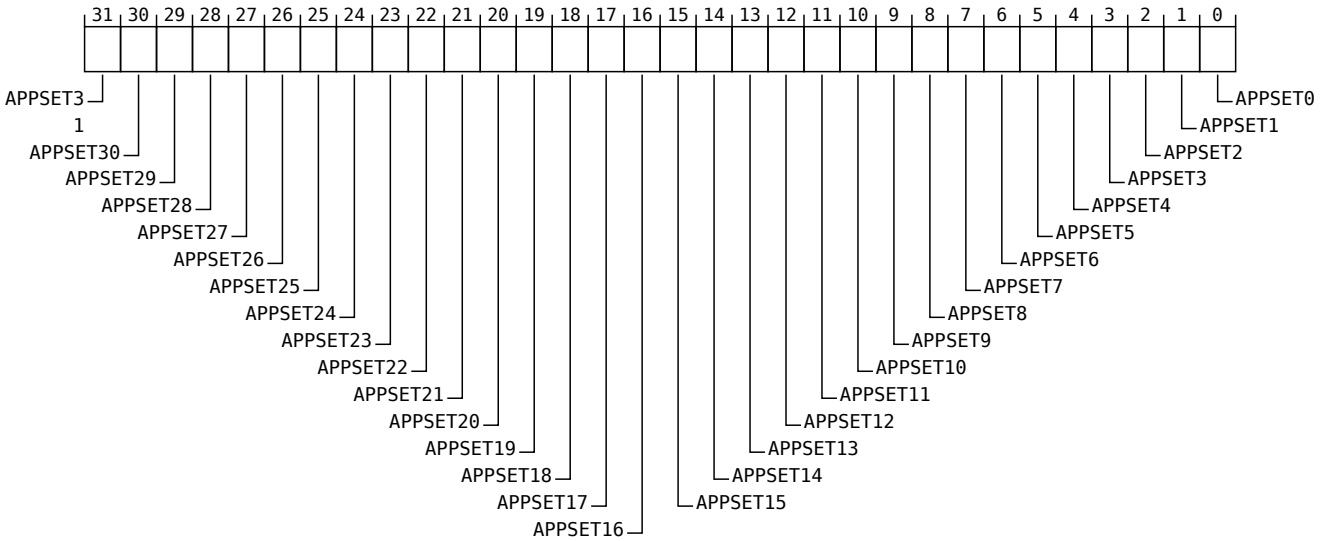
CTIAPPSET is in the Debug power domain

External register CTIAPPSET bits [31:0] are architecturally mapped to External register CTIAPPCLEAR[31:0].

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions



APPSET<x> , bits [x], for x = 31 to 0

Application trigger <x> enable.

APPSET<x>	Meaning
0b0	Reading this means the application trigger is inactive. Writing this has no effect.
0b1	Reading this means the application trigger is active. Writing this sets the corresponding application trigger to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPPULSE.

The reset behavior of this field is:

- On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is W1S.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x014	CTIAPPSET

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

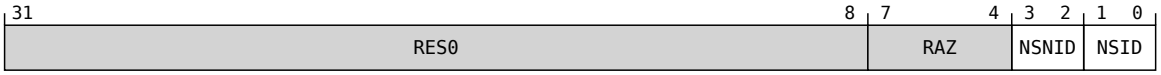
CTIAUTHSTATUS is in the Debug power domain

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SNID.

NSID, bits [1:0]

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SID.

Accessing CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFB8	CTIAUTHSTATUS

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

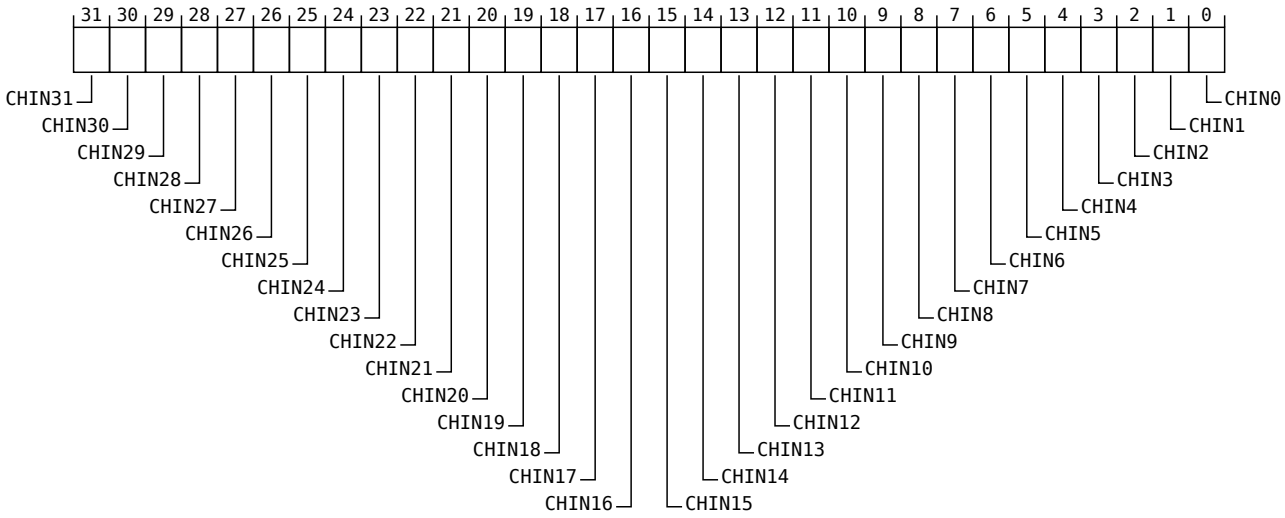
Configuration

CTICHINSTATUS is in the Debug power domain

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions



CHIN<n> , bits [n], for n = 31 to 0

Input channel <n> status.

CHIN<n>	Meaning
0b0	Input channel <n> is inactive.
0b1	Input channel <n> is active.

If the ECT channels do not support multicycle events, then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

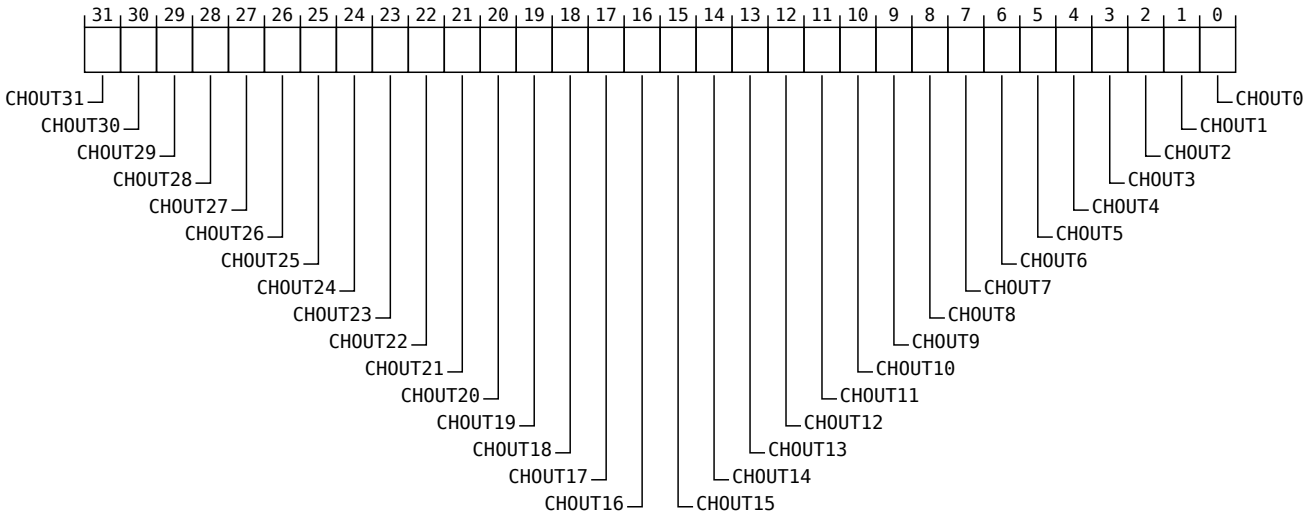
Configuration

CTICHOUTSTATUS is in the Debug power domain

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions



CHOUT<n> , bits [n], for n = 31 to 0

Output channel <n> status.

CHOUT<n>	Meaning
0b0	Output channel <n> is inactive.
0b1	Output channel <n> is active.

If the ECT channels do not support multicycle events, then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

Note

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTICHOUTSTATUS

CTICHOUTSTATUS can be accessed through the external debug interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Offset	Instance
CTI	0x13C	CTICHOUTSTATUS

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Component Identification scheme’.

Configuration

CTICIDR0 is in the Debug power domain

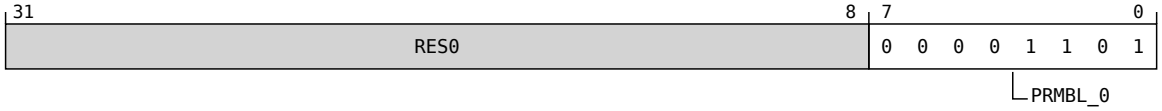
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as `0x0D`

Access to this field is RO.

Accessing CTICIDR0

CTICIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFF0`	CTICIDR0

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Component Identification scheme’.

Configuration

CTICIDR1 is in the Debug power domain

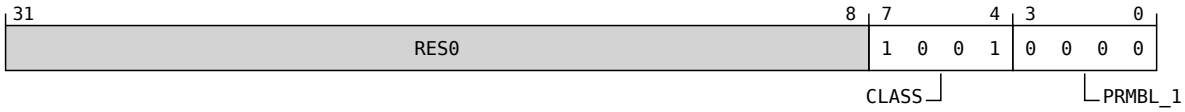
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000

Access to this field is RO.

Accessing CTICIDR1

CTICIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF4	CTICIDR1

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Component Identification scheme’.

Configuration

CTICIDR2 is in the Debug power domain

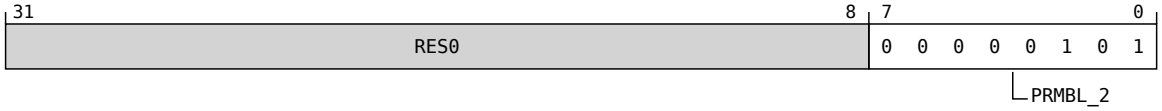
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as `0x05`

Access to this field is RO.

Accessing CTICIDR2

CTICIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFF8`	CTICIDR2

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.11 CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Component Identification scheme’.

Configuration

CTICIDR3 is in the Debug power domain

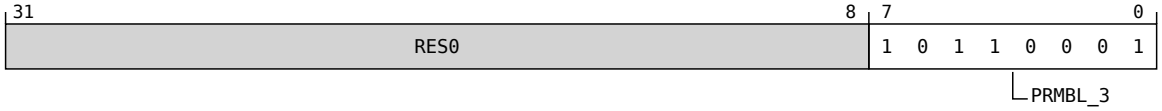
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as `0xB1`

Access to this field is RO.

Accessing CTICIDR3

CTICIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFFC`	CTICIDR3

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.12 CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

CTICLAIMCLR is in the Debug power domain

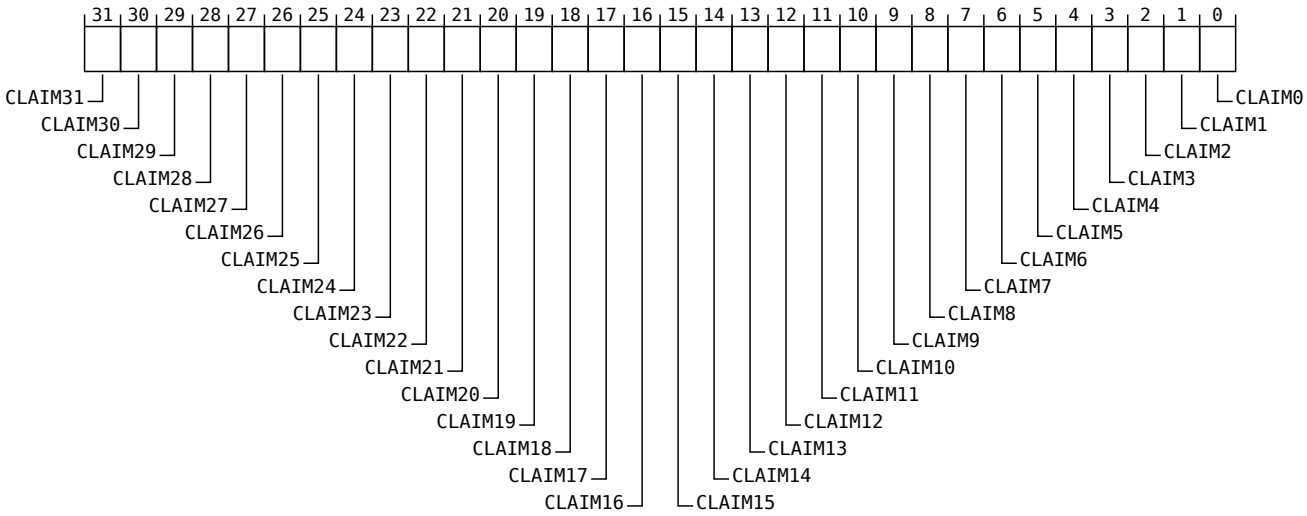
External register CTICLAIMCLR bits [31:0] are architecturally mapped to External register CTICLAIMSET[31:0].

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions



CLAIM<m> , bits [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in CTICLAIMSET.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing this field has the following behavior:

- When m >= NUM_CTI_CLAIM_TAGS, access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.13 CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configuration

CTICLAIMSET is in the Debug power domain

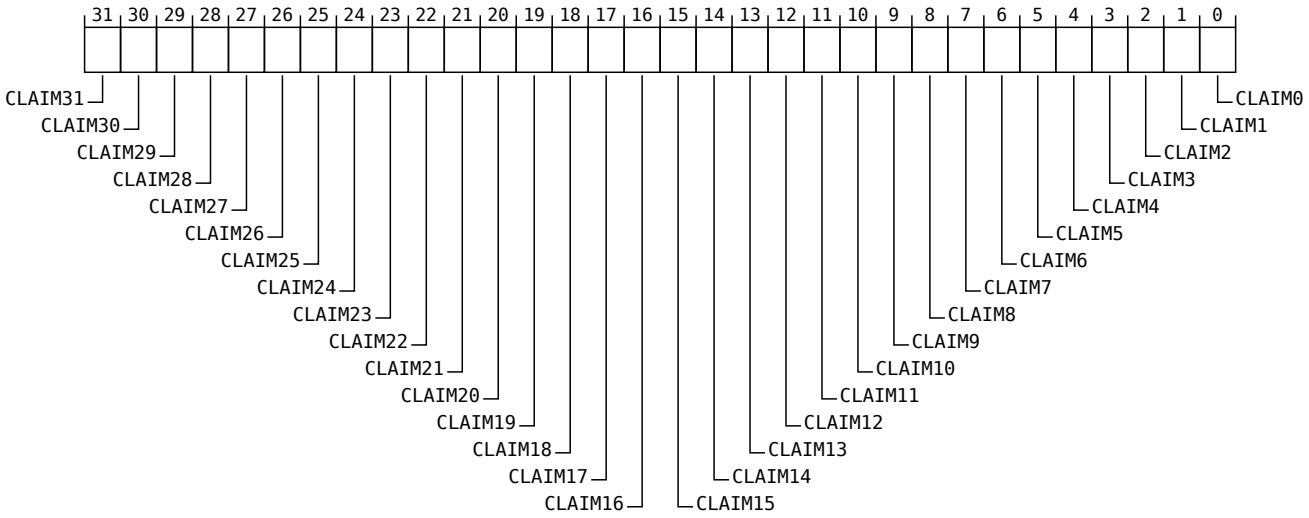
External register CTICLAIMSET bits [31:0] are architecturally mapped to External register CTICLAIMCLR[31:0].

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions



CLAIM<m> , bits [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing this field has the following behavior:

- When m >= NUM_CTI_CLAIM_TAGS, access to this field is RAZ/WI.
- Otherwise, access to this field is RAO/W1S.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

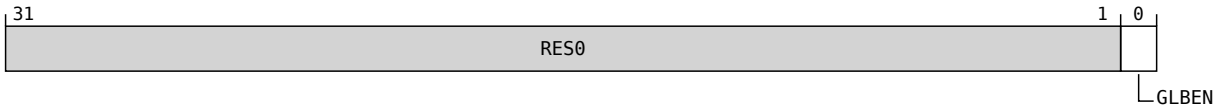
Configuration

CTICONTROL is in the Debug power domain

Attributes

CTICONTROL is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
0b0	CTI mapping functions and application trigger disabled.
0b1	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is CONSTRAINED UNPREDICTABLE which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On a External debug reset, this field resets to '0'.

Accessing CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

Accessible as follows:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.15 CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF0 is in the Debug power domain

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

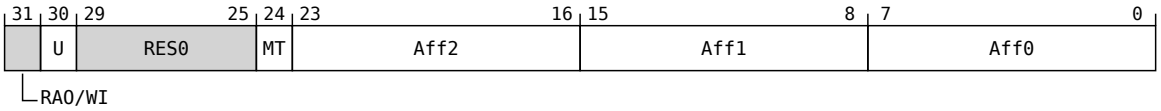
Arm recommends that the CTI is CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVAFF0

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF1 is in the Debug power domain

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

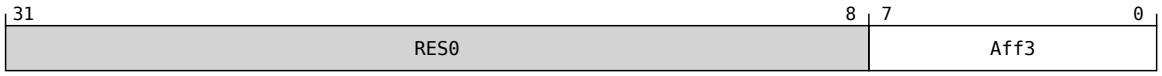
Arm recommends that the CTI is CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of CTIDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configuration

CTIDEVARCH is in the Debug power domain

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

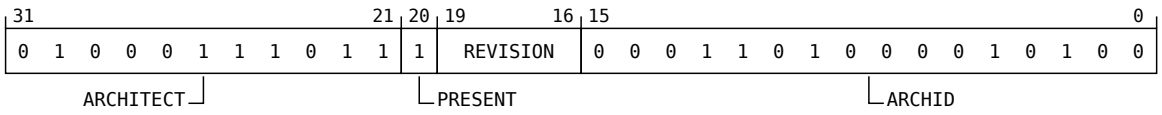
Arm recommends that the CTI is CTIv2.

If this register is not implemented, CTIDEVAFF0 and CTIDEVAFF1 are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions



ARCHITECT, bits [31:21]

Defines the architect of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0b0100`.

Bits [27:21] are the JEP106 identification code, `0b0111011`.

Reads as `0b01000111011`

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the CTIDEVARCH register is present.

Reads as `0b1`

Access to this field is RO.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
`0b0000`	First revision.
`0b0001`	As `0b0000`, and also adds support for CTIDEVCTL.

All other values are reserved.

When FEAT_DoPD is implemented, the value `0b0000` is not permitted.

Access to this field is RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, `0x1`.
- Bits [11:0] are the architecture part number, `0xA14`.

This corresponds to CTI architecture version CTIv2.

Reads as `0x1A14`

Access to this field is RO.

Accessing CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFBC`	CTIDEVARCH

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.18 CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

Purpose

Provides target-specific device controls

Configuration

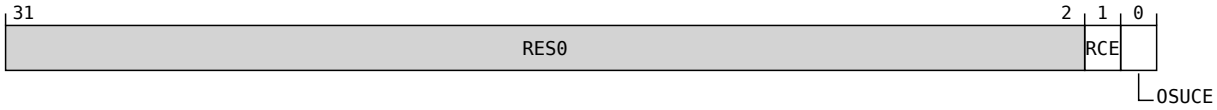
CTIDEVCTL is in the Debug power domain

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

Attributes

CTIDEVCTL is a 32-bit register.

Field descriptions



Bits [31:2]

Reserved, RES0.

RCE, bit [1]

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behavior of this field is:

- On a External debug reset, this field resets to '0'.

OSUCE, bit [0]

OS Unlock Catch Enable

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On a External debug reset, this field resets to '0'.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CTIDEVCTL

CTIDEVCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x150	CTIDEVCTL

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.19 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

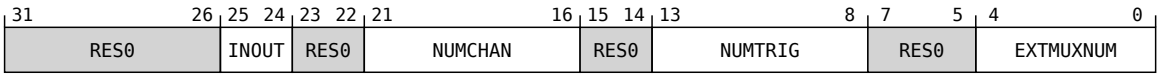
Configuration

CTIDEVID is in the Debug power domain

Attributes

CTIDEVID is a 32-bit register.

Field descriptions



Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INOUT	Meaning
0b00	CTIGATE does not mask propagation of input events from external channels.
0b01	CTIGATE masks propagation of input events from external channels.

All other values are reserved.

Access to this field is RO.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. For Armv8, valid values are:

- 0b000011 3 channels (0..2) implemented.
- 0b000100 4 channels (0..3) implemented.
- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

This field has an IMPLEMENTATION DEFINED value.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

Access to this field is RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Upper bound for number of triggers. The indices of all implemented input and output triggers are less than this value.

This field has an IMPLEMENTATION DEFINED value.

There is no guarantee that all of the input and output triggers, including the highest numbered, are connected to any components, or that the implementation of input and output triggers is symmetrical.

Access to this field is RO.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, ASICCTL.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVID

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC8	CTIDEVID

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.20 CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

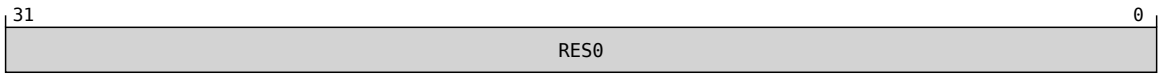
Configuration

CTIDEVID1 is in the Debug power domain

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions



Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID1

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC4	CTIDEVID1

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.21 CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

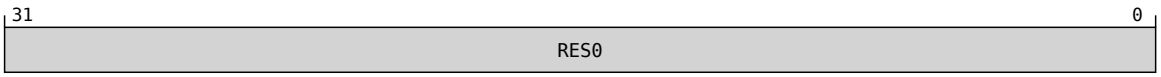
Configuration

CTIDEVID2 is in the Debug power domain

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions



Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID2

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC0	CTIDEVID2

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.22 CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's cross-trigger interface.

Configuration

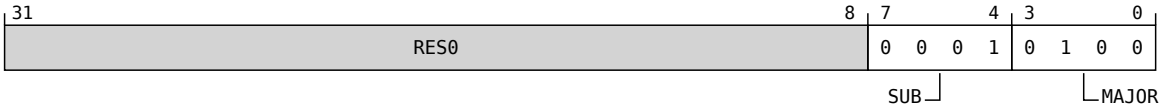
CTIDEVTYPE is in the Debug power domain

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as `0b0001`

Access to this field is RO.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Reads as `0b0100`

Access to this field is RO.

Accessing CTIDEVTYPE

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFCC`	CTIDEVTYPE

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.23 CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

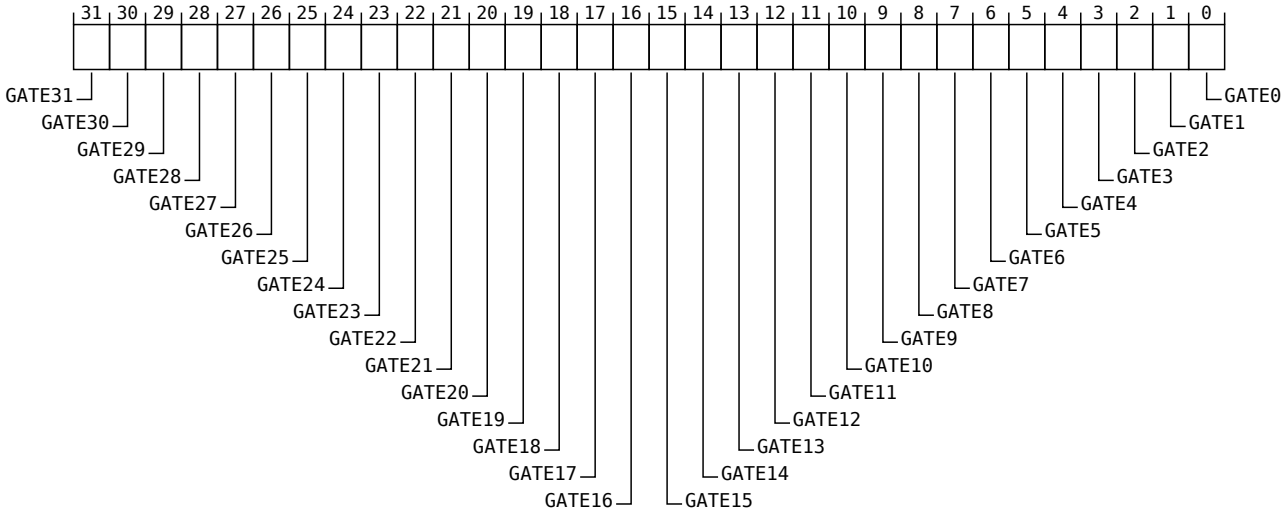
Configuration

CTIGATE is in the Debug power domain

Attributes

CTIGATE is a 32-bit register.

Field descriptions



GATE<x> , bits [x], for x = 31 to 0

Channel <x> gate enable.

GATE<x>	Meaning
0b0	Disable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.
0b1	Enable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.

If GATE<x> is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CTIGATE

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.24 CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configuration

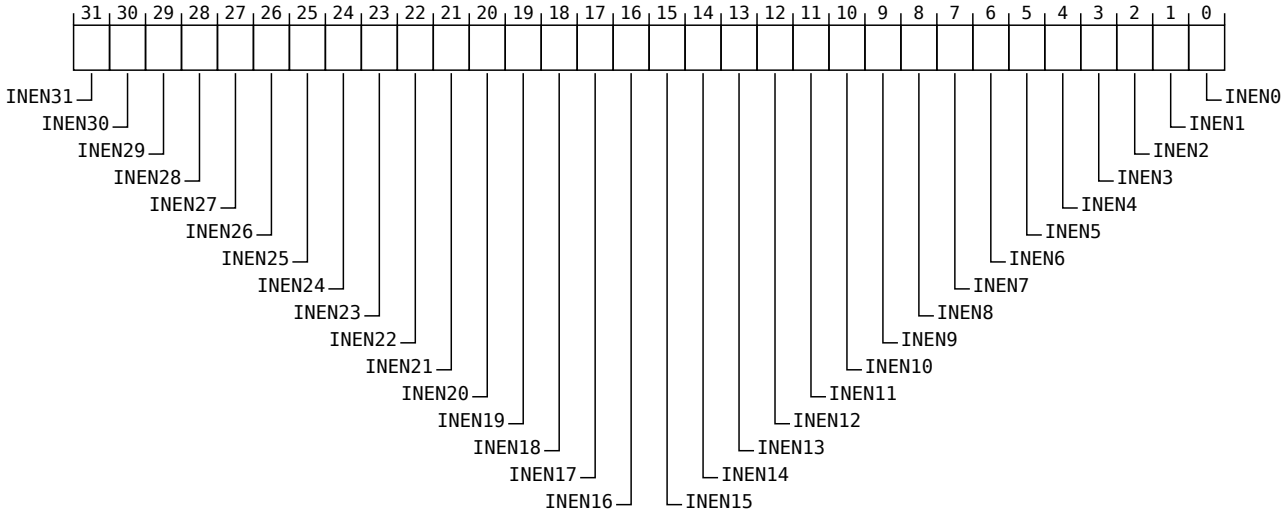
CTIINEN<n> is in the Debug power domain

If input trigger n is not implemented or not connected, CTIINEN<n> is RES0.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions



INEN<x> , bits [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

INEN<x>	Meaning
0b0	Input trigger <n> will not generate an event on output channel <x>.
0b1	Input trigger <n> will generate an event on output channel <x>.

The reset behavior of this field is:

- On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Offset	Instance
CTI	0x020 + (4 * ↪n)	CTIINEN<n>

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.25 CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

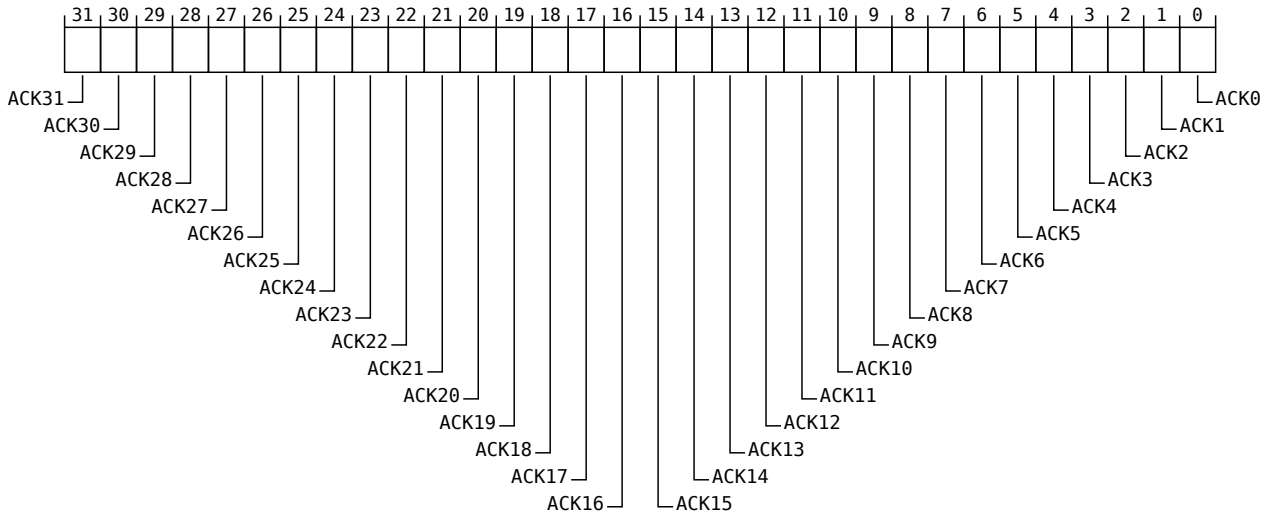
Configuration

CTIINTACK is in the Debug power domain

Attributes

CTIINTACK is a 32-bit register.

Field descriptions



ACK<n> , bits [n], for n = 31 to 0

Acknowledge for output trigger <n>.

If any of the following is true, writes to ACK<n> are ignored:

- n >= CTIDEVID.NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, ACK<n> is RES0:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

ACK<n>	Meaning
0b0	No effect
0b1	Deactivate the trigger.

Accessing this field has the following behavior:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/UNKNOWN.

Accessing CTIINTACK

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x010`	CTIINTACK

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.26 CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

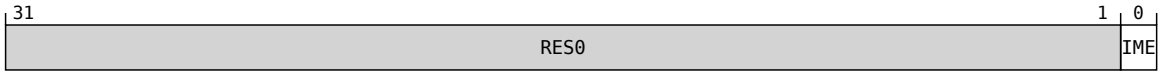
The power domain of CTIITCTRL is IMPLEMENTATION DEFINED

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.

Accessing CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xF00	CTIITCTRL

Accessible as follows:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are IMPLEMENTATION DEFINED.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.27 CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILAR is in the Debug power domain

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

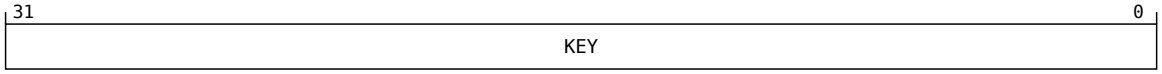
Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

When CTI Software Lock is implemented:

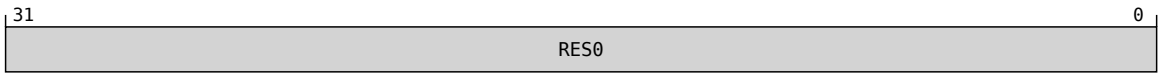


KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:



Otherwise

Bits [31:0]

Reserved, RES0.

Accessing CTILAR

CTILAR can be accessed through the memory-mapped interface:

Component	Offset	Instance
CTI	`0xFB0`	CTILAR

Accesses to this register are WO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.28 CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILSR is in the Debug power domain

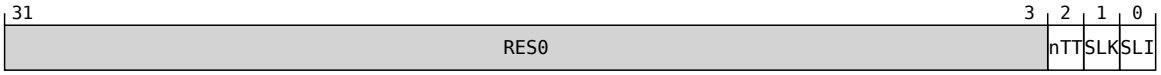
If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLK, bit [1]

When CTI Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On a External debug reset, this field resets to '1'.

Otherwise:

Reserved, RAZ.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is RO.

Accessing CTILSR

CTILSR can be accessed through the memory-mapped interface:

Component	Offset	Instance
CTI	0xFB4	CTILSR

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.29 CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configuration

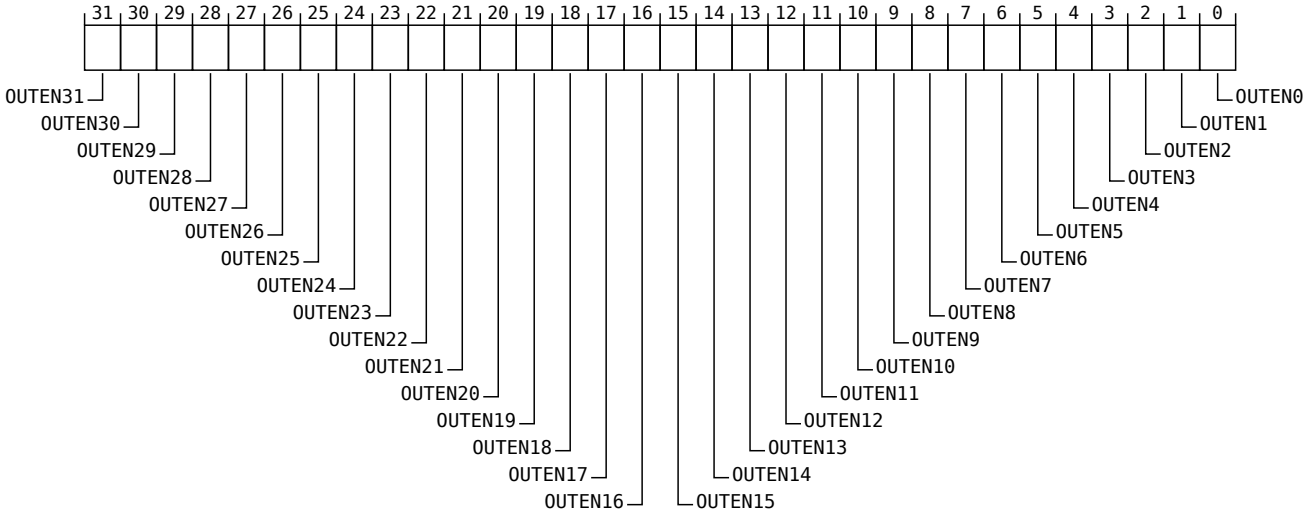
CTIOUTEN<n> is in the Debug power domain

If output trigger n is not implemented or not connected, CTIOUTEN<n> is RES0.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions



OUTEN<x> , bits [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

OUTEN<x>	Meaning
0b0	An event on input channel <x> will not cause output trigger <n> to be asserted.
0b1	An event on input channel <x> will cause output trigger <n> to be asserted.

The reset behavior of this field is:

- On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x0A0 + (4 * n)`	CTIOUTEN<n>

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.30 CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR0 is in the Debug power domain

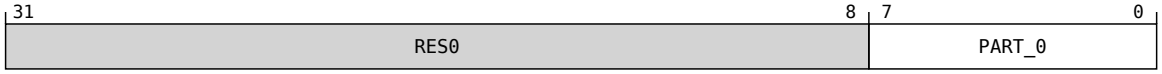
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR0

CTIPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE0	CTIPIDR0

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.31 CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR1 is in the Debug power domain

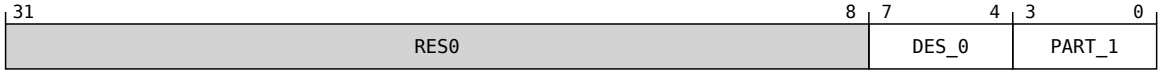
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR1

CTIPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFE4`	CTIPIDR1

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.32 CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR2 is in the Debug power domain

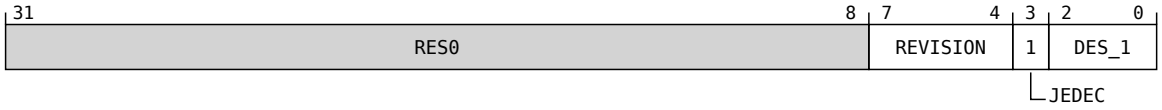
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as `0b1`

Access to this field is RO.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR2

CTIPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFE8`	CTIPIDR2

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.33 CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR3 is in the Debug power domain

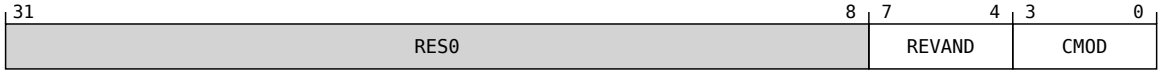
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR3

CTIPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFEC	CTIPIDR3

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.34 CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

CTIPIDR4 is in the Debug power domain

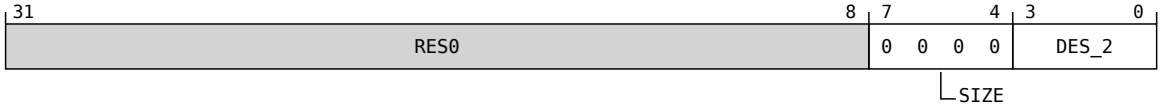
This register is required for CoreSight compliance.

Implementation of this register is OPTIONAL.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as `0b0000`

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR4

CTIPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFD0`	CTIPIDR4

Accesses to this register are RO.

E9.4.35 CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

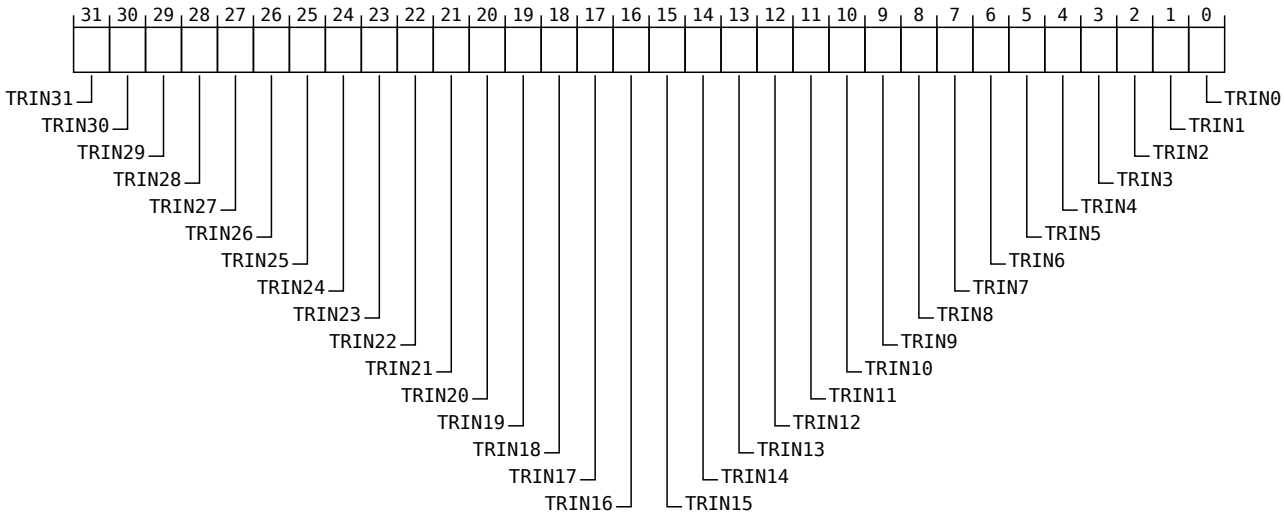
Configuration

CTITRIGINSTATUS is in the Debug power domain

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions



TRIN<n> , bits [n], for n = 31 to 0

Trigger input <n> status.

TRIN<n>	Meaning
0b0	Input trigger n is inactive.
0b1	Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTITRIGINSTATUS

CTITRIGINSTATUS can be accessed through the external debug interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Offset	Instance
CTI	0x130	CTITRIGINSTATUS

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

E9.4.36 CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

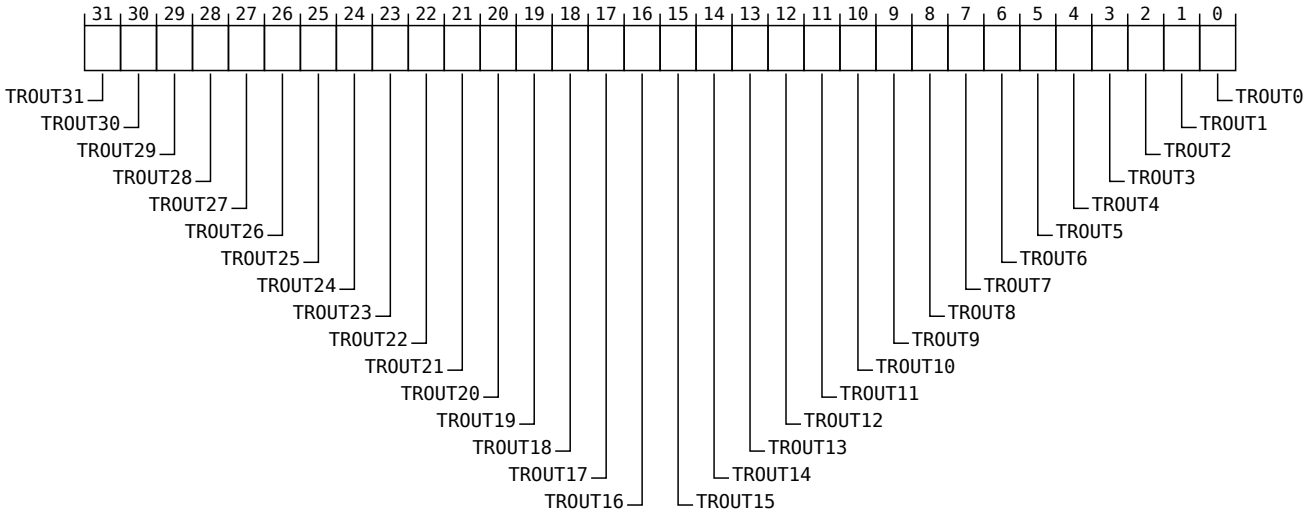
Configuration

CTITRIGOUTSTATUS is in the Debug power domain

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions



TROUT<n> , bits [n], for n = 31 to 0

Trigger output <n> status.

If n is less than CTIDEVID.NUMTRIG, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

TROUT<n>	Meaning
0b0	Output trigger n is inactive.
0b1	Output trigger n is active.

Otherwise when n is less than CTIDEVID.NUMTRIG, it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all of the following are true:
  - Any of the following are true:
    - Output trigger <n> is not implemented or not connected

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

— All of the following are true:
- Output trigger <n> is self-acknowledging
- CTI does not implement multicycle channel events

- an implementation implements TROUT<n>

- Otherwise, access to this field is RO.

Accessing CTITRIGOUTSTATUS

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x134	CTITRIGOUTSTATUS

Accesses to this register are RO.

Chapter F1
Requirements for Memory-mapped Components

This chapter provides some additional information about memory-mapped components. It contains the following sections:

- Supported access sizes.
- Synchronization of memory-mapped registers.
- Access requirements for reserved and unallocated registers.

F1.1 Supported access sizes

The information in this section applies to all accesses to memory-mapped components of the Armv8 and later architectures, unless a register or component description explicitly states otherwise.

The memory access sizes that are supported by any peripheral are IMPLEMENTATION DEFINED by the peripheral.

When FEAT_Debugv8p4 is implemented, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

An implementation of a memory-mapped component that is compatible with the Armv8 and later architectures must support the following:

- Word-aligned 32-bit accesses to access 32-bit registers.
- If the system includes any component with direct memory access to the memory-mapped component which needs to access the component but does not support making 64-bit accesses, word-aligned 32-bit accesses to either half of a 64-bit register that is mapped to a doubleword-aligned pair of adjacent 32-bit locations. This includes, but is not limited to:
  - A PE that implements a 32-bit ISA that does not include 64-bit memory operations. For example, Armv8-M T32.
  - A Debug Access Port that cannot make 64-bit accesses.

  Note

  Some memory-mapped components of the Arm architecture require support for word-aligned 32-bit accesses to either half of a 64-bit memory mapped register even if all components with direct memory access to the memory-mapped component support making 64-bit accesses. These include:

  - The memory-mapped interface to the external debug and CTI registers that are described in External Debug Register Descriptions.
  - The memory-mapped interfaces to the Generic Timer registers that are described in System Level Implementation of the Generic Timer.
  - When FEAT_PMUv3_EXT32 is implemented, the memory-mapped interfaces to the Performance Monitors registers that are described in Recommended External Interface to the Performance Monitors.
- Doubleword-aligned 64-bit accesses to access 64-bit registers that are mapped to a doubleword-aligned pair of adjacent 32-bit locations.

Unless otherwise specified, all registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte accesses.
- Halfword accesses.
- Unaligned word accesses. These accesses are not word single-copy atomic.
- Unaligned doubleword accesses. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair that forms a 64-bit register.
- Quadword accesses or higher accesses.
- Exclusive accesses.

For unsupported accesses, it is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether:

- The access generates an External abort or not.
- The defined side-effects of a read occur or not. A read returns an IMPLEMENTATION DEFINED value that might be UNKNOWN.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- A write is ignored or sets the accessed register or registers to UNKNOWN values.
- The access generates a fault handling interrupt or not.

Such accesses are often due to software faults. That is, software has accessed a location in a way that the component does not support. See also *Arm® Reliability, Availability, and Serviceability (RAS) System Architecture, for A-profile architecture* (ARM IHI 0100) for recommended behavior on accesses that constitute software faults.

For memory-mapped accesses from a PE that complies with an Arm architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory that is accessed, determine the size of the access that is made by an instruction. Example F1-1 shows this.

Example F1-1 Access sizes for memory-mapped accesses

Two Load Doubleword instructions that are made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

The Arm architecture does not require the size of each element that is accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Unless otherwise specified by the component, any access to a memory-mapped component of the Arm architecture is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory type, and only single register load and store instructions, to create memory accesses that are supported by the peripheral. For more information, see Memory types and attributes.

F1.2 Synchronization of memory-mapped registers

This section describes the synchronization requirements for the memory-mapped accesses to System registers.

This section refers to accesses to external system control registers as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

Note

Synchronization requirements for AArch64 System registers define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads and external writes as indirect writes.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. Unless otherwise stated, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible as external system control registers.

Unless required to be observable to all observers in finite time, without explicit synchronization, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a Context synchronization event.
- The Context synchronization event was executed after the write completed.

The order and synchronization of direct reads and direct writes of System registers is defined by Synchronization requirements for AArch64 System registers.

The external agent must be able to guarantee completion of a write. For example, the agent can:

- Mark the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- If the register is read/write and reads are not destructive, read back the value written.
- Use some guaranteed property of the connection between the PE and the external agent.

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the Context synchronization event, and relying on the memory ordering rules provided by the memory model.

External reads and external write complete in the order in which they arrive at the PE. For accesses to different register locations, the external agent must create this order. The agent can:

- Mark the memory as Device-nGnRnE or Device-nGnRE.
- Use the appropriate memory barriers.
- Rely on some guaranteed property of the connection between the PE and the external agent.

However, the external agent cannot force the synchronization of completed writes.

In a simple sequential execution, an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.

For example, some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means the simultaneous writes must be merged.

F1.3 Access requirements for reserved and unallocated registers

This section describes the access requirements for reserved and unallocated memory-mapped components.

The following information relates to certain types of reserved accesses:

- Reads and writes of unallocated locations. These accesses are reserved for the architecture.
- Reads and writes of locations for features that are not implemented, including:
  - OPTIONAL features that are not implemented.
  - Breakpoints and watchpoints that are not implemented.
  - Performance Monitors counters that are not implemented.
  - CTI triggers that are not implemented.
  - Error records that are not implemented.

  These accesses are reserved.
- Reads of WO locations. These accesses are reserved for the architecture.
- Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses are normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture. Software must treat reserved accesses as RES0.

Chapter F2
System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the Generic Timer. It contains the following sections:

- About the Generic Timer specification.
- Memory-mapped counter module.
- Memory-mapped timer components.

Note

- Generic Timer memory-mapped register descriptions describes the System level Generic Timer registers. These registers are memory-mapped.
- Additional Information for Implementations of the Generic Timer gives additional information, that does not form part of the architectural definition of a system level implementation of the Generic Timer.
- The Generic Timer in AArch64 state gives a general description of the AArch64 state view of the Generic Timer, and describes the AArch64 System register interface to the Generic Timer.

Non-Confidential

F2.1 About the Generic Timer specification

The Generic Timer in AArch64 state describes the Arm Generic Timer and its implementation as seen from AArch64 state. These chapters include the definition of the low-latency System register interface to the Generic Timer. However, the Arm Generic Timer architecture also defines a memory-mapped component, that comprises:

- A memory-mapped counter module, that controls the generation of the Count value used by the Generic Timer. This memory-mapped counter module is required in any Arm Generic Timer implementation that requires software control of the Count value of the Generic Timer.
- Optional memory-mapped timer modules. These give a standardized way of providing timers for programmable system components other than PEs that implement the Arm architecture.

The full set of Generic Timer components summarizes these components as seen from AArch64 state. The system level components of the Generic Timer summarizes the system level components.

F2.1.1 Registers in the system level implementation of the Generic Timer

Registers that control components of the system level implementation of the Generic Timer are grouped into *frames*. This specification defines the registers in each frame, and their offsets within the frame. The system defines the position of each frame in the memory map. This means the base addresses for each frame are IMPLEMENTATION DEFINED.

Note

The final 12 words of the first or only 4KB block of a register memory frame is an ID block.

Each frame must be in its own memory page, or memory protection region, and must be aligned to the size of the translation granule or protection granule.

Note

When a system level implementation of the Generic Timer is accessed by a PE:

- Using a VMSA, each frame is in its own memory page, aligned to the size of the translation granule.
- Using a PMSA, each frame is in its own memory protection region, aligned to the size of the memory protection granule.

The following sections give more information about the requirements for the system level Generic Timer component:

- Endianness and supported access sizes.
- Power and reset domains for the system level implementation of the Generic Timer.

F2.1.1.1 Endianness and supported access sizes

All memory-mapped peripherals defined in the Arm architecture must be little-endian. This means the system-level Generic Timer registers, and the register frames, are little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the memory-mapped Generic Timer registers implementations must:

- Comply with the requirements of Supported access sizes.
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if all components with direct memory access to the Generic Timer support making 64-bit accesses.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F2.1.1.2 Power and reset domains for the system level implementation of the Generic Timer

The power and reset domains of the system level implementation of the Generic Timer are IMPLEMENTATION DEFINED as part of the system implementation. In register descriptions, they are called Timer resets to indicate they can be outside the PE power and reset domains defined by the remainder of this manual.

The Arm architecture requires that the CNTCR.{FCREQ, EN} and CNTSR.FCACK fields reset to 0. These Timer reset values apply only on powerup of the power domain in which the registers are implemented or a reset of the reset domain in which they are implemented.

Every other register, or register field, of a system level implementation of the Generic Timer resets to a value that is architecturally UNKNOWN if it has a meaningful reset value. These Timer resets apply on powerup of the power domain in which the register is implemented, and on a reset of the reset domain in which it is implemented.

F2.1.2 The system level components of the Generic Timer

Each system level component has one or two register frames. The possible system level components are:

The memory-mapped counter module, required

This module controls the system counter. It has two frames:

- A control frame, CNTControlBase.
- A status frame, CNTReadBase.

Memory-mapped counter module describes this component.

The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, CNTCTLBase.

The CNTCTLBase frame describes this frame.

Memory-mapped timers, optional

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the CNTBase*N* frame.
- Optionally provides an unprivileged view of the timer in the CNTEL0Base*N* frame.

N is the timer number, and the corresponding frame number, in the range 0-7.

The CNTBaseN and CNTEL0BaseN frames describes these frames.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F2.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. The CNTControlBase frame holds the registers for the memory-mapped counter, and provides:

- An RW control register, CNTCR, that provides:
  - An enable bit for the system counter.
  - An enable bit for Halt-on-debug. For more information, see Halt-on-debug.
  - A field that can be written to request a change to the counter resolution. This mechanism means that, for example, if the counter resolution is halved then the increment to the counter at each tick of the clock is doubled.
    For more information, see Control of counter resolution and increment.

  Writes to this register are rare.
- A RO status register, CNTSR, that provides:
  - A bit that indicates whether the system counter is halted because of an asserted Halt-on-debug signal.
  - A field that indicates whether a requested change to the counter resolution has completed.
- Two contiguous 32-bit RW registers that hold the current system counter value, CNTCV. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

  The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.

  Writes to these registers are rare.
- A *Frequency modes table* of one or more 32-bit entries, where:
  - The first entry in the table defines the *base frequency* of the system counter. It is IMPLEMENTATION DEFINED whether the base frequency indicates the effective frequency of the counter, or the maximum counter resolution.
    Arm recommends that the base frequency indicates the maximum counter resolution.
  - Each subsequent entry in the table defines an alternative frequency of the system counter, that must be an exact divisor of the base frequency.

  A 32-bit zero entry immediately follows the last table entry.

  This table can be RO or RW. For more information, see The Frequency modes table.

In an implementation with multiple physical address spaces, CNTControlBase is only accessible by accesses from the most secure physical address space. For example, in a system with Secure and Non-secure memory maps, CNTControlBase is only accessible by Secure accesses.

In addition, the CNTReadBase frame includes a read-only copy of the system counter value, CNTCV, as two contiguous 32-bit RO registers. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

Counter module control and status register summary describes CNTReadBase and CNTControlBase memory maps, and the registers in each frame.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F2.2.1 Control of counter resolution and increment

The system counter has a fixed *base frequency*, and must maintain the required counter accuracy, meaning Arm recommends that it does not gain or lose more than ten seconds in a 24-hour period, see The system counter. However, the counter can operate at a lower resolution than the base frequency, using a correspondingly larger increment. For example, it can increment by a value four times larger when running at a quarter of the base frequency. Any lower resolution operation, and any switching between resolutions, must not reduce the accuracy of the counter.

Control of the system counter resolution and increment is provided only through the memory-mapped counter module. The following sections describe this control:

- The Frequency modes table.
- Changing the system counter and increment.

F2.2.1.1 The Frequency modes table

The Frequency modes table starts at offset `0x20` in the CNTControlBase frame.

Table entries are 32-bits, and each entry specifies a selected frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

When the system counter is operating at a lower frequency than the base frequency, the increment applied at each counter update is increased by the ratio of the base frequency and the selected frequency.

Note

Where the effective frequency and the base frequency are not the same, the increment is not solely defined by the ratio of the base frequency and the selected frequency. For example, a counter with an effective frequency of 1GHz and a base frequency of 125MHz will increment by a value of 8 on each tick of the base frequency. If the Frequency modes table provides an additional selected frequency of 31.25MHz, then when this frequency is selected the counter increments by 32 on each tick of the selected frequency.

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the Frequency modes table is in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the CNTControlBase memory map shows the table region as RO or RW.

Arm strongly recommends that the Frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED, up to this limit.

Note

- Arm considers it likely that implementations will require significantly fewer entries than the architectural limit.
- In the CNTControlBase frame, the offset range `0x0C0-0x0FC` can be used for IMPLEMENTATION DEFINED registers. If any registers are defined in this space, then the Frequency modes table cannot extend beyond offset `0x0B8`, with a zero word at offset `0x0BC`. This means that if any IMPLEMENTATION DEFINED registers are defined the maximum number of entries in the table is 40, including the zero-word end marker.

F2.2.1.2 Changing the system counter and increment

The value of the CNTCR.FCREQ field specifies which entry in the Frequency modes table specifies the selected frequency.

Changing the value of CNTCR.FCREQ requests a change to the selected frequency. To ensure the frequency change does not affect the overall accuracy of the counter, a change is made as follows:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When changing from a higher frequency to a lower frequency, the counter:
  1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
  2. Switches to operating at the lower frequency.
- When changing from a lower frequency to a higher frequency, the counter:
  1. Waits until the end of the current lower-frequency cycle.
  2. Makes the counter increment required for operation at that lower frequency.
  3. Switches to operating at the higher frequency.

When the frequency has changed, CNTSR is updated to indicate the new selected frequency. Therefore, a system component that is waiting for a frequency change can poll CNTSR to detect the change.

F2.2.2 Halt-on-debug

The CNTCR register provides an enable bit for an OPTIONAL Halt-on-debug signal.

When the CNTCR.HDBG bit is set to 1, and the Halt-on-debug signal is implemented and asserted, the system counter is halted. Otherwise, the system counter ignores the state of this signal.

Where the system counter implements a Halt-on-debug signal and the system supports halting the system counter, Arm recommends that the Halt-on-debug signal can be controlled by a debugger using the Embedded Cross-Trigger (ECT) using a system-level cross-trigger interface that includes:

- A debug request output trigger event that asserts the Halt-on-debug signal.
- A restart request output trigger event that deasserts the Halt-on-debug signal.

For more information, see About the Embedded Cross-Trigger.

Note

Software must use the Halt-on-debug enable bit to ensure that the timers cannot be halted maliciously in an attempt to prohibit progress.

For more information about Halt-on-debug, contact Arm.

F2.2.3 Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory *frames*:

- A control frame, with base address CNTControlBase.
- A status frame, with base address CNTReadBase.

Each of these register memory frames is in its own memory page or memory protection region, and the frame base address points to the start of this region. Each base address must be aligned to the size of the translation granule or protection granule.

Note

Each frame of a memory-mapped Generic Timer takes the name of its base address.

In each register memory frame, the memory at offset `0xFD0-0xFFF` is reserved for twelve 32-bit IMPLEMENTATION DEFINED ID registers, see the CounterID<n> register descriptions for more information.

Note

The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the counter is little-endian.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

In an implementation with multiple physical address spaces, CNTControlBase is only accessible by accesses from the most secure physical address space. For example, in a system with Secure and Non-secure memory maps, CNTControlBase is only accessible by Secure accesses.

Table F2-1 shows the CNTControlBase control registers, in order of their offsets from the CNTControlBase base address, for an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, and also has fewer than 39 CNTFID<n> registers. The Frequency modes table describes how this memory map differs if more CNTFID<n> registers are implemented.

Generic Timer memory-mapped register descriptions describes each of these registers.

Table F2-1 CNTControlBase memory map

Offset	Name	Type	Description
0x000	CNTCR	RW	Counter Control Register.
0x004	CNTSR	RO	Counter Status Register.
0x008	CNTCV[31:0]	RW	Counter Count Value register.
0x00C	CNTCV[63:32]	RW	
0x010	CNTSCR[a]	RW	Counter Scale Register.
0x014-0x018	-	RES0	Reserved.
0x01C	CNTID[a]	RO	Counter Identification Register.

F2.3 Memory-mapped timer components

This part of the Arm Generic Timer specification defines an optional memory-mapped timer component. This can be implemented as part of any programmable system component that does not incorporate a System register mapped Arm Generic Timer, to provide that system component with the timer functionality of an Arm Generic Timer.

The memory map consists of up to eight timer *frames*. The base address of a frame is CNTBaseN, where *N* numbers from 0 up to a maximum permitted value of 7.

Each CNTBaseN timer frame:

- Provides its own set of timers and associated interrupts.
- Is implemented in its own memory page or memory protection region.
- Is implemented at a base address, identified as CNTBaseN, that is aligned to the size of the translation granule or memory protection region.

For each implemented CNTBaseN frame the system can optionally provide an unprivileged view of the frame, described as the EL0 view of the frame. The base address of this second view of the CNTBaseN frame is CNTEL0BaseN.

Note

In the naming of the registers associated with a CNTBaseN or CNTEL0BaseN frame, the value of *N* is represented as <n>, for example CNTACR<n>.

If a CNTEL0BaseN frame is implemented:

- Is implemented in its own memory page or memory protection region and is aligned to the size of the translation granule or memory protection region.
- All registers visible in CNTBaseN, except for CNTVOFF and CNTEL0ACR, can be visible in CNTEL0BaseN.
  - Control fields in CNTEL0ACR determine whether each register is visible.
- The offsets of all visible registers are the same as their offsets in the CNTBaseN frame.

In addition to the implemented CNTBaseN and CNTEL0BaseN frames, the system must provide a single control frame at base address CNTCTLBase. CNTCTLBase must be implemented in its own memory page or memory protection region and is aligned to the size of the translation granule or memory protection region.

The system defines the position of each frame in the memory map. This means the values of each of the CNTBaseN, CNTEL0BaseN, and CNTCTLBase base addresses is IMPLEMENTATION DEFINED.

Note

The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the memory-mapped timers are little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:

- The CNTCTLBase frame.
- The CNTBaseN and CNTEL0BaseN frames.

Note

Providing a complete set of features in a system level implementation gives an implementation example for a system level Generic Timer implementation that provides equivalent features to a System registers Generic Timer implementation in a PE that includes all of the Exception levels.

F2.3.1 The CNTCTLBase frame

The CNTCTLBase frame contains:

- An identification register for the features of the memory-mapped counter and timer implementation.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Access controls for each CNTBaseN frame.
- A virtual offset register for frames that implement a virtual timer.

Table F2-3 shows the CNTCTLBase registers, in order of their offsets from the CNTCTLBase base address.

Note

CNTFRQ and CNTVOFF registers are also implemented in a System register interface to the Generic Timer.

Generic Timer memory-mapped register descriptions describes each of these registers.

Table F2-3 CNTCTLBase memory map

Offset	Register	Type	Security[a]	Description
0x000	CNTFRQ[b]	RW	Restricted	Counter Frequency register.
0x004	CNTNSAR	RW	Restricted	Counter Non-Secure Access register.
0x008	CNTTIDR	RO	No restrictions	Counter Timer ID register.
0x00C- 0x03F	-	RES0	-	Reserved.
0x040+4*N*[c]	CNTACR<n>	RW	Programmable[d]	Counter Access Control register *N*.
0x060- 0x07F	-	RES0	-	Reserved.
0x080+8*N*[c]	CNTVOFF<n>[31:0][b]	RW[e]	Programmable[d]	Virtual Offset register *N*. If the CNTBaseN frame has virtual timer capability then CNTVOFF<n> is implemented as an RW register, otherwise its location is RAZ/WI.
0x084+8*N*[c]	CNTVOFF<n>[63:32][b]	RW[e]		
0x0C0-0x0FC	-	RES0	-	Reserved.
0x100-0x7FC	-	-	-	IMPLEMENTATION DEFINED.
0x800-0xFBC	-	RES0	-	Reserved.
0xFC0-0xFCF	-	-	-	IMPLEMENTATION DEFINED.
0xFD0- 0xFFC	CounterID<n>	RO	No restrictions	Counter ID registers 0-11.

a. Access security restrictions in an implementation with multiple Security states. See the individual register descriptions and CNTNSAR for details on the restrictions. In an implementation that supports only a single Security state all registers are accessible as shown in the *Type* column.

b. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in Generic Timer registers and Generic Timer registers. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.

c. Implemented for each value of *N* from 0 to 7 for which a CNTBaseN frame is implemented.

d. The CNTNSAR determines the Non-secure accessibility of the CNTACR<n> and the CNTVOFF<n> in the CNTCTLBase frame. For more information, see the register descriptions.

e. Address is reserved, RAZ/WI if register not implemented.

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the CNTVOFF register that defines the virtual offset between the physical count and the virtual count. If a memory-mapped Generic Timer component does not distinguish between real time and virtual time, then it can implement CNTVOFF as RAZ/WI. Otherwise CNTVOFF is an RW register, and Arm strongly recommends that the system only permits access to CNTVOFF from EL2 or higher.

F2.3.2 The CNTBaseN and CNTEL0BaseN frames

Each CNTBaseN frame, or {CNTBaseN, CNTEL0BaseN} pair of frames, provides a memory-mapped counter and timer, see:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The CNTBaseN frame.
- The CNTEL0BaseN frame.
- CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames.

F2.3.2.1 The CNTBase*N* frame

Table F2-4 shows the CNTBaseN registers, in order of their offsets from the CNTBaseN base address. Whether a frame includes a virtual timer is IMPLEMENTATION DEFINED. If it does not, then memory at offsets `0x030-0x03C` is RAZ/WI. Except for CNTEL0ACR and the CounterID<n> registers, equivalent registers are also implemented in a System register interface to the timer component of a Generic Timer.

Generic Timer memory-mapped register descriptions describes each of these registers.

Table F2-4 CNTBase*N* memory map

Offset	Register	Type	Description
`0x000`	CNTPCT[31:0][a]	RO	Physical Count register.
`0x004`	CNTPCT[63:32][a]	RO	
`0x008`	CNTVCT[31:0][a]	RO	Virtual Count register.
`0x00C`	CNTVCT[63:32][a]	RO	
`0x010`	CNTFRQ[a]	RO[c]	Counter Frequency register.
`0x014`	CNTEL0ACR	RW[b]	Counter EL0 Access Control Register, optional in the CNTBaseN memory map.
`0x018`	CNTVOFF[31:0][a]	RO[c]	Virtual Offset register. If CNTVOFF in the CNTCTLBase frame is an RW register, a read of this register returns the value of that register. Otherwise is RAZ.
`0x01C`	CNTVOFF[63:32][a]	RO[c]	
`0x020`	CNTP_CVAL[31:0][a]	RW	Physical Timer CompareValue register.
`0x024`	CNTP_CVAL[63:32][a]	RW	
`0x028`	CNTP_TVAL[a]	RW	Physical TimerValue register.
`0x02C`	CNTP_CTL[a]	RW	Physical Timer Control register.
`0x030`	CNTV_CVAL[31:0][a]	RW[b]	Virtual Timer CompareValue register, optional in the CNTBaseN memory map.
`0x034`	CNTV_CVAL[63:32][a]	RW[b]	
`0x038`	CNTV_TVAL[a]	RW[b]	Virtual TimerValue register, optional in the CNTBaseN memory map.
`0x03C`	CNTV_CTL[a]	RW[b]	Virtual Timer Control register, optional in the CNTBaseN memory map.
`0x040-0xFCF`	-	RES0	Reserved.
`0xFD0-0xFFC`	CounterID<n>	RO	Counter ID registers 0-11.

a. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in Generic Timer registers and Generic Timer registers. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.

b. Address is reserved, RAZ/WI if register not implemented.

c. The CNTCTLBase frame includes an RW view of this register.

F2.3.2.2 The CNTEL0Base*N* frame

For any value of *N*, the layout of the registers in the CNTEL0Base*N* frame is identical to the CNTBaseN frame, except that, in the CNTEL0Base*N* frame:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- CNTVOFF is never visible, and the memory at `0x018-0x01C` is RAZ/WI.
- CNTEL0ACR is never visible, and the memory at `0x014` is RAZ/WI.
- If implemented in the CNTBaseN frame, CNTEL0ACR controls whether CNTPCT, CNTVCT, CNTFRQ, the Physical Timer, and the Virtual Timer registers are visible in the CNTEL0BaseN frame.
  If CNTEL0ACR is not implemented then these registers are not visible in the CNTEL0BaseN frame, and their addresses in that frame are RAZ/WI.

If an implementation supports 64-bit atomic accesses, then CNTPCT, CNTVCT, CNTVOFF, CNTP_CVAL, and CNTV_CVAL must be accessible as atomic 64-bit values.

F2.3.2.3 CNTCTLBase status and control fields for the CNTBase*N* and CNTEL0Base*N* frames

In the CNTCTLBase frame:

CNTTIDR controls:

- Whether each CNTBaseN frame is implemented.
- If a CNTBaseN frame is implemented, whether:
  - That CNTBaseN frame has virtual timer capability.
  - A corresponding CNTEL0BaseN frame is implemented.

CNTNSAR controls:

Whether all the following are accessible by Non-secure accesses:

- CNTACR<n>.
- CNTVOFF<n>.
- Each implemented CNTBaseN frame, and any corresponding CNTEL0BaseN frame.

The CNTACR<n> registers control:

For each implemented CNTBaseN frame, the accessibility of the following registers in that frame:

- CNTP_CTL, CNTP_CVAL, and CNTP_TVAL.
- CNTV_CTL, CNTV_CVAL, and CNTV_TVAL.
- CNTVOFF.
- CNTFRQ.
- CNTPCT.
- CNTVCT.

For CNTACR<n>, the value of <n> corresponds to the value of *N* for the controlled CNTBaseN frame.

The CNTVOFF<n> registers provide:

For each implemented CNTBaseN frame that has virtual capability, the RW copy of the CNTVOFF register for that frame.

Note

In a CNTBaseN frame that has virtual timer capability the CNTVOFF register is RO.

For CNTVOFF<n>, the value of <n> corresponds to the value of *N* for the controlled CNTBaseN frame.

Chapter F3
Recommended External Interface to the Performance Monitors

This chapter describes the recommended external interface to the Performance Monitors. It contains the following section:

- About the external interface to the Performance Monitors registers.

Note

Performance Monitors external register descriptions describes the external view of the Performance Monitors registers.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F3.1 About the external interface to the Performance Monitors registers

Arm recommends that:

- An implementation provides the OPTIONAL external debug interface to the Performance Monitors registers, FEAT_PMUv3_EXT.

  Note

  A debugger can use this interface to access counters in the Performance Monitors.

- The implementation includes the OPTIONAL support for memory-mapped access to the External debug interface.

  Note

  — Software running on any PE in a system can use this interface to access counters in the Performance Monitors.

  — Privileged software should use the MMU to control access to this interface.

- The external debug interface is implemented as defined in Recommended External Debug Interface.

The following sections describe the memory-mapped views of the Performance Monitors registers:

- Differences in the external views of the Performance Monitors registers.
- Synchronization of changes to the memory-mapped views.
- Access permissions for external views of the Performance Monitors.

In this section, unless the context explicitly indicates otherwise, any reference to *a memory-mapped view* applies equally to a register view using:

- An access through an external debug interface.
- A memory-mapped access.

F3.1.1 Endianness and supported access sizes

When an implementation supports memory-mapped access to the external debug interface the interface is accessed as a little-endian memory-mapped peripheral. External Performance Monitors registers summary gives the memory map of these registers.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the external interface to the Performance Monitors registers implementations must:

- Comply with the requirements of Supported access sizes.
- When FEAT_PMUv3_EXT32 is implemented, support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register that is mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if all components with direct memory access to the PMU support making 64-bit accesses.

Permitted word-aligned 32-bit accesses are single-copy atomic at word granularity. When FEAT_PMUv3_EXT64 is implemented, permitted doubleword-aligned 64-bit accesses are single-copy atomic at doubleword granularity.

F3.1.2 Differences in the external views of the Performance Monitors registers

An external view of the Performance Monitors registers accesses the same registers as the System registers interface described in Performance Monitors Extension registers, except that:

- The PMSELR is accessible only in the System registers interface.
- The following registers are accessible only in external views:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

  - PMPCSR.
  - PMCFGR.
  - PMIIDR.
  - PMLAR.
  - PMLSR.
  - PMAUTHSTATUS.
  - PMDEVARCH.
  - PMDEVTYPE.
  - PMPIDR0.
  - PMPIDR1.
  - PMPIDR2.
  - PMPIDR3.
  - PMPIDR4.
  - PMCIDR0.
  - PMCIDR1.
  - PMCIDR2.
  - PMCIDR3.
  - PMEVFILT2R<n>.

  Performance Monitors external register descriptions describes these registers.

- The following registers are accessible only in the external view when FEAT_PMUv3_EXT32 is implemented:
  - PMCID1SR.
  - PMVIDSR.
  - PMCID2SR.
  - PMDEVAFF0.
  - PMDEVAFF1.

  Performance Monitors external register descriptions describes these registers.
- The following controls do not affect the external views:
  - PMSELR.
  - PMUSERENR.
  - HDCR.{TPM, TPMCR, HPMN}.

  Instead, see the register descriptions in External System Control Register Descriptions.
- The PMSWINC_EL0 register is OPTIONAL in the external view when FEAT_PMUv3_EXT32 is implemented.

F3.1.3 Synchronization of changes to the memory-mapped views

Synchronization must comply with Synchronization of memory-mapped registers.

In particular, if a Performance Monitor is visible in both System register and an external view, and is accessed simultaneously through these two mechanisms, the behavior must be as if the accesses occurred atomically and in any order. For more information, see Synchronization of changes to the external debug registers.

F3.1.4 Access permissions for external views of the Performance Monitors

For more information, see External debug interface register access permissions.

The following table shows the access permissions for the Performance Monitors registers in a Debug implementation for Armv8-R implementations.

The table uses the following terms:

DLK When FEAT_DoubleLock is implemented and locked, `DoubleLockStatus()` == TRUE, accesses to some registers produce an error. Applies to both interfaces.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EPMAD When `AllowExternalPMUAccess()` == FALSE, external debug access is disabled for the access. See also Behavior of a not permitted memory-mapped access.

EPMSSAD If FEAT_PMUv3_SS is implemented, when `AllowExternalPMSSAccess()` == FALSE, external debug access is disabled for the access. See also Behavior of a not permitted memory-mapped access.

Error Indicates that the access gives an error response.

Def This shows the default access permissions, if none of the conditions in this list prevent access to the register.

Off The Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed, and EDPRSR.PU will read as zero.

Note

If debug power is off, then all external debug interface accesses return an error.

OSLK When the OS Lock is locked, OSLAR_EL1.OSLK == 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface.

SLK This indicates the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the optional Software Lock is locked. See Register access permissions for memory-mapped accesses.

For all other accesses, this column is ignored.

Note

When FEAT_PMUv3_EXT64 is implemented, the Software Lock is not implemented.

- Indicates that the control has no effect on the behavior of the access:

- If no other control affects the behavior, the Default access behavior applies.
- However, another control might determine the behavior.

Table F3-1 Access permissions for the Performance Monitors registers when FEAT_PMUv3_EXT32 is implemented

Offset	Register	Domain	Off	DLK	OSLK	EPMAD	EPMSSAD	Def	SLK

Chapter F4
External System Control Register Descriptions

This chapter describes the external system control registers. It excludes the External debug registers that are described in External Debug Register Descriptions. It contains the following sections:

- About the external system control register descriptions.
- External Performance Monitors registers summary.
- Performance Monitors external register descriptions.
- Generic Timer memory-mapped registers overview.
- Generic Timer memory-mapped register descriptions.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.

F4.1 About the external system control register descriptions

This chapter describes the external system control registers other than the external debug registers. That is, it describes:

An external view of the Performance Monitors registers

Arm recommends that implementations provide access to the Performance Monitors registers through the OPTIONAL External debug interface, and provide the OPTIONAL memory-mapped interface to this interface:

- External Performance Monitors registers summary lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
- Performance Monitors external register descriptions describes each of the memory-mapped registers.

Recommended External Interface to the Performance Monitors describes the recommended interface to these registers.

Note

The Performance Monitors Extension describes the Performance Monitors. The following section describes the System register interfaces to the Performance Monitors, Performance Monitors registers, for accesses from an Exception level that is using AArch64.

The registers for the system level Generic Timer component

Any implementation that includes the Generic Timer must include the memory-mapped system level component described in System Level Implementation of the Generic Timer. In this chapter:

- Generic Timer memory-mapped registers overview gives an overview of the registers, referring to System Level Implementation of the Generic Timer for more information.
- Generic Timer memory-mapped register descriptions describes each of the memory-mapped registers.

Note

The Generic Timer in AArch64 state describes the Generic Timer component that is accessible using the System registers. The following section describes the System register interfaces to that component Generic Timer registers, for accesses from an Exception level that is using AArch64.

Note

External Debug Register Descriptions describes the external debug registers.
Arm® Memory System Resource Partitioning and Monitoring (MPAM) System Component Specification* (ARM IHI 0099)* describes the MPAM memory-mapped registers.
Arm® Reliability, Availability, and Serviceability (RAS) System Architecture, for A-profile architecture (ARM IHI 0100) describes the RAS memory-mapped registers.

F4.2 External Performance Monitors registers summary

When an implementation provides access to the Performance Monitors registers through the External debug interface, that interface provides access to:

- Performance Monitors System registers.
- A read-only configuration register, PMCFGR.
- The OPTIONAL CoreSight registers for the Performance Monitors, if they are implemented.

The locations of the registers are defined as offsets from a system-defined base address. Performance Monitors external register views defines this memory map.

F4.2.1 Performance Monitors external register views

The following tables show the external view of the Performance Monitors registers:

- Table F4-1 when FEAT_PMUv3_EXT32 is implemented.

All other entries are reserved.

Note

- Counters that are reserved because HDCR.HPMN has been changed from its reset value remain visible in any external view.
- The registers that relate to an implemented event counter, PMN*x*, are PMEVCNTR<n> and PMEVTYPER<n>.
- Tables in this section only list the Armv8 registers. For encoding information of the registers introduced by Armv9, see the individual register descriptions in this chapter.

Each entry in the Name column links to the register description in Performance Monitors external register descriptions.

PMCIDR3[g]			0xFFC

a. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.

b. PC Sample-based Profiling Extension registers. Implemented only when FEAT_PCSRv8p2 is implemented, except that from Armv8.2 PMDEVID is required regardless of whether FEAT_PCSRv8p2 is implemented.

Before Armv8.2. the PC Sample-based Profiling Extension can, instead, be implemented in the memory-mapped debug registers space, see The PC Sample-based Profiling Extension.

c. OPTIONAL.

d. CoreSight interface registers, see Management registers and CoreSight compliance.

e. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.

F4.3 Performance Monitors external register descriptions

This section describes the external view of the Performance Monitors registers. External Performance Monitors registers summary lists these registers in offset order.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

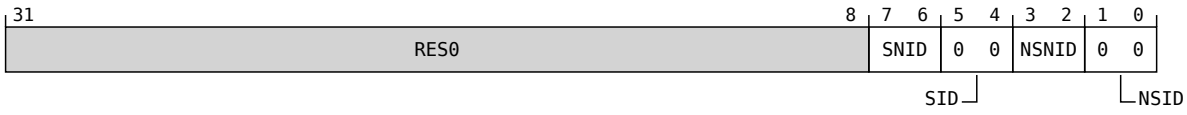
This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMAUTHSTATUS are RES0.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented.

All other values are reserved.

Access to this field is RO.

NSNID, bits [3:2]

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.

NSID, bits [1:0]

Non-secure invasive debug.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NSID	Meaning
0b00	Not implemented.

All other values are reserved.

Access to this field is RO.

Accessing PMAUTHSTATUS

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFB8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.2 PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

Configuration

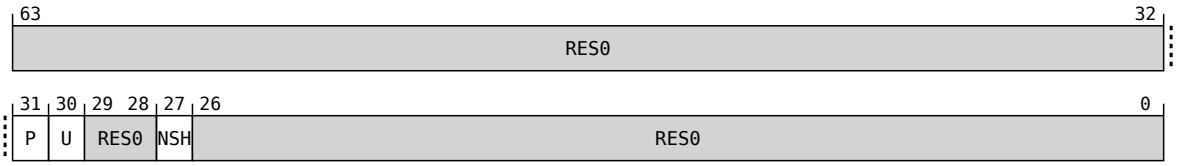
PMCCFILTR_EL0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are RES0.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting cycles in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL1.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL1 is further controlled by PMCCFILTR_EL0.NSK.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting cycles in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL0.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL0 is further controlled by PMCCFILTR_EL0.NSU.

The reset behavior of this field is:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [29:28]

Reserved, RES0.

NSH, bit [27]

EL2 filtering. Controls counting cycles in EL2.

NSH	Meaning
0b0	The PE does not count cycles in EL2.
0b1	This mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [26:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x47C from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.3 PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see 'Time as measured by the Performance Monitors cycle counter'.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

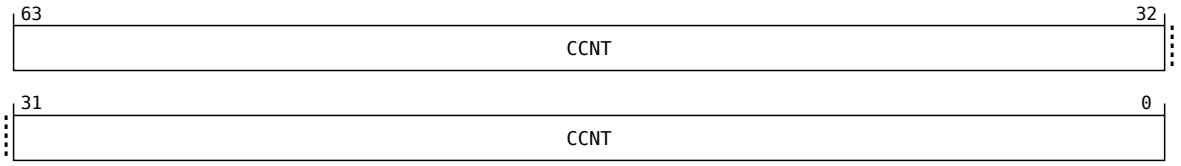
PMCCNTR_EL0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are RES0.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions



CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x0F8 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

When FEAT_PMUv3_EXT32 is implemented

[63:32] Accessible at offset `0x0FC` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.4 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x0000` to `0x001F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Use of this register is deprecated.

Note

This view of the register was previously called PMCEID0_EL0.

Configuration

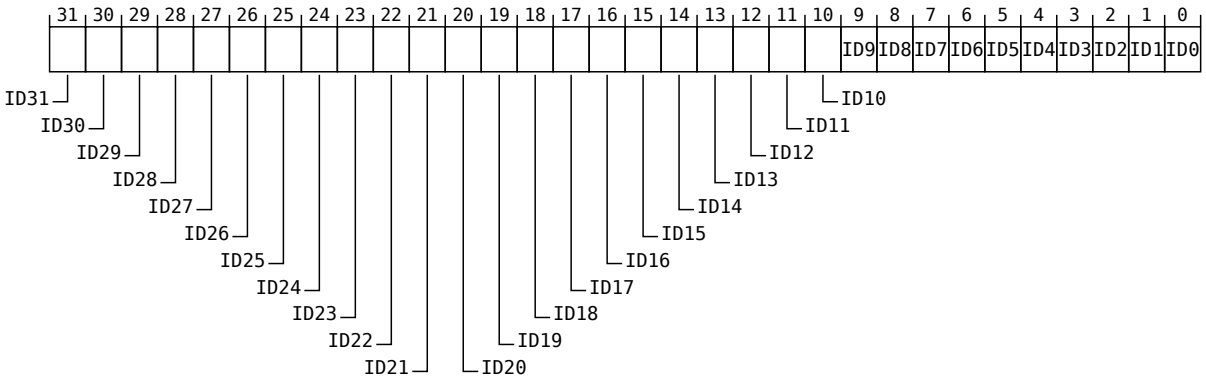
PMCEID0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMCEID0 are RES0.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions



ID<n> , bits [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset `0xE20` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.5 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x020` to `0x03F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Use of this register is deprecated.

Note

This view of the register was previously called PMCEID1_EL0.

Configuration

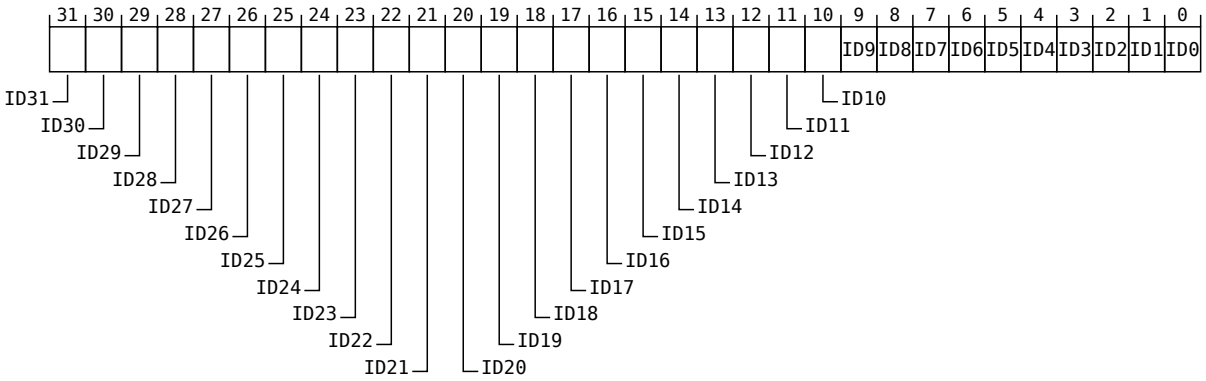
PMCEID1 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMCEID1 are RES0.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions



ID<n> , bits [n], for n = 31 to 0

ID[n] corresponds to Common event (`0x0020` + n).

For each bit:

ID<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset `0xE24` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.6 PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x4000` to `0x401F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Use of this register is deprecated.

Configuration

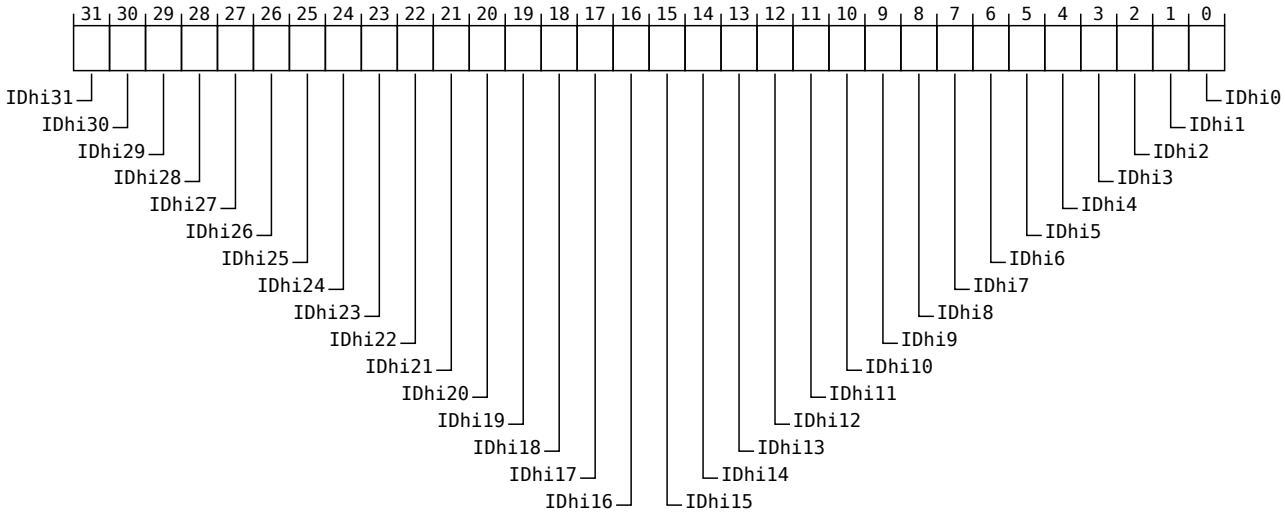
PMCEID2 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions



IDhi<n> , bits [n], for n = 31 to 0

IDhi[n] corresponds to Common event (`0x4000` + n).

For each bit:

IDhi<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID2

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p1 is implemented

Accessible at offset `0xE28` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.7 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Use of this register is deprecated.

Configuration

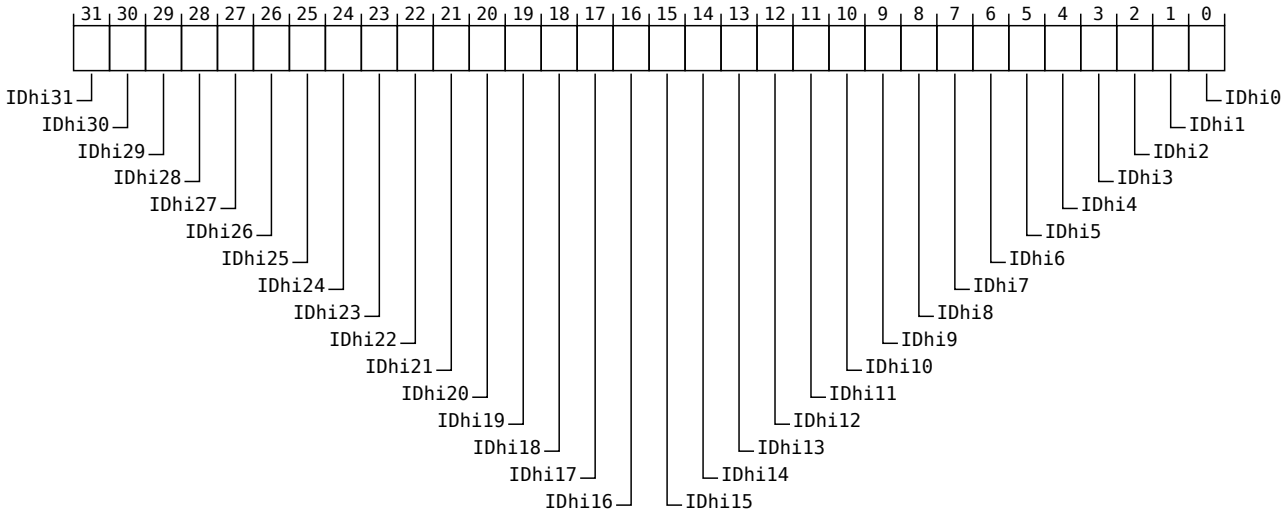
PMCEID3 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions



IDhi<n> , bits [n], for n = 31 to 0

IDhi[n] corresponds to Common event (0x4020 + n).

For each bit:

IDhi<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p1 is implemented

Accessible at offset `0xE2C` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.8 PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

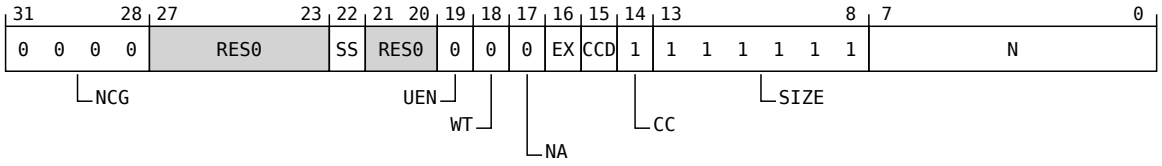
PMCFGR is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCFGR are RES0.

Attributes

PMCFGR is a 32-bit register.

Field descriptions



NCG, bits [31:28]

Defines the number of counter groups implemented, minus one.

NCG	Meaning
0b0000	One counter group implemented.

All other values are reserved.

Access to this field is RO.

Bits [27:23]

Reserved, RES0.

SS, bit [22]

Snapshot supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SS	Meaning
0b0	Snapshot mechanism not supported. The locations 0x600-0x7FC and 0xE30-0xE3C are IMPLEMENTATION DEFINED.
0b1	Snapshot mechanism supported. Locations 0x600-0x7FC and 0xE30-0xE3C contain IMPLEMENTATION DEFINED snapshot registers.

If the architecture-defined form of snapshot is not implemented, a PMU might include an IMPLEMENTATION DEFINED snapshot mechanism, including one using the IMPLEMENTATION DEFINED registers 0x600-0x7FC and 0xE30-0xE3C.

Access to this field is RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Bits [21:20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.

Reads as 0b0

Access to this field is RO.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

Reads as 0b0

Access to this field is RO.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

Reads as 0b0

Access to this field is RO.

EX, bit [16]

Export supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EX	Meaning
0b0	PMCR_EL0.X is RES0.
0b1	PMCR_EL0.X is read/write.

Access to this field is RO.

CCD, bit [15]

Cycle counter has prescale.

This field is RAZ

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCD	Meaning
0b0	PMCR_EL0.D is RES0.
0b1	PMCR_EL0.D is read/write.

Access to this field is RO.

CC, bit [14]

Dedicated cycle counter (counter 31) supported.

Reads as 0b1

Access to this field is RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8.0, the largest counter is 64-bits, so the value of this field is `0b111111`.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8.0, the counters are a doubleword-aligned addresses.

Reads as `0b111111`

Access to this field is RO.

N, bits [7:0]

Number of counters implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

N	Meaning
`0x00`	Only PMCCNTR_EL0 implemented.
`0x01..0x1F`	Number of counters implemented, 2 to 32, minus one.

All other values are reserved.

The count includes the cycle counter, PMCCNTR_EL0.

For example, if PMCFGR.N == `0x07`, then:

- There are eight counters in total.
- This comprises 7 event counters and the cycle counter.

The maximum number of event counters is 31.

Access to this field is RO.

Accessing PMCFGR

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset `0xE00` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.9 PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

Contains the sampled value of CONTEXTIDR_EL1, captured on reading PMPCSR[31:0].

Configuration

PMCID1SR is in the Core power domain.

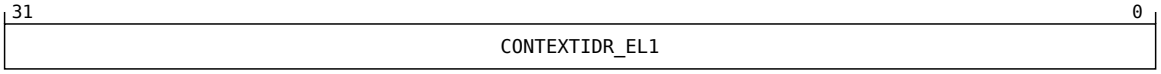
This register is a PC Sample-based Profiling Extension register.

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented.

Attributes

PMCID1SR is a 32-bit register.

Field descriptions



CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.

Because the value written to this register is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether this register is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID1SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented

Accessible at offset `0x208` from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented

Accessible at offset `0x228` from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.10 PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of CONTEXTIDR_EL2, captured on reading PMPCSR[31:0].

Configuration

PMCIDR2SR is in the Core power domain.

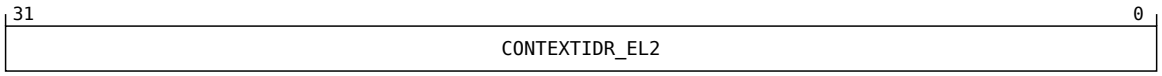
This register is a PC Sample-based Profiling Extension register.

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented.

Attributes

PMCID2SR is a 32-bit register.

Field descriptions



CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- Otherwise, this field is set to an UNKNOWN value.

Because the value written to this field is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether this field is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID2SR

If FEAT_PMUv3_EXT64 is implemented, then the same content is present in the same location, and can be accessed using PMCCIDSR[63:32].

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented

Accessible at offset 0x22C from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.11 PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Component Identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

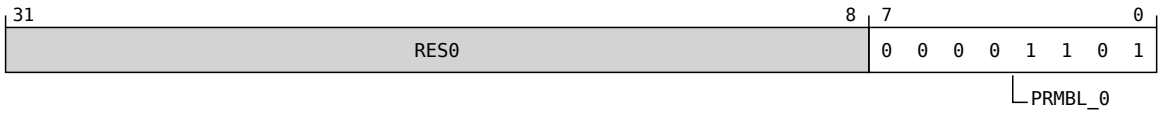
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMCIDR0. Otherwise, direct accesses to PMCIDR0 are RES0.

Attributes

PMCIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as `0x0D`

Access to this field is RO.

Accessing PMCIDR0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset `0xFF0` from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

F4.3.12 PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Component Identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

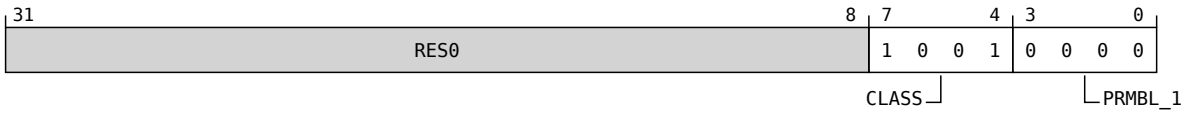
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMCIDR1. Otherwise, direct accesses to PMCIDR1 are RES0.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000

Access to this field is RO.

Accessing PMCIDR1

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFF4 from PMU

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.13 PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Component Identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

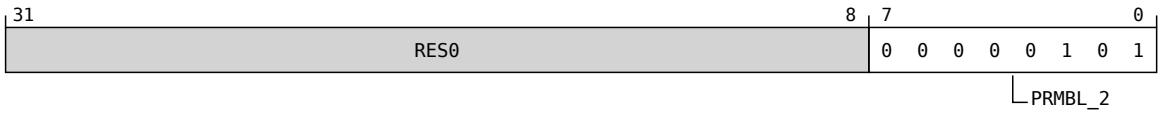
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMCIDR2. Otherwise, direct accesses to PMCIDR2 are RES0.

Attributes

PMCIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as `0x05`

Access to this field is RO.

Accessing PMCIDR2

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset `0xFF8` from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.14 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Component Identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

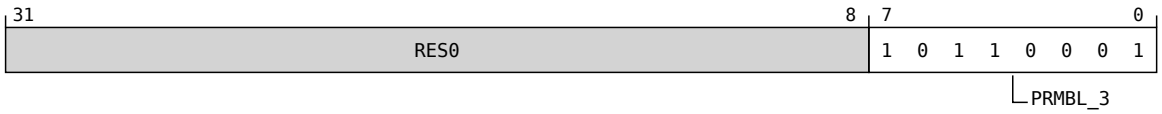
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMCIDR3. Otherwise, direct accesses to PMCIDR3 are RES0.

Attributes

PMCIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1

Access to this field is RO.

Accessing PMCIDR3

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFFC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.15 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear Register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Allows software to disable the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.

Reading from this register shows which counters are enabled.

Configuration

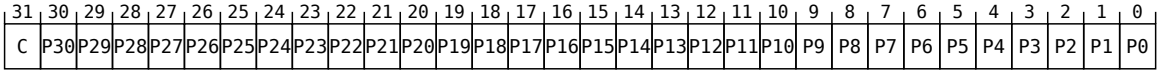
PMCNTENCLR_EL0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are RES0.

Attributes

PMCNTENCLR_EL0 is a 32-bit register.

Field descriptions



C, bit [31]

PMCCNTR_EL0 disable. On writes, allows software to disable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m> , bits [m], for m = 30 to 0

PMEVCNTR<m>_EL0 disable. On writes, allows software to disable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing PMCNTENCLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset `0xC20` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.16 PMCNTENSET_EL0, Performance Monitors Count Enable Set Register

The PMCNTENSET_EL0 characteristics are:

Purpose

Allows software to enable the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.

Reading from this register shows which counters are enabled.

Configuration

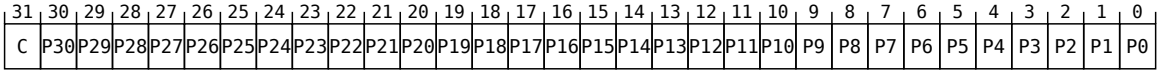
PMCNTENSET_EL0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are RES0.

Attributes

PMCNTENSET_EL0 is a 32-bit register.

Field descriptions



C, bit [31]

PMCCNTR_EL0 enable. On writes, allows software to enable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m> , bits [m], for m = 30 to 0

PMEVCNTR<m>_EL0 enable. On writes, allows software to enable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1S.

Accessing PMCNTENSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset `0xC00` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.17 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Configures and controls the Performance Monitors counters.

Configuration

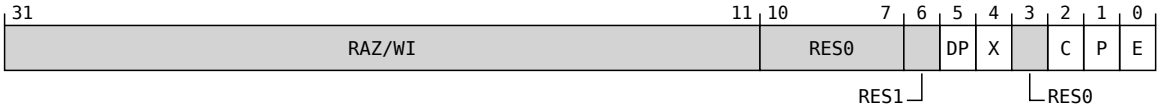
PMCR_EL0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCR_EL0 are RES0.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions



Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bits [10:7]

Reserved, RES0.

Bit [6]

Reserved, RES1.

DP, bit [5]

When FEAT_PMUv3p1 is implemented:

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD or HDCR.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2.

The conditions when this field disables the cycle counter are the same as when event counting by an event counter in the first range is prohibited. For more information about event counter ranges, see MDCR_EL2.HPMN.

For more information, see ‘Prohibiting event and cycle counting’.

The reset behavior of this field is:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If FEAT_ETMv4 is implemented, this field does affect the use of PMU events as an External Input by the trace unit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [3]

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this field are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow field. The value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

P	Meaning
0b0	No action.
0b1	Reset all event counters PMEVCNTR<n>_EL0 to zero.

Writes to this field do not affect the cycle counter PMCCNTR_EL0.

Note

Resetting the event counters does not change the event counter overflow fields.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

E	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0.

The counters affected by this field are:

- The event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.
- The cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PMCR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xE04 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.18 PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

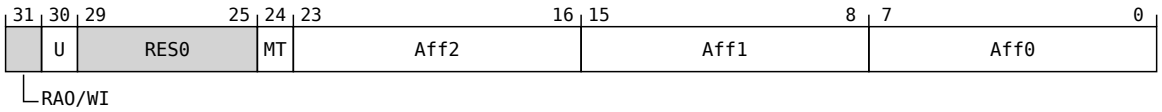
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT32 is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MT	Meaning
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMDEVAFF0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xFA8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.19 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

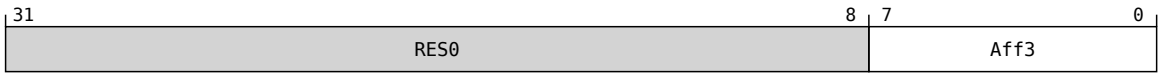
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT32 is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of PMDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMDEVAFF1

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xFAC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.20 PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configuration

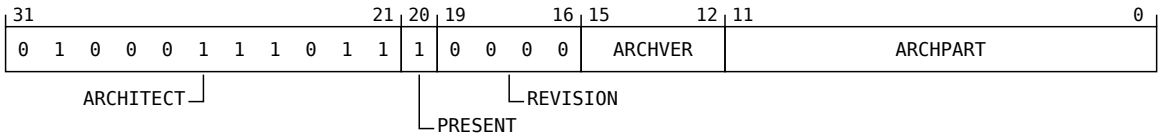
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMDEVARCH are RES0.

Attributes

PMDEVARCH is a 32-bit register.

Field descriptions



ARCHITECT, bits [31:21]

Defines the architect of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0b0100`.

Bits [27:21] are the JEP106 identification code, `0b0111011`.

Reads as `0b01000111011`

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the PMDEVARCH register is present.

Reads as `0b1`

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is `0x0`.

All other values are reserved.

Reads as `0b0000`

Access to this field is RO.

ARCHVER, bits [15:12]

When UInt(PMU.PMDEVARCH.ARCHPART) == `0xA16`:

Architecture Version. Defines the architecture version of the component.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARCHVER	Meaning
0b0010	Performance Monitors Extension version 3, PMUv3.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12].

Access to this field is RO.

Otherwise:

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	PC Sample-based Profiling version 2, FEAT_PCSRv8p2.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12].

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHPART	Meaning
0xA10	PC Sample-based Profiling, including the 32-bit programmers' model extension.
0xA16	Armv8-A PE performance monitors, including the 32-bit programmers' model extension.

FEAT_PMUv3_EXT32 implements the functionality described by the values 0xA10 and 0xA16.

The values 0xA10 and 0xA20 indicate that FEAT_PCSRv8p2 is implemented but the Performance Monitors Extension is not implemented.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHPART is PMDEVARCH.ARCHID[11:0].

Access to this field is RO.

Accessing PMDEVARCH

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFBC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.21 PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Configuration

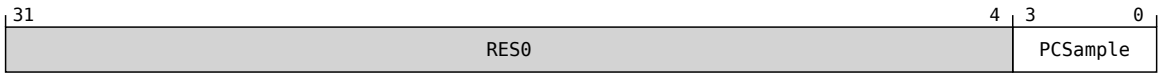
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when (v8Ap2 or FEAT_PCSRv8p2 is implemented) and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMDEVID are RES0.

Attributes

PMDEVID is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.
0b0001	PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.

All other values are reserved.

FEAT_PCSRv8p2 implements the functionality identified by the value 0b0001.

If FEAT_PCSRv8p2 is not implemented, then the only permitted value is 0b0000.

From Armv8.2, when FEAT_PCSRv8p2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

Accessing PMDEVID

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented and (v8Ap2 or FEAT_PCSRv8p2 is implemented)

Accessible at offset 0xFC8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.22 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

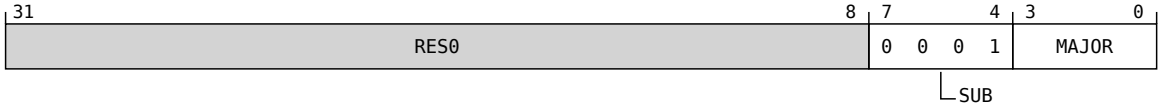
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMDEVTYPE. Otherwise, direct accesses to PMDEVTYPE are RES0.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as `0b0001`

Access to this field is RO.

MAJOR, bits [3:0]

Major type.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MAJOR	Meaning
`0b0000`	Unspecified.
`0b0110`	Performance monitor component.

FEAT_PMUv3 implements the functionality described by the value `0b0110`.

Access to this field is RO.

Accessing PMDEVTYPE

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset `0xFCC` from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.23 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter <n>, which counts events, where <n> is 0 to 30.

Configuration

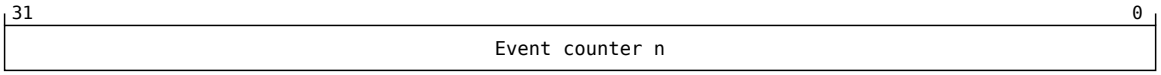
PMEVCNTR<n>_EL0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are RES0.

Attributes

PMEVCNTR<n>_EL0 is a 32-bit register.

Field descriptions



EVCNT, bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset `0x000 + (8 * n)` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.24 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

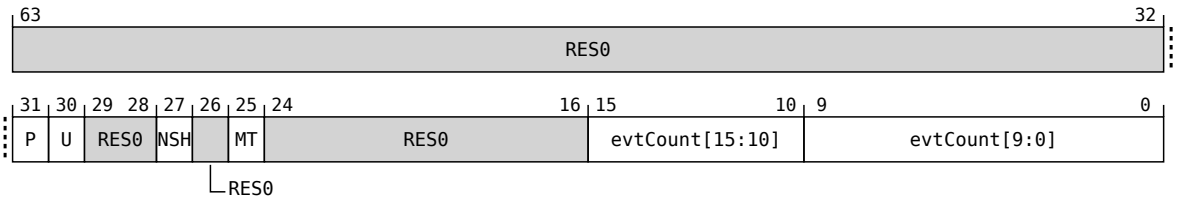
- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are RES0.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting events in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL1.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL1 is further controlled by PMEVTYPER<n>_EL0.NSK.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting events in EL0.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

U	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL0.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL0 is further controlled by PMEVTYPER<n>_EL0.NSU.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [29:28]

Reserved, RES0.

NSH, bit [27]

EL2 filtering. Controls counting events in EL2.

NSH	Meaning
0b0	The PE does not count events in EL2.
0b1	This mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [26]

Reserved, RES0.

MT, bit [25]

When an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Unless otherwise stated:

- If the event counts PE cycles when a stall condition is true and a second condition is true, then the counter counts Processor cycles when the stall condition is true for all of these PEs, and the second condition is true for any of these PEs.
- If the event counts PE cycles when any other condition is true, then the counter counts Processor cycles when the condition is true for any of these PEs.
- Otherwise, the event counts by the sum of the count across all of these PEs.

For the stall events, the stall condition means the applicable condition described by the STALL, STALL_FRONTEND, or STALL_BACKEND event.

The second condition is any condition in addition to this.

For example, for the STALL_FRONTEND_L1I event, the stall condition is STALL_FRONTEND, and the second condition is when there is a demand instruction miss in the first level of instruction cache.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

For the STALL, STALL_FRONTEND, and STALL_BACKEND events themselves, the second condition is the null TRUE condition.

See 'Multithreaded implementations' and 'Cycle event counting in multithreaded implementations'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMU.PMEVCNTR<n>_EL0.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range `0x0000` to `0x003F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range `0x4000` to `0x403F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset `0x400 + (4 * n)` from PMU

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Non-Confidential

F4.3.25 PMEVFILT2R<n>, Performance Monitors Event Filter Registers, n = 0 - 63

The PMEVFILT2R<n> characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED configuration controls for PMU counters.

Each PMEVFILT2R<n> register can provide additional configuration controls for a PMU counter, where:

- For values of n less than 31, if event counter n is implemented, then the controls are for PMU event counter <n>.
- For n equal to 31, the controls are for the cycle counter, PMCCNTR_EL0;
- For all other values of n, PMEVFILT2R<n> is not implemented.

Although this mapping is recommended, it is not required and the function of each register is IMPLEMENTATION DEFINED.

Configuration

PMEVFILT2R<n> is in the Core power domain.

If PMEVFILT2R<n> is not implemented:

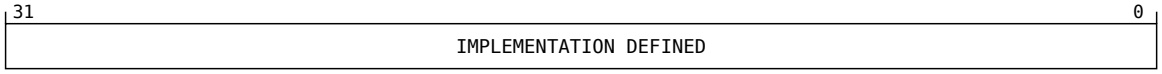
- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMEVFILT2R<n>. Otherwise, direct accesses to PMEVFILT2R<n> are RES0.

Attributes

PMEVFILT2R<n> is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing PMEVFILT2R<n>

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset `0x800 + (4 * n)` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.

F4.3.26 PMIIDR, Performance Monitors Implementation Identification Register

The PMIIDR characteristics are:

Purpose

Provides discovery information about the Performance Monitor component.

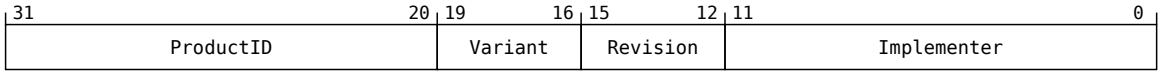
Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented and an implementation implements PMIIDR. Otherwise, direct accesses to PMIIDR are RES0.

Attributes

PMIIDR is a 32-bit register.

Field descriptions



ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

Matches the PMPIDR1.PART_1, PMPIDR0.PART_0 fields if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by PMIIDR.ProductID, or the major revision of the component.

When defining a major revision, PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the most significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If this field is increased, PMIIDR.Revision should be set to `0b0000`.

Matches the PMPIDR2.REVISION field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Component minor revision.

PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the least significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If PMIIDR.Variant field is increased, this field should be set to `0b0000`, otherwise the value in this field should be increased.

Matches the PMPIDR3.REVAND field, if present.

This field has an IMPLEMENTATION DEFINED value.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the PMU.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for PMIIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as `0x43B`.

This field has an IMPLEMENTATION DEFINED value.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

If PMPIDR4 is implemented, PMPIDR4.DES_2 matches bits [11:8] of this field.

If PMPIDR2 is implemented, PMPIDR2.DES_1 matches bits [6:4] of this field.

If PMPIDR1 is implemented, PMPIDR1.DES_0 matches bits [3:0] of this field.

Access to this field is RO.

Accessing PMIIDR

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset `0xE08` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.27 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear Register

The PMINTENCLR_EL1 characteristics are:

Purpose

Allows software to disable the generation of interrupt requests on overflows from the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

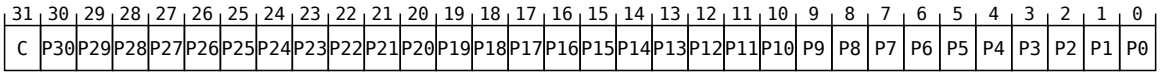
PMINTENCLR_EL1 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are RES0.

Attributes

PMINTENCLR_EL1 is a 32-bit register.

Field descriptions



C, bit [31]

Interrupt request on unsigned overflow of PMCCNTR_EL0 disable. On writes, allows software to disable the interrupt request on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m> , bits [m], for m = 30 to 0

Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 disable. On writes, allows software to disable the interrupt request on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 disabled.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

0b1	Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing PMINTENCLR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xC60 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.28 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set Register

The PMINTENSET_EL1 characteristics are:

Purpose

Allows software to enable the generation of interrupt requests on overflows from the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

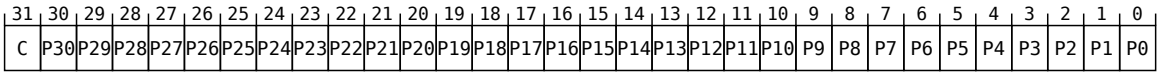
PMINTENSET_EL1 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMINTENSET_EL1 are RES0.

Attributes

PMINTENSET_EL1 is a 32-bit register.

Field descriptions



C, bit [31]

Interrupt request on unsigned overflow of PMCCNTR_EL0 enable. On writes, allows software to enable the interrupt request on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m> , bits [m], for m = 30 to 0

Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 enable. On writes, allows software to enable the interrupt request on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 disabled.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

0b1	Interrupt request on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1S.

Accessing PMINTENSET_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xC40 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.29 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

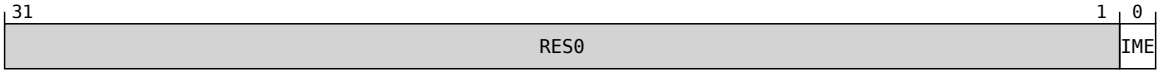
Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMITCTRL. Otherwise, direct accesses to PMITCTRL are RES0.

Attributes

PMITCTRL is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.

Accessing PMITCTRL

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xF00 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.30 PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

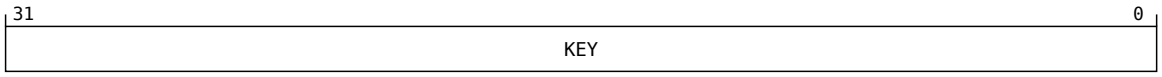
This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMLAR are RES0.

Attributes

PMLAR is a 32-bit register.

Field descriptions

When PMU Software Lock is implemented:

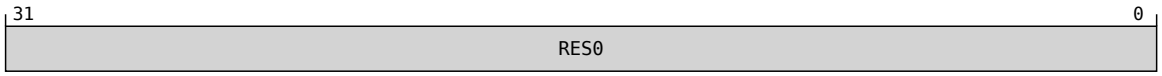


KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:



Otherwise

Bits [31:0]

Reserved, RES0.

Accessing PMLAR

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFB0 from PMU

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are WO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.31 PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

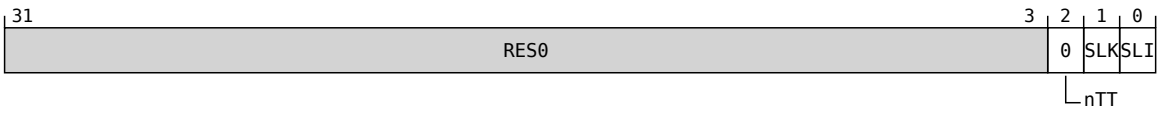
Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMLSR are RES0.

Attributes

PMLSR is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required.

Reads as `0b0`

Access to this field is RO.

SLK, bit [1]

When PMU Software Lock is implemented and FEAT_DoPD is not implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
`0b0`	Lock clear. Writes are permitted to this component's registers.
`0b1`	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- On a External debug reset, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is RO.

Accessing PMLSR

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFB4 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.32 PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation.

Configuration

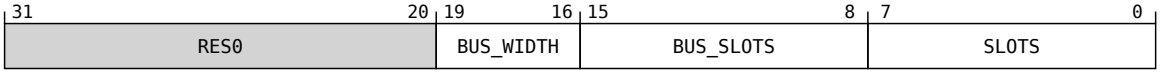
PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

Attributes

PMMIR is a 32-bit register.

Field descriptions



Bits [31:20]

Reserved, RES0.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Access to this field is RO.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

This field has an IMPLEMENTATION DEFINED value.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

Access to this field is RO.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMMIR

If the Core power domain is off or in a low-power state, access to this register returns an Error.

Accesses to this register use the following encodings:

When FEAT_PMUv3p4 is implemented and FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset `0xE40` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.33 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

Purpose

Allows software to clear the unsigned overflow flags for the following counters to 0:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.

Reading from this register shows the current unsigned overflow flag values.

Configuration

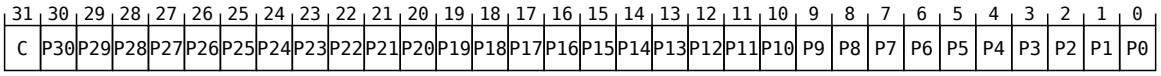
PMOVSCLR_EL0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMOVSCLR_EL0 are RES0.

Attributes

PMOVSCLR_EL0 is a 32-bit register.

Field descriptions



C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMCCNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m> , bits [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMEVCNTR<m>_EL0 to 0. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing PMOVSCLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xC80 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.34 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set Register

The PMOVSSET_EL0 characteristics are:

Purpose

Allows software to set the unsigned overflow flags for the following counters to 1:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.

Reading from this register shows the current unsigned overflow flag values.

Configuration

PMOVSSET_EL0 is in the Core power domain.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are RES0.

Attributes

PMOVSSET_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMCCNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m> , bits [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 set. On writes, allows software to set the unsigned overflow flag for PMEVCNTR<m>_EL0 to 1. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is W1S.

Accessing PMOVSSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xCC0 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.35 PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

PMPCSR is in the Core power domain.

This register is a PC Sample-based Profiling Extension register.

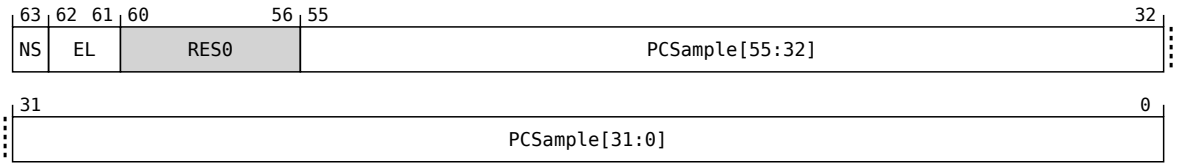
If FEAT_PMUv3_EXT32 is implemented, support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state, then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

Attributes

PMPCSR is a 64-bit register.

Field descriptions



NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EL	Meaning
0b10	Sample is from EL2.
0b11	Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

PCSample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Note

A 32-bit access to PMPCSR[63:32] does not update the PC sample registers. Only a 64-bit access to PMPCSR[63:0] or a 32-bit access to PMPCSR[31:0] updates the PC sample registers. This includes the value a subsequent 32-bit read of PMPCSR[63:32] will return.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented

[31:0] Accessible at offset `0x200` from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented

[63:32] Accessible at offset `0x204` from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented

[31:0] Accessible at offset `0x220` from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented

[63:32] Accessible at offset `0x224` from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

F4.3.36 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

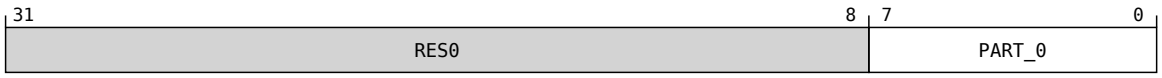
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR0. Otherwise, direct accesses to PMPIDR0 are RES0.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset `0xFE0` from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.37 PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

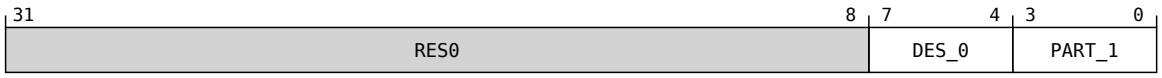
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR1. Otherwise, direct accesses to PMPIDR1 are RES0.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR1

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset `0xFE4` from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.38 PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

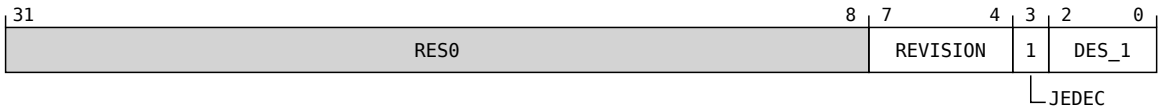
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR2. Otherwise, direct accesses to PMPIDR2 are RES0.

Attributes

PMPIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as `0b1`

Access to this field is RO.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR2

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset `0xFE8` from PMU

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.39 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

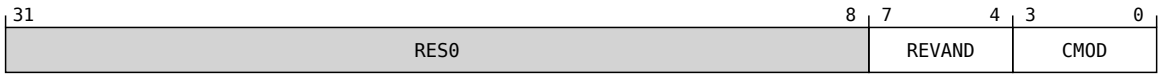
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR3. Otherwise, direct accesses to PMPIDR3 are RES0.

Attributes

PMPIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR3

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xFEC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.40 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see ‘About the Peripheral identification scheme’.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

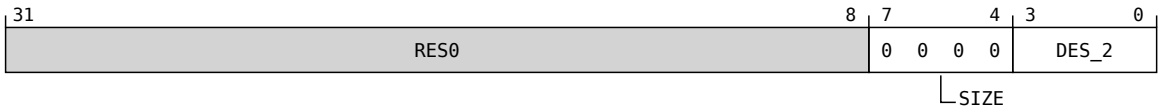
This register is required for CoreSight compliance.

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR4. Otherwise, direct accesses to PMPIDR4 are RES0.

Attributes

PMPIDR4 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as `0b0000`

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR4

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset `0xFD0` from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.41 PMSWINC_EL0, Performance Monitors Software Increment Register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event `0x00`. For more information, see 'SW_INCR'.

Configuration

PMSWINC_EL0 is in the Core power domain.

If this register is implemented, use of it is deprecated.

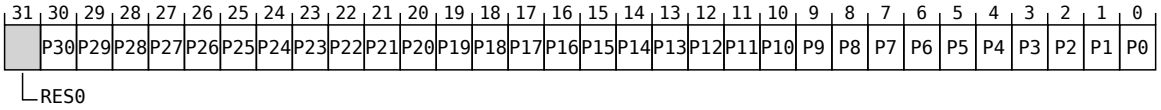
If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

This register is present only when FEAT_PMUv3_EXT32 is implemented and an implementation implements PMSWINC_EL0.

Attributes

PMSWINC_EL0 is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RES0.

P<m> , bits [m], for m = 30 to 0

Event counter software increment bit for PMEVCNTR<m>_EL0.

P<m>	Meaning
`0b0`	No action. The write to this bit is ignored.
`0b1`	It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter m.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

Accessing PMSWINC_EL0

If FEAT_PMUv3p9 or FEAT_PMUv3_EXT64 are implemented, this location is used for accesses to PMZR_EL0.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset `0xCA0` from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.3.42 PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

Purpose

Contains the sampled VMID value that is captured on reading PMPCSR[31:0].

Configuration

PMVIDSR is in the Core power domain.

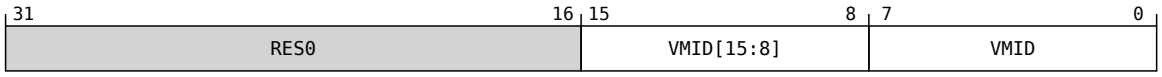
This register is a PC Sample-based Profiling Extension register.

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented.

Attributes

PMVIDSR is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VSCTLR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VSCTLR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.

Because the value written to PMVIDSR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing PMVIDSR

If FEAT_PMUv3_EXT64 is implemented, then the same content is present in the same location, and can be accessed using PMVCIDSR[63:32].

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented

Accessible at offset `0x20C` from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

F4.4 Generic Timer memory-mapped registers overview

The Generic Timer memory-mapped registers are implemented as multiple register frames, with each register frame having its own base address, as follows:

- A single CNTCTLBase register frame, at base address CNTCTLBase.
- Between one and seven CNTBase*N* register frames, each with its own base address CNTBase*N*.
- For each CNTBase*N* register frame, if required, a CNTEL0Base*N* register frame, at base address CNTEL0Base*N*, that provides an EL0 view of the CNTBase*N* register frame.

For more information, see:

- Memory-mapped timer components.
- The CNTBaseN and CNTEL0BaseN frames. This section includes the memory map of the CNTBase*N* and CNTBase*N* register frames.
- The CNTCTLBase frame. This section includes the memory map of the CNTCTLBase register frame.

Note

Providing a complete set of features in a system level implementation gives an implementation example for a system level implementation of the Generic Timer.

F4.5 Generic Timer memory-mapped register descriptions

This section describes the Generic Timer registers. Generic Timer memory-mapped registers overview gives an overview of these registers, and includes links to their memory maps.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.1 CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configuration

It is IMPLEMENTATION DEFINED whether CNTACR<n> is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

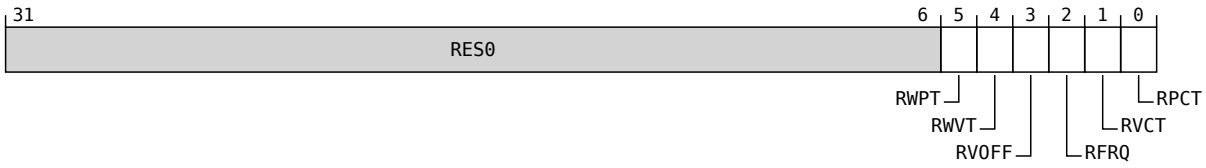
An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions



Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame <n>.

RWPT	Meaning
0b0	No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the EL1 Physical Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>.

RWVT	Meaning
0b0	No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the Virtual Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to CNTVOFF, in frame <n>.

RVOFF	Meaning
0b0	No access to CNTVOFF in frame <n>. The register is RES0.
0b1	Read-only access to CNTVOFF in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to CNTFRQ, in frame <n>.

RFRQ	Meaning
0b0	No access to CNTFRQ in frame <n>. The register is RES0.
0b1	Read-only access to CNTFRQ in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to CNTVCT, in frame <n>.

RVCT	Meaning
0b0	No access to CNTVCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTVCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to CNTPCT, in frame <n>.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RPCT	Meaning
0b0	No access to CNTPCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTPCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTACR<n>

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x040 + (4 * n)	CNTACR<n>

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.2 CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter resolution, and controls counter behavior during debug.

Configuration

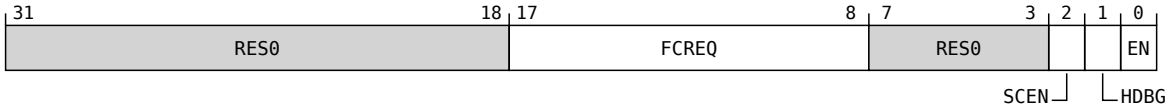
It is IMPLEMENTATION DEFINED whether CNTCR is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCR is a 32-bit register.

Field descriptions



Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see 'The Frequency modes table'. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behavior of this field is:

- On a Timer reset, this field resets to `'0000000000'`.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]

When FEAT_CNTSC is implemented:

Scale Enable.

SCEN	Meaning
`0b0`	Scaling is not enabled. The counter value is incremented by `0x1`.0000000 for each counter tick.
`0b1`	Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1, then:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

HDBG	Meaning
0b0	System counter ignores Halt-on-debug.
0b1	Asserted Halt-on-debug signal halts system counter update.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

EN	Meaning
0b0	System counter disabled.
0b1	System counter enabled.

The reset behavior of this field is:

- On a Timer reset, this field resets to '0'.

Accessing CNTCR

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTCR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

Accesses to this register are RW.

F4.5.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configuration

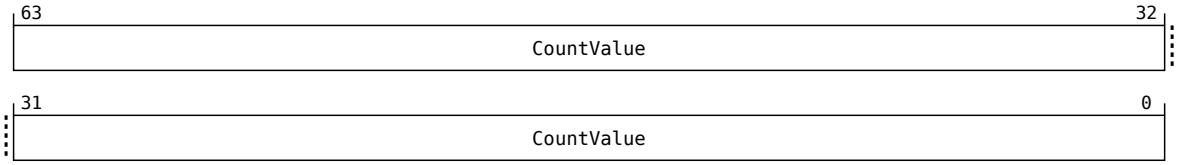
It is IMPLEMENTATION DEFINED whether CNTCV is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCV is a 64-bit register.

Field descriptions



CountValue, bits [63:0]

Indicates the counter value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTCV

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure physical address spaces, this register is implemented only in the Secure physical address space.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

For the instance of the register in the CNTReadBase frame, this register is accessible in all physical address spaces.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	0x008	CNTCV	63:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

Accesses to this register are RO.

F4.5.4 CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Configuration

It is IMPLEMENTATION DEFINED whether CNTEL0ACR is implemented in the Core power domain or in the Debug power domain

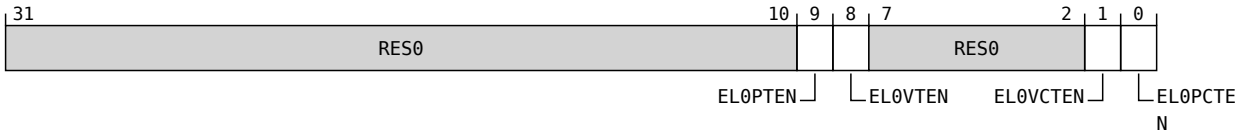
For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implementation of this register is OPTIONAL.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions



Bits [31:10]

Reserved, RES0.

EL0PTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0PTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame, then they are accessible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0VTEN	Meaning
0b0	No access. Registers are RES0 in the second view.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EL0VTEN	Meaning
0b1	Access permitted. If the registers are accessible in the current frame, then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for CNTVCT and CNTFRQ.

EL0VCTEN	Meaning
0b0	CNTVCT is not visible in the second view. If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTVCT and CNTFRQ are visible in the current frame, then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for CNTPCT and CNTFRQ.

EL0PCTEN	Meaning
0b0	CNTPCT is not visible in the second view. If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTPCT and CNTFRQ are visible in the current frame, then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible and accesses are RAZ/WI in that frame.

CNTEL0ACR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFID0 is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see 'The Frequency modes table'.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

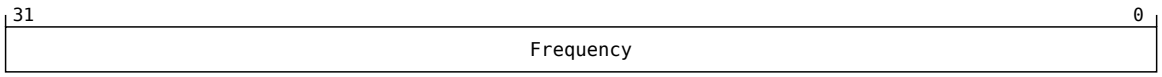
Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions



Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTFID0 can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

Accesses to this register are IMPLEMENTATION DEFINED.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.6 CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter frequencies.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFID<n> is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see 'The Frequency modes table'.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space `0x0C0-0x0FC`, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

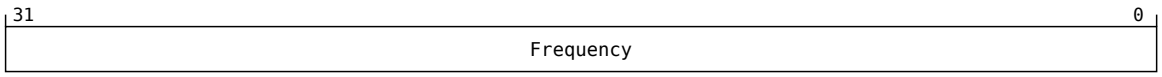
Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions



Frequency, bits [31:0]

A system counter frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is increased by the ratio of the base frequency and the selected frequency.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes these registers, is implemented only in the Secure physical address space.

CNTFID<n> can be accessed through the memory-mapped interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0x020 + (4 * n)`	CNTFID<n>

Accesses to this register are IMPLEMENTATION DEFINED.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the effective frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

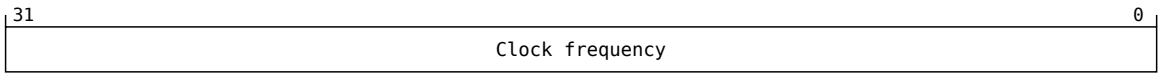
It is IMPLEMENTATION DEFINED whether CNTFRQ is implemented in the Core power domain or in the Debug power domain

For more information see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions



ClockFreq, bits [31:0]

Clock frequency. Indicates the effective frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTBaseN frame.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

    - Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x010	CNTFRQ

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x010	CNTFRQ

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x000	CNTFRQ

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.8 CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configuration

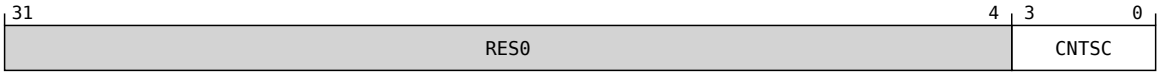
It is IMPLEMENTATION DEFINED whether CNTID is implemented in the Core power domain or in the Debug power domain

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CNTSC	Meaning
0b0000	Counter scaling is not implemented.
0b0001	Counter scaling is implemented.

All other values are reserved.

Access to this field is RO.

Accessing CNTID

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTID can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x1C	CNTID

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.9 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Configuration

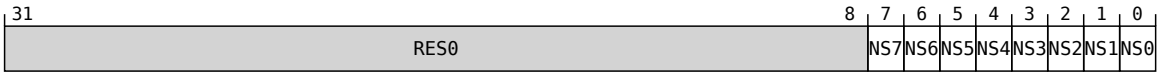
It is IMPLEMENTATION DEFINED whether CNTNSAR is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

NS<n> , bits [n], for n = 7 to 0

Non-secure access to frame n.

NS<n>	Meaning
0b0	Secure access only. Behaves as RES0 to Non-secure accesses.
0b1	Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTNSAR

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.10 CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

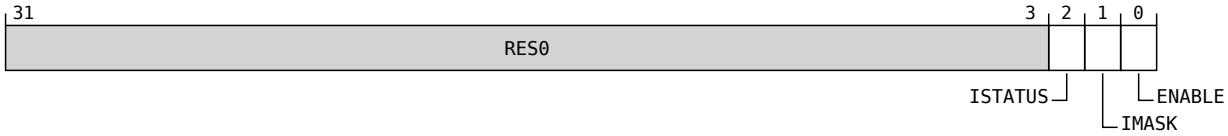
It is IMPLEMENTATION DEFINED whether CNTP_CTL is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0, then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
  - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x02C	CNTP_CTL

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.11 CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configuration

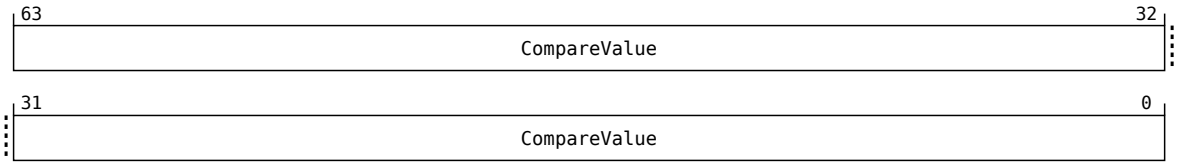
It is IMPLEMENTATION DEFINED whether CNTP_CVAL is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- CNTP_CVAL is accessible in that frame if both:
  - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x020	CNTP_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x024	CNTP_CVAL	63:32

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.12 CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

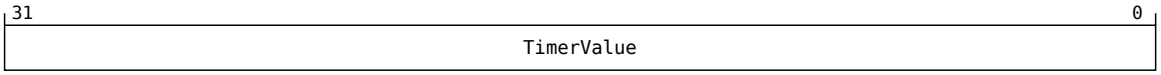
It is IMPLEMENTATION DEFINED whether CNTP_TVAL is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
  - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x028	CNTP_TVAL

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.13 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

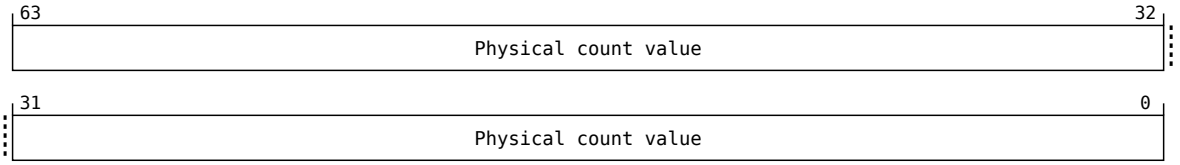
It is IMPLEMENTATION DEFINED whether CNTPCT is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTPCT is a 64-bit register.

Field descriptions



PhysicalCount, bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RPCT is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTPCT is accessible in that frame if both:
  - CNTPCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNTPCT can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x000	CNTPCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x004	CNTPCT	63:32

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x000	CNTPCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x004	CNTPCT	63:32

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.14 CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter effective frequency setting, and controls counter behavior during debug.

Configuration

It is IMPLEMENTATION DEFINED whether CNTSCR is implemented in the Core power domain or in the Debug power domain

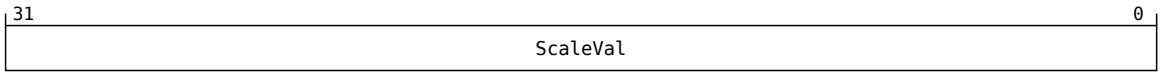
For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

Attributes

CNTSCR is a 32-bit register.

Field descriptions



ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the average amount added to the counter value for one period of the frequency of the Generic counter as described in the CNTFRQ register.

The actual rate of update of the counter value is determined by the counter resolution.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTSCR

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTSCR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.15 CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter resolution status information.

Configuration

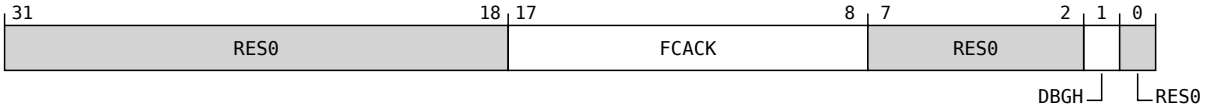
It is IMPLEMENTATION DEFINED whether CNTSR is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSR is a 32-bit register.

Field descriptions



Bits [31:18]

Reserved, RES0.

FCACK, bits [17:8]

Frequency Change Acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table'.

The reset behavior of this field is:

- On a Timer reset, this field resets to `'0000000000'`.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

DBGH	Meaning
`0b0`	Counter is not halted.
`0b1`	Counter is halted.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accessing CNTSR

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTSR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0x004`	CNTSR

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.16 CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the physical address space, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

Configuration

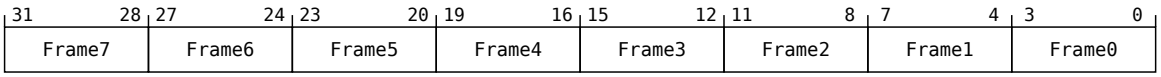
It is IMPLEMENTATION DEFINED whether CNTTIDR is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTTIDR is a 32-bit register.

Field descriptions



Frame<n> , bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

Bit[2]	Meaning
0b0	Frame<n> does not have a second view. The CNTEL0ACR register in the first view of the frame is RES0.
0b1	Frame<n> has a second view, CNTEL0Base<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

The possible values of bit[1] are:

Bit[1]	Meaning
0b0	Frame<n> does not have virtual capability. The virtual time and offset registers are RES0.
0b1	Frame<n> has virtual capability. The virtual time and offset registers are implemented.

If bit[0] is 0, bit[1] is RES0.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
`0b0`	Frame<n> is not implemented. All registers associated with the frame are RES0.
`0b1`	Frame<n> is implemented.

Accessing CNTTIDR

In a system that recognizes two Security states, this register is accessible by both Secure and Non-secure accesses.

CNTTIDR can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	`0x008`	CNTTIDR

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.17 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

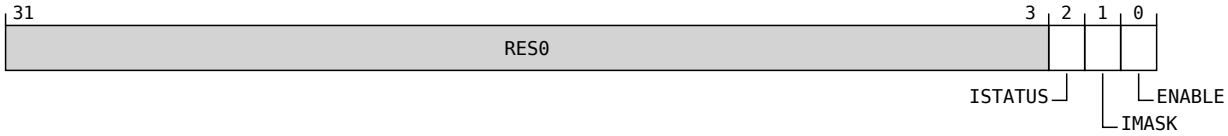
It is IMPLEMENTATION DEFINED whether CNTV_CTL is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0, then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
  - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x03C	CNTV_CTL

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.18 CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configuration

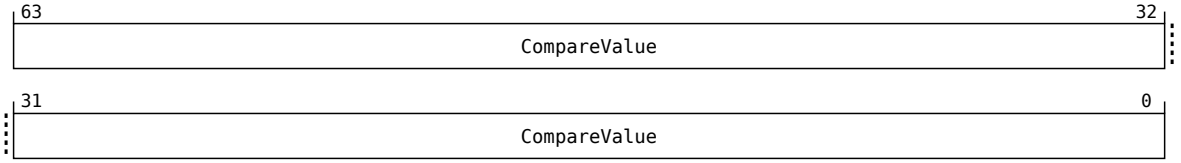
It is IMPLEMENTATION DEFINED whether CNTV_CVAL is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- CNTV_CVAL is accessible in that frame if both:
  - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x030	CNTV_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x034	CNTV_CVAL	63:32

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.19 CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

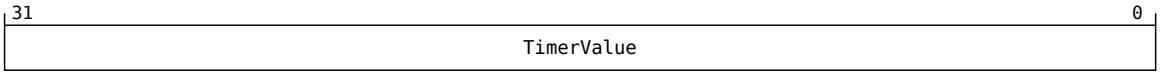
It is IMPLEMENTATION DEFINED whether CNTV_TVAL is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
  - CNTV_TVAL is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x038	CNTV_TVAL

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.20 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configuration

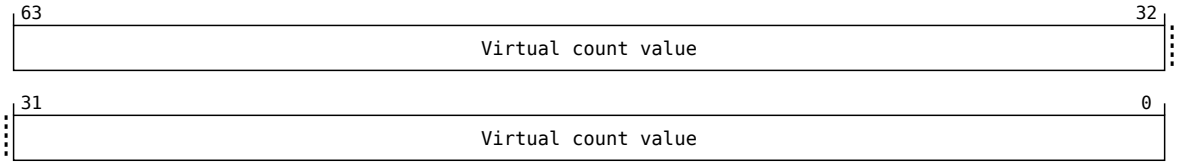
It is IMPLEMENTATION DEFINED whether CNTVCT is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVCT is a 64-bit register.

Field descriptions



VirtualCount, bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
  - CNTVCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT can be accessed through the memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x008	CNTVCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x00C	CNTVCT	63:32

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x008	CNTVCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x00C	CNTVCT	63:32

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.21 CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configuration

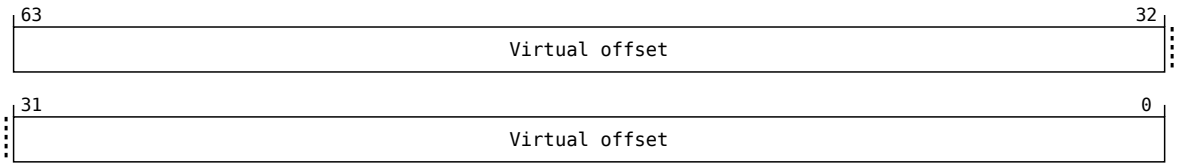
It is IMPLEMENTATION DEFINED whether CNTVOFF is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF register must be accessible as an atomic 64-bit value.

CNTVOFF can be accessed through the memory-mapped interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Frame	Offset	Range
Timer	CNTBaseN	0x018	31:0

Accesses to this register are RO.

Component	Frame	Offset	Range
Timer	CNTBaseN	0x01C	63:32

Accesses to this register are RO.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.22 CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

Configuration

It is IMPLEMENTATION DEFINED whether CNTVOFF<n> is implemented in the Core power domain or in the Debug power domain

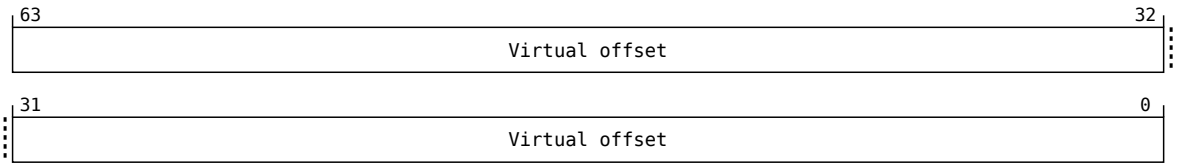
For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implementation of this register is OPTIONAL.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF<n>

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames'.

Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using CNTVOFF.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n> can be accessed through the memory-mapped interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Frame	Offset	Range
Timer	CNTCTLBase	`0x080 + (8 * n)`	31:0

Accesses to this register are RW.

Component	Frame	Offset	Range
Timer	CNTCTLBase	`0x084 + (8 * n)`	63:32

Accesses to this register are RW.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

F4.5.23 CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Configuration

It is IMPLEMENTATION DEFINED whether CounterID<n> is implemented in the Core power domain or in the Debug power domain

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

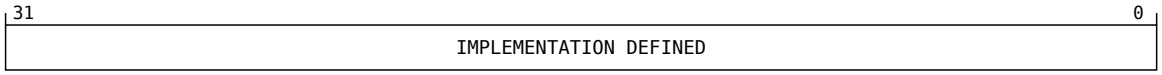
If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of `0xF`.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing CounterID<n>

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure physical address spaces, the frame is implemented only in the Secure physical address space, meaning these registers are implemented only in the Secure physical address space.

For the CNTReadBase frame, these registers are accessible in all physical address spaces.

For the CNTBaseN frames, 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

CounterID<n> can be accessed through the memory-mapped interface:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0xFD0 + (4 * n)`	CounterID<n>

Accesses to this register are RO.

Chapter G1
R-profile Architecture Pseudocode

This chapter contains pseudocode that describes many features of the A-profile architecture. It contains the following sections:

- Pseudocode for AArch64 operation.
- Shared pseudocode.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

G1.1 Pseudocode for AArch64 operation

This section holds the pseudocode for execution in AArch64 state. Functions that are listed in this section are identified as `AArch64.FunctionName`. Some of these functions have an equivalent AArch32 function, `AArch32.FunctionName`. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example `aarch64/debug/breakpoint`.

The top-level sections of the AArch64 pseudocode hierarchy are:

- aarch64/debug.
- aarch64/exceptions.
- aarch64/functions.
- aarch64/translation.

G1.1.1 aarch64/debug

This section includes the following pseudocode functions:

G1.1.1.1 AArch64.BreakpointMatch

```
// AArch64.BreakpointMatch()
// =========================
// Breakpoint matching in an AArch64 translation regime.
// Returns BreakpointInfo structure that contains a boolean indicating if the match is successful
// and the matched address.

BreakpointInfo AArch64.BreakpointMatch(integer n, bits(64) vaddress, AccessDescriptor accdesc,
                                       integer size)
    assert !ELUsingAArch32(S1TranslationRegime());
    assert n < NumBreakpointsImplemented();
    BreakpointInfo brkptinfo;

    linking_enabled = DBGBCR_EL1[n].BT IN {'0x11', '1xx1'};

    // A breakpoint that has linking enabled does not generate debug events in isolation
    if linking_enabled then
        brkptinfo.match = FALSE;
        return brkptinfo;

    enabled    = IsBreakpointEnabled(n);
    linked     = DBGBCR_EL1[n].BT == '0x01';
    isbreakpnt = TRUE;
    linked_to  = FALSE;
    linked_n = UInt(DBGBCR_EL1[n].LBN);
    state_match = AArch64.StateMatch(DBGBCR_EL1[n].SSC, DBGBCR_EL1[n].HMC,
                                     DBGBCR_EL1[n].PMC, linked, linked_n, isbreakpnt,
                                     vaddress, accdesc);

    value_match = AArch64.BreakpointValueMatch(n, vaddress, linked_to);

    brkptinfo.match = value_match && state_match && enabled;
    return brkptinfo;
```

G1.1.1.2 AArch64.BreakpointValueMatch

```
// AArch64.BreakpointValueMatch()
// ==============================
```

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

```
// Returns a boolean indicating if the value match is successful.

boolean AArch64.BreakpointValueMatch(integer n_in, bits(64) vaddress, boolean linked_to)

    // "n_in" is the identity of the breakpoint unit to match against.
    // "vaddress" is the current instruction address, ignored if linked_to is TRUE and for Context
    //   matching breakpoints.
    // "linked_to" is TRUE if this is a call from StateMatch for linking.
    integer n = n_in;
    Constraint c;
    bits(5) dbgtype;

    // If a non-existent breakpoint then it is CONSTRAINED UNPREDICTABLE whether this gives
    // no match or the breakpoint is mapped to another UNKNOWN implemented breakpoint.

G1.2 Shared pseudocode

This section holds the pseudocode that is common to execution in AArch64 state and in AArch32 state. Functions listed in this section are identified only by a `FunctionName`, without an `AArch64.` or `AArch32.` prefix. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example `shared/debug/DebugTarget`.

The top-level sections of the shared pseudocode hierarchy are:

- shared/debug.
- shared/exceptions.
- shared/functions.
- shared/trace.
- shared/translation.

G1.2.1 shared/debug

This section includes the following pseudocode functions:

G1.2.1.1 ClearStickyErrors

```
// ClearStickyErrors()
// ===================

ClearStickyErrors()
    EDSCR.TXU = '0';            // Clear TX underrun flag
    EDSCR.RXO = '0';            // Clear RX overrun flag

    if Halted() then            // in Debug state
        EDSCR.ITO = '0';        // Clear ITR overrun flag

    // If halted and the ITR is not empty then it is UNPREDICTABLE whether the EDSCR.ERR is cleared.
    // The UNPREDICTABLE behavior also affects the instructions in flight, but this is not described
    // in the pseudocode.
    if (Halted() && EDSCR.ITE == '0' &&
          ConstrainUnpredictableBool(Unpredictable_CLEARERRITEZERO)) then
        return;
    EDSCR.ERR = '0';            // Clear cumulative error flag

    return;
```

G1.2.1.2 DebugTarget

```
// DebugTarget()
// =============
// Returns the debug exception target Exception level

bits(2) DebugTarget()
    ss = CurrentSecurityState();
    return DebugTargetFrom(ss);
```

G1.2.1.3 DebugTargetFrom

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.

// Signals the memory system that memory accesses of type HINT to or from the specified address are
// likely in the near future. The memory system may take some action to speed up the memory
// accesses when they do occur, such as pre-loading the specified address into one or more
// caches as indicated by the innermost cache level target (0=L1, 1=L2, etc) and non-temporal hint
// stream. Any or all prefetch hints may be treated as a NOP. A prefetch hint must not cause a
// synchronous abort due to Alignment or Translation faults and the like. Its only effect on
// software-visible state should be on caches and TLBs associated with address, which must be
// accessible by reads, writes or execution, as defined in the translation regime of the current
// Exception level. It is guaranteed not to access Device memory.
// A Prefetch_EXEC hint must not result in an access that could not be performed by a speculative
// instruction fetch, therefore if all associated MMUs are disabled, then it cannot access any
// memory location that cannot be accessed by instruction fetches.

Architectural Constraints on UNPREDICTABLE Behaviors

This chapter describes the architectural constraints on UNPREDICTABLE behaviors in the Armv8 and later architectures. It contains the following sections:

- AArch64 CONSTRAINED UNPREDICTABLE behaviors.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.

H1.1 AArch64 CONSTRAINED UNPREDICTABLE behaviors

It contains the following sections:

- Overview of the constraints on AArch64 UNPREDICTABLE behaviors.
- SBZ or SBO fields in A64 instructions.
- CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values.
- CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization.
- Translation table base address alignment.
- The Performance Monitors Extension.

- Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED.
- Out of range virtual address.
- Mapping of non-idempotent memory locations using the Normal memory type.
- Instruction fetches from Device memory.
- Programming the CSSELR_EL1.{Level, InD, TnD} for a cache level that is not implemented.
- Crossing a page boundary with different memory types or Shareability attributes.
- Crossing a peripheral boundary with a Device access.
- CONSTRAINED UNPREDICTABLE behaviors with Load-Exclusive/Store-Exclusive pairs.
- CONSTRAINED UNPREDICTABLE behavior for A64 instructions.
- Out of range values of the Set/Way/Index fields in cache maintenance instructions.
- Reserved values in System and memory-mapped registers and translation table entries.
- CONSTRAINED UNPREDICTABLE behavior in Debug state.

H1.1.1 Overview of the constraints on AArch64 UNPREDICTABLE behaviors

The term UNPREDICTABLE describes a number of cases where the architecture has a feature that software must not use. For execution in AArch64 state, the Armv8-A and later architectures specify a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

Note

Software designed to be compatible with the Armv8-A and later architectures must not rely on these CONSTRAINED UNPREDICTABLE cases being handled in any way other than those listed under the heading CONSTRAINED UNPREDICTABLE.

H1.1.2 SBZ or SBO fields in A64 instructions

Some A64 instructions have (0) or (1) in the instruction decode to indicate *Should-Be-Zero*, SBZ, or *Should-Be-One*, SBO, as described in Fixed values in AArch64 instruction and System register descriptions. Except for specific cases identified in CONSTRAINED UNPREDICTABLE behaviors with Load-Exclusive/Store-Exclusive pairs, if the instruction bit pattern of an instruction is executed with these fields not having the *should be* values, one of the following must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as if the bit had the *should-be* value.
- Any destination registers of the instruction become UNKNOWN.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H1.1.3 CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values

The Arm architecture allows copies of control values or data values to be cached in a cache or TLB. This can lead to UNPREDICTABLE behavior if the cache or TLB has not been correctly invalidated following a change of the control or data values.

Unless explicitly stated otherwise, the behavior of the PE is consistent with one of:

- The old data or control value.
- The new data or control value.
- An amalgamation of the old and new data or control values.

In an implementation that includes FEAT_TTCNP, this CONSTRAINED UNPREDICTABLE case can arise from misprogramming when setting TTBR.CnP to 1, as identified in the descriptions of the TTBR.CnP field. In this case, for a particular TTBR, the behavior of the PE is consistent with one of:

- The value of the translation table entry pointed to by that TTBR on one of the PEs within the Inner Shareable domain for which both the value of TTBR.CnP is 1 and the other conditions for sharing translation table entries pointed to by that TTBR are met.
- An amalgamation of the values of the translation table entries pointed to by that TTBR on two or more of the PEs within the Inner Shareable domain for which both the value of TTBR.CnP is 1 and the other conditions for sharing translation table entries pointed to by that TTBR are met.

Note

If the Effective value of a control or data value that determines the behavior of the PE results from the amalgamation of two or more values, then that Effective value must not generate a privilege violation. So, for example:

- Where the CONSTRAINED UNPREDICTABLE behavior occurs because inadequate invalidation of the TLB causes multiple hits in the TLB, the failure to invalidate the TLB by software executing at a given Exception level and Security state must not make it possible to access regions of memory with permissions or attributes that could not be accessed at that Exception level and Security state.
- Where the CONSTRAINED UNPREDICTABLE behavior occurs because of a programming error, on one or more PEs in the Inner Shareable domain, when using a TTBR.CnP value of 1 to share translation table entries, the misprogramming must not make it possible to access regions of memory with permissions or attributes that could not be accessed at the Exception level of that TTBR and the Security state corresponding to the translation table entries being shared.

Alternatively to this CONSTRAINED UNPREDICTABLE behavior, an implementation detecting multiple hits in a TLB might generate an exception, reporting the exception using the TLB conflict fault code, see TLB conflict abort.

The choice between the behaviors might, in some implementations, vary for each use of a control or data value.

H1.1.4 CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization

The Arm architecture requires that changes to System registers must be synchronized before they take effect. This can lead to UNPREDICTABLE behavior if the synchronization has not been performed.

In these cases, the behavior of the PE is consistent with the unsynchronized control value being either the old value or the new value.

Where multiple control values are updated but not yet synchronized, each control value might independently be the old value or the new value.

In addition, where the unsynchronized control value applies to different areas of functionality, or what an implementation has constructed as different areas of functionality, those areas might independently treat the control value as being either the old value or the new value.

The choice between these behaviors might, in some implementations, vary for each use of a control value.

Non-Confidential

H1.1.5 Translation table base address alignment

In the translation table base registers TTBR0_EL1, TTBR1_EL1, TTBR0_EL2, register bits[48:*x*] hold the translation table base address, where *x* depends on the translation table granule size and the size of the addressed translation table, as described in Translation granules. Register bits[(*x*-1):0], unless redefined for another purpose, correspond to bits[(*x*-1):0] of the translation table base address and therefore are RES0.

Note

- When FEAT_LPA is implemented and the 64KB granule size is used, register bits[5:2] are redefined to hold bits[51:48] of the translation table base address.
- When FEAT_TTCNP is implemented register bit[0] is redefined as the CnP bit.

For these registers, if one or more RES0 bits in register bits [(x-1):0] does not have a value of 0, this can result in a misaligned translation table base address. In this case, one of the following behaviors must occur:

- The field that is defined to be RES0 is treated as if all the bits had a value of 0:
  - The value read back might be the value written or it might be zero.
- The calculation of an address for a translation table walk using those registers might be corrupted in those bits that are nonzero.

For more information, see the appropriate TTBR.BADDR field description.

H1.1.6 The Performance Monitors Extension

The following subsections describe CONSTRAINED UNPREDICTABLE behaviors when accessing the Performance Monitors Extension in AArch64 state:

- CONSTRAINED UNPREDICTABLE accesses to PMXEVTYPER_EL0 or PMXEVETYPER_EL0.
- CONSTRAINED UNPREDICTABLE accesses to PMEVCNTR<n>_EL0 and PMEVTYPER<n>_EL0.
- CONSTRAINED UNPREDICTABLE behavior caused by MDCR_EL2.HPMN.

H1.1.6.1 CONSTRAINED UNPREDICTABLE accesses to PMXEVTYPER_EL0 or PMXEVETYPER_EL0

If PMSELR_EL0.SEL is greater than the number of event counters accessible at this Exception level, accesses to PMXEVTYPER_EL0 and PMXEVCNTR_EL0 can cause CONSTRAINED UNPREDICTABLE behavior. This occurs when one of the following is true:

- If PMSELR_EL0.SEL is not equal to 31, and PMSELR_EL0.SEL is greater than or equal to PMCR_EL0.N, and the PE is executing in EL2 or EL3.
- If FEAT_SEL2 is disabled or is not implemented, PMSELR_EL0.SEL is not 31, and PMSELR_EL0.SEL is greater than or equal to PMCR_EL0.N, and the PE is executing in Secure EL1 or Secure EL0.
- If PMSELR_EL0.SEL is not 31, and PMSELR_EL0.SEL is greater than or equal to MDCR_EL2.HPMN, and the PE is executing in EL0 or EL1.

In these cases, one of the following behaviors must occur:

- Accesses to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state are UNDEFINED.
- Accesses to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state behave as RAZ/WI.
- Accesses to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state execute as NOPs.
- Accesses to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state behave as if PMSELR_EL0.SEL contains an UNKNOWN value that is less than the number of counters accessible at the current Exception level and Security state.
- Accesses to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state behave as if PMSELR_EL0.SEL is 31.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- If EL2 is implemented and enabled in the current Security state, and PMSELR_EL0.SEL is less than the number of accessible event counters but greater than or equal to the number of accessible counters at this Exception level, access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from EL1 or a permitted access from EL0 is trapped to EL2.

If PMSELR_EL0.SEL is equal to 31, then one of the following behaviors must occur:

- Accesses to PMXEVCNTR_EL0 are UNDEFINED.
- Accesses to PMXEVCNTR_EL0 behave as RAZ/WI.
- Accesses to PMXEVCNTR_EL0 execute as NOPs.
- Accesses to PMXEVCNTR_EL0 behave as if PMSELR_EL0.SEL contains an unknown value that is less than the number of counters accessible at the current Exception level and Security state.

H1.1.6.2 CONSTRAINED UNPREDICTABLE accesses to PMEVCNTR<n>_EL0 and PMEVTYPER<n>_EL0

If <n> is greater than the number of event counters available in the current Exception level and state, reads and writes of PMEVCNTR<n>_EL0 and PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, for an access to PMEVCNTR<n>_EL0 or PMEVTYPER<n>_EL0 from EL1 or a permitted access from EL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2.

Accesses from EL0 to PMEVCNTR<n>_EL0 are permitted when EL1 is using AArch64 and the value of PMUSERENR_EL0.{ER, EN} are both 1.

Accesses from EL0 to PMEVTYPER<n>_EL0 are permitted when EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

H1.1.6.3 CONSTRAINED UNPREDICTABLE behavior caused by MDCR_EL2.HPMN

If PMCR_EL0.N is nonzero, and one of the following is true:

- FEAT_HPMN0 is not implemented and MDCR_EL2.HPMN is set to 0.
- MDCR_EL2.HPMN is set to a value greater than PMCR_EL0.N.

The following CONSTRAINED UNPREDICTABLE behavior applies:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN nonzero value less than PMCR_EL0.N.
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

H1.1.7 Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED

When a CONSTRAINED UNPREDICTABLE instruction is treated as UNDEFINED, ESR_ELx is UNKNOWN.

Note

The value written to ESR_ELx must be consistent with a value that could be created as the result of an exception from the same Exception level that generated the exception, but was the result of a situation that is not CONSTRAINED UNPREDICTABLE at that Exception level. This is to avoid a possible privilege violation.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H1.1.8 Out of range virtual address

If the PE executes a load or store instruction with tagged addressing disabled in the current translation regime, and where the computed virtual address, total access size, and alignment mean that it accesses the bytes at `0xFFFF_FFFF_FFFF_FFFF` and `0x0000_0000_0000_0000`, then the bytes that appear to be from `0x0000_0000_0000_0000` onwards are accessed at an UNKNOWN address. It is permitted for the UNKNOWN address used to be a fixed value such that it always generates an MMU fault.

If the PE executes a load or store instruction with tagged addressing enabled in the current translation regime, and where the computed address, total access size, and alignment mean that it accesses the bytes at `0xFFFF_FFFF_FFFF_FFFF` and `0x0000_0000_0000_0000`, then the bytes that appear to be from `0x0000_0000_0000_0000` onwards are accessed at an UNKNOWN address and the tags associated with address also become UNKNOWN. It is permitted for the UNKNOWN address used to be a fixed value such that it always generates an MMU fault.

Note

Because of Program Counter alignment constraints, it is impossible for a PE to fetch an A64 instruction that includes both the byte at virtual address `0xFFFF_FFFF_FFFF_FFFF` and the byte at virtual address `0x0000_0000_0000_0000`.

H1.1.9 Mapping of non-idempotent memory locations using the Normal memory type

If non-idempotent memory locations are mapped using the Normal memory type, the state of the non-idempotent memory location may become corrupted in following circumstances:

- Speculative read accesses may cause accesses to the non-idempotent memory locations that would not occur as part of a simple sequential execution.
- Writes to non-idempotent memory locations might be merged or split. In this case, the number and size of writes seen by the memory location might not be the number and size that occur as part of a simple sequential execution.

H1.1.10 Instruction fetches from Device memory

Instruction fetches from Device memory are CONSTRAINED UNPREDICTABLE.

If a location in memory has the Device attribute and is not marked as execute-never, then an implementation might perform speculative instruction accesses to this memory location at times when address translation is enabled.

For an instruction fetch from a memory location with the Device attribute that is not marked as execute-never for the current Exception level, an implementation can either:

- Treat the instruction fetch as if it were to a memory location with the Normal, Non-cacheable attribute.
- Take a Permission fault.

H1.1.11 Programming the CSSELR_EL1.{Level, InD, TnD} for a cache level that is not implemented

If the CSSELR_EL1.{Level, InD, TnD} is programmed to a cache level that is not implemented, then a read of CSSELR_EL1 returns an UNKNOWN value in CSSELR_EL1.{Level, InD, TnD}.

If CSSELR_EL1.{Level, InD, TnD} is programmed to a cache level that is not implemented, then on a read of CCSIDR_EL1 an implementation must perform one of the following behaviors:

- The CCSIDR_EL1 read is treated as a NOP.
- The CCSIDR_EL1 read is UNDEFINED.
- The CCSIDR_EL1 read returns an UNKNOWN value.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

When FEAT_CCIDX is implemented, CCSIDR2_EL1 is implemented. If CSSELR_EL1.{Level, InD, TnD} is programmed to a cache level that is not implemented, then on a read of CCSIDR2_EL1 an implementation must perform one of the following behaviors:

- The CCSIDR2_EL1 read is treated as a NOP.
- The CCSIDR2_EL1 read is UNDEFINED.
- The CCSIDR2_EL1 read returns an UNKNOWN value.

H1.1.12 Crossing a page boundary with different memory types or Shareability attributes

If a single load or store instruction generates multiple memory accesses, such that the total set of accesses crosses a page boundary to a memory location that has a different memory type, Normal or Device, or Shareability attribute results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation must perform one of the following behaviors:

- Each memory access generated by the instruction uses the memory type and Shareability attribute associated with its own address.
- The instruction generates an Alignment fault caused by the memory type.
  For the EL1&0 translation regime, if the stage 1 translation generated the mismatch, the resulting exception is taken to EL1.
- The instruction executes as a NOP.

H1.1.13 Crossing a peripheral boundary with a Device access

Performing memory accesses from one load or store instruction to Device memory that crosses a boundary corresponding to the smallest translation granule size of the implementation causes CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation performs one of the following behaviors:

- All memory accesses generated by the instruction are performed as if the boundary has no effect on the memory accesses.
- All memory accesses generated by the instruction are performed as if the boundary has no effect on the memory accesses except that there is no guarantee of ordering between memory accesses.
- The instruction generates an alignment fault caused by the memory type.
- The instruction generates an Alignment fault caused by the memory type.
  For the EL1&0 translation regime, if the stage 1 translation generated the mismatch, the resulting exception is taken to EL1.
- The instruction executes as a NOP.

Note

The boundary referred to is between two Device memory regions that are both:

- Of the size of the smallest implemented translation granule.
- Aligned to the size of the smallest implemented translation granule.

H1.1.14 CONSTRAINED UNPREDICTABLE behaviors with SVE memory accesses

The CONSTRAINED UNPREDICTABLE behaviors that are associated with memory accesses due to loads and stores also apply to SVE vector load and store instructions. The CONSTRAINED UNPREDICTABLE behaviors are described in Crossing a page

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

boundary with different memory types or Shareability attributes and Crossing a peripheral boundary with a Device access.

The CONSTRAINED UNPREDICTABLE behaviors apply to the following SVE memory accesses:

- When an SVE unpredicated contiguous load or store instruction accesses an address range that crosses a boundary between memory types, Shareability attributes, or peripherals.
- When an SVE predicated contiguous load or store instruction performs memory accesses that are associated with Active elements on both sides of a boundary between different memory types, Shareability attributes, or peripherals.
- When an SVE predicated non-contiguous load or store instruction performs a memory access that is associated with an Active element that crosses a boundary between memory types, Shareability attributes, or peripherals.

Memory addresses that are associated with *Inactive elements* cannot trigger CONSTRAINED UNPREDICTABLE behaviors.

If SVE vector loads and stores trigger a CONSTRAINED UNPREDICTABLE behavior that then generates an alignment fault, the fault is handled in the same as any other synchronous memory fault caused by an SVE load or store instruction.

H1.1.15 CONSTRAINED UNPREDICTABLE behaviors with Load-Exclusive/Store-Exclusive pairs

Load-Exclusive and Store-Exclusive instruction usage restrictions defines a Load-Exclusive/Store-Exclusive pair, and identifies various CONSTRAINED UNPREDICTABLE behaviors associated with using Load-Exclusive/Store-Exclusive pairs. In summary, these cases are:

- The target virtual address of a `StoreExcl` instruction is different from the virtual address of the preceding `LoadExcl` instruction in the same thread of execution.
- The transaction size of a `StoreExcl` instruction is different from the transaction size of the preceding `LoadExcl` instruction in the same thread of execution.
- The `StoreExcl` instruction accesses a different number of registers than the preceding `LoadExcl` instruction in the same thread of execution.
- The memory attributes for a `StoreExcl` instruction are different from the memory attributes for the preceding `LoadExcl` instruction in the same thread of execution, either:
  - Because the translation of the accessed address changes between the `LoadExcl` instruction and the `StoreExcl` instruction.
  - Because the `LoadExcl` instruction and the `StoreExcl` instruction use different virtual addresses, with different attributes, that point to the same physical address.

In addition, the effect of a data or unified cache invalidate, clean, or clean and invalidate instruction on a local or global Exclusives monitor that is in the Exclusive Access state is CONSTRAINED UNPREDICTABLE.

See the descriptions in Load-Exclusive and Store-Exclusive instruction usage restrictions for the permitted behavior in each of these cases, and any constraints that might apply to whether the case is CONSTRAINED UNPREDICTABLE.

H1.1.16 CONSTRAINED UNPREDICTABLE behavior for A64 instructions

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A64 instructions listed in A64 Base Instruction Descriptions and A64 Advanced SIMD and Floating-point Instruction Descriptions.

H1.1.16.1 LD64B

For a description of this instruction and encoding, see LD64B.

H1.1.16.1.1 CONSTRAINED UNPREDICTABLE behavior

If a memory location does not support this instruction, then one of the following behaviors must occur:

- A stage 1 Data Abort, reported using the DFSC code of 110101, is generated.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The instruction performs the memory accesses, but the accesses are not single-copy atomic above the byte level.

H1.1.16.2 LDAXP

For a description of this instruction and the encoding, see LDAXP.

H1.1.16.2.1 CONSTRAINED UNPREDICTABLE behavior

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the transfer register is set to an UNKNOWN value.

H1.1.16.3 LDNP

For a description of this instruction and the encoding, see LDNP.

H1.1.16.3.1 CONSTRAINED UNPREDICTABLE behavior

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the transfer register is set to an UNKNOWN value.

H1.1.16.4 LDNP (SIMD&FP)

For a description of this instruction and the encoding, see LDNP (SIMD&FP).

H1.1.16.4.1 CONSTRAINED UNPREDICTABLE behavior

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the transfer register is set to an UNKNOWN value.

H1.1.16.5 LDP and LDIAPP

For a description of these instructions and the encoding, see LDP and LDIAPP.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H1.1.16.5.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `(t == n || t2 == n) && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

If t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode, and the transfer register is set to an UNKNOWN value.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.6 LDP (SIMD&FP)

For a description of this instruction and the encoding, see LDP (SIMD&FP).

H1.1.16.6.1 CONSTRAINED UNPREDICTABLE behavior

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the transfer register is set to an UNKNOWN value.

H1.1.16.7 LDPSW

For a description of this instruction and the encoding, see LDPSW.

H1.1.16.7.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `(t == n || t2 == n) && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode, and the register loaded is set to an UNKNOWN value.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.8 LDR (immediate)

For a description of this instruction and the encoding, see LDR (immediate).

H1.1.16.8.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.9 LDRB (immediate)

For a description of this instruction and the encoding, see LDRB (immediate).

H1.1.16.9.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.10 LDRH (immediate)

For a description of this instruction and the encoding, see LDRH (immediate).

H1.1.16.10.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.

- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.11 LDRSB (immediate)

For a description of this instruction and the encoding, see LDRSB (immediate).

H1.1.16.11.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.12 LDRSH (immediate)

For a description of this instruction and the encoding, see LDRSH (immediate).

H1.1.16.12.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.13 LDRSW (immediate)

For a description of this instruction and the encoding, see LDRSW (immediate).

H1.1.16.13.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.14 LDXP

For a description of this instruction and the encoding, see LDXP.

H1.1.16.14.1 CONSTRAINED UNPREDICTABLE behavior

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the transfer register is set to an UNKNOWN value.

H1.1.16.15 ST64B

For a description of this instruction and encoding, see ST64B.

H1.1.16.15.1 CONSTRAINED UNPREDICTABLE behavior

If a memory location does not support this instruction, then one of the following behaviors must occur:

- A stage 1 Data Abort, reported using the DFSC code of 110101, is generated.
- The instruction performs the memory accesses, but the accesses are not single-copy atomic above the byte level.

H1.1.16.16 STP and STILP

For a description of these instructions and the encoding, see STP and STILP.

H1.1.16.16.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `(t == n || t2 == n) && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.17 STLXP

For a description of this instruction and the encoding, see STLXP.

H1.1.16.17.1 CONSTRAINED UNPREDICTABLE behavior

If `s == t || (s == t2)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

H1.1.16.18 STLXR

For a description of this instruction and the encoding, see STLXR.

H1.1.16.18.1 CONSTRAINED UNPREDICTABLE behavior

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

H1.1.16.19 STLXRB

For a description of this instruction and the encoding, see STLXRB.

H1.1.16.19.1 CONSTRAINED UNPREDICTABLE behavior

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

H1.1.16.20 STLXRH

For a description of this instruction and the encoding, see STLXRH.

H1.1.16.20.1 CONSTRAINED UNPREDICTABLE behavior

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

H1.1.16.21 STR (immediate)

For a description of this instruction and the encoding, see STR (immediate).

H1.1.16.21.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Note

Pre-indexed addressing and post-indexed addressing imply writeback.

H1.1.16.22 STRB (immediate)

For a description of this instruction and the encoding, see STRB (immediate).

H1.1.16.22.1 CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

H1.1.16.26 STXRB

For a description of this instruction and the encoding, see STXRB.

H1.1.16.26.1 CONSTRAINED UNPREDICTABLE behavior

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

H1.1.16.27 STXRH

For a description of this instruction and the encoding, see STXRH.

H1.1.16.27.1 CONSTRAINED UNPREDICTABLE behavior

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

H1.1.17 Out of range values of the Set/Way/Index fields in cache maintenance instructions

In the cache maintenance by set/way instructions DC CISW, DC CSW, and DC ISW, if any set/way/index argument is larger than the value supported by the implementation, then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

H1.1.18 Reserved values in System and memory-mapped registers and translation table entries

Unless otherwise stated in this manual, all unallocated or reserved values of fields with allocated values within AArch64 System registers, memory-mapped registers, and translation table entries behave in one of the following ways:

- The unallocated value maps onto any of the allocated values, but otherwise does not cause CONSTRAINED UNPREDICTABLE behavior.
- The unallocated value causes effects that could be achieved by a combination of more than one of the allocated values.
- The unallocated value causes the field to have no functional effect.

Unless otherwise stated, when a direct write of a System register or memory-mapped register writes an unallocated value to a field, if that value is unallocated in all contexts then a subsequent read of the field returns an UNKNOWN value.

H1.1.19 CONSTRAINED UNPREDICTABLE behavior in Debug state

Behavior in Debug state of this manual describes the CONSTRAINED UNPREDICTABLE behaviors that are specifically associated with Debug state.

H1.1.20 PMSAv64 CONSTRAINED UNPREDICTABLE behavior

This section lists the CONSTRAINED UNPREDICTABLE behaviors of the MPUs in PMSAv64.

If HCR_EL2.VM is 1 and SCTLR_EL2.{M, BR} is {0, 0}, then the behavior is CONSTRAINED UNPREDICTABLE with the following permitted behaviors:

- The stage 2 memory attribute becomes UNKNOWN.
- Raises a stage 2 level 0 translation fault.

Any accesses to an MPU base address register PRBAR_ELx, limit address register PRLAR_ELx, or select register PSERLR_ELx above the number of implemented regions specified by MPUIR_ELx.REGION is CONSTRAINED UNPREDICTABLE. The CONSTAINED UNPREDICTABLE behavior is one of:

- Reads of base, limit or select registers for an unimplemented region returns an UNKNOWN value.
- Writes to base, limit or select registers for an unimplemented region causes those registers to become UNKNOWN.

Appendix H2
Recommendations for Reporting Memory Attributes on an Interconnect

This appendix describes the Arm recommendations for reporting the memory attributes that are assigned by the PE. It contains the following section:

- Arm recommendations for reporting memory attributes on an interconnect.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H2.1 Arm recommendations for reporting memory attributes on an interconnect

The Arm architecture defines the architectural interface between software and the PE hardware. This means the mechanisms by which different memory type and Cacheability attributes are presented on an interface to an interconnect fabric such as AMBA® AXI are, strictly, outside the scope of the architecture. This appendix describes an approach for the interface between a PE implementation and an interconnect fabric that Arm strongly recommends, but these recommendations do not form part of the Arm architecture.

H2.1.1 Effect of microarchitectural choices on memory attributes

Implementations of the Arm architecture permit considerable variability in the presentation of memory attributes on the interconnect fabric, particularly in cases where the PE implementation does not provide optimized support for a memory type. For example, an implementation might treat Write-Through locations as Non-cacheable at some level of cache, because functionally this is consistent with the definition of Write-Through, but for the particular implementation the performance trade-off does not merit the hardware directly providing Write-Through capability. However, in such implementations, the assigned memory attributes are not changed by the microarchitectural choices. The microarchitecture simply implements different ways of handling some memory attributes.

Therefore, Arm strongly recommended that where any or all of the following memory attributes are presented on the interface between a PE and an interconnect fabric, the attributes that are presented are completely consistent with the attributes defined by the translation system:

- The memory type, Normal or Device.
- The Early Write Acknowledgment attribute.
- The ordering requirements.
- The Shareability.
- The Cacheability, including where practicable, the allocation hints.

H2.1.1.1 Effect when memory accesses are forced to be Non-cacheable

Arm also strongly recommends that the effects of forcing accesses to Normal memory to be Non-cacheable, as described in Enabling and disabling the caching of memory accesses for AArch64, are reflected on the interconnect by the memory type and attributes used for memory transactions generated while the cache is disabled.

Appendix H3
Arm Pseudocode Definition

This appendix provides a definition of the pseudocode that is used in this manual, and defines some *helper* procedures and functions that are used by pseudocode. It contains the following sections:

- About the Arm pseudocode.
- Pseudocode for instruction descriptions.
- Data types.
- Operators.
- Statements and control structures.
- Built-in functions.
- Miscellaneous helper procedures and functions.
- Arm pseudocode definition index.

Note

This appendix is not a formal language definition for the pseudocode. It is a guide to help understand the use of Arm pseudocode. This appendix is not complete. Changes are planned for future releases.

H3.1 About the Arm pseudocode

The Arm pseudocode provides precise descriptions of some areas of the Arm architecture. This includes description of the decoding and operation of all valid instructions. Pseudocode for instruction descriptions gives general information about this instruction pseudocode, including its limitations.

The following sections describe the Arm pseudocode in detail:

- Data types.
- Operators.
- Statements and control structures.

Built-in functions and Miscellaneous helper procedures and functions describe some built-in functions and pseudocode helper functions that are used by the pseudocode functions that are described elsewhere in this manual. Arm pseudocode definition index contains the indexes to the pseudocode.

H3.1.1 General limitations of Arm pseudocode

The pseudocode statements `IMPLEMENTATION_DEFINED`, `SEE`, `UNDEFINED`, and `UNPREDICTABLE` indicate behavior that differs from that indicated by the pseudocode being executed. If one of them is encountered:

- Earlier behavior indicated by the pseudocode is only specified as occurring to the extent required to determine that the statement is executed.
- No subsequent behavior indicated by the pseudocode occurs.

For more information, see Special statements.

H3.2 Pseudocode for instruction descriptions

Each instruction description includes pseudocode that provides a precise description of what the instruction does, subject to the limitations described in General limitations of Arm pseudocode and Limitations of the instruction pseudocode.

In the instruction pseudocode, instruction fields are referred to by the names shown in the encoding diagram for the instruction. Instruction encoding diagrams and instruction pseudocode gives more information about the pseudocode provided for each instruction.

H3.2.1 Instruction encoding diagrams and instruction pseudocode

Instruction descriptions in this manual contain:

- An Encoding section, containing one or more encoding diagrams, each followed by some encoding-specific pseudocode that translates the fields of the encoding into inputs for the common pseudocode of the instruction, and picks out any encoding-specific special cases.
- An Operation section, containing common pseudocode that applies to all of the encodings being described. The Operation section pseudocode contains a call to the `EncodingSpecificOperations()` function, either at its start or only after a condition code check performed by `if ConditionPassed() then`.

An encoding diagram specifies each bit of the instruction as one of the following:

- An obligatory 0 or 1, represented in the diagram as 0 or 1. If this bit does not have this value, the encoding corresponds to a different instruction.

An encoding diagram matches an instruction if all obligatory bits are identical in the encoding diagram and the instruction.

In the context of the instruction pseudocode, the execution model for an instruction is:

1. Find all encoding diagrams that match the instruction. It is possible that no encoding diagram matches. In that case, abandon this execution model and consult the relevant instruction set chapter instead to find out how the instruction is to be treated. The bit pattern of such an instruction is usually reserved and UNDEFINED, though there are some other possibilities. For example, unallocated hint instructions are documented as being reserved and executed as NOPs.
2. If the operation pseudocode for the matching encoding diagrams starts with a condition code check, perform that check. If the condition code check fails, abandon this execution model and treat the instruction as a NOP. If there are multiple matching encoding diagrams, either all or none of their corresponding pieces of common pseudocode start with a condition code check.
3. Perform the encoding-specific pseudocode for each of the matching encoding diagrams independently and in parallel. Each such piece of encoding-specific pseudocode starts with a bitstring variable for each named bit or multi-bit field in its corresponding encoding diagram, named the same as the bit or multi-bit field and initialized with the values of the corresponding bit or bits from the bit pattern of the instruction.

   In a few cases, the encoding diagram contains more than one bit or field with same name. In these cases, the values of the different instances of those bits or fields must be identical. The encoding-specific pseudocode contains a special case using the `Consistent()` function to specify what happens if they are not identical. `Consistent()` returns `TRUE` if all instruction bits or fields with the same name as its argument have the same value, and `FALSE` otherwise.

   If there are multiple matching encoding diagrams, all but one of the corresponding pieces of pseudocode must contain a special case that indicates that it does not apply. Discard the results of all such pieces of pseudocode and their corresponding encoding diagrams.

   There is now one remaining piece of pseudocode and its corresponding encoding diagram left to consider. This pseudocode might also contain a special case, most commonly one indicating that it is CONSTRAINED UNPREDICTABLE. If so, abandon this execution model and treat the instruction according to the special case.
4. Check the *should be* bits of the encoding diagram against the corresponding bits of the bit pattern of the instruction. If any of them do not match, abandon this execution model and treat the instruction as CONSTRAINED UNPREDICTABLE.
5. Perform the rest of the operation pseudocode for the instruction description that contains the encoding diagram. That pseudocode starts with all variables set to the values they were left with by the encoding-specific pseudocode.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The `ConditionPassed()` call in the common pseudocode, if present, performs step 2, and the `EncodingSpecificOperations()` call performs steps 3 and 4.

H3.2.2 Limitations of the instruction pseudocode

The pseudocode descriptions of instruction functionality have a number of limitations. These are mainly due to the fact that, for clarity and brevity, the pseudocode is a sequential and mostly deterministic language.

These limitations include:

- Pseudocode does not describe the ordering requirements when an instruction generates multiple memory accesses. For a description of the ordering requirements on memory accesses, see External visibility requirement.
- Pseudocode does not describe the exact rules when an instruction that generates any of the following fails its condition code check:
  - UNDEFINED instruction.
  - Hyp trap.
  - Monitor trap.
  - Trap to AArch64 exception.

  In such cases, the `UNDEFINED` pseudocode statement or call to the applicable trap function lies inside the `if ConditionPassed() then ...` structure, either directly or in the `EncodingSpecificOperations()` function call, and so the pseudocode indicates that the instruction executes as a NOP. For the exact rules, see:
  - Conditional execution of undefined instructions.
  - EL2 configurable controls.
  - EL3 configurable controls.
  - Configurable instruction controls.
- Pseudocode does not describe the exact ordering requirements when a single floating-point instruction generates more than one floating-point exception and one or more of those floating-point exceptions is trapped. Combinations of floating-point exceptions describes the exact rules.

  Note

  There is no limitation in the case where all the floating-point exceptions are untrapped, because the pseudocode specifies the same behavior as the cross-referenced section.
- An exception can be taken during execution of the pseudocode for an instruction, either explicitly as a result of the execution of a pseudocode function such as `Abort()`, or implicitly, for example if an interrupt is taken during execution of an `LDM` instruction. If this happens, the pseudocode does not describe the extent to which the normal behavior of the instruction occurs.

H3.3 Data types

This section describes:

- General data type rules.
- Bitstrings.
- Integers.
- Reals.
- Booleans.
- Enumerations.
- Structures.
- Tuples.
- Arrays.

H3.3.1 General data type rules

Arm architecture pseudocode is a strongly typed language. Every literal and variable is of one of the following types:

- Bitstring.
- Integer.
- Boolean.
- Real.
- Enumeration.
- Tuple.
- Struct.
- Array.

The type of a literal is determined by its syntax. A variable can be assigned to without an explicit declaration. The variable implicitly has the type of the assigned value. For example, the following assignments implicitly declare the variables `x`, `y` and `z` to have types integer, bitstring of length 1, and Boolean, respectively.

```
x = 1;
y = '1';
z = TRUE;
```

Variables can also have their types declared explicitly by preceding the variable name with the name of the type. The following example declares explicitly that a variable named `count` is an integer.

```
integer count;
```

This is most often done in function definitions for the arguments and the result of the function.

The remaining subsections describe each data type in more detail.

H3.3.2 Bitstrings

This section describes the bitstring data type.

H3.3.2.1 Syntax

`bits(N)` The type name of a bitstring of length `N`.

`bit` A synonym of `bits(1)`.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H3.3.2.2 Description

A bitstring is a finite-length string of 0s and 1s. Each length of bitstring is a different type. The minimum permitted length of a bitstring is 0.

Bitstring constants literals are written as a single quotation mark, followed by the string of 0s and 1s, followed by another single quotation mark. For example, the two constants literals of type `bit` are `'0'` and `'1'`. Spaces can be included in bitstrings for clarity.

The bits in a bitstring are numbered from left to right N-1 to 0. This numbering is used when accessing the bitstring using bitslices. In conversions to and from integers, bit N-1 is the MSByte and bit 0 is the LSByte. This order matches the order in which bitstrings derived from encoding diagrams are printed.

Every bitstring value has a left-to-right order, with the bits being numbered in standard *little-endian* order. That is, the leftmost bit of a bitstring of length `N` is bit (N-1) and its right-most bit is bit 0. This order is used as the most-significant-to-least-significant bit order in conversions to and from integers. For bitstring constants and bitstrings that are derived from encoding diagrams, this order matches the way that they are printed.

Bitstrings are the only concrete data type in pseudocode, corresponding directly to the contents values that are manipulated in registers, memory locations, and instructions. All other data types are abstract.

H3.3.3 Integers

This section describes the data type for integer numbers.

H3.3.3.1 Syntax

`integer` The type name for the integer data type.

H3.3.3.2 Description

Pseudocode integers are unbounded in size and can be either positive or negative. That is, they are mathematical integers rather than what computer languages and architectures commonly call integers. Computer integers are represented in pseudocode as bitstrings of the appropriate length, and the pseudocode provides functions to interpret those bitstrings as integers.

Integer literals are normally written in decimal form, such as `0`, `15`, `-1234`. They can also be written in C-style hexadecimal form, such as `0x55` or `0x8000_0000`. Hexadecimal integer literals are treated as positive unless they have a preceding minus sign. For example, `0x8000_0000` is the integer $+2^{31}$. If -2^{31} needs to be written in hexadecimal, it must be written as `-0x8000_0000`.

H3.3.4 Reals

This section describes the data type for real numbers.

H3.3.4.1 Syntax

`real` The type name for the real data type.

H3.3.4.2 Description

Pseudocode reals are unbounded in size and precision. That is, they are mathematical real numbers, not computer floating-point numbers. Computer floating-point numbers are represented in pseudocode as bitstrings of the appropriate length, and the pseudocode provides functions to interpret those bitstrings as reals.

Real constant literals are written in decimal form with a decimal point. This means `0` is an integer constant literal, but `0.0` is a real constant literal.

Non-Confidential

H3.3.5 Booleans

This section describes the Boolean data type.

H3.3.5.1 Syntax

`boolean` The type name for the Boolean data type.

`TRUE or FALSE` The two values a Boolean variable can take.

H3.3.5.2 Description

A Boolean is a logical `TRUE` or `FALSE` value.

Note

This is not the same type as `bit`, which is a bitstring of length 1. A Boolean can only take on one of two values: `TRUE` or `FALSE`.

H3.3.6 Enumerations

This section describes the enumeration data type.

H3.3.6.1 Syntax and examples

`enumeration` Keyword to defined a new enumeration type.

```
enumeration Example {Example_One, Example_Two, Example_Three};
```

A definition of a new enumeration called `Example`, which can take on the values `Example_One`, `Example_Two`, `Example_Three`.

H3.3.6.2 Description

An enumeration is a defined set of named values.

An enumeration must contain at least one named value. A named value must not be shared between enumerations.

Enumerations must be defined explicitly, although a variable of an enumeration type can be declared implicitly by assigning one of the named values to it. By convention, each named value starts with the name of the enumeration followed by an underscore. The name of the enumeration is its *type name*, or *type*, and the named values are its possible *values*.

H3.3.7 Structures

This section describes the structure data type.

H3.3.7.1 Syntax and examples

`type` The keyword used to declare the structure data type.

```
type ShiftSpec is (bits(2) shift, integer amount)
```

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

An example definition for a new structure called `ShiftSpec` that contains an bitstring member called `shift` and a integer member named `amount`. Structure definitions must not be terminated with a semicolon.

```
ShiftSpec abc;
```

A declaration of a variable named `abc` of type `ShiftSpec`.

```
abc.shift
```

Syntax to refer to the individual members within the structure variable.

H3.3.7.2 Description

A structure is a compound data type composed of one or more data items. The data items can be of different data types. This can include compound data types. The data items of a structure are called its members and are named.

In the syntax section, the example defines a structure called `ShiftSpec` with two members. The first is a bitstring of length 2 named `shift` and the second is an integer named `amount`. After declaring a variable of that type named `abc`, the members of this structure are referred to as `abc.shift` and `abc.amount`.

Every definition of a structure creates a different type, even if the number and type of their members are identical. For example:

```
type ShiftSpec1 is (bits(2) shift, integer amount)
type ShiftSpec2 is (bits(2) shift, integer amount)
```

`ShiftSpec1` and `ShiftSpec2` are two different types despite having identical definitions. This means that the value in a variable of type `ShiftSpec1` cannot be assigned to variable of type `ShiftSpec2`.

H3.3.8 Tuples

This section describes the tuple data type.

H3.3.8.1 Examples

```
(bits(32) shifter_result, bit shifter_carry_out)
```

An example of the tuple syntax.

```
(shift_t, shift_n) = ('00', 0);
```

An example of assigning values to a tuple.

H3.3.8.2 Description

A tuple is an ordered set of data items, separated by commas and enclosed in parentheses. The items can be of different types and a tuple must contain at least one data item.

Tuples are often used as the return type for functions that return multiple results. For example, in the syntax section, the example tuple is the return type of the function `Shift_C()`, which performs a standard A32/T32 shift or rotation. Its return type is a tuple containing two data items, with the first of type `bits(32)` and the second of type `bit`.

Each tuple is a separate compound data type. The compound data type is represented as a comma-separated list of ordered data types between parentheses. This means that the example tuple at the start of this section is of type `(bits(32), bit)`. The general principle that types can be implied by an assignment extends to implying the type of the elements in the tuple. For example, in the syntax section, the example assignment implicitly declares:

- `shift_t` to be of type `bits(2)`.
- `shift_n` to be of type `integer`.
- `(shift_t, shift_n)` to be a tuple of type `(bits(2), integer)`.

Non-Confidential

H3.3.9 Arrays

This section describes the array data type.

H3.3.9.1 Syntax

`array` The type name for the array data type.

```
array data_type array_name[A..B];
```

Declaration of an array of type `data_type`, which might be compound data type. It is named `array_name` and is indexed with an integer range from `A` to `B`.

H3.3.9.2 Description

An array is an ordered set of fixed size containing items of a single data type. This can include compound data types. Pseudocode arrays are indexed by either enumerations or integer ranges. An integer range is represented by the lower inclusive end of the range, then `..`, then the upper inclusive end of the range.

For example:

The following example declares an array of 31 bitstrings of length 64, indexed from 0 to 30.

```
array bits(64) _R[0..30];
```

Arrays are always explicitly declared, and there is no notation for a constant literal array. Arrays always contain at least one element data item, because:

- Enumerations always contain at least one symbolic constant named value.
- Integer ranges always contain at least one integer.

An array declared with an enumeration type as the index must be accessed using enumeration values of that enumeration type. An array declared with an integer range type as the index must be accessed using integer values from that inclusive range. Accessing such an array with an integer value outside of the range is a coding error.

Arrays do not usually appear directly in pseudocode. The items that syntactically look like arrays in pseudocode are usually array-like functions such as `R[i]`, `MemU[address, size]` or `Elem[vector, i, size]`. These functions package up and abstract additional operations normally performed on accesses to the underlying arrays, such as register banking, memory protection, endian-dependent byte ordering, exclusive-access housekeeping and Advanced SIMD element processing. See Function and procedure calls.

H3.4 Operators

This section describes:

- Relational operators.
- Boolean operators.
- Bitstring operators.
- Arithmetic operators.
- The assignment operator.
- Precedence rules.
- Conditional expressions.
- Operator polymorphism.

H3.4.1 Relational operators

The following operations yield results of type `boolean`.

H3.4.1.1 Equality and non-equality

If two variables `x` and `y` are of the same type, their values can be tested for equality by using the expression `x == y` and for non-equality by using the expression `x != y`. In both cases, the result is of type `boolean`.

Both `x` and `y` must be of type `bits(N)`, `real`, `enumeration`, `boolean`, or `integer`. Named values from an `enumeration` can only be compared if they are both from the same `enumeration`. An exception is that a bitstring can be tested for equality with an integer to allow a `d==15` test.

A special form of comparison is defined with a bitstring literal that can contain bit values `'0'`, `'1'`, and `'x'`. Any bit with value `'x'` is ignored in determining the result of the comparison. For example, if `opcode` is a 4-bit bitstring, the expression `opcode == '1x0x'` matches the values `'1000'`, `'1100'`, `'1001'`, and `'1101'`. This is known as a bitmask.

Note

This special form is permitted in the implied equality comparisons in the `when` parts of `case ... of ...` structures.

H3.4.1.2 Comparisons

If `x` and `y` are integers or reals, then `x < y`, `x <= y`, `x > y`, and `x >= y` are less than, less than or equal, greater than, and greater than or equal comparisons between them, producing Boolean results.

H3.4.1.3 Set membership with `IN`

`<expression> IN {<set>}` produces `TRUE` if `<expression>` is a member of `<set>`. Otherwise, it is `FALSE`. `<set>` must be a list of expressions separated by commas.

H3.4.2 Boolean operators

If `x` is a Boolean expression, then `!x` is its logical inverse.

If `x` and `y` are Boolean expressions, then `x && y` is the result of ANDing them together. As in the C language, if `x` is `FALSE`, the result is determined to be `FALSE` without evaluating `y`.

Note

This is known as short circuit evaluation.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

If `x` and `y` are `boolean`s, then `x || y` is the result of ORing them together. As in the C language, if `x` is `TRUE`, the result is determined to be `TRUE` without evaluating `y`.

Note

If `x` and `y` are `boolean`s or Boolean expressions, then the result of `x != y` is the same as the result of exclusive-ORing `x` and `y` together. The operator `EOR` only accepts bitstring arguments.

H3.4.3 Bitstring operators

The following operations can be applied only to bitstrings.

H3.4.3.1 Logical operations on bitstrings

If `x` is a bitstring, `NOT(x)` is the bitstring of the same length obtained by logically inverting every bit of `x`.

If `x` and `y` are bitstrings of the same length, `x AND y`, `x OR y`, and `x EOR y` are the bitstrings of that same length obtained by logically ANDing, logically ORing, and exclusive-ORing corresponding bits of `x` and `y` together.

H3.4.3.2 Bitstring concatenation and slicing

If `x` and `y` are bitstrings of lengths `N` and `M` respectively, then `x:y` is the bitstring of length `N+M` constructed by concatenating `x` and `y` in left-to-right order.

The bitstring slicing operator addresses specific bits in a bitstring. This can be used to create a new bitstring from extracted bits or to set the value of specific bits. Its syntax is `x<integer_list>`, where `x` is the integer or bitstring being sliced, and `<integer_list>` is a comma-separated list of integers enclosed in angle brackets. The length of the resulting bitstring is equal to the number of integers in `<integer_list>`. In `x<integer_list>`, each of the integers in `<integer_list>` must be:

- `>= 0`.
- `< Len(x)` if `x` is a bitstring.

The definition of `x<integer_list>` depends on whether `integer_list` contains more than one integer:

- If `integer_list` contains more than one integer, `x<i, j, k,..., n>` is defined to be the concatenation: `x<i> : x<j> : x<k> : ... : x<n>`.
- If `integer_list` consists of just one integer `i`, `x<i>` is defined to be:
  - If `x` is a bitstring, `'0'` if bit `i` of `x` is a zero and `'1'` if bit `i` of `x` is a one.
  - If `x` is an integer, and `y` is the unique integer in the range `0` to `2^(i+1)-1` that is congruent to `x` modulo `2^(i+1)`. Then `x<i>` is `'0'` if `y < 2^i` and `'1'` if `y >= 2^i`.
    Loosely, this definition treats an integer as equivalent to a sufficiently long two's complement representation of it as a bitstring.

The notation for a range expression is `i:j` with `i >= j` is shorthand for the integers in order from `i` down to `j`, with both end values included. For example, `instr<31:28>` represents `instr<31, 30, 29, 28>`.

`x<integer_list>` is assignable provided `x` is an assignable bitstring and no integer appears more than once in `<integer_list>`. In particular, `x<i>` is assignable if `x` is an assignable bitstring and `0 <= i < Len(x)`.

Encoding diagrams for registers frequently show named bits or multi-bit fields. For example, the encoding diagram for the APSR shows its bit<31> as `N`. In such cases, the syntax `APSR.N` is used as a more readable synonym for `APSR<31>` as named bits can be referred to with the same syntax as referring to members of a struct. A comma-separated list of named bits enclosed in angle brackets following the register name allows multiple bits to be addressed simultaneously. For example, `APSR.<N, C, Q>` is synonymous with `APSR <31, 29, 27>`.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H3.4.4 Arithmetic operators

Most pseudocode arithmetic is performed on integer or real values, with operands obtained by conversions from bitstrings and results converted back to bitstrings. As these data types are the unbounded mathematical types, no issues arise about overflow or similar errors.

H3.4.4.1 Unary plus and minus

If `x` is an integer or real, then `+x` is `x` unchanged, `-x` is `x` with its sign reversed. Both are of the same type as `x`.

H3.4.4.2 Addition and subtraction

If `x` and `y` are integers or reals, `x+y` and `x-y` are their sum and difference. Both are of type `integer` if `x` and `y` are both of type `integer`, and `real` otherwise.

There are two cases where the types of `x` and `y` can be different. A bitstring and an integer can be added together to allow the operation `PC + 4`. An integer can be subtracted from a bitstring to allow the operation `PC - 2`.

If `x` and `y` are bitstrings of the same length `N`, so that `N = Len(x) = Len(y)`, then `x+y` and `x-y` are the least significant *N* bits of the results of converting `x` and `y` to integers and adding or subtracting them. Signed and unsigned conversions produce the same result:

```
x+y = (SInt(x) + SInt(y))<N-1:0>
    = (UInt(x) + UInt(y))<N-1:0>
x-y = (SInt(x) - SInt(y))<N-1:0>
    = (UInt(x) - UInt(y))<N-1:0>
```

If `x` is a bitstring of length `N` and `y` is an integer, `x+y` and `x-y` are the bitstrings of length `N` defined by `x+y = x + y<N-1:0>` and `x-y = x - y<N-1:0>`. Similarly, if `x` is an integer and `y` is a bitstring of length `M`, `x+y` and `x-y` are the bitstrings of length `M` defined by `x+y = x<M-1:0> + y` and `x-y = x<M-1:0> - y`.

H3.4.4.3 Multiplication

If `x` and `y` are integers or reals, then `x * y` is the product of `x` and `y`. It is of type `integer` if `x` and `y` are both of type `integer`, and `real` otherwise.

H3.4.4.4 Division and modulo

If `x` and `y` are reals, then `x/y` is the result of dividing `x` by `y`, and is always of type `real`.

If `x` and `y` are integers, then `x DIV y` and `x MOD y` are defined by:

```
x DIV y = RoundDown(x/y)
x MOD y = x - y * (x DIV y)
```

It is a pseudocode error to use any of `x/y`, `x MOD y`, or `x DIV y` in any context where `y` can be zero.

H3.4.4.5 Scaling

If `x` and `n` are of type `integer`, then:

- `x << n = RoundDown(x * 2^n)`.
- `x >> n = RoundDown(x * 2^(-n))`.

H3.4.4.6 Raising to a power

If `x` is an integer or a real and `n` is an integer, then `x^n` is the result of raising `x` to the power of `n`, and:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- If `x` is of type `integer`, then `x^n` is of type `integer`.
- If `x` is of type `real`, then `x^n` is of type `real`.

H3.4.5 The assignment operator

The assignment operator is the = character, which assigns the value of the right-hand side to the left-hand side. An assignment statement takes the form:

```
<assignable_expression> = <expression>;
```

This following subsection defines valid expression syntax.

H3.4.5.1 General expression syntax

An expression is one of the following:

- A literal.
- A variable, optionally preceded by a data type name to declare its type.
- The word `UNKNOWN` preceded by a data type name to declare its type.
- The result of applying a language-defined operator to other expressions.
- The result of applying a function to other expressions.

Variable names normally consist of alphanumeric and underscore characters, starting with an alphabetic or underscore character.

Each register defined in an Arm architecture specification defines a correspondingly named pseudocode bitstring variable, and that variable has the stated behavior of the register. For example, if a bit of a register is defined as RAZ/WI, then the corresponding bit of its variable reads as '0' and ignore writes.

An expression like `bits(32) UNKNOWN` indicates that the result of the expression is a value of the given type, but the architecture does not specify what value it is and software must not rely on such values. The value produced must not:

- Return information that cannot be accessed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE or `CONSTRAINED UNPREDICTABLE` and do not return UNKNOWN values,
- Be promoted as providing any useful information to software.

Note

UNKNOWN values are similar to the definition of UNPREDICTABLE, but do not indicate that the entire architectural state becomes unspecified.

Only the following expressions are assignable. This means that these are the only expressions that can be placed on the left-hand side of an assignment.

- Variables.
- The results of applying some operators to other expressions.

  The description of each language-defined operator that can generate an assignable expression specifies the circumstances under which it does so. For example, those circumstances might require that one or more of the expressions the operator operates on is an assignable expression.
- The results of applying array-like functions to other expressions. The description of an array-like function specifies the circumstances under which it can generate an assignable expression.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Note

If the right-hand side in an assignment is a function returning a tuple, an item in the assignment destination can be written as – to indicate that the corresponding item of the assigned tuple value is discarded. For example:

```
(shifted, -) = LSL_C(operand, amount);
```

The expression on the right-hand side itself can be a tuple. For example:

```
(x, y) = (function_1(), function_2());
```

Every expression has a data type.

- For a literal, this data type is determined by the syntax of the literal.
- For a variable, there are the following possible sources for the data type
  - An optional preceding data type name.
  - A data type the variable was given earlier in the pseudocode by recursive application of this rule.
  - A data type the variable is being given by assignment, either by direct assignment to the variable, or by assignment to a list of which the variable is a member.

  It is a pseudocode error if none of these data type sources exists for a variable, or if more than one of them exists and they do not agree about the type.
- For a language-defined operator, the definition of the operator determines the data type.
- For a function, the definition of the function determines the data type.

H3.4.6 Precedence rules

The precedence rules for expressions are:

1. Literals, variables and function invocations are evaluated with higher priority than any operators using their results, but see Boolean operators.
2. Operators on integers follow the normal operator precedence rules of *exponentiation before multiply/divide before add/subtract*, with sequences of multiply/divides or add/subtracts evaluated left-to-right.
3. Other expressions must be parenthesized to indicate operator precedence if ambiguity is possible, but need not be if all permitted precedence orders under the type rules necessarily lead to the same result. For example, if `i`, `j` and `k` are integer variables, `i > 0 && j > 0 && k > 0` is acceptable, but `i > 0 && j > 0 || k > 0` is not.

H3.4.7 Conditional expressions

If `x` and `y` are two values of the same type and `t` is a value of type `boolean`, then `if t then x else y` is an expression of the same type as `x` and `y` that produces `x` if `t` is `TRUE` and `y` if `t` is `FALSE`.

H3.4.8 Operator polymorphism

Operators in pseudocode can be polymorphic, with different functionality when applied to different data types. Each resulting form of an operator has a different prototype definition. For example, the operator + has forms that act on various combinations of integers, reals and bitstrings.

Table H3-1 summarizes the operand types valid for each unary operator and the result type. Table H3-2 summarizes the operand types valid for each binary operator and the result type.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table H3-1 Result and operand types permitted for unary operators

Operator	Operand Type	Result Type
-	integer	integer
	real	real
NOT	bits(N)	bits(N)
!	boolean	boolean

Table H3-2 Result and operand types permitted for binary operators

Operator	First operand type	Second operand type	Result type
==	bits(N)	integer	boolean
		bits(N)	
	integer	integer	
	real	real	
	enumeration	enumeration	
	boolean	boolean	
!=	bits(N)	bits(N)	boolean
	integer	integer	
	real	real	
<, > <=, >=	integer	integer	boolean
	real	real	
+, -	integer	integer	integer
	real	real	real
	bits(N)	bits(N)	bits(N)
		integer	
<<, >>	integer	integer	integer
*	integer	integer	integer
	real	real	real
	bits(N)	bits(N)	bits(N)
/	real	real	real
DIV	integer	integer	integer
MOD	integer	integer	integer
	bits(N)	integer	
&&, ||	boolean	boolean	boolean
AND, OR, EOR	bits(N)	bits(N)	bits(N)
^	integer	integer	integer
	real	integer	real

H3.5 Statements and control structures

This section describes the statements and program structures available in the pseudocode:

- Statements and Indentation.
- Function and procedure calls.
- Conditional control structures.
- Loop control structures.
- Special statements.
- Comments.

H3.5.1 Statements and Indentation

A simple statement is either an assignment, a function call, or a procedure call. Each statement must be terminated with a semicolon.

Indentation normally indicates the structure in compound statements. The statements contained in structures such as `if ... then ... else ...` or procedure and function definitions are indented more deeply than the statement structure itself. The end of a compound statement structure and their end is indicated by returning to the original indentation level or less.

Indentation is normally done by four spaces for each level. Standard indentation uses four spaces for each level of indent.

H3.5.2 Function and procedure calls

This section describes how functions and procedures are defined and called in the pseudocode.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H3.5.2.1 Procedure and function definitions

A procedure definition has the form:

```
<procedure name>(<argument prototypes>)
    <statement 1>;
    <statement 2>;
    ...
    <statement n>;
```

where `<argument prototypes>` consists of zero or more argument definitions, separated by commas. Each argument definition consists of a type name followed by the name of the argument.

Note

This first definition line is not terminated by a semicolon. This distinguishes it from a procedure call.

A function definition is similar, but also declares the return type of the function:

```
<return type> <function name>(<argument prototypes>)
    <statement 1>;
    <statement 2>;
    ...
    <statement n>;
```

Note

A function or procedure name can include a ".". This is a convention used for functions that have similar but different behaviors in AArch32 and AArch64 states.

Array-like functions are similar, but are written with square brackets and have two forms. These two forms exist because reading from and writing to an array element require different functions. They are frequently used in memory operations. An array-like function definition with a return type is equivalent to reading from an array. For example:

```
<return type> <function name>[<argument prototypes>]
    <statement 1>;
    <statement 2>;
    ...
    <statement n>;
```

Its related function definition with no return type is equivalent to writing to an array. For example:

```
<function name>[<argument prototypes>] = <value prototype>
    <statement 1>;
    <statement 2>;
    ...
    <statement n>;
```

The value prototype determines what data type can be written to the array. The two related functions must share the same name, but the value prototype and return type can be different.

H3.5.2.2 Procedure calls

A procedure call has the form:

```
<procedure_name>(<arguments>);
```

H3.5.2.3 Return statements

A procedure return has the form:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

```
return;
```

A function return has the form:

```
return <expression>;
```

where `<expression>` is of the type declared in the function prototype line.

H3.5.3 Conditional control structures

This section describes how conditional control structures are used in the pseudocode.

H3.5.3.1 if . . . then . . . else . . .

In addition to being a ternary operator, a multi-line `if ... then ... else ...` structure can act as a control structure and has the form:

```
if <boolean_expression> then
    <statement 1>;
    <statement 2>;
    ...
    <statement n>;

elsif <boolean_expression> then
    <statement a>;
    <statement b>;
    ...
    <statement z>;
else
    <statement A>;
    <statement B>;
    ...
    <statement Z>;
```

The block of lines consisting of `elsif` and its indented statements is optional, and multiple `elsif` blocks can be used.

The block of lines consisting of `else` and its indented statements is optional.

Abbreviated one-line forms can be used when the `then` part, and in the `else` part if it is present, contain only simple statements such as:

```
if <boolean_expression> then <statement 1>;
if <boolean_expression> then <statement 1>; else <statement A>;
if <boolean_expression> then <statement 1>; <statement 2>; else <statement A>;
```

Note

In these forms, `<statement 1>`, `<statement 2>`, and `<statement A>` must be terminated by semicolons. This, and the fact that the `else` part is optional, distinguish its use as a control structure from its use as a ternary operator.

H3.5.3.2 case . . . of . . .

A `case ... of ...` structure has the form:

```
case <expression> of
    when <literal values1>
        <statement 1>;
        <statement 2>;
        ...
        <statement n>;
```

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

```
    when <literal values2>
        <statement 1>;
        <statement 2>;
        ...
        <statement n>;

    ... more "when" groups if required ...

    otherwise
        <statement A>;
        <statement B>;
        ...
        <statement Z>;
```

In this structure, `<literal values1>` and `<literal values2>` consist of literal values of the same type as `<expression>`, separated by commas. There can be additional `when` groups in the structure. Abbreviated one line forms of `when` and `otherwise` parts can be used when they contain only simple statements.

If `<expression>` has a bitstring type, the literal values can also include bitstring literals containing `'x'` bits, known as bitmasks. For details, see Equality and non-equality.

H3.5.4 Loop control structures

This section describes the three loop control structures used in the pseudocode.

H3.5.4.1 repeat . . . until . . .

A `repeat ... until ...` structure has the form:

```
repeat
    <statement 1>;
    <statement 2>;
    ...
    <statement n>;
until <boolean_expression>;
```

It executes the statement block at least once, and the loop repeats until `<boolean expression>` evaluates to `TRUE`. Variables explicitly declared inside the loop body have scope local to that loop and might not be accessed outside the loop body.

H3.5.4.2 while . . . do

A `while ... do` structure has the form:

```
while <boolean_expression> do
    <statement 1>;
    <statement 2>;
    ...
    <statement n>;
```

It begins executing the statement block only if the Boolean expression is true. The loop then runs until the expression is false.

H3.5.4.3 for . . .

A `for ...` structure has the form:

```
for <assignable_expression> = <integer_expr1> to <integer_expr2>
    <statement 1>;
```

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

```
    <statement 2>;
    ...
    <statement n>;
```

The <assignable_expression> is initialized to <integer_expr1> and compared to <integer_expr2>. If <assignable_expression> is less than or equal to <integer_expr2>, the loop body is executed and the <assignable_expression> incremented by one. The comparison, execution of the loop body, and increment is repeated until <assignable_expression> is greater than <integer_expr2>.

There is an alternate form:

```
for <assignable_expression> = <integer_expr1> downto <integer_expr2>
```

where <assignable_expression> is decremented after the comparison, execution of the loop body, and decrement repeats until <assignable_expression> is less than <integer_expr2>.

H3.5.5 Special statements

This section describes statements with particular architecturally defined behaviors.

H3.5.5.1 UNDEFINED

This subsection describes the statement:

```
UNDEFINED;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is that the Undefined Instruction exception is taken.

H3.5.5.2 UNPREDICTABLE

This subsection describes the statement:

```
UNPREDICTABLE;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is UNPREDICTABLE.

H3.5.5.3 SEE. . .

This subsection describes the statement:

```
SEE <reference>;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is that nothing occurs as a result of the current pseudocode because some other piece of pseudocode defines the required behavior. The <reference> indicates where that other pseudocode can be found.

It usually refers to another instruction, but can also refer to another encoding or note of the same instruction.

H3.5.5.4 IMPLEMENTATION_DEFINED

This subsection describes the statement:

```
IMPLEMENTATION_DEFINED {"<text>"};
```

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is IMPLEMENTATION DEFINED. An optional `<text>` field can give more information.

H3.5.6 Comments

The pseudocode supports two styles of comments:

- `//` starts a comment that is terminated by the end of the line.
- `/*` starts a comment that is terminated by `*/`.

`/**/` statements might not be nested, and the first `*/` ends the comment.

Note

Comment lines do not require a terminating semicolon.

H3.6 Built-in functions

This section describes:

- Bitstring manipulation functions.
- Arithmetic functions.

H3.6.1 Bitstring manipulation functions

The following bitstring manipulation functions are defined:

H3.6.1.1 Bitstring length and most significant bit

If `x` is a bitstring:

- The bitstring length function `Len(x)` returns the length of `x` as an integer.

H3.6.1.2 Bitstring concatenation and replication

If `x` is a bitstring and `n` is an integer with `n >= 0`:

- `Replicate(x, n)` is the bitstring of length `n*Len(x)` consisting of `n` copies of `x` concatenated together.
- `Zeros(n) = Replicate('0', n)`.
- `Ones(n) = Replicate('1', n)`.

H3.6.1.3 Bitstring count

If `x` is a bitstring, `BitCount(x)` is an integer result equal to the number of bits of `x` that are ones.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H3.6.1.4 Testing a bitstring for being all zero or all ones

If `x` is a bitstring:

- `IsZero(x)` produces `TRUE` if all of the bits of `x` are zeros and `FALSE` if any of them are ones
- `IsZeroBit(x)` produces `'1'` if all of the bits of `x` are zeros and `'0'` if any of them are ones.

`IsOnes(x)` and `IsOnesBit(x)` work in the corresponding ways. This means:

```
IsZero(x)    = (BitCount(x) == 0)
IsOnes(x)    = (BitCount(x) == Len(x))
IsZeroBit(x) = if IsZero(x) then '1' else '0'
IsOnesBit(x) = if IsOnes(x) then '1' else '0'
```

H3.6.1.5 Lowest and highest set bits of a bitstring

If `x` is a bitstring, and `N = Len(x)`:

- `LowestSetBit(x)` is the minimum bit number of any of the bits of `x` that are ones. If all of its bits are zeros, `LowestSetBit(x) = N`.
- `HighestSetBit(x)` is the maximum bit number of any of the bits of `x` that are ones. If all of its bits are zeros, `HighestSetBit(x) = -1`.
- `CountLeadingZeroBits(x)` is the number of zero bits at the left end of x, in the range 0 to *N*. This means: `CountLeadingZeroBits(x) = N - 1 - HighestSetBit(x)`.
- `CountLeadingSignBits(x)` is the number of copies of the sign bit of x at the left end of x, excluding the sign bit itself, and is in the range 0 to *N*-1. This means: `CountLeadingSignBits(x) = CountLeadingZeroBits(x<N-1:1> EOR x<N-2:0>)`.

H3.6.1.6 Zero-extension and sign-extension of bitstrings

If `x` is a bitstring and `i` is an integer, then `ZeroExtend(x, i)` is `x` extended to a length of `i` bits, by adding sufficient zero bits to its left. That is, if `i == Len(x)`, then `ZeroExtend(x, i) = x`, and if `i > Len(x)`, then:

```
ZeroExtend(x, i) = Replicate('0', i-Len(x)) : x
```

If `x` is a bitstring and `i` is an integer, then `SignExtend(x, i)` is `x` extended to a length of `i` bits, by adding sufficient copies of its leftmost bit to its left. That is, if `i == Len(x)`, then `SignExtend(x, i) = x`, and if `i > Len(x)`, then:

```
SignExtend(x, i) = Replicate(TopBit(x), i-Len(x)) : x
```

It is a pseudocode error to use either `ZeroExtend(x, i)` or `SignExtend(x, i)` in a context where it is possible that `i < Len(x)`.

H3.6.1.7 Converting bitstrings to integers

If `x` is a bitstring, `SInt()` is the integer whose two's complement representation is `x`.

`UInt()` is the integer whose unsigned representation is `x`.

`Int (x, unsigned)` returns either `SInt(x)` or `UInt(x)` depending on the value of its second argument.

H3.6.2 Arithmetic functions

This section defines built-in arithmetic functions.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H3.6.2.1 Absolute value

If `x` is either of type real or integer, `Abs(x)` returns the absolute value of `x`. The result is the same type as `x`.

H3.6.2.2 Rounding and aligning

If `x` is a real:

- `RoundDown(x)` produces the largest integer `n` such that `n <= x`.
- `RoundUp(x)` produces the smallest integer `n` such that `n >= x`.
- `RoundTowardsZero(x)` produces:
  - `RoundDown(x)` if `x > 0.0`.
  - `0` if `x == 0.0`.
  - `RoundUp(x)` if `x < 0.0`.

If `x` and `y` are both of type `integer`, `Align(x, y) = y * (x DIV y)`, and is of type `integer`.

If `x` is of type `bitstring` and `y` is of type `integer`, `Align(x, y) = (Align(UInt(x), y))<Len(x)-1:0>`, and is a `bitstring` of the same length as `x`.

It is a pseudocode error to use either form of `Align(x, y)` in any context where `y` can be 0. In practice, `Align(x, y)` is only used with `y` a constant power of two, and the bitstring form used with `y = 2^n` has the effect of producing its argument with its n low-order bits forced to zero.

H3.6.2.3 Maximum and minimum

If `x` and `y` are integers or reals, then `Max(x, y)` and `Min(x, y)` are their maximum and minimum respectively. x and y must both be of type integer or of type real. The function returns a value of the same type as its operands.

H3.7 Miscellaneous helper procedures and functions

This section lists the prototypes of miscellaneous *helper* procedures and functions used by the pseudocode, together with a brief description of the effect of the procedure or function. The pseudocode does not define the operation of these helper procedures and functions.

Note

A-profile Architecture Pseudocode also has an entry for each of these functions, but currently these entries do not say anything about the effect of the function. When this information is added in A-profile Architecture Pseudocode, this section will be removed from the manual.

H3.7.1 EndOfInstruction()

This procedure terminates processing of the current instruction.

```
EndOfInstruction();
```

H3.7.2 Hint_Debug()

This procedure supplies a hint to the debug system.

```
Hint_Debug(bits(4) option);
```

H3.7.3 Hint_PreloadData()

This procedure performs a *preload data* hint.

```
Hint_PreloadData(bits(32) address);
```

H3.7.4 Hint_PreloadDataForWrite()

This procedure performs a *preload data* hint with a probability that the use will be for a write.

```
Hint_PreloadDataForWrite(bits(32) address);
```

H3.7.5 Hint_PreloadInstr()

This procedure performs a *preload instructions* hint.

```
Hint_PreloadInstr(bits(32) address);
```

H3.7.6 Hint_Yield()

This procedure performs a *Yield* hint.

```
Hint_Yield();
```

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H3.7.7 IsExternalAbort()

This function returns `TRUE` if the abort currently being processed is an External abort and FALSE otherwise. It is used only in exception entry pseudocode.

```
boolean IsExternalAbort(Fault type)
    assert type != Fault_None;

boolean IsExternalAbort(FaultRecord fault);
```

H3.7.8 IsAsyncAbort()

This function returns `TRUE` if the abort currently being processed is an asynchronous abort, and `FALSE` otherwise. It is used only in exception entry pseudocode.

```
boolean IsAsyncAbort(Fault type)
    assert type != Fault_None;

boolean IsAsyncAbort(FaultRecord fault);
```

H3.7.9 LSInstructionSyndrome()

This function returns the extended syndrome information for a fault reported in the HSR.

```
bits(11) LSInstructionSyndrome();
```

H3.7.10 ProcessorID()

This function returns an integer that uniquely identifies the executing PE in the system.

```
integer ProcessorID();
```

H3.7.11 RemapRegsHaveResetValues()

This function returns `TRUE` if the remap registers PRRR and NMRR have their IMPLEMENTATION DEFINED reset values, and `FALSE` otherwise.

```
boolean RemapRegsHaveResetValues();
```

H3.7.12 ResetControlRegisters()

This function resets the System registers and memory-mapped control registers that have architecturally defined reset values to those values. For more information about the affected registers, see:

- Reset behavior.

```
AArch64.ResetControlRegisters(boolean ResetIsCold)
```

H3.7.13 ThisInstr()

This function returns the bitstring encoding of the currently executing instruction.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

```
bits(32) ThisInstr();
```

Note

Currently, this function is used only on 32-bit instruction encodings.

H3.7.14 ThisInstrLength()

This function returns the length, in bits, of the current instruction. This means it returns 32 or 16:

```
integer ThisInstrLength();
```

H3.8 Arm pseudocode definition index

This section contains the following tables:

- Table H3-3 which contains the pseudocode data types.
- Table H3-4 which contains the pseudocode operators.
- Table H3-5 which contains the pseudocode keywords and control structures.
- Table H3-6 which contains the statements with special behaviors.

Table H3-3 Index of pseudocode data types

Keyword	Meaning
`array`	Type name for the array type
`bit`	Keyword equivalent to `bits(1)`
`bits(N)`	Type name for the bitstring of length `N` data type
`boolean`	Type name for the Boolean data type
`enumeration`	Keyword to define a new enumeration type
`integer`	Type name for the integer data type
`real`	Type name for the real data type
`type`	Keyword to define a new structure

Table H3-4 Index of pseudocode operators

Operator	Meaning
`-`	Unary minus on integers or reals
	Subtraction of integers, reals, and bitstrings
	Used in the left-hand side of an assignment or a tuple to discard the result
`+`	Unary plus on integers or reals
	Addition of integers, reals, and bitstrings
`.`	Extract named member from a list
	Extract named bit or field from a register
`:`	Bitstring concatenation
	Integer range in bitstring extraction operator
`!`	Boolean NOT
`!=`	Comparison for inequality
`(...)`	Around arguments of procedure or function
`[...]`	Around array index
	Around arguments of array-like function
`*`	Multiplication of integers, reals, and bitstrings
`/`	Division of reals
`&&`	Boolean AND

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Operator	Meaning
`<`	*Less than* comparison of integers and reals
`<...>`	Slicing of specified bits of bitstring or integer
`<<`	Multiply integer by power of 2
`<=`	*Less than or equal* comparison of integers and reals
`=`	Assignment operator
`==`	Comparison for equality
`>`	*Greater than* comparison of integers and reals
`>=`	*Greater than or equal* comparison of integers and reals
`>>`	Divide integer by power of 2
`||`	Boolean OR
`^`	Exponential operator
`AND`	Bitwise AND of bitstrings
`DIV`	Quotient from integer division
`EOR`	Bitwise EOR of bitstrings
`IN`	Tests membership of a certain expression in a set of values
`MOD`	Remainder from integer division
`NOT`	Bitwise inversion of bitstrings
`OR`	Bitwise OR of bitstrings
`case ... of ...`	Control structure for the
`if ... then ... else ...`	Condition expression selecting between two values

Table H3-5 Index of pseudocode keywords and control structures

Operator	Meaning
`/*...*/`	Comment delimiters
`//`	Introduces comment terminated by end of line
`FALSE`	One of two values a Boolean can take (other than `TRUE`)
`for ... = ...to ...`	Loop control structure, counting up from the initial value to the upper limit
`for ... = ... downto ...`	Loop control structure, counting down from the initial value to the lower limit
`if ... then ... else ...`	Conditional control structure
`otherwise`	Introduces default case in `case ... of ...` control structure
`repeat ... until ...`	Loop control structure that runs at least once until the termination condition is satisfied
`return`	Procedure or function return
`TRUE`	One of two values a Boolean can take (other than `FALSE`)
`when`	Introduces specific case in `case ... of ...` control structure
`while ... do ...`	Loop control structure that runs until the termination condition is satisfied

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table H3-6 Index of special statements

Keyword	Meaning
`IMPLEMENTATION_DEFINED`	Describes IMPLEMENTATION DEFINED behavior
`SEE`	Points to other pseudocode to use instead
`UNDEFINED`	Cause Undefined Instruction exception
`UNKNOWN`	Unspecified value
`UNPREDICTABLE`	Unspecified behavior

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.

Appendix H4
Registers Index

This appendix provides indexes to the register descriptions in this manual. It contains the following sections:

- Introduction and register disambiguation.
- Alphabetical index of AArch64 registers and System instructions.
- Functional index of AArch64 registers and System instructions.
- Alphabetical index of memory-mapped registers.
- Functional index of memory-mapped registers.

Non-Confidential

H4.1 Introduction and register disambiguation

In some sections of this manual, registers are referred to by a *general name*, where the description applies to more than one context. In an AArch64 only implementation the description applies to multiple Exception levels, and therefore at a particular Exception level the register names need to take the appropriate Exception level suffix, _EL0, _EL1, or _EL2.

The following section disambiguates the general register names:

- Register name disambiguation by Exception level.

H4.1.1 Register name disambiguation by Exception level

Table H4-1 disambiguates the general names of the AArch64 System registers by Exception level.

Table H4-1 Disambiguation of AArch64 System registers by Exception level

General form	EL0	EL1	EL2
AFSR0_ELx	-	AFSR0_EL1	AFSR0_EL2

H4.3 Functional index of AArch64 registers and System instructions

This section is an index of the AArch64 registers and System instructions, divided by functional group. Each of the following sections lists the registers for a functional group:

- Special-purpose registers.
- VMSA-specific registers.
- ID registers.
- Performance monitors registers.
- Debug registers.
- Trace registers.
- RAS registers.
- Generic timer registers.
- Cache maintenance system instructions.
- Address translation system instructions.
- TLB maintenance system instructions.
- Prediction restriction System instructions.
- Base system registers.

H4.3.1 Special-purpose registers

This section is an index to the registers in the Special-purpose registers functional group.

Table H4-3 Special-purpose registers

Register	Description, see
DLR_EL0	Debug Link Register
DSPSR_EL0	Debug Saved Program Status Register
ELR_EL1	Exception Link Register (EL1)
ELR_EL2	Exception Link Register (EL2)
SP_EL0	Stack Pointer (EL0)
SP_EL1	Stack Pointer (EL1)
SP_EL2	Stack Pointer (EL2)
SPSR_abt	Saved Program Status Register (Abort mode)
SPSR_EL1	Saved Program Status Register (EL1)
SPSR_EL2	Saved Program Status Register (EL2)
SPSR_fiq	Saved Program Status Register (FIQ mode)
SPSR_irq	Saved Program Status Register (IRQ mode)
SPSR_und	Saved Program Status Register (Undefined mode)

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

H4.3.2 VMSA-specific registers

This section is an index to the registers in the Virtual memory control registers functional group.

Table H4-4 VMSA-specific registers

Register	Description, see
AMAIR_EL1	Auxiliary Memory Attribute Indirection Register (EL1)
AMAIR_EL2	Auxiliary Memory Attribute Indirection Register (EL2)
CONTEXTIDR_EL1	Context ID Register (EL1)
CONTEXTIDR_EL2	Context ID Register (EL2)
MAIR_EL1	Memory Attribute Indirection Register (EL1)
MAIR_EL2	Memory Attribute Indirection Register (EL2)
TCR_EL1	Translation Control Register (EL1)
TCR_EL2	Translation Control Register (EL2)
TTBR0_EL1	Translation Table Base Register 0 (EL1)
TTBR1_EL1	Translation Table Base Register 1 (EL1)
VTCR_EL2	Virtualization Translation Control Register

H4.3.3 ID registers

This section is an index to the registers in the Identification registers functional group.

Table H4-5 ID registers

Register	Description, see
CCSIDR2_EL1	Current Cache Size ID Register 2
CCSIDR_EL1	Current Cache Size ID Register
CLIDR_EL1	Cache Level ID Register
CSSELR_EL1	Cache Size Selection Register
CTR_EL0	Cache Type Register
DCZID_EL0	Data Cache Zero ID Register
ID_AA64AFR0_EL1	AArch64 Auxiliary Feature Register 0
ID_AA64AFR1_EL1	AArch64 Auxiliary Feature Register 1
ID_AA64DFR0_EL1	AArch64 Debug Feature Register 0
ID_AA64DFR1_EL1	AArch64 Debug Feature Register 1
ID_AA64DFR2_EL1	AArch64 Debug Feature Register 2
ID_AA64ISAR0_EL1	AArch64 Instruction Set Attribute Register 0
ID_AA64ISAR1_EL1	AArch64 Instruction Set Attribute Register 1
ID_AA64ISAR2_EL1	AArch64 Instruction Set Attribute Register 2
ID_AA64MMFR0_EL1	AArch64 Memory Model Feature Register 0
ID_AA64MMFR1_EL1	AArch64 Memory Model Feature Register 1

Non-Confidential

Register	Description, see
ID_AA64MMFR2_EL1	AArch64 Memory Model Feature Register 2
ID_AA64MMFR3_EL1	AArch64 Memory Model Feature Register 3
ID_AA64MMFR4_EL1	AArch64 Memory Model Feature Register 4
ID_AA64PFR0_EL1	AArch64 Processor Feature Register 0
ID_AA64PFR1_EL1	AArch64 Processor Feature Register 1
ID_AA64PFR2_EL1	AArch64 Processor Feature Register 2
ID_AFR0_EL1	AArch32 Auxiliary Feature Register 0
ID_DFR0_EL1	AArch32 Debug Feature Register 0
ID_DFR1_EL1	AArch32 Debug Feature Register 1
ID_ISAR0_EL1	AArch32 Instruction Set Attribute Register 0
ID_ISAR1_EL1	AArch32 Instruction Set Attribute Register 1
ID_ISAR2_EL1	AArch32 Instruction Set Attribute Register 2
ID_ISAR3_EL1	AArch32 Instruction Set Attribute Register 3
ID_ISAR4_EL1	AArch32 Instruction Set Attribute Register 4
ID_ISAR5_EL1	AArch32 Instruction Set Attribute Register 5
ID_ISAR6_EL1	AArch32 Instruction Set Attribute Register 6
ID_MMFR0_EL1	AArch32 Memory Model Feature Register 0
ID_MMFR1_EL1	AArch32 Memory Model Feature Register 1
ID_MMFR2_EL1	AArch32 Memory Model Feature Register 2
ID_MMFR3_EL1	AArch32 Memory Model Feature Register 3
ID_MMFR4_EL1	AArch32 Memory Model Feature Register 4
ID_MMFR5_EL1	AArch32 Memory Model Feature Register 5
ID_PFR0_EL1	AArch32 Processor Feature Register 0
ID_PFR1_EL1	AArch32 Processor Feature Register 1
ID_PFR2_EL1	AArch32 Processor Feature Register 2
MIDR_EL1	Main ID Register
MPIDR_EL1	Multiprocessor Affinity Register
MVFR0_EL1	AArch32 Media and VFP Feature Register 0
MVFR1_EL1	AArch32 Media and VFP Feature Register 1
MVFR2_EL1	AArch32 Media and VFP Feature Register 2
REVIDR_EL1	Revision ID Register
VMPIDR_EL2	Virtualization Multiprocessor ID Register
VPIDR_EL2	Virtualization Processor ID Register

H4.3.4 Performance monitors registers

This section is an index to the registers in the Performance Monitors registers functional group.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table H4-6 Performance monitors registers

Register	Description, see
PMCCFILTR_EL0	Performance Monitors Cycle Count Filter Register
PMCCNTR_EL0	Performance Monitors Cycle Count Register
PMCEID0_EL0	Performance Monitors Common Event Identification Register 0
PMCEID1_EL0	Performance Monitors Common Event Identification Register 1
PMCNTENCLR_EL0	Performance Monitors Count Enable Clear Register
PMCNTENSET_EL0	Performance Monitors Count Enable Set Register
PMCR_EL0	Performance Monitors Control Register
PMINTENCLR_EL1	Performance Monitors Interrupt Enable Clear Register
PMINTENSET_EL1	Performance Monitors Interrupt Enable Set Register
PMMIR_EL1	Performance Monitors Machine Identification Register
PMOVSCLR_EL0	Performance Monitors Overflow Flag Status Clear Register
PMOVSSET_EL0	Performance Monitors Overflow Flag Status Set Register
PMSELR_EL0	Performance Monitors Event Counter Selection Register
PMSWINC_EL0	Performance Monitors Software Increment Register
PMUSERENR_EL0	Performance Monitors User Enable Register
PMXEVCNTR_EL0	Performance Monitors Selected Event Count Register
PMXEVTYPER_EL0	Performance Monitors Selected Event Type Register

H4.3.5 Debug registers

This section is an index to the registers in the Debug registers functional group.

Table H4-7 Debug registers

Register	Description, see
DBGAUTHSTATUS_EL1	Debug Authentication Status Register
DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear Register
DBGCLAIMSET_EL1	Debug CLAIM Tag Set Register
DBGDTR_EL0	Debug Data Transfer Register, half-duplex
DBGDTRRX_EL0	Debug Data Transfer Register, Receive
DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
DBGPRCR_EL1	Debug Power Control Register
MDCCINT_EL1	Monitor DCC Interrupt Enable Register
MDCCSR_EL0	Monitor DCC Status Register
MDCR_EL2	Monitor Debug Configuration Register (EL2)
MDRAR_EL1	Monitor Debug ROM Address Register

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Register	Description, see
MDSCR_EL1	Monitor Debug System Control Register
OSDLR_EL1	OS Double Lock Register
OSDTRRX_EL1	OS Lock Data Transfer Register, Receive
OSDTRTX_EL1	OS Lock Data Transfer Register, Transmit
OSECCR_EL1	OS Lock Exception Catch Control Register
OSLAR_EL1	OS Lock Access Register
OSLSR_EL1	OS Lock Status Register
TRFCR_EL1	Trace Filter Control Register (EL1)
TRFCR_EL2	Trace Filter Control Register (EL2)

H4.3.6 Trace registers

This section is an index to the registers in the Trace unit registers functional group.

Table H4-8 Trace registers

Description, see

H4.3.7 RAS registers

This section is an index to the registers in the RAS registers functional group.

Table H4-9 RAS registers

Register	Description, see
DISR_EL1	Deferred Interrupt Status Register
ERRIDR_EL1	Error Record ID Register
ERRSELR_EL1	Error Record Select Register
ERXADDR_EL1	Selected Error Record Address Register
ERXCTLR_EL1	Selected Error Record Control Register
ERXFR_EL1	Selected Error Record Feature Register
ERXMISC0_EL1	Selected Error Record Miscellaneous Register 0
ERXMISC1_EL1	Selected Error Record Miscellaneous Register 1
ERXMISC2_EL1	Selected Error Record Miscellaneous Register 2
ERXMISC3_EL1	Selected Error Record Miscellaneous Register 3
ERXPFGCDN_EL1	Selected Pseudo-fault Generation Countdown Register
ERXPFGCTL_EL1	Selected Pseudo-fault Generation Control Register
ERXPFGF_EL1	Selected Pseudo-fault Generation Feature Register

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Register	Description, see
ERXSTATUS_EL1	Selected Error Record Primary Status Register
VDISR_EL2	Virtual Deferred Interrupt Status Register (EL2)
VSESR_EL2	Virtual SError Exception Syndrome Register (EL2)

H4.3.8 Generic timer registers

This section is an index to the registers in the Generic Timer registers functional group.

Table H4-10 Generic timer registers

Register	Description, see
CNTFRQ_EL0	Counter-timer Frequency Register
CNTHCTL_EL2	Counter-timer Hypervisor Control Register
CNTHPS_CTL_EL2	Counter-timer Secure Physical Timer Control Register (EL2)
CNTHPS_CVAL_EL2	Counter-timer Secure Physical Timer CompareValue Register (EL2)
CNTHPS_TVAL_EL2	Counter-timer Secure Physical Timer TimerValue Register (EL2)
CNTKCTL_EL1	Counter-timer Kernel Control Register
CNTP_CTL_EL0	Counter-timer Physical Timer Control Register
CNTP_CVAL_EL0	Counter-timer Physical Timer CompareValue Register
CNTP_TVAL_EL0	Counter-timer Physical Timer TimerValue Register
CNTPCT_EL0	Counter-timer Physical Count Register
CNTV_CTL_EL0	Counter-timer Virtual Timer Control Register
CNTV_CVAL_EL0	Counter-timer Virtual Timer CompareValue Register
CNTV_TVAL_EL0	Counter-timer Virtual Timer TimerValue Register
CNTVCT_EL0	Counter-timer Virtual Count Register
CNTVOFF_EL2	Counter-timer Virtual Offset Register

H4.3.9 Cache maintenance system instructions

This section is an index to the registers in the Cache maintenance instructions functional group.

Table H4-11 Cache maintenance system instructions

System instruction	Description, see
DC CISW	Data or unified Cache line Clean and Invalidate by Set-Way
DC CIVAC	Data or unified Cache line Clean and Invalidate by VA to PoC
DC CSW	Data or unified Cache line Clean by Set-Way
DC CVAC	Data or unified Cache line Clean by VA to PoC

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

System instruction	Description, see
DC CVADP	Data or unified Cache line Clean by VA to PoDP
DC CVAP	Data or unified Cache line Clean by VA to PoP
DC CVAU	Data or unified Cache line Clean by VA to PoU
DC ISW	Data or unified Cache line Invalidate by Set-Way
DC IVAC	Data or unified Cache line Invalidate by VA to PoC
DC ZVA	Data Cache Zero by VA
IC IALLU	Instruction Cache Invalidate All to PoU
IC IALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
IC IVAU	Instruction Cache line Invalidate by VA to PoU

H4.3.10 Address translation system instructions

This section is an index to the registers in the Address translation instructions functional group.

Table H4-12 Address translation system instructions

System instruction	Description, see
AT S12E0R	Address Translate Stages 1 and 2 EL0 Read
AT S12E0W	Address Translate Stages 1 and 2 EL0 Write
AT S12E1R	Address Translate Stages 1 and 2 EL1 Read
AT S12E1W	Address Translate Stages 1 and 2 EL1 Write
AT S1E0R	Address Translate Stage 1 EL0 Read
AT S1E0W	Address Translate Stage 1 EL0 Write
AT S1E1R	Address Translate Stage 1 EL1 Read
AT S1E1RP	Address Translate Stage 1 EL1 Read PAN
AT S1E1W	Address Translate Stage 1 EL1 Write
AT S1E1WP	Address Translate Stage 1 EL1 Write PAN
AT S1E2R	Address Translate Stage 1 EL2 Read
AT S1E2W	Address Translate Stage 1 EL2 Write
AT S1E3R	Address Translate Stage 1 EL3 Read
AT S1E3W	Address Translate Stage 1 EL3 Write

H4.3.11 TLB maintenance system instructions

This section is an index to the registers in the TLB maintenance instructions functional group.

Non-Confidential

Table H4-13 TLB maintenance system instructions

System instruction	Description, see
TLBI ALLE1	TLB Invalidate All, EL1
TLBI ALLE1IS	TLB Invalidate All, EL1, Inner Shareable
TLBI ALLE1OS	TLB Invalidate All, EL1, Outer Shareable
TLBI ALLE2	TLB Invalidate All, EL2
TLBI ALLE2IS	TLB Invalidate All, EL2, Inner Shareable
TLBI ALLE2OS	TLB Invalidate All, EL2, Outer Shareable
TLBI ALLE3	TLB Invalidate All, EL3
TLBI ALLE3IS	TLB Invalidate All, EL3, Inner Shareable
TLBI ALLE3OS	TLB Invalidate All, EL3, Outer Shareable
TLBI ASIDE1	TLB Invalidate by ASID, EL1
TLBI ASIDE1IS	TLB Invalidate by ASID, EL1, Inner Shareable
TLBI ASIDE1OS	TLB Invalidate by ASID, EL1, Outer Shareable
TLBI IPAS2E1	TLB Invalidate by Intermediate Physical Address, Stage 2, EL1
TLBI IPAS2E1IS	TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable
TLBI IPAS2E1OS	TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable
TLBI IPAS2LE1	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1
TLBI IPAS2LE1IS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable
TLBI IPAS2LE1OS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable
TLBI RIPAS2E1	TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1
TLBI RIPAS2E1IS	TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable
TLBI RIPAS2E1OS	TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable
TLBI RIPAS2LE1	TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1
TLBI RIPAS2LE1IS	TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable
TLBI RIPAS2LE1OS	TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable
TLBI RVAAE1	TLB Range Invalidate by VA, All ASID, EL1
TLBI RVAAE1IS	TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable
TLBI RVAAE1OS	TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable
TLBI RVAALE1	TLB Range Invalidate by VA, All ASID, Last level, EL1
TLBI RVAALE1IS	TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable
TLBI RVAALE1OS	TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

System instruction	Description, see
TLBI RVAE1	TLB Range Invalidate by VA, EL1
TLBI RVAE1IS	TLB Range Invalidate by VA, EL1, Inner Shareable
TLBI RVAE1OS	TLB Range Invalidate by VA, EL1, Outer Shareable
TLBI RVAE2	TLB Range Invalidate by VA, EL2
TLBI RVAE2IS	TLB Range Invalidate by VA, EL2, Inner Shareable
TLBI RVAE2OS	TLB Range Invalidate by VA, EL2, Outer Shareable
TLBI RVAE3	TLB Range Invalidate by VA, EL3
TLBI RVAE3IS	TLB Range Invalidate by VA, EL3, Inner Shareable
TLBI RVAE3OS	TLB Range Invalidate by VA, EL3, Outer Shareable
TLBI RVALE1	TLB Range Invalidate by VA, Last level, EL1
TLBI RVALE1IS	TLB Range Invalidate by VA, Last level, EL1, Inner Shareable
TLBI RVALE1OS	TLB Range Invalidate by VA, Last level, EL1, Outer Shareable
TLBI RVALE2	TLB Range Invalidate by VA, Last level, EL2
TLBI RVALE2IS	TLB Range Invalidate by VA, Last level, EL2, Inner Shareable
TLBI RVALE2OS	TLB Range Invalidate by VA, Last level, EL2, Outer Shareable
TLBI RVALE3	TLB Range Invalidate by VA, Last level, EL3
TLBI RVALE3IS	TLB Range Invalidate by VA, Last level, EL3, Inner Shareable
TLBI RVALE3OS	TLB Range Invalidate by VA, Last level, EL3, Outer Shareable
TLBI VAAE1	TLB Invalidate by VA, All ASID, EL1
TLBI VAAE1IS	TLB Invalidate by VA, All ASID, EL1, Inner Shareable
TLBI VAAE1OS	TLB Invalidate by VA, All ASID, EL1, Outer Shareable
TLBI VAALE1	TLB Invalidate by VA, All ASID, Last level, EL1
TLBI VAALE1IS	TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable
TLBI VAALE1OS	TLB Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable
TLBI VAE1	TLB Invalidate by VA, EL1
TLBI VAE1IS	TLB Invalidate by VA, EL1, Inner Shareable
TLBI VAE1OS	TLB Invalidate by VA, EL1, Outer Shareable
TLBI VAE2	TLB Invalidate by VA, EL2
TLBI VAE2IS	TLB Invalidate by VA, EL2, Inner Shareable
TLBI VAE2OS	TLB Invalidate by VA, EL2, Outer Shareable
TLBI VAE3	TLB Invalidate by VA, EL3
TLBI VAE3IS	TLB Invalidate by VA, EL3, Inner Shareable
TLBI VAE3OS	TLB Invalidate by VA, EL3, Outer Shareable
TLBI VALE1	TLB Invalidate by VA, Last level, EL1
TLBI VALE1IS	TLB Invalidate by VA, Last level, EL1, Inner Shareable
TLBI VALE1OS	TLB Invalidate by VA, Last level, EL1, Outer Shareable
TLBI VALE2	TLB Invalidate by VA, Last level, EL2
TLBI VALE2IS	TLB Invalidate by VA, Last level, EL2, Inner Shareable
TLBI VALE2OS	TLB Invalidate by VA, Last level, EL2, Outer Shareable

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.

System instruction	Description, see
TLBI VALE3	TLB Invalidate by VA, Last level, EL3
TLBI VALE3IS	TLB Invalidate by VA, Last level, EL3, Inner Shareable
TLBI VALE3OS	TLB Invalidate by VA, Last level, EL3, Outer Shareable
TLBI VMALLE1	TLB Invalidate by VMID, All at stage 1, EL1
TLBI VMALLE1IS	TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable
TLBI VMALLE1OS	TLB Invalidate by VMID, All at stage 1, EL1, Outer Shareable
TLBI VMALLS12E1	TLB Invalidate by VMID, All at Stage 1 and 2, EL1
TLBI VMALLS12E1IS	TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable
TLBI VMALLS12E1OS	TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Outer Shareable

H4.3.12 Prediction restriction System instructions

This section is an index to the registers in the Prediction restriction instructions functional group.

Table H4-14 Cache maintenance system instructions

System instruction	Description, see
CFP RCTX	Control Flow Prediction Restriction by Context
CPP RCTX	Cache Prefetch Prediction Restriction by Context
DVP RCTX	Data Value Prediction Restriction by Context

H4.3.13 Base system registers

This section is an index to the registers in the functional group.

Table H4-15 Base system registers

Register	Description, see
CPACR_EL1	Architectural Feature Access Control Register
SCTLR_EL1	System Control Register (EL1)
SCTLR_EL2	System Control Register (EL2)

H4.4 Alphabetical index of memory-mapped registers

This section is an index of memory-mapped registers in alphabetical order.

Table H4-16 Alphabetical index of Memory-Mapped Registers

Register	Description, see
ASICCTL	CTI External Multiplexer Control register
CNTCR	Counter Control Register
CNTCV	Counter Count Value register
CNTEL0ACR	Counter-timer EL0 Access Control Register
CNTFID0	Counter Frequency ID
CNTFRQ	Counter-timer Frequency
CNTID	Counter Identification Register
CNTNSAR	Counter-timer Non-secure Access Register
CNTP_CTL	Counter-timer Physical Timer Control
CNTP_CVAL	Counter-timer Physical Timer CompareValue
CNTP_TVAL	Counter-timer Physical Timer TimerValue
CNTPCT	Counter-timer Physical Count
CNTSCR	Counter Scale Register
CNTSR	Counter Status Register
CNTTIDR	Counter-timer Timer ID Register
CNTV_CTL	Counter-timer Virtual Timer Control
CNTV_CVAL	Counter-timer Virtual Timer CompareValue
CNTV_TVAL	Counter-timer Virtual Timer TimerValue
CNTVCT	Counter-timer Virtual Count
CNTVOFF	Counter-timer Virtual Offset
CTIAPPCLEAR	CTI Application Trigger Clear register
CTIAPPPULSE	CTI Application Pulse register
CTIAPPSET	CTI Application Trigger Set register
CTIAUTHSTATUS	CTI Authentication Status register
CTICHINSTATUS	CTI Channel In Status register
CTICHOUTSTATUS	CTI Channel Out Status register
CTICIDR0	CTI Component Identification Register 0
CTICIDR1	CTI Component Identification Register 1
CTICIDR2	CTI Component Identification Register 2
CTICIDR3	CTI Component Identification Register 3
CTICLAIMCLR	CTI CLAIM Tag Clear register
CTICLAIMSET	CTI CLAIM Tag Set register
CTICONTROL	CTI Control register
CTIDEVAFF0	CTI Device Affinity register 0
CTIDEVAFF1	CTI Device Affinity register 1
CTIDEVARCH	CTI Device Architecture register

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Register	Description, see
CTIDEVCTL	CTI Device Control register
CTIDEVID	CTI Device ID register 0
CTIDEVID1	CTI Device ID register 1
CTIDEVID2	CTI Device ID register 2
CTIDEVTYPE	CTI Device Type register
CTIGATE	CTI Channel Gate Enable register
CTIINTACK	CTI Output Trigger Acknowledge register
CTIITCTRL	CTI Integration mode Control register
CTILAR	CTI Lock Access Register
CTILSR	CTI Lock Status Register
CTIPIDR0	CTI Peripheral Identification Register 0
CTIPIDR1	CTI Peripheral Identification Register 1
CTIPIDR2	CTI Peripheral Identification Register 2
CTIPIDR3	CTI Peripheral Identification Register 3
CTIPIDR4	CTI Peripheral Identification Register 4
CTITRIGINSTATUS	CTI Trigger In Status register
CTITRIGOUTSTATUS	CTI Trigger Out Status register
DBGAUTHSTATUS_EL1	Debug Authentication Status Register
DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear Register
DBGCLAIMSET_EL1	Debug CLAIM Tag Set Register
DBGDTRRX_EL0	Debug Data Transfer Register, Receive
DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
EDAA32PFR	External Debug Auxiliary Processor Feature Register
EDACR	External Debug Auxiliary Control Register
EDCIDR0	External Debug Component Identification Register 0
EDCIDR1	External Debug Component Identification Register 1
EDCIDR2	External Debug Component Identification Register 2
EDCIDR3	External Debug Component Identification Register 3
EDDEVAFF0	External Debug Device Affinity register 0
EDDEVAFF1	External Debug Device Affinity register 1
EDDEVARCH	External Debug Device Architecture Register
EDDEVID	External Debug Device ID register 0
EDDEVID1	External Debug Device ID Register 1
EDDEVID2	External Debug Device ID register 2
EDDEVTYPE	External Debug Device Type register
EDDFR	External Debug Feature Register
EDECCR	External Debug Exception Catch Control Register
EDECR	External Debug Execution Control Register
EDESR	External Debug Event Status Register
EDITCTRL	External Debug Integration mode Control register

H4.5 Functional index of memory-mapped registers

This section is an index of the memory-mapped registers, divided by functional group. Each of the following sections lists the registers for a functional group:

- ID registers.
- Performance monitors registers.
- Generic timer registers.
- Debug registers.
- Cross-trigger interface registers.

H4.5.1 ID registers

This section is an index to the registers in the Identification registers functional group.

Table H4-17 ID registers

Register	Description, see
EDAA32PFR	External Debug Auxiliary Processor Feature Register
EDDFR	External Debug Feature Register
EDPFR	External Debug Processor Feature Register
MIDR_EL1	Main ID Register

H4.5.2 Performance monitors registers

This section is an index to the registers in the Performance Monitors registers functional group.

Table H4-18 Performance monitors registers

Register	Description, see
PMAUTHSTATUS	Performance Monitors Authentication Status register
PMCCFILTR_EL0	Performance Monitors Cycle Counter Filter Register
PMCCNTR_EL0	Performance Monitors Cycle Counter
PMCEID0	Performance Monitors Common Event Identification register 0
PMCEID1	Performance Monitors Common Event Identification register 1
PMCEID2	Performance Monitors Common Event Identification register 2
PMCEID3	Performance Monitors Common Event Identification register 3
PMCFGR	Performance Monitors Configuration Register
PMCID1SR	CONTEXTIDR_EL1 Sample Register
PMCID2SR	CONTEXTIDR_EL2 Sample Register
PMCIDR0	Performance Monitors Component Identification Register 0

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Register	Description, see
PMCIDR1	Performance Monitors Component Identification Register 1
PMCIDR2	Performance Monitors Component Identification Register 2
PMCIDR3	Performance Monitors Component Identification Register 3
PMCNTENCLR_EL0	Performance Monitors Count Enable Clear Register
PMCNTENSET_EL0	Performance Monitors Count Enable Set Register
PMCR_EL0	Performance Monitors Control Register
PMDEVAFF0	Performance Monitors Device Affinity register 0
PMDEVAFF1	Performance Monitors Device Affinity register 1
PMDEVARCH	Performance Monitors Device Architecture register
PMDEVID	Performance Monitors Device ID register
PMDEVTYPE	Performance Monitors Device Type register
PMIIDR	Performance Monitors Implementation Identification Register
PMINTENCLR_EL1	Performance Monitors Interrupt Enable Clear Register
PMINTENSET_EL1	Performance Monitors Interrupt Enable Set Register
PMITCTRL	Performance Monitors Integration mode Control register
PMLAR	Performance Monitors Lock Access Register
PMLSR	Performance Monitors Lock Status Register
PMMIR	Performance Monitors Machine Identification Register
PMOVSCLR_EL0	Performance Monitors Overflow Flag Status Clear register
PMOVSSET_EL0	Performance Monitors Overflow Flag Status Set Register
PMPCSR	Program Counter Sample Register
PMPIDR0	Performance Monitors Peripheral Identification Register 0
PMPIDR1	Performance Monitors Peripheral Identification Register 1
PMPIDR2	Performance Monitors Peripheral Identification Register 2
PMPIDR3	Performance Monitors Peripheral Identification Register 3
PMPIDR4	Performance Monitors Peripheral Identification Register 4
PMSWINC_EL0	Performance Monitors Software Increment Register
PMVIDSR	VMID Sample Register

H4.5.3 Debug registers

This section is an index to the registers in the Debug registers functional group.

Table H4-19 Debug registers

Register	Description, see
DBGAUTHSTATUS_EL1	Debug Authentication Status Register

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Register	Description, see
DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear Register
DBGCLAIMSET_EL1	Debug CLAIM Tag Set Register
DBGDTRRX_EL0	Debug Data Transfer Register, Receive
DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
EDACR	External Debug Auxiliary Control Register
EDCIDR0	External Debug Component Identification Register 0
EDCIDR1	External Debug Component Identification Register 1
EDCIDR2	External Debug Component Identification Register 2
EDCIDR3	External Debug Component Identification Register 3
EDDEVAFF0	External Debug Device Affinity register 0
EDDEVAFF1	External Debug Device Affinity register 1
EDDEVARCH	External Debug Device Architecture Register
EDDEVID	External Debug Device ID register 0
EDDEVID1	External Debug Device ID Register 1
EDDEVID2	External Debug Device ID register 2
EDDEVTYPE	External Debug Device Type register
EDECCR	External Debug Exception Catch Control Register
EDECR	External Debug Execution Control Register
EDESR	External Debug Event Status Register
EDITCTRL	External Debug Integration mode Control register
EDITR	External Debug Instruction Transfer Register
EDLAR	External Debug Lock Access Register
EDLSR	External Debug Lock Status Register
EDPIDR0	External Debug Peripheral Identification Register 0
EDPIDR1	External Debug Peripheral Identification Register 1
EDPIDR2	External Debug Peripheral Identification Register 2
EDPIDR3	External Debug Peripheral Identification Register 3
EDPIDR4	External Debug Peripheral Identification Register 4
EDPRCR	External Debug Power-Reset Control Register
EDPRSR	External Debug Processor Status Register
EDRCR	External Debug Reserve Control Register
EDSCR	External Debug Status and Control Register

OSLAR_EL1	OS Lock Access Register

H4.5.4 Cross-trigger interface registers

This section is an index to the registers in the Cross-Trigger Interface registers functional group.

Table H4-20 Cross-trigger interface registers

Register	Description, see
ASICCTL	CTI External Multiplexer Control register
CTIAPPCLEAR	CTI Application Trigger Clear register
CTIAPPPULSE	CTI Application Pulse register
CTIAPPSET	CTI Application Trigger Set register
CTIAUTHSTATUS	CTI Authentication Status register
CTICHINSTATUS	CTI Channel In Status register
CTICHOUTSTATUS	CTI Channel Out Status register
CTICIDR0	CTI Component Identification Register 0
CTICIDR1	CTI Component Identification Register 1
CTICIDR2	CTI Component Identification Register 2
CTICIDR3	CTI Component Identification Register 3
CTICLAIMCLR	CTI CLAIM Tag Clear register
CTICLAIMSET	CTI CLAIM Tag Set register
CTICONTROL	CTI Control register
CTIDEVAFF0	CTI Device Affinity register 0
CTIDEVAFF1	CTI Device Affinity register 1
CTIDEVARCH	CTI Device Architecture register
CTIDEVCTL	CTI Device Control register
CTIDEVID	CTI Device ID register 0
CTIDEVID1	CTI Device ID register 1
CTIDEVID2	CTI Device ID register 2
CTIDEVTYPE	CTI Device Type register
CTIGATE	CTI Channel Gate Enable register
CTIINTACK	CTI Output Trigger Acknowledge register
CTIITCTRL	CTI Integration mode Control register
CTILAR	CTI Lock Access Register
CTILSR	CTI Lock Status Register
CTIPIDR0	CTI Peripheral Identification Register 0
CTIPIDR1	CTI Peripheral Identification Register 1
CTIPIDR2	CTI Peripheral Identification Register 2
CTIPIDR3	CTI Peripheral Identification Register 3
CTIPIDR4	CTI Peripheral Identification Register 4

Non-Confidential

Glossary

A64 instruction A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch64. A64 instructions must be word-aligned.

AArch32 The 32-bit Execution state. AArch32 state and the associated instrucion sets, T32 and A32, are not described in this Manual. See *Arm Architecture Reference Manual, for A-profile architecture (ARM DDI0487)*.

AArch64 The 64-bit Execution state. In AArch64 state, addresses are held in 64-bit registers, and instructions in the base instruction set can use 64-bit registers for their processing. AArch64 state supports the A64 instruction set.

See also A64 instruction.

Abort An exception caused by an illegal memory access. Aborts can be caused by the external memory system or the MMU.

Active element An Active element is an SVE vector element or predicate element that is a source register element or destination register element used by an SVE instruction. When the corresponding element in the instruction's Governing predicate is TRUE, the element is Active. If an instruction is unpredicated, all of the vector elements or predicate elements are implicitly Active.

Addressing mode Means a method for generating the memory address used by a load/store instruction.

Advanced SIMD A feature of the Arm architecture that provides SIMD operations on a register file of SIMD and floating-point registers. Where an implementation supports both Advanced SIMD and floating-point instructions, these instructions operate on the same register file.

Aligned A data item stored at an address that is exactly divisible by the highest power of 2 that divides exactly into its size in bytes. Aligned halfwords, words and doublewords therefore have addresses that are divisible by 2, 4 and 8 respectively.

An aligned access is one where the address of the access is aligned to the size of each element of the access.

AMBA Advanced Microcontroller Bus Architecture. The AMBA family of protocol specifications is the Arm open standard for on-chip buses. AMBA provides solutions for the interconnection and management of the functional blocks that make up a *System-on-Chip* (SoC). Applications include the development of embedded systems with one or more processors or signal processors and multiple peripherals.

Analysis of the trace element stream Refers to the process of:

- Tracing elements that carry information that a trace analyzer requires to enable it to analyze the trace successfully.
- Tracing elements that either directly indicate program execution, or carry information about program execution.

A trace element stream might also contain trace elements that contain timing information. This term is distinct from analysis of program execution.

Architecturally executed An instruction is architecturally executed only if it would be executed in a simple sequential execution of the program. When such an instruction has been executed and retired, it has been *architecturally executed*. Any instruction that, in a simple sequential execution of a program, is treated as a `NOP` because it fails its condition code check, is an architecturally executed instruction.

In a PE that performs speculative execution, an instruction is not architecturally executed if the PE discards the results of a speculative execution.

See also Condition code check, Simple sequential execution.

Architecturally mapped Where this manual describes a register as being *architecturally mapped* to another register, this indicates that, in an implementation that supports both of the registers, the two registers access the same state.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Architecturally UNKNOWN An architecturally UNKNOWN value is a value that is not defined by the architecture but must meet the requirements of the definition of UNKNOWN. Implementations can define the value of the field, but are not required to do so.

See also IMPLEMENTATION DEFINED.

Architecturally Allowed Execution An *Architecturally Allowed Execution* must satisfy the External visibility requirement.

Associativity See Cache associativity.

Asynchronous accumulation Faults that are accumulated in a status register, where the update to the register is asynchronous to the instruction that causes the fault.

Atomicity Describes either single-copy atomicity or multi-copy atomicity. Atomicity in the Arm architecture defines these forms of atomicity for the Arm architecture.

See also Multi-copy atomicity and Single-copy atomicity.

Might also refer to poison-atomicity. See Poison atomicity.

Availability Readiness for correct service.

Banked register A register that has multiple instances, with the instance that is in use depending on the PE mode, Security state, or other PE state.

Baseboard Management Controller A PE dedicated to system control and monitoring.

Base register A register specified by a load/store instruction that is used as the base value for the address calculation for the instruction. Depending on the instruction and its addressing mode, an offset can be added to or subtracted from the base register value to form the virtual address that is sent to memory.

Base register writeback Describes writing back a modified value to the base register used in an address calculation.

Behaves as if Where this manual indicates that a PE *behaves as if* a certain condition applies, all descriptions of the operation of the PE must be re-evaluated taking account of that condition, together with any other conditions that affect operation.

Big-endian memory Means that, for example:

- A byte or halfword at a word-aligned address is the most significant byte or halfword in the word at that address.
- A byte at a halfword-aligned address is the most significant byte in the halfword at that address.

See also Endianness, Little-endian memory.

Blocking Describes an operation that does not permit following instructions to be executed before the operation completes.

A non-blocking operation can permit following instructions to be executed before the operation completes, and in the event of encountering an exception does not signal an exception to the PE. This enables implementations to retire following instructions while the non-blocking operation is executing, without the need to retain precise PE state.

Branch History Buffer (BHB) The Branch History Buffer is an internal structure that stores branch instruction information including the history of previously executed branches.

Branch prediction Is where a PE selects a future execution path to fetch along. For example, after a branch instruction, the PE can choose to speculatively fetch either the instruction following the branch or the instruction at the branch target.

See also Prefetching.

Breakpoint A debug event triggered by the execution of a particular instruction, specified by one or both of the address of the instruction and the state of the PE when the instruction is executed.

Built-in self test (BIST) A mechanism that permits a machine to test itself.

Burst A group of transfers that form a single transaction.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

BWA BandWidth Allocation.

BWPBM BandWidth Portion Bit Map.

Byte An 8-bit data item.

CE See Corrected Error.

Cache associativity The number of locations in a cache set to which an address can be assigned. Each location is identified by its *way* value.

Cache level The position of a cache in the cache hierarchy. In the Arm architecture, the lower numbered levels are those closest to the PE. For more information, see Terms used in describing the cache maintenance instructions.

Cache line The basic unit of storage in a cache. Its size in words is always a power of two, usually 4 or 8 words. A cache line must be aligned to a suitable memory boundary. A *memory cache line* is a block of memory locations with the same size and alignment as a cache line. Memory cache lines are sometimes loosely called cache lines.

Cache lockdown Enables critical software and data to be loaded into the cache so that the cache lines containing them are not subsequently reallocated. It alleviates the delays caused by accessing a cache in a worst-case situation. This ensures that all subsequent accesses to the software and data concerned are cache hits and so complete quickly.

Cache miss A memory access that cannot be processed at high speed because the data it addresses is not in the cache.

Cache sets Areas of a cache, divided up to simplify and speed up the process of determining whether a cache hit occurs. The number of cache sets is always a power of two.

Cache way A cache way consists of one cache line from each cache set. The cache ways are indexed from 0 to (Associativity-1). Each cache line in a cache way is chosen to have the same index as the cache way. For example, cache way *n* consists of the cache line with index *n* from each cache set.

Coherence order See Coherent.

Coherent Data accesses from a set of observers to a byte in memory are coherent if accesses to that byte in memory by the members of that set of observers are consistent with there being a single total order of all writes to that byte in memory by all members of the set of observers. This single total order of all to writes to that memory location is the *coherence order* for that byte in memory.

Commit window The Commit window defines the range of *P0 elements* that are committed by a *Commit element*. The oldest *P0 element* in the Commit window is the first *P0 element* committed when a *Commit element* occurs. By default, the Commit window starts on the oldest uncommitted *P0 element* and moves forward to the next uncommitted *P0 element*, with each *P0 element* committed by a *Commit element*. The Commit Window Move element moves the start of the Commit window by a number of *P0 elements*, to allow a *Commit element* to commit *P0 elements* that are younger than the oldest uncommitted *P0 elements*, leaving these older *P0 elements* uncommitted.

Completer An agent in a computing system that responds to and completes a memory transaction that was initiated by a Requester.

See also Requester.

Constructive instruction encoding A constructive instruction encoding is an instruction encoding where the destination register is encoded independently of the source registers.

Condition code check The process of determining whether a conditional instruction executes normally or is treated as a `NOP`. For an instruction that includes a condition code field, that field is compared with the condition flags to determine whether the instruction is executed normally.

See also Condition code field, Condition flags, Conditional execution.

Condition code field A 4-bit field in an instruction that specifies the condition under which the instruction executes.

See also Condition code check.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Condition flags The N, Z, C, and V bits of PSTATE, an SPSR, or FPSCR. See the register descriptions for more information.

See also Condition code check, PSTATE.

Conditional execution When a conditional instruction starts executing, if the condition code check returns TRUE, the instruction executes normally. Otherwise, it is treated as a `NOP`.

See also Condition code check.

CONSTRAINED UNPREDICTABLE Where an instruction can result in UNPREDICTABLE behavior, the Armv8 and later architectures specify a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

Execution at Non-secure EL1 or EL0 of an instruction that is CONSTRAINED UNPREDICTABLE can be implemented as generating a trap exception that is taken to EL2, provided that at least one instruction that is not UNPREDICTABLE and is not CONSTRAINED UNPREDICTABLE causes a trap exception that is taken to EL2.

In body text, the term CONSTRAINED UNPREDICTABLE is shown in SMALL CAPITALS.

See also UNPREDICTABLE.

Containable error See Contained error.

Contained error An error that is not uncontained or uncontainable.

Context switch The saving and restoring of computational state when switching between different threads or processes. In this manual, the term context switch describes any situation where the context is switched by an operating system and might or might not include changes to the address space.

Context Synchronization event One of:

- Performing an ISB operation. An ISB operation is performed when an `ISB` instruction is executed and does not fail its condition code check.
- Exception entry, if any of the following is true:
  - FEAT_ExS is not implemented.
  - FEAT_ExS is implemented and the appropriate SCTLR_ELx.EIS bit is set.
- Return from an exception, if any of the following is true:
  - FEAT_ExS is not implemented.
  - FEAT_ExS is implemented and the appropriate SCTLR_ELx.EIS bit is set.
  - Exit from Debug state.
- Executing a `DCPS` instruction.
- Executing a `DRPS` instruction.

The effects of a Context synchronization event are:

- All unmasked interrupts that are pending at the time of the Context synchronization event are taken before the first instruction after the Context synchronization event.
- If halting is allowed, all Halting debug events that are pending at the time of the Context synchronization event are taken before the first instruction after the Context synchronization event.
- No instructions appearing in program order after an instruction that causes a Context synchronization event will have performed any part of their functionality until the Context synchronization event has occurred.
- All direct and indirect writes to System registers that are made before the Context synchronization event affect any instruction, including a direct read, that appears in program order after the instruction causing the Context synchronization event.
- All completed changes to the translation tables for entries that, before the change, were not permitted to be cached in a TLB, affect all instruction fetches that appear in program order after the instruction causing the Context synchronization event.
- The following invalidations, if completed before the Context synchronization event will affect all instructions that appear in program order after the Context synchronization event:

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

  - TLBS.
  - Instruction caches.
- Changes to the Debug external authentication interfaces that are made before the Context synchronization event affect any instruction that appears in program order after the instruction causing the Context synchronization event.
- The effect of the completion of any of the instructions added by FEAT_SPECRES is synchronized to the current execution context.
- Restrictions on the effects of speculation (as described in Restrictions on the effects of speculation) are observed.
- Ensuring that the `TSB` instruction is executed in the necessary order with respect to other instructions.
- Profiling operations for all instructions that are executed in program order are synchronized by execution of a `PSB` instruction before the Context synchronization event.
- See also:
  - Restrictions on the effects of speculation.
  - Trace Synchronization Barrier.
  - Synchronization and debug exceptions.
  - Synchronization in self-hosted trace.
  - Synchronization of register updates.
  - Speculation in the trace element stream.
  - Trace Synchronization event.
  - Self-hosted trace extension synchronization rules.
  - Execution, data prediction and prefetching restriction System instructions.
  - Synchronization and Statistical Profiling.
  - Synchronization and Halting debug events.
  - Synchronization of memory-mapped registers.
  - CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization.

Note

- The architecture requires that instructions that generate Context synchronization events do not appear to be executed speculatively, except that the performance monitor counters are permitted to reveal such speculation.
- *Context synchronization events* were previously described as *context synchronization operations*.

Conventional memory Memory locations from which generic OSs and application runtimes expect to create allocations for general software use.

Core See Processing element (PE).

CoreSight Address Translation Unit A form of System MMU for trace streams.

Corrected error An error that is detected by hardware and that hardware has corrected.

Counter resolution See Counter resolution.

CPBM Cache-Portion Bit Map.

CSU Cache-Storage Usage.

Data independent timing (DIT) The time that it takes to execute a piece of code where the time is not a function of the data being operated on. For more information, see About PSTATE.DIT and About the DIT bit.

Debugger In most of this manual, *debugger* refers to any agent that is performing debug. However, some chapters or parts of this manual require a more rigorous definition, and define debugger locally. See:

- Definition of a debugger in the context of self-hosted debug.
- Definition of a debugger in the context of self-hosted debug.
- Definition and constraints of a debugger in the context of external debug.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Deferred error An error that has not been silently propagated but does not require immediate action at the producer. The error might have passed from the producer to a consumer.

Deprecated Something that is present in the Arm architecture for backward compatibility.

Features that are deprecated but are not OPTIONAL are present in current implementations of the Arm architecture, but might not be present, or might be deprecated and OPTIONAL, in future versions of the Arm architecture.

Arm strongly recommends software to avoid using deprecated features. Where a feature is deprecated for performance reasons, Arm strongly recommends software to avoid using that feature because of the likelihood of the significant negative impact on performance.

See also OPTIONAL.

Destructive instruction encoding A destructive instruction encoding is an instruction encoding where one of the source registers is also used as the destination register.

Detected error An error that has been detected and signaled to a consumer.

Detected Uncorrected error A detected error that has not been be corrected and causes failure.

Digital signal processing (DSP) Algorithms for processing signals that have been sampled and converted to digital form. DSP algorithms often use saturated arithmetic.

Direct branch Branch instructions whose target is relative to the PC of the branch and the offset is determined solely from the opcode of the executed instruction.

See also Indirect branch.

Direct Memory Access (DMA) An operation that accesses main memory directly, without the PE performing any accesses to the data concerned.

Direct read A direct read of a System register is a read performed by a System register access instruction.

For more information, see Direct read.

See also Direct write, Indirect read, Indirect write.

Direct write A direct write of a System register is a write performed by a System register access instruction.

For more information, see Direct write.

See also Direct read, Indirect read, Indirect write.

DMA See Direct Memory Access (DMA).

DNM See Do-Not-Modify (DNM).

Domain In the Arm architecture, *domain* is used in the following contexts.

Shareability domain Defines a set of observers for which the Shareability attributes make the data or unified caches transparent for data accesses.

Power domain Defines a block of logic with a single, common, power supply.

Memory regions domain

When using the Short-descriptor translation table format, defines a collection of Sections, Large pages and Small pages of memory, that can have their access permissions switched rapidly by writing to the *Domain Access Control Register* (DACR). Arm deprecates any use of memory regions domains.

Do-Not-Modify (DNM) Means the value must not be altered by software. DNM fields read as UNKNOWN values, and must only be written with the value read from the same field on the same PE.

Double-precision value Consists of two consecutive 32-bit words that are interpreted as a basic double-precision floating-point number according to the *IEEE Standard for Floating-point Arithmetic*.

Doubleword A 64-bit data item. Doublewords are normally at least word-aligned in Arm systems.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Doubleword-aligned Means that the address is divisible by 8.

Downstream Information propagating in the direction from Requesters towards terminating Completer components.

DSB Data Synchronization Barrier.

DSP See Digital signal processing (DSP).

DUE See Detected Uncorrected error.

DUE FIT RATE The FIT rate for failures from a DUE.

ECC See Error Correction Code (ECC).

EDAC See Error Correction Code (ECC).

EDC See Error Detection Code (EDC).

Effective frequency See Effective frequency.

Effective value A register control field, meaning a field in a register that controls some aspect of the behavior, can be described as having an *Effective value*:

- In some cases, the description of a control *a* specifies that when control *a* is active it causes a register control field *b* to be treated as having a fixed value for all purposes other than direct reads, or direct reads and direct writes, of the register containing control field *b*. When control *a* is active that fixed value is described as the *Effective value* of register control field *b*.
  In other cases, in some contexts a register control field *b* is not implemented or is not accessible, but behavior of the PE is as if control field *b* was implemented and accessible, and had a particular value. In this case, that value is the *Effective value* of register control field *b*.

  Note

  Where a register control field is introduced in a particular version of the architecture, and is not implemented in an earlier version of the architecture, typically it will have an *Effective value* in that earlier version of the architecture.

- Otherwise, the *Effective value* of a register control field is the value of that field.

Endianness An aspect of the system memory mapping.

See also Big-endian memory and Little-endian memory.

Error Correction Code (ECC) A code capable of detecting and correcting a number of errors.

Error Detection Code (EDC) A code capable of detecting, but not correcting, errors.

Error propagation Passing an error from a producer to a consumer.

Error record Data recorded about an error, usually by hardware.

ETEEvent A feature of the trace unit that is used to generate *Event elements* and drive External Outputs. Each ETEEvent can be programmed to be sensitive to resource events.

Event trace The trace uses *Event elements* that indicate certain events have occurred in the program that the PE is executing. The program events to be indicated are selected before a trace session.

Exceptional occurrence Events indicated by an *Exception element* by the ETE architecture, including the following:

- PE architectural exceptions.
- ETE defined exceptions.
- IMPLEMENTATION DEFINED exceptions.

Exception Handles an event. For example, an exception could handle an external interrupt or an undefined instruction.

Exception vector A fixed address that contains the address of the first instruction of the corresponding exception handler.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Executing processing element (PEe) The name given to an example PE that executes a specified instruction.

See also Processing element (PE).

Execution stream The stream of instructions that would have been executed by sequential execution of the program.

External abort An abort that is generated by the external memory system.

Fault An event that causes the program to deviate from the intended behavior, for example an invalid translation.

Field Replaceable Unit (FRU) A component or unit in a system that can be replaced without return to base.

First active element The First active element of an SVE vector or predicate register is the lowest numbered element that is an Active element.

First-fault load SVE provides a First-fault option for some SVE vector load instructions. This option causes memory access faults to be suppressed if they do not occur as a result of the First active element of the vector. Instead, the FFR is updated to indicate which of the Active elements were not successfully loaded.

Flat address mapping Is where the physical address for every access is equal to its virtual address.

Flush-to-zero mode A processing mode that optimizes the performance of some floating-point algorithms by replacing the denormalized operands and Intermediate results with zeros, without significantly affecting the accuracy of their final results.

FRU See Field Replaceable Unit (FRU).

General-purpose registers The registers that the base instructions use for processing:

- In AArch64 state the general-purpose registers are:
  - W0-W30 when accessed as 32-bit registers.
  - X0-X30 when accessed as 64-bit registers.

Generated by The memory model is written in terms of reads from memory and writes to memory. These reads and writes:

- Are generated by instructions such as loads, stores, and atomic memory accesses.
- Correspond to the memory accesses, other than translation table walks, that are defined in the instruction pseudocode.

Some instructions generate more than one read or write.

Generic Interrupt Controller (GIC) Arm system architecture interrupt controller for IRQ and FIQ interrupt exceptions.

Governing predicate The predicate register that is used to determine the Active elements of a predicated instruction is known as the Governing predicate for that instruction.

GIC See Generic Interrupt Controller (GIC).

Halfword A 16-bit data item. Halfwords are normally halfword-aligned in Arm systems.

Halfword-aligned Means that the address is divisible by 2.

High vectors An alternative location for the exception vectors. The high vector address range is near the top of the address space, rather than at the bottom.

ICN InterConnect Network.

IGNORED Indicates that the architecture guarantees that the bit or field is not interpreted or modified by hardware.

In body text, the term IGNORED is shown in SMALL CAPITALS.

Immediate and offset fields Are unsigned unless otherwise stated.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Immediate value A value that is encoded directly in the instruction and used as numeric data when the instruction is executed. Many instructions can be used with an immediate argument.

IMP An abbreviation used in diagrams to indicate that one or more bits have IMPLEMENTATION DEFINED behavior.

IMPLEMENTATION DEFINED Means that the behavior is not architecturally defined, but must be defined and documented by individual implementations.

In body text, the term IMPLEMENTATION DEFINED is shown in SMALL CAPITALS.

IMPLEMENTATION SPECIFIC Means that the behavior is not architecturally defined, and might not be documented by an individual implementation. Used when there are several implementation options available and the option chosen does not affect software compatibility.

In body text, the term IMPLEMENTATION SPECIFIC is shown in SMALL CAPITALS.

Imprecise exception An exception that is not precise.

Inactive element An Inactive element is an SVE vector element or predicate element that is an unused source register element or destination register element for the associated instruction. When the corresponding element of an instruction's Governing predicate is FALSE, it is an Inactive element.

Index register A register specified in some load and store instructions. The value of this register is used as an offset to be added to or subtracted from the base register value to form the virtual address that is sent to memory. Some instruction forms permit the index register value to be shifted before the addition or subtraction.

Indirect branch Branch instructions that are not direct branches.

See also Direct branch.

Indirect read When an instruction uses a System register value to establish operating conditions, that use of the System register is an indirect read of the System register.

For more information, including additional examples of indirect reads, see Indirect read.

See also Direct read, Direct write, Indirect write.

Indirect write An indirect write of a System register occurs when the contents of a register are updated by some mechanism other than a Direct write to that register. For example, an indirect write to a register might occur as a side-effect of executing an instruction that does not perform a direct write to the register, or because of some operation performed by an external agent.

For more information, see Indirect write.

See also Direct read, Direct write, Indirect read.

Inline literals These are constant addresses and other data items held in the same area as the software itself. They are automatically generated by compilers, and can also appear in assembler code.

Intermediate physical address (IPA) An implementation of virtualization, the address to which a Guest OS maps a VA. A hypervisor might then map the IPA to a PA. Typically, the Guest OS is unaware of the translation from IPA to PA.

See also Physical address (PA), Virtual address (VA).

Interrupt In a PE context, an asynchronous exception. There are three interrupt exceptions: IRQ, FIQ, and SError. IRQ and FIQ are always precise. In a system architecture context, an asynchronous event sent to a PE or GIC for processing as an interrupt exception.

IPA See Intermediate physical address (IPA).

kvm Kernel-based Virtual Machine, an open-source software package that implements a type-2 hypervisor within Linux.

Latent error An error that is present in a system but not yet detected.

Last active element The Last active element of an SVE vector or predicate register is the highest numbered element that is an Active element.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Level See Cache level.

Level of Coherence (LoC) The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of coherency. For more information, see Terms used in describing the cache maintenance instructions.

See also Cache level, Point of coherency (PoC).

Level of Unification, Inner Shareable (LoUIS) The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for the Inner Shareable Shareability domain. For more information, see Terms used in describing the cache maintenance instructions.

See also Cache level, Point of unification (PoU).

Level of Unification, uniprocessor (LoUU) For a PE, the last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for that PE. For more information, see Terms used in describing the cache maintenance instructions.

See also Cache level, Point of unification (PoU).

Line See Cache line.

Little-endian memory Means that, for example:

- A byte or halfword at a word-aligned address is the least significant byte or halfword in the word at that address.
- A byte at a halfword-aligned address is the least significant byte in the halfword at that address.

See also Big-endian memory, Endianness.

Load/store architecture An architecture where data-processing operations only operate on register contents, not directly on memory contents.

LoC See Level of Coherence (LoC).

LoUIS See Level of Unification, Inner Shareable (LoUIS).

LoUU See Level of Unification, uniprocessor (LoUU).

Lockdown See Cache lockdown.

MBWU Memory BandWidth Usage.

Memory barrier See Memory barriers.

Memory coherency The problem of ensuring that when a memory location is read, either by a data read or an instruction fetch, the value actually obtained is always the value that was most recently written to the location. This can be difficult when there are multiple possible physical locations, such as main memory and at least one of a write buffer and one or more levels of cache.

Memory element An item of data in memory that is transferred to or from a vector element by an SVE load or store instruction. Each memory element has an access size and a type. The memory element access size is specified by each load and store instruction independently of the vector element size.

Memory Management Unit (MMU) Provides detailed control of the part of a memory system that provides a single stage of address translation. Most of the control is provided using translation tables that are held in memory, and define the attributes of different regions of the physical memory map.

Memory Protection Unit (MPU) A hardware unit whose registers provide simple control of a limited number of protection regions in memory.

Merging predication When a predicated SVE instruction specifies merging predication, the Inactive elements of the destination register remain unchanged.

Memory system component MSC. A function, unit, or design block in a memory system that can have partitionable resources. MSCs consist of all units that handle load or store requests issued by any MPAM Requester. These can include cache memories, interconnects, memory management units, memory channel

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

controllers, queues, buffers, and rate adaptors. An MSC can contain one or more resources that each can have zero or more resource partitioning controls. For example, a PE can contain several caches, each of which might have zero or more resource partitioning controls.

Memory system resource A resource that affects the performance of software's use of the memory system and is either local to an MSC (such as cache-memory capacity) or non-local (such as memory bandwidth, which is present over an entire path, from Requester to Completer, that can pass through multiple MSCs).

MMR Memory-mapped Register.

Microarchitecturally-finished An operation that has finished all of its operational pseudocode, although the results of any memory accesses, including translation table walks and updates, are not yet coherent with other observers.

Microarchitecturally-unfinished An operation that has not completed all of its operational pseudocode.

Miss See Cache miss.

MMU See Memory Management Unit (MMU).

MPU See Memory Protection Unit (MPU).

Multi-copy atomicity The form of atomicity described in Requirements for multi-copy atomicity.

See also Atomicity, Single-copy atomicity.

NaN Not a Number. A floating-point value that can be used when neither a numeric value nor an infinity is appropriate. A NaN can be a *Quiet* NaN, that propagate through most floating-point operations, or a *signaling* NaN, that causes an Invalid Operation floating-point exception when used. For more information, see the *IEEE Standard for Floating-point Arithmetic*.

See also Quiet NaN, Signaling NaN.

Natural eviction A natural eviction is an eviction that occurs in the course of the normal operation of the memory system, rather than because of an operation that explicitly causes an eviction from the cache, such as the execution of a cache maintenance instruction. Typically, a natural eviction occurs when the caching algorithm requires data to be cached but the cache does not have room for that data.

Non-fault load SVE provides a Non-fault option for some SVE vector load instructions. This option causes all memory access faults to be suppressed. Instead, the FFR is updated to indicate which of the Active elements were not successfully loaded.

Observer A PE or mechanism in the system, such as a peripheral device, that can generate reads from or writes to memory.

Obsolete Obsolete indicates something that is no longer supported by Arm. When an architectural feature is described as obsolete, this indicates that the architecture has no support for that feature, although an earlier version of the architecture did support it.

Offset addressing Means that the memory address is formed by adding or subtracting an offset to or from the base register value.

OPTIONAL When applied to a feature of the architecture, OPTIONAL indicates a feature that is not required in an implementation of the Arm architecture:

- If a feature is OPTIONAL and deprecated, this indicates that the feature is being phased out of the architecture. Arm expects such a features to be included in a new implementation only if there is a known backward-compatibility reason for the inclusion of the feature.
  A feature that is OPTIONAL and deprecated might not be present in future versions of the architecture.
- A feature that is OPTIONAL but not deprecated is, typically, a feature added to a version of the Arm architecture after the initial release of that version of the architecture. Arm recommends that such features are included in all new implementations of the architecture.

In body text, these meanings of the term OPTIONAL are shown in SMALL CAPITALS.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Note

Do not confuse these Arm-specific uses of OPTIONAL with other uses of *optional*, where it has its usual meaning. These include:

- Optional arguments in the syntax of many instructions.
- Behavior determined by an implementation choice

See also Deprecated.

Other-multi-copy atomic This is a Memory Write effect from an observer that, if observed by a different observer, is then observed by all other observers that access the location coherently.

PA See Physical address (PA).

Packed access A memory access that is performed as a result of an SVE load or store instruction for which the vector element size and the memory element size are the same.

PCIe See Peripheral Component Interconnect Express (PCI Express or PCIe).

PE See Processing element (PE).

Peripheral Component Interconnect Express (PCI Express or PCIe) A high-speed serial computer expansion bus standard maintained and developed by the PCI Special Interest Group.

PEe The executing processing element. See Executing processing element.

PFA See Predictive Failure Analysis (PFA).

Physical address (PA) An address that identifies a location in the physical memory map.

See also Intermediate physical address (IPA), Virtual address (VA).

Point of coherency (PoC) See Terms used in describing the cache maintenance instructions for the AArch64 state and Terminology for Clean, Invalidate, and Clean and Invalidate instructions for the AArch32 state.

Point of Deep Persistence (PoDP) See Terms used in describing the cache maintenance instructions.

Point of encryption (PoE) See Terms used in describing the cache maintenance instructions.

Point of persistence (PoP) See Terms used in describing the cache maintenance instructions.

Point of physical aliasing (PoPA) See Terms used in describing the cache maintenance instructions.

Point of physical storage (PoPS) See Terms used in describing the cache maintenance instructions.

Point of unification (PoU) See Terms used in describing the cache maintenance instructions for the AArch64 state and Terminology for Clean, Invalidate, and Clean and Invalidate instructions for the AArch32 state.

Poison atomicity The form of atomicity described in Clearing Deferred errors from poisoned Locations.

See also Atomicity.

Poison granule A region of naturally-aligned memory affected by poison.

See Error propagation for information on poison.

Post-indexed addressing Means that the memory address is the base register value, but an offset is added to or subtracted from the base register value and the result is written back to the base register.

Precise exception An exception where the exception handler receives the state of the PE and the state of the memory system consistent with the PE having executed all of the instructions up to, but not including, the point in the instruction stream where the exception was taken. The state of the PE and the state of the memory do not include instructions that occurred after this point.

Prefetching Prefetching refers to speculatively fetching instructions or data from the memory system. In particular, instruction prefetching is the process of fetching instructions from memory before the instructions that

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

precede them, in simple sequential execution of the program, have finished executing. Prefetching an instruction does not mean that the instruction has to be executed.

In this manual, references to instruction or data fetching apply also to prefetching, unless the context explicitly indicates otherwise.

Note

The Prefetch Abort exception can be generated on any instruction fetch, and is not limited to speculative instruction fetches.

See also Simple sequential execution.

Prefixed instruction The instruction that immediately follows a MOVPRFX instruction in program order.

Pre-indexed addressing Means that the memory address is formed in the same way as for offset addressing, but the memory address is also written back to the base register.

Processing element (PE) The abstract machine defined in the Arm architecture, as documented in an Arm Architecture Reference Manual. A PE implementation compliant with the Arm architecture must conform with the behaviors described in the corresponding Arm Architecture Reference Manual.

Protection granule A quantum of memory for which an EDC or ECC provides detection or correction. For example, a 72/64 SECDED ECC scheme has a 64-bit protection granule.

Protection region A memory region whose position, size, and other properties are defined by Memory Protection Unit registers.

Protection Unit See Memory Protection Unit (MPU).

Pseudo-instruction UAL assembler syntax that assembles to an instruction encoding that is expected to disassemble to a different assembler syntax, and is described in this manual under that other syntax. For example, `MOV <Rd>, <Rm>, LSL #<n>` is a pseudo-instruction that is expected to disassemble as `LSL <Rd>, <Rm>, #<n>`.

PSTATE An abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

See also Condition flags.

Quadword A 128-bit data item. Quadwords are normally at least word-aligned in Arm systems.

Quadword-aligned Means that the address is divisible by 16.

Quiet NaN A NaN that propagates unchanged through most floating-point operations.

See also NaN, Signaling NaN.

RAO See Read-As-One (RAO).

RAZ See Read-As-Zero (RAZ).

RAO/SBOP In versions of the Arm architecture before Armv8, Read-As-One, Should-Be-One-or-Preserved on writes.

From the introduction of the Armv8 architecture, RES1 replaces this description.

See also UNK/SBOP, Read-As-One (RAO), RES1, Should-Be-One-or-Preserved (SBOP).

RAO/WI Read-As-One, Writes Ignored.

Hardware must implement the field as Read-As-One, and must ignore writes to the field.

Software can rely on the field reading as all 1s, and on writes being ignored.

This description can apply to a single bit that reads as 1, or to a field that reads as all 1s.

See also Read-As-One (RAO).

RAZ/SBZP In versions of the Arm architecture before Armv8, Read-As-Zero, Should-Be-Zero-or-Preserved on writes.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

From the introduction of the Armv8 architecture, RES0 replaces this description.

See also UNK/SBZP, Read-As-Zero (RAZ), RES0, Should-Be-Zero-or-Preserved (SBZP).

RAZ/WI Read-As-Zero, Writes Ignored.

Hardware must implement the field as Read-As-Zero, and must ignore writes to the field.

Software can rely on the field reading as all 0s, and on writes being ignored.

This description can apply to a single bit that reads as 0, or to a field that reads as all 0s.

See also Read-As-Zero (RAZ).

Read-allocate cache A cache in which a cache miss on reading data causes a cache line to be allocated into the cache.

Read-As-One (RAO) Hardware must implement the field as reading as all 1s.

Software:

- Can rely on the field reading as all 1s.
- Must use a SBOP policy to write to the field.

This description can apply to a single bit that reads as 1, or to a field that reads as all 1s.

See also RAO/SBOP, RAO/WI, RES1.

Read-As-Zero (RAZ) Hardware must implement the field as reading as all 0s.

Software:

- Can rely on the field reading as all 0s
- Must use a SBZP policy to write to the field.

This description can apply to a single bit that reads as 0, or to a field that reads as all 0s.

See also RAZ/SBZP, RAZ/WI, RES0.

Read-to-Clear (RC) A read of the field clears the field to 0 once the read is complete.

Read, modify, write In a read, modify, write instruction sequence, a value is read to a general-purpose register, the relevant fields updated in that register, and the new value written back.

Recoverable error A contained error that must be corrected to allow the correct operation of the system or smaller parts of the system to continue.

Reliability Continuity of correct service.

Requester An agent in a computing system that is capable of initiating memory transactions.

See also Completer.

RES0 A reserved bit. Used for fields in register descriptions, and for fields in architecturally-defined data structures that are held in memory, for example in translation table descriptors.

Within the architecture, there are some cases where a register bit or field:

- Is RES0 in some defined architectural context.
- Has different defined behavior in a different architectural context.

This means the definition of RES0 for fields in read/write registers is:

If a bit is RES0 in all contexts

For a bit in a read/write register, it is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired to 0. In this case:
   - Reads of the bit always return 0.
   - Writes to the bit are ignored.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

2. The bit can be written. In this case:
    - An indirect write to the register sets the bit to 0.
    - A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.

      If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
    - A direct write to the bit must update a storage location associated with the bit.
    - The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RES0 bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a bit-by-bit basis.

If a bit is RES0 only in some contexts

For a bit in a read/write register, when the bit is described as RES0:

- An indirect write to the register sets the bit to 0.
- A read of the bit must return the value last successfully written to the bit, by either a direct or an indirect write, regardless of the use of the register when the bit was written.

  If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
- A direct write to the bit must update a storage location associated with the bit.
- While the use of the register is such that the bit is described as RES0, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

Considering only contexts that apply to a particular implementation, if there is a context in which a bit is defined as RES0, another context in which the same bit is defined as RES1, and no context in which the bit is defined as a functional bit, then it is IMPLEMENTATION DEFINED whether:

- Writes to the bit are ignored, and reads of the bit return an UNKNOWN value.
- The value of the bit can be written, and a read returns the last value written to the bit.

The RES0 description can apply to bits or fields that are read-only, or are write-only:

- For a read-only bit, RES0 indicates that the bit reads as 0, but software must treat the bit as UNKNOWN.
- For a write-only bit, RES0 indicates that software must treat the bit as SBZ.

A bit that is RES0 in a context is reserved for possible future use in that context. To preserve forward compatibility, software:

- Must not rely on the bit reading as 0.
- Must use an SBZP policy to write to the bit.

This RES0 description can apply to a single bit, or to a field for which each bit of the field must be treated as RES0.

In body text, the term RES0 is shown in SMALL CAPITALS.

See also Read-As-Zero (RAZ), RES0H, RES1, Should-Be-Zero-or-Preserved (SBZP), UNKNOWN.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RES0H A reserved bit or field with SBZP. This behavior uses the hardwired to 0 subset of the RES0 definition.

See also Read-As-Zero (RAZ), RES0, RES1, Should-Be-Zero-or-Preserved (SBZP).

RES1 A reserved bit. Used for fields in register descriptions, and for fields in architecturally-defined data structures that are held in memory, for example in translation table descriptors.

Within the architecture, there are some cases where a register bit or field:

- Is RES1 in some defined architectural context.
- Has different defined behavior in a different architectural context.

This means the definition of RES1 for fields in read/write registers is:

If a bit is RES1 in all contexts

For a bit in a read/write register, it is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired to 1. In this case:
   - Reads of the bit always return 1.
   - Writes to the bit are ignored.
2. The bit can be written. In this case:
   - An indirect write to the register sets the bit to 1.
   - A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.

     If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
   - A direct write to the bit must update a storage location associated with the bit.
   - The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RES1 bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a bit-by-bit basis.

If a bit is RES1 only in some contexts

For a bit in a read/write register, when the bit is described as RES1:

- An indirect write to the register sets the bit to 1.
- A read of the bit must return the value last successfully written to the bit, regardless of the use of the register when the bit was written.

  Note

  As indicated in this list, this value might be written by an indirect write to the register.

  If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
- A direct write to the bit must update a storage location associated with the bit.
- While the use of the register is such that the bit is described as RES1, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Considering only contexts that apply to a particular implementation, if there is a context in which a bit is defined as RES0, another context in which the same bit is defined as RES1, and no context in which the bit is defined as a functional bit, then it is IMPLEMENTATION DEFINED whether:

- Writes to the bit are ignored, and reads of the bit return an UNKNOWN value.
- The value of the bit can be written, and a read returns the last value written to the bit.

The RES1 description can apply to bits or fields that are read-only, or are write-only:

- For a read-only bit, RES1 indicates that the bit reads as 1, but software must treat the bit as UNKNOWN.
- For a write-only bit, RES1 indicates that software must treat the bit as SBO.

A bit that is RES1 in a context is reserved for possible future use in that context. To preserve forward compatibility, software:

- Must not rely on the bit reading as 1.
- Must use an SBOP policy to write to the bit.

This RES1 description can apply to a single bit, or to a field for which each bit of the field must be treated as RES1.

In body text, the term RES1 is shown in SMALL CAPITALS.

See also Read-As-One (RAO), RES0, RES0H, Should-Be-One-or-Preserved (SBOP), UNKNOWN.

Reserved Unless otherwise stated:

- Instructions that are reserved or that access reserved registers have UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior.
- Bit positions described as reserved are:
  - In an RW or WO register, RES0.
  - In an RO register, UNK.

See also CONSTRAINED UNPREDICTABLE, RES0, RES0H, RES1, UNDEFINED, UNK, UNPREDICTABLE.

Resource partition The collection of MPAM resource control settings associated with a software environment and identified by the combination of a physical PARTID space and a partition number.

RESS Reserved, Sign extended. A register value is extended by copying the sign bit into all of the reserved bits to the left of the most significant bit of the field. The values of these bits are identical to the most significant bit of the value being extended.

Within the architecture, a register bit or field can be treated:

- As RESS in few defined architectural contexts.
- In a different defined behavior in other architectural contexts.

This means the definition of RESS for fields in read/write registers is:

If a field [Q:P] is RESS in all contexts

For a bit in a read/write register, it is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired as a sign-extension of bit [P-1]. In this case:
   - Reads of the bit always return the value of bit [P-1].
   - Writes to the bit are ignored.
2. The bit can be written. In this case:
   - An indirect write to the register sets the bit to the same value as bit [P-1].

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.

  If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.

- A direct write to the bit must update a storage location associated with the bit.
- The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RESS bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a bit-by-bit basis.

If a field [Q:P] is RESS only in some contexts

For a bit in a read/write register, when the bit is described as RESS:

- An indirect write to the register sets the bit to the same value as bit [P-1].
- A read of the bit must return the value last successfully written to the bit, regardless of the use of the register when the bit was written.

  Note

  As indicated in this list, this value might be written by an indirect write to the register.

  If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
- A direct write to the bit must update a storage location associated with the bit.
- While the use of the register is such that the bit is described as RESS, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

Considering only contexts that apply to a particular implementation, if there is a context in which a bit is defined as RES0, another context in which the same bit is defined as RES1, and no context in which the bit is defined as a functional bit, then it is IMPLEMENTATION DEFINED whether:

- Writes to the bit are ignored, and reads of the bit return an UNKNOWN value.
- The value of the bit can be written, and a read returns the last value written to the bit.

The RESS description can apply to bits or fields that are read-only, or are write-only:

- For a read-only bit, RESS indicates that the bit reads as the value of bit [P-1], but software must treat the bit as UNKNOWN.
- For a write-only bit, RESS indicates that software must treat the bit as SBO or SBZ as necessary.

A bit that is RESS in a context is reserved for possible future use in that context. To preserve forward compatibility, software:

- Must not rely on the bit reading as [P-1].
- Must use a SBOP or SBZP policy to write to the bit.

This RESS description can apply to a single bit, or to a field for which each bit of the field must be treated as RESS.

Non-Confidential

Rewind point A rewind point is a point in the program flow to which execution can return if all subsequent execution is found to have been incorrectly speculatively executed.

RISC Reduced Instruction Set Computer.

Rounding error The value of the rounded result of an arithmetic operation minus the exact result of the operation.

Rounding mode Specifies how the exact result of a floating-point operation is rounded to a value that is representable in the destination format. The rounding modes are defined by the *IEEE Standard for Floating-point Arithmetic*, see Floating-point standards, and terminology.

Saturated arithmetic Integer arithmetic in which a result that would be greater than the largest representable number is set to the largest representable number, and a result that would be less than the smallest representable number is set to the smallest representable number. Signed saturated arithmetic is often used in DSP algorithms. It contrasts with the normal signed integer arithmetic used in Arm processors, in which overflowing results wrap around from $+2^{31}$-1 to -2^{31} or vice versa.

SBO See Should-Be-One (SBO).

SBOP See Should-Be-One-or-Preserved (SBOP).

SBZ See Should-Be-Zero (SBZ).

SBZP See Should-Be-Zero-or-Preserved (SBZP).

Scalar base register A scalar base register refers to an AArch64 general-purpose register, X0-X31, or the current stack pointer, SP.

Scalar index register A scalar index register refers to an AArch64 general-purpose register, X0-X31, or for certain instructions, XZR.

SDC See Silent Data Corruption (SDC).

SDC FIT rate The FIT rate for failures because of SDC.

SDEC Single device error correction EDAC. This can detect and correct multiple clustered errors in a protection granule, such as the types of errors that might be seen if a protection granule is striped across multiple devices and multiple errors come from a single device.

SECDED Single error correct, double error detect EDAC. This can detect a single or double bit error and correct a single bit error in a protection granule.

SED Single error detect EDC. This can detect a single bit error in a protection granule.

Security hole A mechanism by which execution at the current level of privilege can achieve an outcome that cannot be achieved at the current or a lower level of privilege using instructions that are not UNPREDICTABLE and are not CONSTRAINED UNPREDICTABLE. The Arm architecture forbids security holes.

See also CONSTRAINED UNPREDICTABLE, UNPREDICTABLE.

Self-modifying code Code that writes one or more instructions to memory and then executes them. When using self-modifying code, you must use cache maintenance and barrier instructions to ensure synchronization. For more information, see Caches and memory hierarchy.

SError exception An asynchronous exception in the Arm architecture.

Serviceability The ability to undergo modifications and repairs.

Service failure mode A mode entered to reduce the severity of an error.

Set See Cache sets.

Should-Be-One (SBO) Hardware must ignore writes to the field.

Arm strongly recommends that software writes the field as all 1s. If software writes a value that is not all 1s, it must expect an UNPREDICTABLE or CONSTRAINED UNPREDICTABLE result.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

This description can apply to a single bit that should be written as 1, or to a field that should be written as all 1s.

See also CONSTRAINED UNPREDICTABLE, UNPREDICTABLE.

Should-Be-One-or-Preserved (SBOP) From the introduction of the Armv8 architecture, the description Should-Be-One-or-Preserved (SBOP) is superseded by RES1.

Hardware must ignore writes to the field.

When writing this field, software must either write all 1s to this field or, if the register is being restored from a previously read state, write the previously read value to this field. If this is not done, then the result is unpredictable.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

See also CONSTRAINED UNPREDICTABLE, UNPREDICTABLE.

Should-Be-Zero (SBZ) Hardware must ignore writes to the field.

Arm strongly recommends that software writes the field as all 0s. If software writes a value that is not all 0s, it must expect an UNPREDICTABLE or CONSTRAINED UNPREDICTABLE result.

This description can apply to a single bit that should be written as 0, or to a field that should be written as all 0s.

See also CONSTRAINED UNPREDICTABLE, UNPREDICTABLE.

Should-Be-Zero-or-Preserved (SBZP) From the introduction of the Armv8 architecture, the description Should-Be-Zero-or-Preserved (SBZP) is superseded by RES0.

Hardware must ignore writes to the field.

When writing this field, software must either write all 0s to this field or, if the register is being restored from a previously read state, write the previously read value to this field. If this is not done, then the result is unpredictable.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

See also CONSTRAINED UNPREDICTABLE, UNPREDICTABLE.

Signaling NaN An Invalid Operation floating-point exception occurs whenever any floating-point operation receives a signaling NaN as an operand. Signaling NaNs can be used in debugging, to track down some uses of uninitialized variables.

See also NaN, Quiet NaN.

Signed immediate and offset fields Are encoded in two's complement notation unless otherwise stated.

Silent Data Corruption (SDC) An error that is not detected by hardware or software.

SIMD Single-Instruction, Multiple-Data.

Simple sequential execution The behavior of an implementation that fetches, decodes and completely executes each instruction before proceeding to the next instruction. Such an implementation performs no speculative accesses to memory, including to instruction memory. The implementation does not pipeline any phase of execution. In practice, this is the theoretical execution model that the architecture is based on, and Arm does not expect this model to correspond to a realistic implementation of the architecture.

Single-copy atomicity The form of atomicity described in Properties of single-copy atomic accesses.

See also Atomicity, Multi-copy atomicity.

Single-precision value A 32-bit word that is interpreted as a basic single-precision floating-point number according to the *IEEE Standard for Floating-point Arithmetic*.

SMMU System Memory Management Unit.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Spatial locality The observed effect that after a program has accessed a memory location, it is likely to also access nearby memory locations in the near future. Caches with multi-word cache lines exploit this effect to improve performance.

Special-purpose register One of the Special purpose registers for which all direct and indirect reads and writes to the register appear to occur in program order relative to other instructions, without the need for any explicit synchronization.

Speculative Speculative operations are:

- Operations that are generated by instructions that appear in the Execution stream after a branch that is not architecturally resolved.
- Operations that are generated by instructions that appear in the Execution stream after an instruction where a synchronous exception condition has not been architecturally resolved.
- Operations that are generated by conditional instructions for which the conditions for the instruction have not been architecturally resolved.
- Operations that are generated by instructions that appear in the Execution stream after the point at which a precise asynchronous exception will be taken.
- Operations generated by instructions for which one or more of the arguments come from a register that has not been architecturally resolved.
- Operations generated by the hardware that are not directly generated by any instructions appearing in the Execution stream.
- Memory effects (M2) generated by load or store instructions (LS2) appearing in program order after load or store instructions (LS1) that generate memory effects (M1) where all of the following apply:
  - M1 is locally-ordered-before M2.
  - LS1 has not been executed before LS2.
- Read accesses generated for a translation table walk for which the granule protection check for the address being accessed has not been architecturally resolved.

See also Execution stream.

SPI Shared Peripheral Interrupt.

Superpriority An attribute that is used to denote virtual and physical IRQ and FIQ interrupts as non-maskable. IRQ and FIQ interrupts with Superpriority can be taken under certain conditions where usually they would be masked by the PSTATE.{I, F} bits.

System Control Processor A PE dedicated to system control and monitoring.

Temporal locality The observed effect that after a program has accesses a memory location, it is likely to access the same memory location again in the near future. Caches exploit this effect to improve performance.

TLB See Translation Lookaside Buffer (TLB).

TLB lockdown A way to prevent specific translation table entries from being evicted from a TLB. This ensures that accesses to the associated regions of virtual memory never cause a translation table walk.

Translation Lookaside Buffer (TLB) A microarchitectural structure containing the results of translation table walks. They help to reduce the average cost of a memory access.

Translation table A table held in memory that defines the properties of regions of virtual memory.

Translation table walk The process of doing a full translation table lookup. It is performed automatically by hardware.

Trap enable bits In VFPv2, VFPv3U, and VFPv4U, determine whether trapped or untrapped exception handling is selected. If trapped exception handling is selected, the way it is carried out is IMPLEMENTATION DEFINED.

Unaligned An unaligned access is an access where the address of the access is not aligned to the size of an element of the access.

Unaligned memory accesses Are memory accesses that are not, or might not be, appropriately halfword-aligned, word-aligned, or doubleword-aligned.

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Unallocated Except where otherwise stated in this manual, an instruction encoding is unallocated if the architecture does not assign a specific function to the entire bit pattern of the instruction, but instead describes it as CONSTRAINED UNPREDICTABLE, UNDEFINED, UNPREDICTABLE, or as an unallocated hint instruction.

A bit in a register is unallocated if the architecture does not assign a function to that bit.

See also CONSTRAINED UNPREDICTABLE, UNDEFINED, UNPREDICTABLE.

Uncontainable error See Uncontained error.

Uncontained error An error that has been, or might have been, silently propagated.

Uncorrected error An error caused by a fault which was not removed.

UNDEFINED Indicates cases where an attempt to execute a particular encoding bit pattern generates an exception, that is taken to the current Exception level, or to the default Exception level for taking exceptions if the UNDEFINED encoding was executed at EL0. This applies to:

- Any encoding that is not allocated to any instruction.
- Any encoding that is defined as never accessible at the current Exception level.
- Some cases where an enable, disable, or trap control means an encoding is not accessible at the current Exception level.

Note

On reset, the default Exception level for taking exceptions from EL0 is EL1. However, an implementation might include controls that can change this, effectively making EL1 inactive. See the description of the Exception model for more information

In body text, the term UNDEFINED is shown in SMALL CAPITALS.

See also Undefined Instruction exception.

Undetected error See Latent error.

Unified cache Is a cache used for both processing instruction fetches and processing data loads and stores.

Unindexed addressing Means addressing in which the base register value is used directly as the virtual address to send to memory, without adding or subtracting an offset. In most types of load/store instruction, unindexed addressing is performed by using offset addressing with an immediate offset of 0.

UNK An abbreviation indicating that software must treat a field as containing an UNKNOWN value.

Hardware must implement the bit as read as 0, or all 0s for a multi-bit field. Software must not rely on the field reading as zero.

See also UNKNOWN.

UNK/SBOP Hardware must implement the field as Read-As-One, and must ignore writes to the field.

Software must not rely on the field reading as all 1s, and except for writing back to the register it must treat the value as if it is UNKNOWN. Software must use an SBOP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

See also Read-As-One (RAO), Should-Be-One-or-Preserved (SBOP), UNKNOWN.

UNK/SBZP Hardware must implement the bit as Read-As-Zero, and must ignore writes to the field.

Software must not rely on the field reading as all 0s, and except for writing back to the register must treat the value as if it is UNKNOWN. Software must use an SBZP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

See also Read-As-Zero (RAZ), Should-Be-Zero-or-Preserved (SBZP), UNKNOWN.

UNKNOWN An UNKNOWN value does not contain valid data, and can vary from implementation to implementation. An UNKNOWN value must not return information that cannot be accessed at the current or a lower level

Copyright © 2025 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

of privilege using instructions that are not UNPREDICTABLE, are not CONSTRAINED UNPREDICTABLE, and do not return UNKNOWN values.

An UNKNOWN value can vary from moment to moment, and instruction to instruction, unless it has previously been assigned, other than at reset, to one of the following registers:

- Any of the general-purpose registers.
- Any of the Advanced SIMD and floating-point registers.
- Any of the Scalable Vector Extension registers.
- Any of the PSTATE N, Z, C, or V flags.

An UNKNOWN value must not be documented or promoted as having a defined value or effect.

In body text, the term UNKNOWN is shown in SMALL CAPITALS.

See also CONSTRAINED UNPREDICTABLE, UNDEFINED, UNK, UNPREDICTABLE.

UNPREDICTABLE Means the behavior cannot be relied upon. UNPREDICTABLE behavior must not perform any function that cannot be performed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE.

UNPREDICTABLE behavior must not be documented or promoted as having a defined effect.

An instruction that is UNPREDICTABLE can be implemented as UNDEFINED.

Execution at Non-secure EL1 or EL0 of an instruction that is UNPREDICTABLE can be implemented as generating a trap exception that is taken to EL2, provided that at least one instruction that is not UNPREDICTABLE and is not CONSTRAINED UNPREDICTABLE causes a trap exception that is taken to EL2.

In body text, the term UNPREDICTABLE is shown in SMALL CAPITALS.

See also CONSTRAINED UNPREDICTABLE, UNDEFINED.

Unrecoverable error A contained error that is not recoverable. Continued correct operation is generally not possible. Usually this means correct operation of the system, but it can also be used in other contexts to describe correct operation of a smaller part. Systems might use high-level recovery techniques to work around an unrecoverable yet contained error in a component so that the system recovers from the error.

Upstream Information propagating in the direction from terminating Completer components towards Requesters.

VA See Virtual address (VA).

VFP In Armv7, an extension to the Arm architecture, that provides single-precision and double-precision floating-point arithmetic.

Vector A one-dimensional array of vector elements of the same size and data type.

Vector element Individual subdivisions of a vector register that can be 8, 16, 32, 64 or 128 bits in size. The vector element size and data type is specified independently by each instruction.

Virtual address (VA) An address generated by an Arm PE. This means it is an address that might be held in the program counter of the PE. For a PMSA implementation, the virtual address is identical to the physical address.

See also Intermediate physical address (IPA), Physical address (PA).

VM Virtual Machine.

VMM Virtual Machine Monitor. An alias for “hypervisor”.

Virtual PARTID A PARTID in MPAM that can be used by a virtual machine (VM). Virtual PARTIDs are mapped into physical PARTIDs using the virtual partition mapping entries in the MPAMVPM0 - MPAMVPM7 registers.

Watchpoint A debug event triggered by an access to memory, specified in terms of the address of the location in memory being accessed.

Way See Cache way.

WI Writes Ignored. In a register that software can write to, a WI attribute applied to a bit or field indicates that the bit or field ignores the value written by software and retains the value it had before that write.

See also RAO/WI, RAZ/WI, RES0, RES1.

Word A 32-bit data item. Words are normally word-aligned in Arm systems.

Word-aligned Means that the address is divisible by 4.

Write-allocate cache A cache in which a cache miss on storing data causes a cache line to be allocated into the cache.

Write-back cache A cache in which when a cache hit occurs on a write access, the data is only written to the cache. Data in the cache can therefore be more up-to-date than data in the next level of cache or memory. Any such data is written back to the next level of cache or memory when the cache line is cleaned. Another common term for a write-back cache is a *copy-back cache*.

Write-One-to-Clear (W1C) Writes of 0 to the bit are ignored. A write of 1 clears the bit to 0.

Write-One-to-Set (W1S) Writes of 0 to the bit are ignored. A write of 1 sets the bit to 1.

Write-Through cache A cache in which when a cache hit occurs on a write access, the data is written both to the cache and to the next level of cache or memory.

Write buffer A block of high-speed memory that optimizes stores to main memory.
