- **No Derivative Works.** You may not alter, transform, or build upon this work.

Notices and Disclaimers

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

Terminology 10

About This Programmer's Reference Manual

This Preface serves as an Introduction to the Programmer's Reference Manual (PRM) for the Graphics Processing Unit (GPU) included on the Kaby Lake series of chips. The PRM includes both narrative content that explains conceptually how the different modules of the GPU work, and a comprehensive Command Reference that describes named memory addresses/registers, commands, structures and enumerations, at the bit-level.

A Public View of the PRM

For each major chip series, Intel publicly releases a version of the PRM for the Open Source development community and developers at large. For those releases, we release the PRM in Portable Document Format (PDF).

In Multiple PDF Files

Due to file size constraints in generating PDF output (the Kaby Lake "Open Source" version of the PRM is roughly 5,000 pages long), the PRM is generated in multiple PDF files. The organization of those files reflects the major components of the Kaby Lake GPU. Both the narrative content and the Command Reference had to be partitioned into multiple PDF files.

Without Cross-book Links

Cross-book hyperlinks could not reasonably be included for the PDF. Instead, those links have been disabled and colored dark red and display in a serif font for easy recognition. This is an example:

RING_BUFFER_TAIL – Ring Buffer Tail

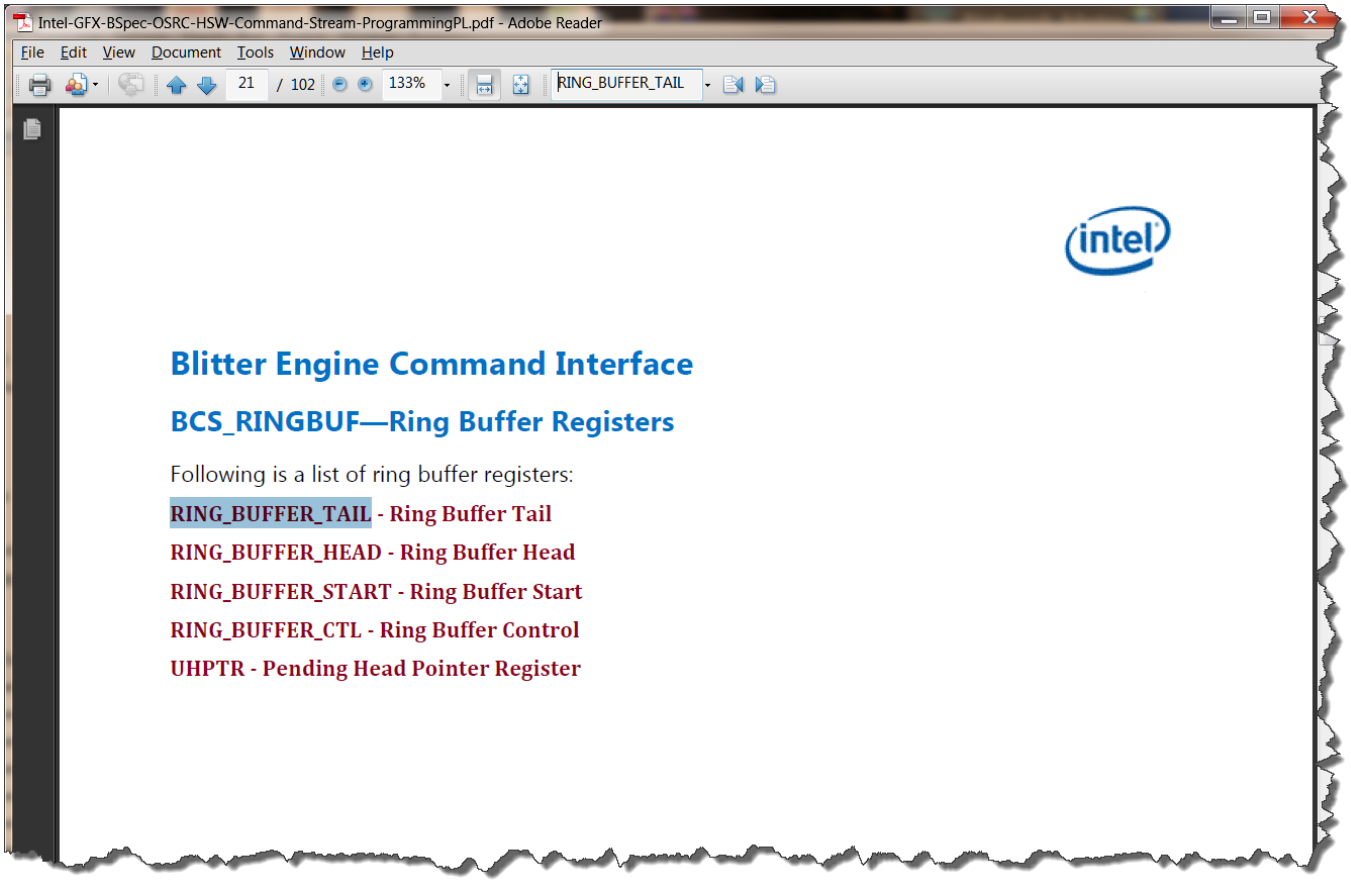
RING_BUFFER_HEAD – Ring Buffer Head

Searching Across Multiple PDF Files

You can quickly access the detailed explanation for each named memory address, command, structure or enumerator utilizing the Advanced Search capabilities in Acrobat Reader.

To maximize the efficiency of the search, make sure to place all PRM PDFs in a single folder, or at least the four Command Reference PDFs in a single folder.

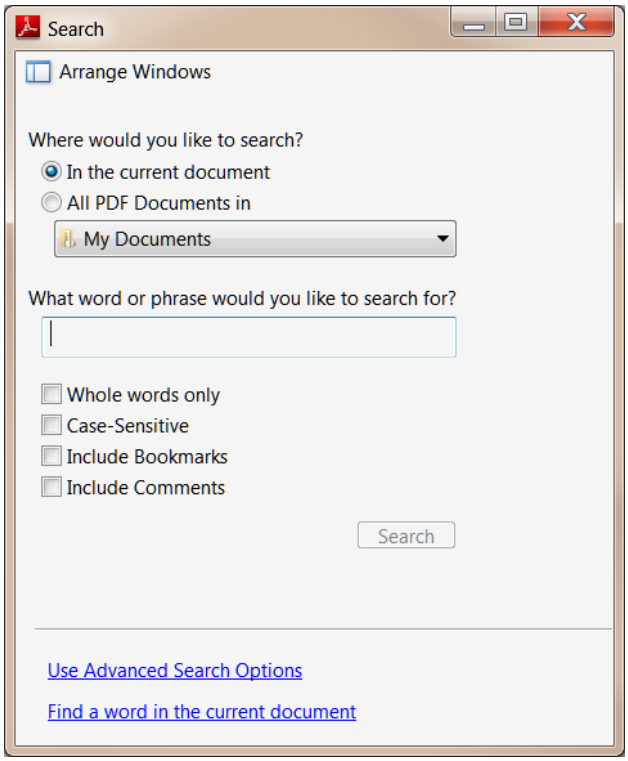
Let's walk through an example PDF search … you might be reading the Command Stream Programming module PDF file and encounter the page illustrated below.



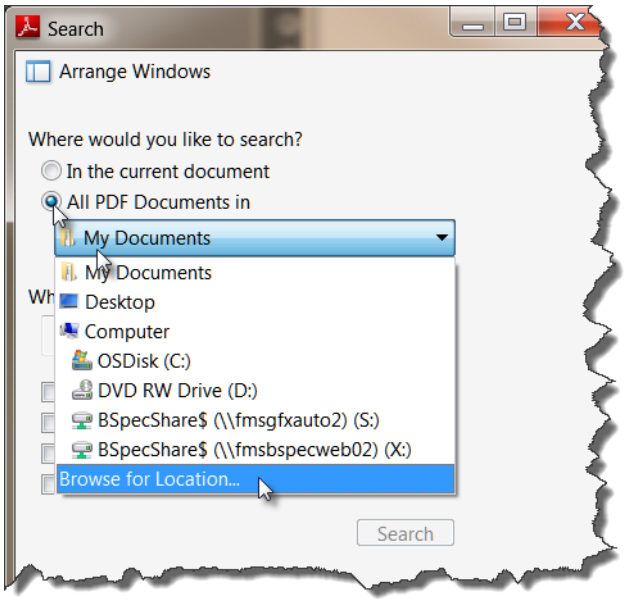
To view the detailed explanation of one of the listed registers … for this example, we will use **RING_BUFFER_TAIL …**

1. Simply select **Search** or **Advanced Search** from the **Edit** menu, depending on the version of Acrobat you might be using. (If you are using some other PDF Reader, it probably will also have advanced search capabilities.)

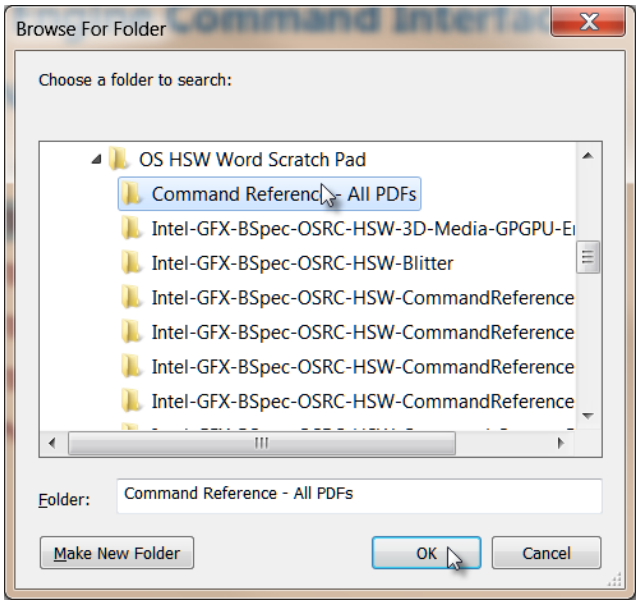
A search dialog box then displays.



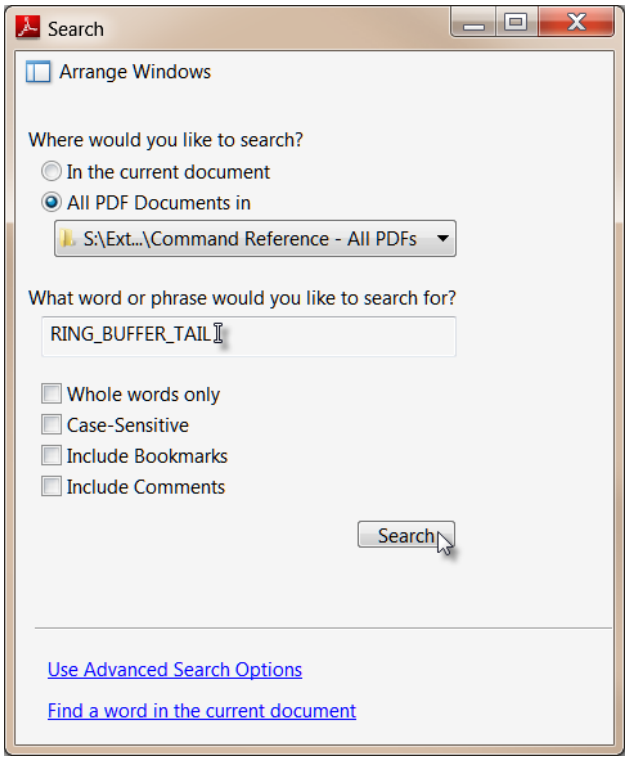
2. Select the **All PDF Documents in** radio button, click the pull-down list box, then select **Browse for Location...**



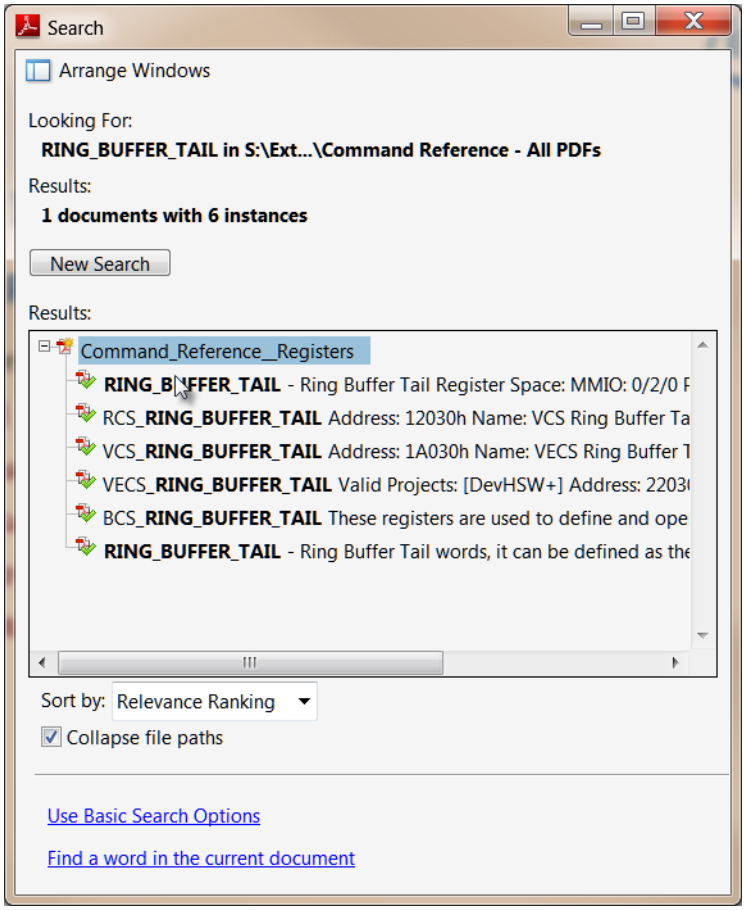
3. Browse to and select the folder containing the pertinent PDF files and click **OK**.



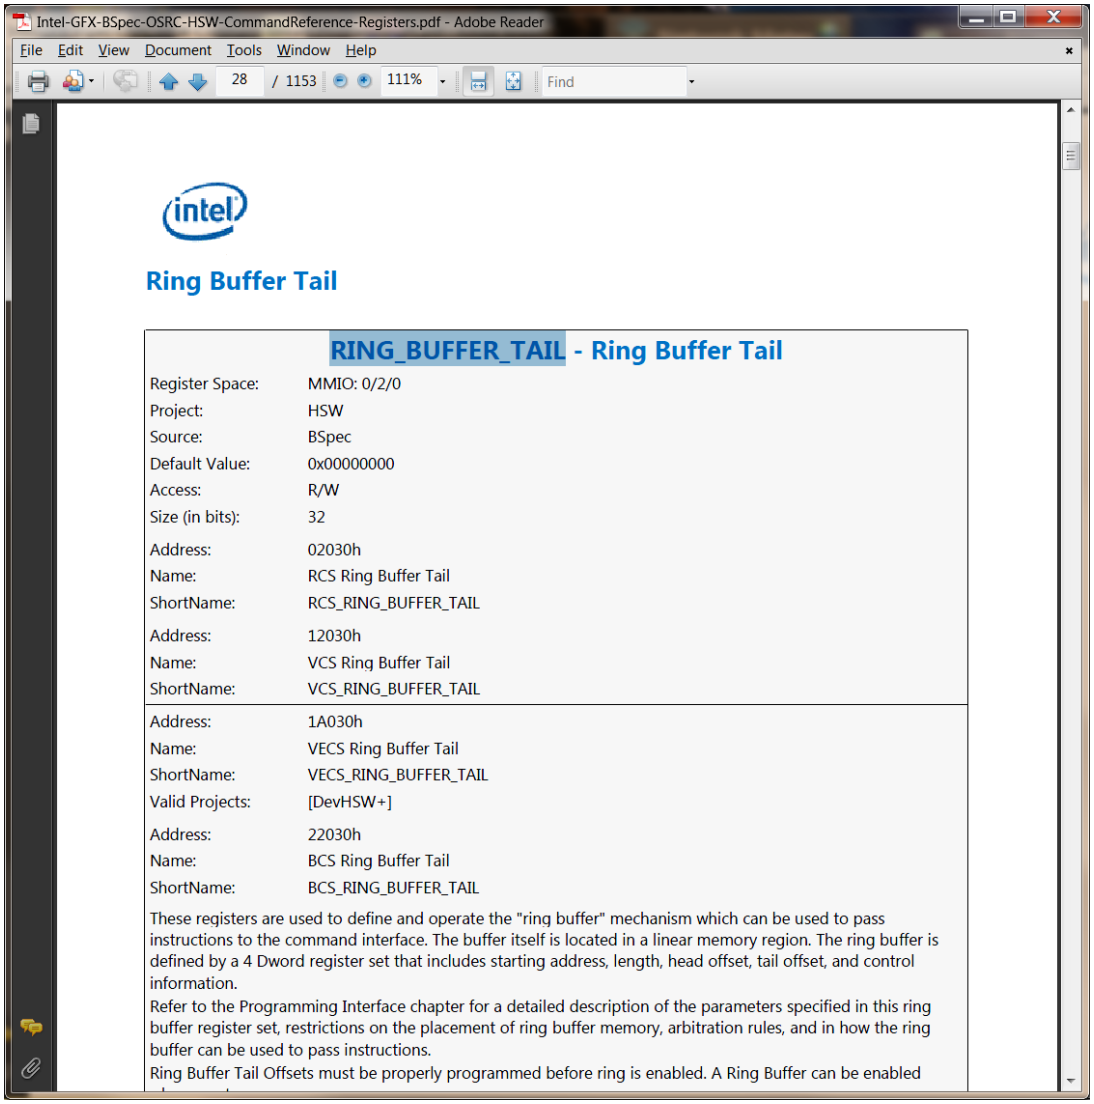
4. The Browse for Folder dialog closes and the focus shifts back to the original Search dialog. Enter the word or phrase from the red, serif text in the **What word or phrase would you like to search for?** text box and click **Search**.



As matches are found, they will be listed. When the search is complete, the dialog will appear similar to the following:



Click the most relevant result and the PDF file containing that result will open at the correct page.



Organization of the PRM

The Intel® Graphics PRM is organized into the following content areas:

Command Reference provides a tabular graphical interface tool for searching for and displaying command opcodes, registers, structures, and instructions.

GPU Overview introduces the GPU and its subsystems. This includes high level descriptions of its hardware pipelines, command formats, register maps, and supported memory/surface formats.

Configurations tracks the evolution of the graphics architecture and provides generational information for many basic architectural attributes.

Memory Views covers the Graphics Memory Interface, including memory interface functions, tiling, the physical graphics memory, page faults and error handling, memory types, common video and non-video surface formats, and other information related to the memory interface.

Command Stream Programming describes the programming interfaces for Command Streamer, which manages the use of the 3D and Media pipelines. It performs switching between pipelines and forwarding command streams to the currently active pipeline. It also manages the allocation of the Unified Return Buffer (URB) and helps support the Constant URB Entry (CURBE) function. It includes the following topics:

Topic
Command Formats
Blitter Engine Command Interface
Render Engine Command Interface
Video Codec Engine Command Interface
Video Enhancement Engine Command Interface
Preemption
Command Streamer (CS) ALU Programming
Resource Streamer

3D/Media/GPGPU Engine includes the following topics:

- Command stream backend processing
- The Graphics L3 large-storage cache, which also acts as a GFX Unified Return Buffer (URB)
- Shared Local Memory (SLM)
- Messaging
- Shared functions for the 3D pipeline
- 3D fixed functions
- Media/GPGPU Pipeline processing via both fixed functions and programmable GPU cores
- Execution units

Media VDBOX covers the **Multi-Format Codec (MFX) Engine**, the hardware fixed-function pipeline that includes both multi-format decoding (MFD) and multi-format encoding (MFC).

Media VEBOX discusses the Video Enhancement pipeline, an independent pipe that manages image enhancement functions. Topics include denoise filtering, deinterlacing, color processing, auto contrast enhancement, the capture pipe, output statistics, and video enhancement engine functions.

HEVC covers the High Efficiency Video Coding (HEVC) Codec Pipeline (HCP), which is a fixed function hardware video codec pipeline responsible for encoding and decoding HEVC streams, with a target resolution of 4kx2k at 60 frames per second.

Blitter discusses the **BL**ock **I**mage **T**ransfer**er** Engine for 2D graphics processing.

Display describes display engine registers, including display HD audio configuration and programming. It includes VGA and extended VGA registers, CPU display registers, North display engine registers, and South display engine registers. The Display section explains audio codec verbs, display audio configuration registers, and the display audio controller registers.

Memory Mapped I/O (**MMIO**) includes information on Slice Registers and Die Recovery Units including Start and End Range offsets.

SFC discusses the commands sent to the **Scalar and Format Converter (SFC)** pipeline from the Media VEBOX and Media VDBOX.

Observability Performance Counters discusses performance visibility, including performance event

Workarounds provide software workarounds for known issues with the GPU.

Device Tags and Definitions

The following table lists device "tags" (abbreviations, projects) used in various parts of this document as aliases for the device names. PRM content without any device tagging applies to all devices in the current spec.

Program Name	Graphics Architecture	Description
Kaby Lake	Gen9p5	An update to the Skylake microarchitecture, using a 14nm process.

Reserved Bits and Software Compatibility

In many register, instruction, and memory layout descriptions, certain bits are marked as “Reserved.” When bits are marked as reserved, it is essential for compatibility with future devices that the software treat these bits as having a future, though unknown, effect. The behavior of reserved bits should be regarded as undefined *and unpredictable*. Software should follow the guidelines listed below in dealing with reserved bits:

1. Do not depend on the states of any reserved bits when testing values of registers that contain such bits.
2. Mask out the reserved bits before testing.
3. Do not depend on the states of any reserved bits when storing to an instruction or to a register.
4. When loading a register or formatting an instruction, always load the reserved bits with the values indicated in the documentation (if any), or reload them with the values previously read from the register.

Terminology

Term	Abbr.	Definition
3D Pipeline	--	One of the two pipelines supported in the GPE. The 3D Pipeline is a set of fixed-function units arranged in a pipelined fashion, which process 3D-related commands by spawning EU threads. Typically this processing includes rendering primitives. See *3D Pipeline*.
Adjacency	--	One can consider a single line object as existing in a strip of connected lines. The neighboring line objects are called "adjacent objects", with the non-shared endpoints called the "adjacent vertices." The same concept can be applied to a single triangle object, considering it as existing in a mesh of connected triangles. Each triangle shares edges with three other adjacent triangles, each defined by a non-shared adjacent vertex. Knowledge of these adjacent objects/vertices is required by some object processing algorithms (e.g., silhouette edge detection). See *3D Pipeline*.
Application IP	AIP	Application Instruction Pointer. This is part of the control registers for exception handling for a thread. Upon an exception, hardware moves the current IP into this register and then jumps to System Instruction Pointer (SIP).
Architectural Register File	ARF	A collection of architecturally visible registers for a thread such as address registers, accumulator, flags, notification registers, IP, null, etc.
Binding Table	--	Memory-resident list of pointers to surface state blocks (also in memory).
Binding Table Pointer	BTP	Pointer to a binding table, specified as an offset from the Surface State Base Address register.
Blitter	BLT	Block Image Transferrer
Bypass Mode	--	Mode where a given fixed function (FF) unit is disabled and forwards data down the pipeline unchanged. Not supported by all FF units.
Byte	B	A numerical data type of 8 bits, B represents a signed byte integer.
Child Thread	--	A branch-node or a leaf-node thread that is created by another thread. It is a kind of thread associated with the media fixed function pipeline. A child thread is originated from a thread (the parent) executing on an EU and forwarded to the Thread Dispatcher by the TS unit. A child thread may or may not have child threads depending on whether it is a branch-node or a leaf-node thread. All pre-allocated resources such as URB and scratch memory for a child thread are managed by its parent thread. See also *Parent Thread*.
Clip Space	--	A 4-dimensional coordinate system within which a clipping frustum is defined. Object positions are projected from Clip Space to NDC space via "perspecitive divide" by the W coordinate, and then viewport mapped into Screen Space.
Clipper	--	3D fixed function unit that removes invisible portions of the drawing sequence by discarding (culling) primitives or by "replacing" primitives with one or more primitives that replicate only the visible portion of the original primitive.
Color Calculator	CC	Part of the Data Port shared function, the color calculator performs fixed-function pixel operations (e.g., blending) before writing a result pixel into the render cache.

Term	Abbr.	Definition
Command	--	Directive fetched from a ring buffer in memory by the Command Streamer and routed down a pipeline. Should not be confused with instructions which are fetched by the instruction cache subsystem and executed on an EU.
Command Streamer	CS or CSI	Functional unit of the Graphics Processing Engine that fetches commands, parses them, and routes them to the appropriate pipeline.
Constant URB Entry	CURBE	A UE that contains "constant" data for use by various stages of the pipeline.
Control Register	CR	The read-write registers are used for thread mode control and exception handling for a thread.
Core	--	Alternative name for an EU in the multi-processor system. See *EU*.
Data Port	DP	Shared function unit that performs a majority of the memory access types on behalf of SNB+ programs. The Data Port contains the render cache and the constant cache and performs all memory accesses requested by SNB+ programs except those performed by the Sampler. See DataPort.
Degenerate Object	--	Object that is invisible due to coincident vertices or because it does not intersect any sample points (usually due to being tiny or a very thin sliver).
Destination	--	Describes an output or write operand.
Destination Size	--	The number of data elements in the destination of a SIMD instruction.
Destination Width	--	The size of each of (possibly) many elements of the destination of a SIMD instruction.
Double Quad word (DQword)	DQ	A fundamental data type, DQ represents 16 bytes.
Double word (DWord)	D or DW	A fundamental data type, D or DW represents 4 bytes.
Drawing Rectangle	--	A screen-space rectangle within which 3D primitives are rendered. An object's screen-space positions are relative to the Drawing Rectangle origin. See *Strips and Fans*.
End of Block	EOB	A 1-bit flag in the non-zero DCT coefficient data structure indicating the end of an 8x8 block in a DCT coefficient data buffer.
End Of Thread	EOT	A message sideband signal on the Output message bus signifying that the message requester thread is terminated. A thread must have at least one SEND instruction with the EOT bit in the message descriptor field set to properly terminate.
Exception	--	Type of (normally rare) interruption to EU execution of a thread's instructions. An exception occurrence causes the EU thread to begin executing the System Routine, which is designed to handle exceptions.
Execution Channel	--	Single lane of a SIMD operand.
Execution Size	ExecSize	Execution Size indicates the number of data elements processed by an SIMD instruction. It is one of the instruction fields and can be changed per instruction.
Execution Unit	EU	An EU is a multi-threaded processor within the multi-processor system. Each EU is a fully-capable processor containing instruction fetch and decode, register files, source operand swizzle and SIMD ALU, etc. An EU is also referred to as a core.

Term	Abbr.	Definition
Execution Unit Identifier	EUID	The 4-bit field within a thread state register (SR0) that identifies the row and column location of the EU where a thread is located. A thread can be uniquely identified by the EUID and TID.
Execution Width	ExecWidth	The width of each of several data elements that may be processed by a single SIMD instruction.
Extended Math Unit	EM	A Shared Function that performs more complex math operations on behalf of several EUs.
Fixed Function	FF	Function of the pipeline that is performed by dedicated (vs. programmable) hardware.
Fixed Function ID	FFID	Unique identifier for a fixed function unit.
Gateway	GW	See *Message Gateway*.
General Register File	GRF	Large read/write register file shared by all the EUs for operand sources and destinations. This is the most commonly used read-write register space organized as an array of 256-bit registers for a thread.
General State Base Address	--	The Graphics Address of a block of memory-resident “state data”, which includes state blocks, scratch space, constant buffers, and kernel programs. The contents of this memory block are referenced via offsets from the contents of the General State Base Address register. See *Graphics Processing Engine*.
Geometry Shader	GS	Fixed-function unit between the vertex shader and the clipper that (if enabled) dispatches “geometry shader” threads on its input primitives. Application-supplied geometry shaders normally expand each input primitive into several output primitives to perform 3D modeling algorithms such as fur/fins.
Graphics Address	--	The GPE virtual address of some memory-resident object. This virtual address gets mapped by a GTT or PGTT to a physical memory address. Note that many memory-resident objects are referenced not with Graphics Addresses, but instead with offsets from a “base address register”.
Graphics Processing Engine	GPE	Collective name for the Subsystem, the 3D and Media pipelines, and the Command Streamer.
Guardband	GB	Region that may be clipped against to make sure objects do not exceed the limitations of the renderer's coordinate space.
Horizontal Stride	HorzStride	The distance in element-sized units between adjacent elements of a region-based GRF access.
Immediate floating point vector	VF	A numerical data type of 32 bits, an immediate floating point vector of type VF contains 4 floating point elements with 8 bits each. The 8-bit floating point element contains a sign field, a 3-bit exponent field and a 4-bit mantissa field. It may be used to specify the type of an immediate operand in an instruction.
Immediate integer vector	V	A numerical data type of 32 bits, an immediate integer vector of type V contains 8 signed integer elements with 4 bits each. The 4-bit integer element is in 2’s complement form. It may be used to specify the type of an immediate operand in an instruction.
Index Buffer	IB	Buffer in memory containing vertex indices.

Term	Abbr.	Definition
Intel Architecture	IA	
Instance	--	In the context of the VF unit, an instance is one of a sequence of sets of similar primitive data. Each set has identical vertex data but may have unique instance data that differentiates it from other sets in the sequence.
Instruction	--	Data in memory directing an EU operation. Instructions are fetched from memory, stored in a cache, and executed on one or more cores. Not to be confused with commands which are fetched and parsed by the command streamer and dispatched down the 3D or Media pipeline.
Instruction Pointer	IP	The address (really an offset) of the instruction currently being fetched by an EU. Each EU has its own IP.
Instruction Set Architecture	ISA	The ISA describes the instructions supported by an EU.
Instruction State Cache	ISC	On-chip memory that holds recently-used instructions and state variable values.
Interface Descriptor	--	Media analog of a State Descriptor.
Intermediate Z	IZ	Completion of the Z (depth) test at the front end of the Windower/Masker unit when certain conditions are met (no alpha, no pixel-shader computed Z values, etc.).
Inverse Discrete Cosine Transform	IDCT	The stage in the video decoding pipe between IQ and MC.
Inverse Quantization	IQ	A stage in the video decoding pipe between IS and IDCT.
JIT	--	Just-in-time compiler, aka "jitter".
Kernel	--	A sequence of instructions that is logically part of the driver or generated by the jitter. Differentiated from a Shader which is an application supplied program that is translated by the jitter to instructions.
Logical Ring Context Area	LRCA	Memory area used to store contents of registers and state information required for initiating and resuming communication between software application and hardware graphics pipeline via Ring Buffers.
Least Significant Bit	LSB	The bit with the lowest bit position within a group of bits, which could be a bit group, DWord, field, instruction, memory range, register, or structure. For example, bit 0 of a DWord.
MathBox	--	See *Extended Math Unit*
Media	--	Term for operations such as video decode and encode that are normally performed by the Media pipeline.
Media Pipeline	--	Fixed function stages dedicated to media and “generic” processing, sometimes referred to as the generic pipeline.
Memory-mapped Input/Output	MMIO	A methord for performing input/output between the CPU/GPU and peripheral devices.
Message	--	Messages are data packages transmitted from a thread to another thread, another shared function, or another fixed function. Message passing is the primary communication mechanism of the architecture.

Term	Abbr.	Definition
Message Gateway	--	Shared function that enables thread-to-thread message communication/synchronization, used solely by the Media pipeline.
Most Significant Bit	MSB	The bit with the highest bit position within a group of bits, which could be a bit group, DWord, field, instruction, memory range, register, or structure. For example, bit 31 of a DWord.
Motion Compensation	MC	Part of the video decoding pipe.
Motion Picture Expert Group	MPEG	MPEG is the international standard body JTC1/SC29/WG11 under ISO/IEC that has defined audio and video compression standards such as MPEG-1, MPEG-2, and MPEG-4.
Motion Vector Field Selection	MVFS	A four-bit field selecting reference fields for the motion vectors of the current macroblock.
Multiple Render Targets	MRT	Multiple independent surfaces that may be the target of a sequence of 3D or Media commands that use the same surface state.
Normalized Device Coordinates	NDC	Clip Space Coordinates that have been divided by the Clip Space “W” component.
Object	--	A single triangle, line, or point.
OpenGL	OGL	**O**pen **G**raphics **L**ibrary. A graphics API specification associated with Linux.
Parent Thread	--	A thread corresponding to a root-node or a branch-node in thread generation hierarchy. A parent thread may be a root thread or a child thread depending on its position in the thread generation hierarchy.
Pipeline Stage	--	An abstracted element of the 3D Pipeline, providing functions performed by a combination of the corresponding hardware FF unit and the threads spawned by that FF unit.
Pipelined State Pointers	PSP	Pointers to state blocks in memory that are passed down the pipeline.
Pixel Shader	PS	Shader that is supplied by the application, translated by the jitter and is dispatched to the EU by the Windower (conceptually) once per pixel.
Point	--	A drawing object characterized only by position coordinates and width.
Primitive	--	Synonym for object: triangle, rectangle, line, or point.
Primitive Topology	--	A composite primitive such as a triangle strip or a line list. Also includes the objects triangle, line, and point as degenerate cases.
Provoking Vertex	--	The vertex of a primitive topology from which vertex attributes that are constant across the primitive are taken.
Quad Quad word (QQword)	QQ	A fundamental data type, QQ represents 32 bytes.
Quad Word (QWord)	QW	A fundamental data type, QW represents 8 bytes.
Rasterization	--	Conversion of an object represented by vertices into the set of pixels that make up the object.

Term	Abbr.	Definition
Region-based addressing	--	Collective term for the register addressing modes available in the EU instruction set that permit discontiguous register data to be fetched and used as a single operand.
Render Cache	RC	Cache in which pixel color and depth information is written before being written to memory, and where prior pixel destination attributes are read in preparation for blending and Z test.
Render Target	RT	A destination surface in memory where render results are written.
Render Target Array Index	--	Selector of which of several render targets the current operation is targeting.
Resource Streamer	RS	Functional unit of the Graphics Processing Engine that examines the commands in the ring buffer in an attempt to pre-process certain long latency items for the remainder of the graphics processing.
Root Thread	--	A root-node thread. A thread corresponds to a root-node in a thread generation hierarchy. It is a kind of thread associated with the media fixed function pipeline. A root thread is originated from the VFE unit and forwarded to the Thread Dispatcher by the TS unit. A root thread may or may not have child threads. A root thread may have scratch memory managed by TS. A root thread with children has its URB resource managed by the VFE.
Sampler	--	Shared function that samples textures and reads data from buffers on behalf of EU programs.
Scratch Space	--	Memory allocated to the subsystem that is used by EU threads for data storage that exceeds their register allocation, persistent storage, storage of mask stack entries beyond the first 16, etc.
Shader	--	A program supplied by the application in a high level shader language, and translated to instructions by the jitter.
Shared Function	SF	Function unit that is shared by EUs. EUs send messages to shared functions, that consume the data and may return results. The Sampler, Data Port, and Extended Math unit are all shared functions.
Shared Function ID	SFID	Unique identifier used by kernels and shaders to target shared functions and to identify their returned messages.
Single Instruction Multiple Data	SIMD	A parallel processing architecture that exploits data parallelism at the instruction level. It can also be used to describe the instructions in such an architecture or to describe the amount of data parallelism in a particular instruction (SIMD8 for example).
Source	--	Describes an input or read operand.
Spawn	--	To initiate a thread for execution on an EU. Done by the thread spawner as well as most FF units in the 3D Pipeline.
Sprite Point	--	Point object using full range texture coordinates. Points that are not sprite points use the texture coordinates of the point's center across the entire point object.
State Descriptor	--	Blocks in memory that describe the state associated with a particular FF, including its associated kernel pointer, kernel resource allowances, and a pointer to its surface state.

Term	Abbr.	Definition
State Register	SR	The read-only registers containing the state information of the current thread, including the EUID/TID, Dispatcher Mask, and System IP.
State Variable	SV	An individual state element that can be varied to change the way given primitives are rendered or media objects processed. On state variables persist only in memory and are cached as needed by rendering/processing operations except for a small amount of non-pipelined state.
Stream Output	--	A term for writing the output of a FF unit directly to a memory buffer instead of, or in addition to, the output passing to the next FF unit in the pipeline. Currently only supported for the Geometry Shader (GS) FF unit.
Strips and Fans	SF	Fixed function unit whose main function is to decompose primitive topologies such as strips and fans into primitives or objects.
Sub-Register	--	Subfield of a SIMD register. A SIMD register is an aligned fixed size register for a register file or a register type. For example, a GRF register, *r2*, is a 256-bits wide, 256-bit aligned register. A sub-register, *r2.3:d*, is the fourth dword of GRF register *r2*.
Subsystem	--	The name given to the resources shared by the FF units, including shared functions and EUs.
Surface	--	A rendering operand or destination, including textures, buffers, and render targets.
Surface State Base Pointer	--	Base address used when referencing binding table and surface state data.
Synchronized Root Thread	--	A root thread that is dispatched by TS upon a 'dispatch root thread' message.
System IP	SIP	There is one global System IP register for all the threads. From a thread's point of view, this is a virtual read only register. Upon an exception, hardware performs some bookkeeping and then jumps to SIP.
System Routine	--	Sequence of instructions that handles exceptions. SIP is programmed to point to this routine, and all threads encountering an exception will call it.
Thread	--	An instance of a kernel program executed on an EU. The life cycle for a thread starts from the executing the first instruction after being dispatched from Thread Dispatcher to an EU to the execution of the last instruction – a *send* instruction with EOT that signals the thread termination. Threads in the system may be independent from each other or communicate with each other through Message Gateway share function.
Thread Dispatcher	TD	Functional unit that arbitrates thread initiation requests from Fixed Functions units and instantiates the threads on EUs.
Thread Identifier	TID	The field within a thread state register (SR0) that identifies which thread slots on an EU a thread occupies. A thread can be uniquely identified by the EUID and TID.
Thread Payload	--	Before a thread starting execution, some amount of data is pre-loaded into the thread's GRF (starting at r0). This data is typically a combination of control information provided by the spawning entity (FF Unit) and data read from the URB.

Term	Abbr.	Definition
Thread Spawner	TS	The second and the last fixed function stage of the media pipeline that initiates new threads on behalf of generic/media processing.
Topology	--	See *Primitive Topology*.
Unified Return Buffer	URB	The on-chip memory managed/shared by Fixed Functions in order for a thread to return data that will be consumed either by a Fixed Function or other threads.
Unsigned Byte integer	UB	A numerical data type of 8 bits.
Unsigned Double Word integer	UD	A numerical data type of 32 bits. It may be used to specify the type of an operand in an instruction.
Unsigned Word integer	UW	A numerical data type of 16 bits. It may be used to specify the type of an operand in an instruction.
Unsynchronized Root Thread	--	A root thread that is automatically dispatched by TS.
URB Dereference	--	
URB Entry	UE	URB Entry: A logical entity stored in the URB (such as a vertex), referenced via a URB Handle.
URB Entry Allocation Size	--	Number of URB entries allocated to a Fixed Function unit.
URB Fence	Fence	Virtual, movable boundaries between the URB regions owned by each FF unit.
URB Handle	--	A unique identifier for an URB entry that is passed down a pipeline.
URB Reference	--	
Variable Length Decode	VLD	The first stage of the video decoding pipe that consists mainly of bit-wide operations.
Vertex Buffer	VB	Buffer in memory containing vertex attributes.
Vertex Cache	VC	Cache of Vertex URB Entry (VUE) handles tagged with vertex indices. See the VS chapter for details on this cache.
Vertex Fetcher	VF	The first FF unit in the 3D Pipeline responsible for fetching vertex data from memory. Sometimes referred to as the Vertex Formatter.
Vertex Header	--	Vertex data required for every vertex appearing at the beginning of a Vertex URB Entry.
Vertex ID	--	Unique ID for each vertex that can optionally be included in vertex attribute data sent down the pipeline and used by kernel/shader threads.
Vertex Shader	VS	An API-supplied program that calculates vertex attributes. Also refers to the FF unit that dispatches threads to “shade” (calculate attributes for) vertices.
Vertex URB Entry	VUE	An URB entry that contains data for a specific vertex.
Vertical Stride	VertStride	The distance in element-sized units between 2 vertically-adjacent elements of a region-based GRF access.
Video Front End	VFE	The first fixed function in the generic pipeline; performs fixed-function media operations.

Term	Abbr.	Definition
Viewport	VP	
Windower IZ	WIZ	Term for Windower/Masker that encapsulates its early (“intermediate”) depth test function.
Windower/Masker	WM	Fixed function triangle/line rasterizer.
Word	W	A numerical data type of 16 bits, W represents a signed word integer.

Notices and Disclaimers

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

3DPRIMITIVE

3DPRIMITIVE

Source: RenderCS

Length Bias: 2

The 3DPRIMITIVE command is used to submit 3D primitives to be processed by the 3D pipeline. Typically the processing results in rendering pixel data into the render targets, but this is not required.
The parameters passed in this command are forwarded to the Vertex Fetch function. The Vertex Fetch function will use this information to generate vertex data structures and store them in the URB. These vertices are then passed down the 3D pipeline.

Programming Notes

If the threads spawned by this command are required to observe memory writes performed by threads spawned from a previous command, software must precede this command with a command that performs a (preferably pipelined) memory flush (e.g., 3D_PIPECONTROL).

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 3h 3DPRIMITIVE Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 0h 3DPRIMITIVE Format: OpCode
	15	**Reserved**
	14	**Reserved** Format: MBZ
	13	**Reserved** Format: MBZ
	12	**Reserved**
	11	**Reserved**
	10	**Indirect Parameter Enable** Format: Enable If set, the values in DW 2-5 are ignored and replaced by the current values of the corresponding

3DPRIMITIVE

		3DPRIM_xxx MMIO registers: • 3DPRIM_VERTEX_COUNT (instead of DW2: VertexCountPerInstance) • 3DPRIM_START_VERTEX (instead of DW3: StartVertexLocation) • 3DPRIM_INSTANCE_COUNT (instead of DW4: InstanceCount) • 3DPRIM_START_INSTANCE (instead of DW5: StartInstanceLocation) • 3DPRIM_BASE_VERTEX (instead of DW6: BaseVertexLocation) Indirect Parameter Enable and End Offset Enable shall not be ENABLED at the same time, or behavior is UNDEFINED.
	9	**UAV Coherency Required** Format: U1 SW will be required to set this bit if there is the possibility of sharing a UAV from a previous 3DPRIMITVE command. If set, this command may cause a flush due to UAV coherency requirements. If none of the shaders have UAV access enabled, then this bit is ignored.
	8	**Predicate Enable** Format: Enable If set, this command is executed (or not) depending on the current value of the MI Predicate internal state bit. This command is ignored only if PredicateEnable is set and the Predicate state bit is 0.
	7:0	**DWord Length** Default Value: 5h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:10	**Reserved** Format: MBZ
	9	**End Offset Enable** Format: Enable If set, the Vertex Count Per Instance field is IGNORED, and the 3DPRIM_END_OFFSET register is used to indirectly specify the vertex count by defining the amount of valid data in VB0. The following restrictions apply: • VB0 must be enabled for use • VertexAccessType = SEQUENTIAL • Start Vertex Location = 0 • Start Instance Location = 0 • Base Vertex Location = 0 Vertices are output until EndOffset is reached or exceeded in VB0. If EndOffset is reached or

3DPRIMITIVE

exceeded within the data associated with a vertex, that vertex is considered incomplete and will not be output. Partial objects will be discarded (as is normally done).
If clear, End Offset is ignored.
Indirect Parameter Enable and End Offset Enable must not be ENABLED at the same time, or behavior is UNDEFINED.

8 Vertex Access Type

This field specifies how data held in vertex buffers marked as VERTEXDATA is accessed by Vertex Fetch.

Value	Name	Description
0h	SEQUENTIAL	VERTEXDATA buffers are accessed sequentiallyRequiref if End Offset Enable is ENABLED.
1h	RANDOM	VERTEXDATA buffers are accessed randomly via an index obtained from the Index Buffer.

7:6 Reserved

Format:	MBZ

5:0 Primitive Topology Type

Format:	3D_Prim_Topo_Type See table below for encoding, see 3D Overview for diagrams and general comments

Description
This field specifies the topology type of 3D primitive generated by this command. Note that a single primitive topology (list/strip/fan/etc.) can contain a number of basic objects (lines, triangles, etc.).
This field is ignored. The topology type is specified via the 3DSTATE_VF_TOPOLOGY command.

2 31:0 Vertex Count Per Instance

Format:	U32 Count of vertices

This field specifies how many vertices are to be generated for each instance of the primitive topology. If End Offset Enable is clear:
Format = U32 count of vertices
Range = [0, 2^32-1] (upper limit probably constrained by VB size)
Ignored if End Offset Enable or Indirect Parameter Enable is ENABLED.

Programming Notes

- This per-instance value should specify a valid number of vertices for the primitive topology type. E.g., for 3DPRIM_TRILIST_ADJ, this field should specify a multiple of 6 vertices. However, in cases where too few or too many vertices are provided, the unused vertices will be silently discarded by the pipeline.
- A 0 value is this field effectively makes the command a 'no-operation'.

3DPRIMITIVE

3	31:0	**Start Vertex Location** Format: U32 structure index This field specifies the "starting vertex" for each instance. This allows skipping over part of the vertices in a buffer if, for example, a previous 3DPRIMITIVE command had already drawn the primitives associated with the earlier entries. For SEQUENTIAL access, this field specifies, for each instance, a starting structure index into the vertex buffers For RANDOM access, this field specifies, for each instance, a starting index into the Index Buffer. **Programming Notes** • Access of any data outside of the valid extent of a vertex or index buffer will return the value 0 (i.e., appears as if the data stored at the invalid location was 0). • Must be set to 0 if End Offset Enable is ENABLED. • Ignored if Indirect Parameter Enable is ENABLED
4	31:0	**Instance Count** Format: U32 Count of instances This field specifies the number of instances by which the primitive topology is to be regenerated. A value of 0 indicates "no instances" (no-op operation). A value of 1 effectively specifies "non-instanced" operation, though vertex buffers will still be used to provide instance data, if so programmed. Ignored if Indirect Parameter Enable is ENABLED. **Value**: [0, FFFFFFFFh] — **Name**:
5	31:0	**Start Instance Location** Format: U32 structure index **Description** This field specifies the "starting instance" for the command as an initial structure index into Vertex Buffers for vertex elements with InstancingEnable set. Subsequent instances will access sequential instance data structures, as controlled by the Instance Data Step Rate. **Programming Notes** • Access of any data outside of the valid extent of a vertex or index buffer will return the value 0 (i.e., appears as if the data stored at the invalid location was 0). • Must be set to 0 if End Offset Enable is ENABLED. • Ignored if Indirect Parameter Enable is ENABLED.

<table>
<tr><th colspan="3">3DPRIMITIVE</th></tr>
<tr><td>6</td><td>31:0</td><td>Base Vertex Location
<table><tr><td>Format:</td><td>S31 index structure bias</td></tr></table>This field specifies a signed bias to be added to values read from the index buffer. This allows the same index buffer values to access different vertex data for different commands.This field applies only to RANDOM access mode. This field is ignored for SEQUENTIAL access mode, where there Start Vertex Location can be used to specify different regions in the vertex buffers.
Programming Notes
• Access of any data outside of the valid extent of a vertex or index buffer will return the value 0 (i.e., appears as if the data stored at the invalid location was 0).
• Must be set to 0 if End Offset Enable is ENABLED.
• Ignored if Indirect Parameter Enable is ENABLED.</td></tr>
</table>

3DSTATE_AA_LINE_PARAMETERS

3DSTATE_AA_LINE_PARAMETERS

Source: RenderCS

Length Bias: 2

The 3DSTATE_AA_LINE_PARAMS command is used to specify the slope and bias terms used in the improved alpha coverage computation (specifically for DX WHQL compliance). Note that in these devices the coverage values passed to PS threads are full U0.8 values, versus in the previous iterations where U0.4 values were passed.

DWord	Bit	Description

3DSTATE_BINDING_TABLE_POOL_ALLOC

3DSTATE_BINDING_TABLE_POOL_ALLOC

Source: RenderCS

Length Bias: 2

Description

This command sets up the binding table pool for HW generated binding tables.

Programming Notes

When RS is enabled due to a MI_RS_CONTROL or MI_BATCH_BUFFER_START with RS enable bit set, driver must reprogam the 3DSTATE_BINDING_TABLE_POOL_ALLOC to ensure the resource streamer and render engine are in sync with the programming with the command. Otherwise there could be cases where RS sees that the Binding Table Pool is disabled while the render pipeline sees the binding table is enabled in the case the 3DSTATE_BINDING_TABLE_POOL_ALLOC was enabled while RS was off.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode

	7:0	**DWord Length** Default Value: 0h DWORD_COUNT_n Format: =n
1	31:6	**Color Calc State Pointer** Format: DynamicStateOffset[31:6]COLOR_CALC_STATE Specifies the 64-byte aligned offset of the COLOR_CALC_STATE. This offset is relative to the **Dynamic State Base Address**.
	5:1	**Reserved** Format: MBZ
	0	**Color Calc State Pointer Valid** Format: Enable If set, the hardware will fetch the CC state. This bit is context saved and restored so the CC state is considered undefined once this bit is cleared due to the possiblity of the CC state changing between context switches.

3DSTATE_CHROMA_KEY

3DSTATE_CHROMA_KEY

Source: RenderCS

Length Bias: 2

The 3DSTATE_CHROMA_KEY instruction is used to program texture color/chroma-key key values. A table containing four set of values is supported. The ChromaKey Index sampler state variable is used to select which table entry is associated with the map. Texture chromakey functions are enabled and controlled via use of the ChromaKey Enable texture sampler state variable.Texture Color Key (keying on a paletted texture index) is not supported.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: Opcode

3DSTATE_CLEAR_PARAMS

3DSTATE_CLEAR_PARAMS

Source: RenderCS

Length Bias: 2

Description

This command defines the depth clear value delivered as a pipelined state command. However, the state change pipelining isn't completely transparent (see restriction below).

HW will internally manage the draining pipe and flushing of the caches when this command is issued. The PIPE_CONTROL restrictions are removed.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 04h 3DSTATE_CLEAR_PARAMS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**Dword Length** Default Value: 1h Excludes Dword (0,1) Format: =n Total Length - 2
1	31:0	**Depth Clear Value** Format: IEEE_Float This field defines the clear value that will be applied to the depth buffer if the Depth Buffer Clear field is enabled. It is valid only if Depth Buffer Clear Value Valid is set. **Programming Notes** The clear value must be between the min and max depth values (inclusive) defined in the CC_VIEWPORT. If the depth buffer format is D32_FLOAT, then values must be limited to the range of +0.0f and 1.0f inclusive; values outside this range are reserved.
2	31:1	**Reserved**

3DSTATE_CLEAR_PARAMS		
		Format: MBZ
	0	**Depth Clear Value Valid** Format: Boolean This field enables the **Depth Clear Value**. If clear, the depth clear value is obtained from interpolated depth of an arbitrary pixel of the primitive rendered with **Depth Buffer Clear** set in WM_STATE or 3DSTATE_WM. If set, the depth clear value is obtained from the **Depth Clear Value** field of this command.

3DSTATE_CLIP

3DSTATE_CLIP

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 12h 3DSTATE_CLIP Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 02h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:21	**Reserved** Format: MBZ
	20	**Force User Clip Distance Cull Test Enable Bitmask** Format: Enable This field provides a work around override for the computation of SOL_INT::Render_Enable

Value	Name	Description
0h	Normal	Clip_INT::User Clip Distance Cull Test Enable Bitmask normally
1h	Force	Forces Clip_INT::User Clip Distance Cull Test Enable Bitmask to use the value in 3DSTATE_CLIP:: User Clip Distance Cull Test Enable Bitmask

3DSTATE_CLIP

19 Vertex Sub Pixel Precision Select

Format:	U1

Selects the number of fractional bits maintained in the vertex data

Value	Name	Description
0h	8 Bit	8 sub pixel precision bits maintained
1h	4 Bit	4 sub pixel precision bits maintained

18 Early Cull Enable

Format:	Enable

This field is used to enable/disable the EarlyCull function. When this bit is set triangles are checked if they are backface culled before proceedign through must clip function.

Programming Notes
Setting this bit must not impact functionality, this state only controls the performance of the must clip function. Vertex Sub Pixel Precision Selectprecision must be set to "8 bit" in order avoid precision issues.

17 Force User Clip Distance Clip Test Enable Bitmask

Format:	Enable

This field provides a work around override for the computation of SOL_INT::Render_Enable.

Value	Name	Description
0b	Normal	Clip_INT:: User Clip Distance Clip Test Enable Bitmask normally
1b	Force	Forces Clip_INT:: User Clip Distance Clip Test Enable Bitmask to use the value in 3DSTATE_CLIP::User Clip Distance Clip Test Enable Bitmask

16 Force Clip Mode

Format:	Enable

This field provides a work around override for the computation of SOL_INT::Render_Enable.

Value	Name	Description
0b	Normal	Clip_INT::Clip Mode is computed normally.
1b	Force	Forces Clip_INT::Clip Mode to use the value in 3DSTATE_CLIP::User Clip Mode.

15:11 Reserved

Format:	MBZ

10 Clipper Statistics Enable

Format:	Enable

This bit controls whether Clip-unit-specific statistics register(s) can be incremented.

Value	Name	Description
0h	Disable	CL_INVOCATIONS_COUNT cannot increment
1h	Enable	CL_INVOCATIONS_COUNT can increment

9:8 Reserved

Format:	MBZ

3DSTATE_CLIP

	7:0	**User Clip Distance Cull Test Enable Bitmask** Format: Enable[8] This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept determination needs to be made (does not cause a must clip).DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.
2	31	**Clip Enable** Format: Enable Specifies whether the Clip function is enabled or disabled (pass-through).
	30	**API Mode** Controls the definition of the NEAR clipping plane Value / Name / Description 0h / OGL / NEAR VP boundary == 0.0 (NDC)
	29	**Reserved** Format: MBZ
	28	**Viewport XY Clip Test Enable** Format: Enable This field is used to control whether the Viewport X, Y extents [-1,1] are considered in VertexClipTest. If both the Guardband and Viewport XY ClipTest are DISABLED, all vertices are considered "visible" with respect to the XY directions.
	27	**Reserved** Format: MBZ
	26	**Guardband Clip Test Enable** Format: Enable This field is used to control whether the Guardband X, Y extents are considered in VertexClipTest for non-point objects. If the Guardband ClipTest is DISABLED but the Viewport XY ClipTest is ENABLED, ClipDetermination operates as if the Guardband were coincident with the Viewport. If both the Guardband and Viewport XY ClipTest are DISABLED, all vertices are considered "visible" with respect to the XY directions.
	25:24	**Reserved** Format: MBZ
	23:16	**User Clip Distance Clip Test Enable Bitmask** Format: Enable[8] This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept / must clip determination needs to be made.DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.

3DSTATE_CLIP

15:13 Clip Mode

This field specifies a general mode of the CLIP unit, when the CLIP unit is ENABLED.

Value	Name	Description
0h	NORMAL	TrivialAccept objects are passed down the pipeline, MustClip objects Clipped in the Fixed Function Clipper HW, TrivialReject and BAD objects are discarded
1h	Reserved	
2h	Reserved	
3h	REJECT_ALL	All objects are discarded
4h	ACCEPT_ALL	All objects (except BAD objects) are trivially accepted. This effectively disables the clip-test/clip-determination function. Note that the CLIP unit will still filter out adacency information, which may be required since the SF unit does not accept primitives with adjacency.
5h-7h	Reserved	

12:10 Reserved

Format:	MBZ

9 Perspective Divide Disable

Format:	Disable

This field disables the Perspective Divide function performed on homogeneous position read from the URB. This feature can be used by software to submit pre-transformed "screen-space" geometry for rasterization. This likely requires the W component of positions to contain "rhw" (aka 1/w) in order to support perspective-correct interpolation of vertex attributes. Likewise, the X, Y, Z components will likely be required to be X/W, Y/W, Z/W. Note that the device does not support clipping when perspective divide is disabled. Software must specify CLIPMODE_ACCEPT_ALL whenever it disables perspective divide. This implies that software must ensure that object positions are completely contained within the "guardband" screen-space limits imposed by the SF unit (e.g., by clipping in CPU SW before submitting the objects).

8 Non-Perspective Barycentric Enable

Format:	Enable

This field enables computation of non-perspective barycentric parameters in the clipper, which are sent to SF unit in the must clip case. This field must be enabled if any non-perspective interpolation modes are used in pixel shader.

Programming Notes
This field must be set whenever Enable bits 3 or 4 or 5 of 3DSTATE_WM:Barycentric Interpolation Mode is set. This indicates that one of the Non-perspetive barycentric interpolation modes are used.

7:6 Reserved

Format:	MBZ

3DSTATE_CLIP

	5:4	**Triangle Strip/List Provoking Vertex Select** Format: U2 enumerated type This field selects which vertex of a triangle (in a triangle strip or list primitive) is considered the "provoking vertex". **Value** / **Name** 0h: 0 1h: 1 2h: 2 3h: Reserved
	3:2	**Line Strip/List Provoking Vertex Select** Format: U2 enumerated type This field selects which vertex of a line (in a line strip or list primitive) is considered the "provoking vertex". **Value** / **Name** 0h: 0 1h: 1 2h: Reserved 3h: Reserved
	1:0	**Triangle Fan Provoking Vertex Select** Format: U2 enumerated type This field selects which vertex of a triangle (in a triangle fan primitive) is considered the "provoking vertex". **Value** / **Name** 0h: 0 1h: 1 2h: 2 3h: Reserved
3	31:28	**Reserved** Format: MBZ

3DSTATE_CLIP

	27:17	**Minimum Point Width** Format: U8.3 pixels This value is used to clamp read-back PointWidth values.
	16:6	**Maximum Point Width** Format: U8.3 pixels This value is used to clamp read-back PointWidth values.
	5	**Force Zero RTA Index Enable** Format: Enable If set, the Clip unit will ignore the read-back RTAIndex and operate as if the value 0 was read-back. If clear, the read-back value is used.
	4	**Reserved** Format: MBZ
	3:0	**Maximum VP Index** Format: U4-1 index value (# of viewports) This field specifies the maximum valid VPIndex value, corresponding to the number of active viewports. If the source of the VPIndex exceeds this maximum value, a VPIndex value of 0 is passed down the pipeline. Note that this clamping does not affect a VPIndex value stored in the URB.

3DSTATE_CONSTANT_DS

3DSTATE_CONSTANT_DS

Source: RenderCS

Length Bias: 2

This command sets pointers to the push constants for the DS unit. The constant data pointed to by this command is loaded into the DS unit's push constant buffer (PCB).

Programming Notes

3DSTATE_GATHER_DS command must be dispatched along with any 3DSTATE_CONSTANT_DS command when Gather Pool is enabled within a batch buffer.

The 3DSTATE_CONSTANT_* command is not committed to the shader unit until the corresponding (same shader) 3DSTATE_BINDING_TABLE_POINTER_* command is parsed. For example, the 3DSTATE_CONSTANT_VS command will not fetch the constant buffers from memory and make available to the shader until the 3DSTATE_BINDING_TABLE_POINTERS_VS is parsed by the render command streamer. In case of multiple 3DSTATE_CONSTANT_VS programmed prior to 3DSTATE_BINDING_TABLE_POINTER_VS, only the most recently programmed 3DSTATE_CONSTANT_VS will be committed.
On usage model of enabling legacy mode is when Resource Streamer is not enabled.

Workaround

Workaround:
The driver must ensure The following case does not occur without a flush to the 3D engine:
3DSTATE_CONSTANT_* with buffer 3 read length equal to zero committed followed by a
3DSTATE_CONSTANT_* with buffer 0 read length not equal to zero committed. Possible ways to avoid this condition include:

- always force buffer 3 to have a non zero read length
- always force buffer 0 to a zero read length

DWord	Bit	Description

3DSTATE_DEPTH_BUFFER

3DSTATE_DEPTH_BUFFER

Source: RenderCS

Length Bias: 2

The depth buffer surface state is delivered as a pipelined state packet. However, the state change pipelining isn't completely transparent (see restriction below).

WM HW will internally manage the draining pipe and flushing of the caches when this commands is issued. The PIPE_CONTROL restrictions are removed.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 5h 3DSTATE_DEPTH_BUFFER Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Format: =n Excludes DWord(0,1) Value: 6h — Name: Excludes Dword (0,1) **[Default]**
1	31:29	**Surface Type** Value / Name / Description: 0h / Reserved / Reserved 1h / SURFTYPE_2D / Defines a 2-dimensional map or array of maps 2h / Reserved / Reserved 3h / SURFTYPE_CUBE / Defines a cube map 4h-6h / Reserved / 7h / SURFTYPE_NULL / Defines a null surface

3DSTATE_DEPTH_BUFFER

		Programming Notes The Surface Type of the depth buffer must be the same as the Surface Type of the render target(s) (defined in SURFACE_STATE), unless either the depth buffer or render targets are SURFTYPE_NULL. 1D surface type not allowed for depth surface and stencil surface. **Workaround** Workaround : If depth/stencil is enabled with 1D render target, depth/stencil surface type needs to be set to 2D surface type and height set to 1. Depth will use (legacy) TileY and stencil will use TileW. For this case only, the Surface Type of the depth buffer can be 2D while the Surface Type of the render target(s) are 1D, representing an exception to a programming note above.
	28	**Depth Write Enable** Format: Enable This field enables depth writes to the depth buffer surface. Both this field and the Depth Buffer Write Enable field in DEPTH_STENCIL_STATE must be enabled in order for depth writes to occur.
	27	**Stencil Write Enable** Format: Enable This field enables stencil writes to the depth buffer or stencil buffer surface, depending on where stencil is located. Both this field and the Stencil Buffer Write Enable field in DEPTH_STENCIL_STATE must be enabled in order for stencil writes to occur.
	26:24	**Reserved** Format: MBZ
	23	**Reserved** Format: MBZ
	22	**Hierarchical Depth Buffer Enable** Format: Enable If enabled, indicates that a hierarchical depth buffer is defined. **Programming Notes** If this field is enabled, the Software Tiled Rendering Mode must be NORMAL. This field must be disabled if Early Depth Test Enable is disabled OR if depth buffer surface type is NULL. This field must be disabled if surface type field is SURFTYPE_1D
	21	**Reserved** Format: MBZ
	20:18	**Surface Format** Specifies the format of the depth buffer. See Stencil Test Enable field in

3DSTATE_DEPTH_BUFFER

DEPTH_STENCIL_STATE field for restrictions on the use of some of these formats.

Value	Name
0h	Reserved
1h	D32_FLOAT
2h	Reserved
3h	D24_UNORM_X8_UINT
4h	Reserved
5h	D16_UNORM
6h-7h	Reserved

17:0 **Surface Pitch**

Format:	U18-1 Pitch in (Bytes-1)

Description

For TileYF and TileYS surfaces, the range is dependent on the Cu parameter (refer to *Memory Data Formats* section for the definition of the Cu parameter depending on the case). The range in bytes is [2^{Cu}-1,262143] -> [(2^{Cu})B,256KB] = [1 tile, 256KB/(2^{Cu}) tiles]

Value	Name
[7Fh,3FFFFh]	

Programming Notes

The pitch specified must be a multiple of the tile pitch, in the range [128B, 128KB].
The minimum pitch should be calculated as per the formula given below.

pixel_size	Depth Format
2	Z16
4	Z24
4	Z32

The minimum pitch should be calculated based on Cu, Cv, W_L.
The Cu, Cv are the tile constants and $W_L$is the aligned width adjusted for MSAA.
to get the Cu, Cv, $W_L$values and Calculations.
Then use this for pitch formula :
Minimum_pitch =(ceiling((W_0 pixel_size) / (1 « Cu)) *(1 « Cu))– 1 ; //$W_0$is the aligned width for the largest LOD (i.e LOD 0)*
(1 « Cu) = tile width in bytes
(1 « Cv) = tile height in lines

3DSTATE_DEPTH_BUFFER

2..3 This field specifies the address of the buffer in mapped Graphics Memory. **Programming Notes:** The Depth Buffer can only be mapped to Main Memory (uncached). If the surface is tiled, the base address must conform to the Per-Surface Tiling Alignment Rules. If the buffer is linear, the surface must be 64-byte aligned.	63:0	**Surface Base Address** Format: GraphicsAddress63-0
4	31:18	**Height** Format: U14-1 This field specifies the height of the surface. If the surface is MIP-mapped, this field contains the height of the base MIP level.

Value	Name	Description	Exists If
[0,0]	Legal Range	Must be zero	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_1D')
[0,16383]	Legal Range	Height of surface - 1 (y/v dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')
[0,16383]	Legal Range	Height of surface - 1 (y/v dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_3D')

3DSTATE_DEPTH_BUFFER

[0,16383]	Legal Range	y/v dimension	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE')

Programming Notes

The Height of the depth buffer must be the same as the Height of the render target(s) (defined in SURFACE_STATE), unless Surface Type is SURFTYPE_1D or SURFTYPE_2D with Depth = 0 (non-array) and LOD = 0 (non-mip mapped).

17:4 **Width**

Format:	U14-1

This field specifies the width of the surface. If the surface is MIP-mapped, this field specifies the width of the base MIP level. The width is specified in units of pixels.

Value	Name	Description	Exists If
[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_1D')
[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')
[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_3D')
[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE')

Programming Notes

The Width specified by this field must be less than or equal to the surface pitch (specified in bytes via the Surface Pitch field).

For cube maps, Width must be set equal to Height.

The Width of the depth buffer must be the same as the Width of the render target(s) (defined in SURFACE_STATE), unless Surface Type is SURFTYPE_1D or SURFTYPE_2D with Depth = 0 (non-array) and LOD = 0 (non-mip mapped).

3:0 **LOD**

Format:	U4 for LOD units

Value	Name
[0,14]	

Programming Notes

The LOD of the depth buffer must be the same as the LOD of the render target(s) (defined in SURFACE_STATE)

3DSTATE_DEPTH_BUFFER

5 — 31:21 — Depth

Format:	U11-1

This field specifies the total number of levels for a volume texture or the number of array elements allowed to be accessed starting at the Minimum Array Element for arrayed surfaces. If the volume texture is MIP-mapped, this field specifies the depth of the base MIP level.

Value	Name	Description	Exists If
[0,2047]	Legal Range	Number of array elements - 1	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_1D')
[0,2047]	Legal Range	Number of array elements - 1	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')
[0,2047]	Legal Range	Depth of surface - 1 (r/z dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_3D')
[0,0]	Legal Range	Must be zero	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE')

Programming Notes

The Depth of the depth buffer must be the same as the Depth of the render target(s) (defined in SURFACE_STATE).

20:10 — Minimum Array Element

Format:	U11

For 1D and 2D Surfaces:
This field indicates the minimum array element that can be accessed as part of this surface. The delivered array index is added to this field before being used to address the surface.
For 3D Surfaces
This field indicates the minimum 'R' coordinate on the LOD currently being rendered to. This field is added to the delivered array index before it is used to address the surface.
For Other Surfaces
This field is ignored

Value	Name	Exists If
[0,2047]	SURFTYPE_1D/2D	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_1D'|Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')
[0,2047]	SURFTYPE_3D	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_3D')

9:7 — Reserved

Format:	MBZ

6:0 — Depth Buffer Object Control State

Format:	MEMORY_OBJECT_CONTROL_STATE

Specifies the memory object control state for the depth buffer.

3DSTATE_DEPTH_BUFFER

6	31:30	**Tiled Resource Mode** **For Depth Buffer Surfaces:** This field specifies the tiled resource mode. **For other surfaces:** This field is ignored.

Value	Name	Description
0h	NONE	No tiled resource
1h	TILEYF	4KB tiled resources
2h	TILEYS	64KB tiled resources
3h	Reserved	

Programming Notes
If **Tile Mode** is not set to TILEMODE_YMAJOR, this field must be set to TRMODE_NONE.
HIZ and Stencil surfaces can't be tiled resource, hence will continue to follow legacy tiledY and tiledW respectively.

29:26 **Mip Tail Start LOD**

Format:	U4 in LOD Units

For Sampling Engine, Render Target, and Typed Surfaces: This field indicates which LOD is the first one in the MIP tail if **Tiled Mode** is not TRMODE_NONE. The MIP tail has a different layout than the rest of the surface. Refer to the *Memory Data Formats* section for more details. **For other surfaces:** This field is ignored.

Programming Notes
This field must be zero if the **Surface Format** is MONO8
This field is ignored if **Tiled Mode** is TRMODE_NONE unless **Surface Type** is SURFTYPE_1D.
If **Tiled Mode** is not TRMODE_NONE, this field must be set to ensure that mips within the mip tail do not overlap given the storage algorithms given in the Memory Data Formats section. The following table indicates the *maximum* size of the mip that is set to be the Mip Tail Start LOD for various cases:

Surface Type	Tiling Mode	#MS	Bits Per Element				
			8	16	32	64	128
1D	64KB	1	16384	8192	4096	2048	1024
	4KB	1	1024	512	256	128	64
2D/ CUBE	TIleYS	1	128x256	128x128	64x128	64x64	32x64
		2	128x128	64x128	64x64	32x64	32x32
		4	64x128	64x64	32x64	32x32	16x32
		8	64x64	32x64	32x32	16x32	16x16

3DSTATE_DEPTH_BUFFER

		16	32x64	32x32	16x32	16x16	8x16
	TileYF	any	64x32	32x32	32x16	16x16	16x8
3D	TIleYS	1	32x32x32	16x32x32	16x32x16	16x16x16	8x16x16
	TIleYF	1	16x8x16	8x8x16	8x8x8	8x4x8	4x4x8

25:0 Reserved

Format:	MBZ

7 — 31:21 Render Target View Extent

Format:	U11-1

Value	Name	Description	Exists If
[0,2047]	Legal Range	Number of array elements- 1	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_1D')
[0,2047]	Legal Range	Number of array elements- 1	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')
[0,2047]	Legal Range	To indication extent of [1,2048]	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_3D')
[0,0]	Legal Range	Must be zero	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE')

20:15 Reserved

14:0 Surface QPitch

Format:	QPitch[16:2]

Description

The interpretation of this field is dependent on **Surface Type** as follows:

- SURFTYPE_1D: distance in *pixels* between array slices
- SURFTYPE_2D/CUBE: distance in *rows* between array slices
- SURFTYPE_3D: distance in *rows* between R-slices

For 1D and 2D Surfaces:
This field must be set to the same value as the Depth field.
For 3D Surfaces:
This field indicates the extent of the accessible 'R' coordinates minus 1 on the LOD currently being rendered to.
For Other Surfaces
This field is ignored.

Value	Name	Description
[4h, 1FFFCh]		in multiples of 4 (low 2 bits missing)

3DSTATE_DEPTH_BUFFER		
		Programming Notes Software must ensure that this field is set to a value sufficiently large that array slices in the surface do not overlap. Refer to the *Memory Data Formats* section for information on how surfaces are stored. TYS/TYF QPitch is valid only for 2D array surfaces and represents the tile-padded total number of texels(lines) in a single array slice. Height of each LOD: HL = AlignToTileHeight(MSAA_height_factor * (**height** »L) > 0? **height**»L : 1), where AlignToTileHeight(x) is (ceiling((x) / (1 « Cv)) *(1 « Cv)) Height of all LODs is a sum: H = H0+H1+..Hn, N is number of mip levels. If surface has MIP tail, equation stops at Hn where n=MipTailStartLOD. MipTail is single tile. QPitch is multiple of tile height (1 « Cv) and should be equal or greater H computed above.

3DSTATE_DRAWING_RECTANGLE

3DSTATE_DRAWING_RECTANGLE

Source: RenderCS

Length Bias: 2

The 3DSTATE_DRAWING_RECTANGLE command is used to set the 3D drawing rectangle and related state.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 1h 3DSTATE_NONPIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 00h 3DSTATE_DRAWING_RECTANGLE Format: OpCode
	15:14	**Core Mode Select** Format: U2 Specifies which core this command will be considered valid and update based on the state in this command. Value / Name / Description: 0h / Legacy / Both cores are enabled and will update the state. 1h / Core 0 Enabled / State will be updated in Core 0 only 2h / Core 1 Enabled / State will be updated in Core 1 only 3h / Reserved /
	13:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 2h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:16	**Clipped Drawing Rectangle Y Min** Format: U16 in Pixels from Color Buffer origin (upper left corner) Specifies Ymin value of (inclusive) intersection of Drawing rectangle with the Color (Destination) Buffer, used for clipping. Pixels with Y coordinates less than Ymin will be clipped out.

3DSTATE_DRAWING_RECTANGLE

Value	Name
[0,16383]	Device ignores bits 31:30

Programming Notes
This value can be larger than Clipped Drawing Rectangle Y Max. If Ymin>Ymax, the clipped drawing rectangle is null, all polygons are discarded. If Ymin==Ymax, the clipped drawing rectangle is 1 pixel wide in the Y direction.

15:0 **Clipped Drawing Rectangle X Min**

Format:	U16 in Pixels from Color Buffer origin (upper left corner)

Specifies Xmin value of (inclusive) intersection of Drawing rectangle with the Color (Destination) Buffer, used for clipping. Pixels with X coordinates less than Xmin will be clipped out.

Value	Name
[0,16383]	Device ignores bits 15:14

Programming Notes
This value can be larger than Clipped Drawing Rectangle X Max. If Xmin>Xmax, the clipped drawing rectangle is null, all polygons are discarded. If Xmin==Xmax, the clipped drawing rectangle is 1 pixel wide in the X direction.

2 31:16 **Clipped Drawing Rectangle Y Max**

Format:	U16 in Pixels from Color Buffer origin (upper left corner)

Specifies Ymax value of (inclusive) intersection of Drawing rectangle with the Color (Destination) Buffer, used for clipping. Pixels with coordinates greater than Ymax will be clipped out.

Value	Name
[0,16383]	Device ignores bits 31:30

Programming Notes
This value can be less than Clipped Drawing Rectangle Y Min. If Ymax<Ymin, the clipped drawing rectangle is null, all polygons are discarded. If Ymin==Ymax, the clipped drawing rectangle is 1 pixel wide in the Y direction.

15:0 **Clipped Drawing Rectangle X Max**

Format:	U16 in Pixels from Color Buffer origin (upper left corner)

Specifies Xmax value of (inclusive) intersection of Drawing rectangle with the Color (Destination) Buffer, used for clipping. Pixels with coordinates greater than Xmax will be clipped out.

Value	Name
[0,16383]	Device ignores bits 15:14

Programming Notes
This value can be less than Clipped Drawing Rectangle X Min. If Xmax<Xmin, the clipped drawing rectangle is null, all polygons are discarded.If Xmin==Xmax, the clipped drawing

3DSTATE_DRAWING_RECTANGLE

		rectangle is 1 pixel wide in the X direction.
3	31:16	**Drawing Rectangle Origin Y** Format: S15 in Pixels from Color Buffer origin (upper left corner). **Description** Range: [-16384,16383] (Bit 31 should be a sign extension) Specifies Y origin of Drawing Rectangle (in whole pixels) relative to origin of the Color Buffer, used to map incoming (Draw Rectangle-relative) vertex positions to the Color Buffer space.
	15:0	**Drawing Rectangle Origin X** Format: S15 in Pixels from Color Buffer origin (upper left corner). **Description** Range: [-16384,16383] (Bit 15 should be a sign extension) Specifies X origin of Drawing Rectangle (in whole pixels) relative to origin of the Color Buffer, used to map incoming (Draw Rectangle-relative) vertex positions to the Color Buffer space.

3DSTATE_DS

3DSTATE_DS		
Source:	RenderCS	
Length Bias:	2	
The state used by DS is defined with this inline state packet		
DWord	**Bit**	**Description**
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 1Dh 3DSTATE_DS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 9h Excludes DWord (0,1) Format: =n Total Length - 2
1..2	63:6	**Kernel Start Pointer** Format: InstructionBaseOffset[63:6]Kernel This field specifies the starting location of the kernel program run by threads spawned by this FF unit. It is specified as a 64-byte-granular offset from the Instruction Base Address. This field is ignored if DS Function Enable is DISABLED.
	5:0	**Reserved** Format: MBZ
3	31	**Reserved** Format: MBZ

3DSTATE_DS

30 Vector Mask Enable

Format:	U1 Enumerated Type

Upon subsequent DS thread dispatches, this bit is loaded into the EU's Vector Mask Enable (VME, cr0.0[3]) thread state. Refer to EU documentation for the definition and use of VME state.

Value	Name	Description
0h	Dmask	The EU will use the Dispatch Mask (supplied by the DS stage) for instruction execution.
1h	Vmask	The EU will use the Vector Mask (derived from the Dispatch Mask) for instruction execution.

Programming Notes
Under normal conditions SW shall specify DMask, as the DS stage will provide a Dispatch Mask appropriate to SIMD4x2 or SIMD8 thread execution (as a function of dispatch mode). E.g., for SIMD4x2 thread execution, the DS stage will generate a Dispatch Mask that is equal to what the EU would use as the Vector Mask. For SIMD8 execution there is no known usage model for use of Vector Mask (as there is for PS shaders).

29:27 Sampler Count

Format:	U3

Specifies how many samplers (in multiples of 4) the kernel uses. Used only for prefetching the associated sampler state entries.
This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description
0h	No Samplers	No samplers used
1h	1-4 Samplers	between 1 and 4 samplers used
2h	5-8 Samplers	between 5 and 8 samplers used
3h	9-12 Samplers	between 9 and 12 samplers used
4h	13-16 Samplers	between 13 and 16 samplers used

26 Reserved

Format:	MBZ

25:18 Binding Table Entry Count

Format:	U8

When HW Generated Binding Table is disabled:
Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state.
Note: For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache.
This field is ignored if DS Function Enable is DISABLED.

When HW Generated Binding Table bit is enabled:

3DSTATE_DS

This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched.

Value	Name
[0,255]	

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.

17 **Thread Dispatch Priority**

Format:	U1 Enumerated Type

Specifies the priority of the thread for dispatch:
This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description
0h	Normal	Normal Priority
1h	High	High Priority

16 **Floating Point Mode**

Format:	U1 Enumerated Type

Specifies the initial floating point mode used by the dispatched thread.
This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 Rules
1h	Alternate	Use alternate rules

15 **Reserved**

Format:	MBZ

14 **Accesses UAV**

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment.

Programming Notes
This field must not be set when DS Function Enable is disabled.

13 **Illegal Opcode Exception Enable**

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment.
This field is ignored if DS Function Enable is DISABLED.

12:8 **Reserved**

3DSTATE_DS

		Format: MBZ
	7	**Software Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[13] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if DS Function Enable is DISABLED.
	6:0	**Reserved** Format: MBZ
4..5	63:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[63:10]ScratchSpace Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if DS Function Enable is DISABLED.
	9:4	**Reserved** Format: MBZ
	3:0	**Per-Thread Scratch Space** Format: U4 power of 2 Bytes over 1K Bytes Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit.The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. This field is ignored if DS Function Enable is DISABLED. **Value** / **Name**: [0,11] indicating [1K Bytes, 2M Bytes] **Programming Notes**: This amount is available to the kernel for information only. It will be passed verbatim (if not altered by the kernel) to the Data Port in any scratch space access messages, but the Data Port will ignore it.
6	31:25	**Reserved** Format: MBZ
	24:20	**Dispatch GRF Start Register For URB Data** Format: GRFRegister[4:0] Specifies the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload.

3DSTATE_DS

This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description
[0,31]		indicating GRF [R0, R31]

Programming Notes
When SIMD8_SINGLE_OR_DUAL_PATCH dispatch mode is selected, SW shall program this field to a value of 6 or greater to accommodate either the DUAL_PATCH or SIMD8_SINGLE_PATCH payloads.

19:18 Reserved

Format:	MBZ

17:11 Patch URB Entry Read Length

Format:	U7

Specifies how much data (in 256-bit units) is to be read from the Patch URB entry and passed in the DS thread payload.
This field is ignored if DS Function Enable is DISABLED.

Value	Name
[0,64]	

10 Reserved

Format:	MBZ

9:4 Patch URB Entry Read Offset

Format:	U6

Specifies the offset (in 256-bit units) at which Patch URB data is to be read from the URB before being included in the thread payload.
This field is ignored if DS Function Enable is DISABLED.

Value	Name
[0,63]	

3:0 Reserved

Format:	MBZ

7 31 Reserved

Format:	MBZ

30 Reserved

Format:	MBZ

29:21 Maximum Number of Threads

Format:	U9-1 Thread Count

Specifies the maximum number of simultaneous DS threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual

3DSTATE_DS

dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance.
This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description
[0,335]		indicating thread count of [1,336]

20:11 Reserved

Format:	MBZ

10 Statistics Enable

Format:	Enable

If ENABLED, this FF unit will engage in statistics gathering. Refer to the Statistics Gathering section. If DISABLED, statistics information associated with this FF stage will be left unchanged.
This field is ignored if DS Function Enable is DISABLED.

9:5 Reserved

Format:	MBZ

4:3 Dispatch Mode

Format:	U2

This field specifies how the DS stage generates DS thread requests, and correspondingly impacts the DS thread payload. The setting of this field must agree with how the DS kernel was compiled.
This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description	Programming Notes
0h	SIMD4X2	DS threads are passed one patch, up to 2 domain point inputs, and up to two output vertex handles. The DS kernel (at KSP) is expected to run in SIMD4x2 execution mode. The DUAL_PATCH KSP is ignored. The **Single Domain Point Dispatch** field can be used to force single domain point dispatches.	
1h	SIMD8_SINGLE_PATCH	DS threads are passed one patch, up to 8 domain point inputs, and up to 8 output vertex handles. All the domain points are associated with the single input patch. The DS kernel (at KSP) is expected to run in SIMD8 execution mode. The DUAL_PATCH KSP is ignored.	

3DSTATE_DS

		2h	SIMD8_SINGLE_OR_DUAL_PATCH	SIMD8_SINGLE_OR_DUAL_PATCH This mode enables use of both the KSP and the DUAL_PATCH KSP. The KSP kernel operates just like in SIMD8_SINGLE_PATCH mode. See DUAL_PATCH Thread Execution for a discussion of how the DUAL_PATCH KSP is used.	At least 2 HS URB handles must be allocated in order to enable this mode. SIMD8_SINGLE_OR_DUAL_PATCH must not be used if the domain shader kernel uses primitive id.
		3h	Reserved		
	2	**Compute W Coordinate Enable** Format: Enable If ENABLED, the DS unit will (for each domain point) compute W = 1 - (U + V) and pass the result as a floating point value in the DS thread payload. If DISABLED, 0.0 will be passed. This field must only be ENABLED for the tessellation of TRI domains, where UVW coordinates are required. This field must be DISABLED for other domains (as they only require UV coordinates) otherwise the computed W coordinate is UNDEFINED. This field is ignored if DS Function Enable is DISABLED.			
	1	**Cache Disable** Format: Disable This bit controls the operation of the DS Cache. This field is ignored if DS Function Enable is DISABLED. If the DS Cache is DISABLED and the DS Function is ENABLED, the DS Cache is not used and all incoming domain points will be passed to DS threads. If the DS Cache is ENABLED and the DS Function is ENABLED, incoming domain points that do not hit in the DS Cache will be passed to DS threads. The DS Cache is invalidated whenever the DS Cache becomes DISABLED , whenever the DS Function Enable toggles, and between patches.			
	0	**Function Enable** Format: Enable If ENABLED, DS threads will be spawned to process incoming domain points which miss in the DS cache. If DISABLED, the DS stage goes into pass-through mode and performs no specific processing. This field is always used. **Programming Notes** The tessellation stages (HS, TE and DS) must be enabled/disabled as a group. I.e., draw commands can only be issued if all three stages are enabled or all three stages are disabled, otherwise the behavior is UNDEFINED.			
8	31:28	**Reserved** Format: MBZ			
	27	**Reserved**			

3DSTATE_DS

26:21 Vertex URB Entry Output Read Offset

Format:	U6

Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB by SBE.

Value	Name
[0,63]	

20:16 Vertex URB Entry Output Length

Format:	U5

Specifies the amount of URB data written for each Vertex URB entry, in 256-bit register increments.

Value	Name
[1,16]	

Programming Notes
This length does not include the vertex header.

15:8 User Clip Distance Clip Test Enable Bitmask

Format:	U8

This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept / must clip determination needs to be made.

DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.

7:0 User Clip Distance Cull Test Enable Bitmask

Format:	U8

This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept determination needs to be made (does not cause a must clip).

DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.

9..10 63:6 DUAL_PATCH Kernel Start Pointer

Format:	InstructionBaseOffset[63:6]Kernel

This field specifies the starting location of the DUAL_PATCH kernel program run by threads spawned by this FF unit.

It is specified as a 64-byte-granular offset from the Instruction Base Address. This field is ignored if DS Function Enable is DISABLED.

See DUAL_PATCH Thread Execution for a discussion of how the DUAL_PATCH KSP is used.

5:0 Reserved

Format:	MBZ

3DSTATE_DX9_CONSTANT_BUFFER_POOL_ALLOC

3DSTATE_DX9_CONSTANT_BUFFER_POOL_ALLOC

Source: RenderCS

Length Bias: 2

This command sets up the Gather Pool for Gather Buffers.

Programming Notes

This command must only be programmed when resource streamer is enabled thru batch buffer start and MI_RS_CONTROL has not disabled resource streamer.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode

3DSTATE_DX9_GENERATE_ACTIVE_PS

3DSTATE_DX9_GENERATE_ACTIVE_PS

Source: RenderCS

Length Bias: 2

The 3DSTATE_DX9_GENERATE_ACTIVE_PS command is used to generate fixed functions' DX9 Constant Buffer. A DX9 Constant register is made active by writing it out to the constant buffer.

Programming Notes

Restriction:
The global and local buffers are not initialized after reset. Any data written without being initialized will be undefined. DX9 constant buffers are written due to context save/restore or the Generate Active Command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode

1	31:24	**Reserved** Format: MBZ
	23:13	**Pointer to PS Constant Buffer** Format: ConstantBufferOffset[23:13]BINDING_TABLE_STATE* Specifies the 8KB aligned address offset of the PS function's Dx9 constant buffer. This offset is relative to the DX9 Constant buffer Base Address.

3DSTATE_DX9_GENERATE_ACTIVE_PS

12 DX9 Enable

Format:	Enable
Format:	U1

When this bit is set, the Resource Streamer will generate the PS constant buffer according to the DX9 rules:

1. Valid local register are made active.
2. Global register becomes active, unless the corresponding local register is valid.
3. Local register valids are reset.

When this bit is cleared, the Resource Streamer will generate the PS constant buffer according to the DX8 rules:

1. Global register become active.
2. Local register valids are reset.

Programming Notes
In DX8 mode software will set all constants as globals, even ones locally defined within a shader.

11 Clamp Enable

Format:	Enable
Format:	U1

When this bit is set, the Resource Streamer will generate the PS constant buffer with the global values clamped to [-1,1]. When this bit is cleared, the Resource Streamer will generate the PS constant buffer without the global value clamped.

Programming Notes
The clamping affects the values written out to the constant buffer and values read by the Gather engine for push constant buffer generation.

10 Local Valid Bit Reset Enable

Format:	U1

Value	Name	Description
0	Disable	Disable resetting of the local valid bits on the generate active command
1	Enable	Enable resetting of the local valid bits on the generate active command

9 Buffer Write Disable

Format:	U1

When this bit is set, the Resource Streamer will not write the values of the on-die registers to the constant buffer. The internal handshaking will take place as if it did.

Value	Name	Description
0	Enable Writes	On-die register values are written out to the constant buffer.
1	Disable Writes	On-die registers are not written out.

3DSTATE_DX9_GENERATE_ACTIVE_PS		
	8	**Disable Produce to Command Stream** Format: MBZ When set this bit will disable the produce to the command stream for the generation of a constant buffer. This bit must only be set by HW during a context save and restore. Otherwise it will cause the render command stream to hang waiting for a produce. During context save and restore command stream is not parsing the same command buffer.
	7:0	**Reserved** Format: MBZ

3DSTATE_DX9_GENERATE_ACTIVE_VS

3DSTATE_DX9_GENERATE_ACTIVE_VS

Source: RenderCS

Length Bias: 2

The 3DSTATE_DX9_GENERATE_ACTIVE_VS command is used to generate fixed functions' DX9 Constant Buffer. A DX9 Constant register is made active by writing it out to the constant buffer.

Programming Restriction:The global and local buffers are not initialized after reset. Any data written without being initialized will be undefined. DX9 constant buffers are written due to context save/restore or the Generate Active Command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 41h 3DSTATE_DX9_GENERATE_ACTIVE_VS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:24	**Reserved** Format: MBZ
	23:13	**Pointer to VS Constant Buffer** Format: ConstantBufferOffset[23:13] Specifies the 8KB aligned address offset of the VS function's Dx9 constant buffer. This offset is relative to the DX9 Constant buffer Base Address.

3DSTATE_DX9_GENERATE_ACTIVE_VS

12 DX9 Enable

Format:	Enable

When this bit is set, the Resource Streamer will generate the VS constant buffer according to the DX9 rules:

1. Valid local register are made active.
2. Global register becomes active, unless the corresponding local register is valid.
3. Local register valids are reset.

When this bit is cleared, the Resource Streamer will generate the VS constant buffer according to the DX8 rules:

1. Global register become active.
2. Local register valids are reset.

Programming Notes
In DX8 mode software will set all constants as globals, even ones locally defined within a shader.

11 Clamp Enable

Format:	Enable

When this bit is set, the Resource Streamer will generate the VS constant buffer with the global values clamped to [-1,1]. When this bit is cleared, the Resource Streamer will generate the VS constant buffer without the global value clamped.

Programming Notes
The clamping affects the values written out to the constant buffer and values read by the Gather engine for push constant buffer generation.

10 Local Valid Bit Reset Enable

Format:	Enable

Value	Name	Description
0	Disable	Disable resetting of the local valid bits on the generate active command
1	Enable	Enable resetting of the local valid bits on the generate active command

9 Buffer Write Disable

Format:	Disable

When this bit is set, the Resource Streamer will not write the values of the on-die registers to the constant buffer. The internal handshaking will take place as if it did.

Value	Name	Description
0	Enable Writes	On-die register values are written out to the constant buffer.
1	Disable Writes	On-die registers are not written out.

3DSTATE_DX9_GENERATE_ACTIVE_VS		
	8	**Disable Produce to Command Stream** Format: MBZ When set this bit will disable the produce to the command stream for the generation of a constant buffer. This bit must only be set by HW during a context save and restore. Otherwise it will cause the render command stream to hang waiting for a produce. During context save and restore command stream is not parsing the same command buffer.

3DSTATE_GATHER_CONSTANT_DS

3DSTATE_GATHER_CONSTANT_DS

Source: RenderCS

Length Bias: 2

This command uses the constant buffer binding table entries to reference constant buffer surface states for the DS unit. The constant data in these is gathered and packed according to a gather table contained in this command.

Programming Notes

The HW generated binding table must be enabled to use this command.

The length of the gather table is derived from the total length of the command. The command length is in DWords, but the gather table entries are 16 bits in length. If there is an unused odd entry at the end of the command the channel mask should be set to all 0s.

When a 3DSTATE_GATHER_CONSTANT_* command is used there must be a matching 3DSTATE_CONSTANT_*. Furthermore the 3DSTATE_CONSTANT_* must occur in the same order as the 3DSTATE_GATHER_CONSTANT_*. For example if a 3DSTATE_GATHER_CONSTANT_VS occurs before a 3DSTATE_GATHER_CONSTANT_PS, then the 3DSTATE_CONSTANT_VS must occur before the 3DSTATE_CONSTANT_PS.

If Gather pool is enabled, there must be a corresponding 3DSTATE_GATHER_CONSTANT command with any 3DSTATE_CONSTANT for any particular shader. To avoid any update to the Gather pool, and yet program the 3DSTATE_CONSTANT for a particular shader, send a 3DSTATE_GATHER_CONSTANT command with all valid bits set to zero.

The 3DSTATE_GATHER_CONSTANT_* command is not committed to the resource streamer engine until the corresponding (same shader) 3DSTATE_BINDING_TABLE_POINTER_* command. For example, the 3DSTATE_GATHER_CONSTANT_VS command will not actually generate a buffer in memory until the 3DSTATE_BINDING_TABLE_POINTERS_VS is parsed by the resource streamer.

The following commands must be executed after any 3DSTATE_GATHER_CONSTANT_* command that has Constant Buffer Valid greater than zero: •(N times, mininum number is 4) MI_RS_STORE_DATA_IMM –To force engine idle before executing the next instruction. Write must occur to address that will not corrupt memory:
•Resource Streamer Flush = 1
•3DSTATE_GATHER_CONSTANT_* (Ensures correct timing of sync between resource streamer and render pipeline) •The Constant Buffer Valid field should be zero and the Dword length equal to 1h.
•3DSTATE_CONSTANT_*: •All values match the previous 3DSTATE_CONSTANT_*

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode

3DSTATE_GATHER_CONSTANT_GS

3DSTATE_GATHER_CONSTANT_GS

Source: RenderCS

Length Bias: 2

This command uses the constant buffer binding table entries to reference constant buffer surface states for GS unit. The constant data in these is gathered and packed according to a gather table contained in this command.

Programming Notes

The HW generated binding table must be enabled to use this command.

The length of the gather table is derived from the total length of the command. The command length is in DWords, but the gather table entries are 16 bits in length. If there is an unused odd entry at the end of the command the channel mask should be set to all 0s.

When a 3DSTATE_GATHER_CONSTANT_* command is used there must be a matching 3DSTATE_CONSTANT_*. Furthermore the 3DSTATE_CONSTANT_* must occur in the same order as the 3DSTATE_GATHER_CONSTANT_*. For example if a 3DSTATE_GATHER_CONSTANT_VS occurs before a 3DSTATE_GATHER_CONSTANT_PS, then the 3DSTATE_CONSTANT_VS must occur before the 3DSTATE_CONSTANT_PS.

If Gather pool is enabled, there must be a corresponding 3DSTATE_GATHER_CONSTANT command with any 3DSTATE_CONSTANT for any particular shader. To avoid any update to the Gather pool, and yet program the 3DSTATE_CONSTANT for a particular shader, send a 3DSTATE_GATHER_CONSTANT command with all valid bits set to zero.

The 3DSTATE_GATHER_CONSTANT_* command is not committed to the resource streamer engine until the corresponding (same shader) 3DSTATE_BINDING_TABLE_POINTER_* command. For example, the 3DSTATE_GATHER_CONSTANT_VS command will not actually generate a buffer in memory until the 3DSTATE_BINDING_TABLE_POINTERS_VS is parsed by the resource streamer.

The following commands must be executed after any 3DSTATE_GATHER_CONSTANT_* command that has Constant Buffer Valid greater than zero: •(N times, mininum number is 4) MI_RS_STORE_DATA_IMM –To force engine idle before executing the next instruction. Write must occur to address that will not corrupt memory:
•Resource Streamer Flush = 1
•3DSTATE_GATHER_CONSTANT_* (Ensures correct timing of sync between resource streamer and render pipeline) •The Constant Buffer Valid field should be zero and the Dword length equal to 1h.
•3DSTATE_CONSTANT_*: •All values match the previous 3DSTATE_CONSTANT_*

3DSTATE_GATHER_CONSTANT_VS

3DSTATE_GATHER_CONSTANT_VS

Source: RenderCS

Length Bias: 2

This command uses the constant buffer binding table entries to reference constant buffer surface states for VS unit. The constant data in these is gathered and packed according to a gather table contained in this command.

Programming Notes

The HW generated binding table must be enabled to use this command.

The length of the gather table is derived from the total length of the command. The command length is in DWords, but the gather table entries are 16 bits in length. If there is an unused odd entry at the end of the command the channel mask should be set to all 0s.

When a 3DSTATE_GATHER_CONSTANT_* command is used there must be a matching 3DSTATE_CONSTANT_*. Furthermore the 3DSTATE_CONSTANT_* must occur in the same order as the 3DSTATE_GATHER_CONSTANT_*. For example if a 3DSTATE_GATHER_CONSTANT_VS occurs before a 3DSTATE_GATHER_CONSTANT_PS, then the 3DSTATE_CONSTANT_VS must occur before the 3DSTATE_CONSTANT_PS.

If Gather pool is enabled, there must be a corresponding 3DSTATE_GATHER_CONSTANT command with any 3DSTATE_CONSTANT for any particular shader. To avoid any update to the Gather pool, and yet program the 3DSTATE_CONSTANT for a particular shader, send a 3DSTATE_GATHER_CONSTANT command with all valid bits set to zero.

The 3DSTATE_GATHER_CONSTANT_* command is not committed to the resource streamer engine until the corresponding (same shader) 3DSTATE_BINDING_TABLE_POINTER_* command. For example, the 3DSTATE_GATHER_CONSTANT_VS command will not actually generate a buffer in memory until the 3DSTATE_BINDING_TABLE_POINTERS_VS is parsed by the resource streamer.

Workaround

The following commands must be executed after any 3DSTATE_GATHER_CONSTANT_* command that has Constant Buffer Valid greater than zero: •(N times, mininum number is 4) MI_RS_STORE_DATA_IMM –To force engine idle before executing the next instruction. Write must occur to address that will not corrupt memory: •Resource Streamer Flush = 1 •3DSTATE_GATHER_CONSTANT_* (Ensures correct timing of sync between resource streamer and render pipeline) •The Constant Buffer Valid field should be zero and the Dword length equal to 1h. •3DSTATE_CONSTANT_*: •All values match the previous 3DSTATE_CONSTANT_*

Format:	U16

This field specifies which of the 16 constant buffers are used in the push constant gather. If a bit is set it indicates the corresponding constant buffer is used. If a bit is clear it indicates the corresponding constant buffer is not used. If this field is zero it indicate that the gather buffer is not used.

15:12 Constant Buffer Binding Table Block

Format:	U4

This field specifies the 16 entry block constant buffer in the binding table. The constant buffer entry block must be aligned on a 16 entry boundary.

11:2 Reserved

Format:	MBZ

1 Update Gather Table Only

Format:	U1

When this bit is set, the Resource Streamer will update the on chip buffer of Gather Index values. Any following Binding Table Pointer will not commit this command to the Gather Engine.

Value	Name	Description
0	Commit Gather	Update Gather Table and Commit Gather on next BTP.
1	Non-Commit Gather	Update Gather Table Only.

3DSTATE_GATHER_CONSTANT_VS

0 — DX9 On-Die Register Read Enable

Format:	Enable

When this bit is set, the Resource Streamer will not read out to the constant buffer, but instead it will read from the on-die registers. The internal handshaking will take place as if it did perform the read from the constant buffer. The **Constant Buffer Offset** is the offset into the on-die register and the **Binding Table Index Offset** will cause it to be a 4KB offset if the value is '1'. If the **Binding Table Index Offset** is '0' then the engine will read from the lower 4KB of the constant buffer. This bit only has effect if the Dx9 enable is set.

2 — 31:23 — Reserved

Format:	MBZ

22:6 — Gather Buffer Offset

Format:	GatherBufferOffset[22:6]

This field specifies the offset of the gather buffer within the Gather Pool.

Programming Notes
SW increments the offset by the size of the gather buffer in 512 bit units for each gather buffer generated.

5 — Constant Buffer Dx9 Generate Stall

Format:	Enable

When this bit is set the resource streamer will wait for the Dx9 constant buffer generator to be done before issuing this command to ensure buffer synchronization.

4 — Constant Buffer Dx9 Enable

Format:	Enable

When this bit is set it indicates that the constant buffer is a HW generated Dx9 constant buffer. The resource streamer will wait for the Dx9 constant buffer generator to be done before issuing this command to ensure buffer synchronization. Additionally the Dx9 constant buffers are a single buffer but larger than 4KB. Internally the HW will treat the DX9 buffer as 2 constant buffers. When this bit is enable only the 1st constant buffer valid bit is set. The 2nd constant buffer surface pointer will automatically be the 1st pointer + 4KB.

3 — On-Die Table

Format:	U1

This bit controls whether the on-die table is loaded or read.

Value	Name	Description
0h	Load	Load the on-die table w/ table contained in this command and do the gather using the table in this command.
1h	Read	Read the on-die table and use its contents for doing the gather command.

Programming Notes
The HW will overwrite DW1 and DW2 of the previous GATHER with the current DW1 and DW2. If using the same gather tables, then the valid bits must be still in sync with the indexes used in

3DSTATE_GATHER_CONSTANT_VS		
		the previous GATHER table. The Dword Length field must be set to 1h when this field is enabled.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 11h 3DSTATE_GS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Format: =n Value: 8h — Name: Excludes DWord (0,1) **[Default]**
1..2	63:6	**Kernel Start Pointer** Format: InstructionBaseOffset[63:6]Kernel This field specifies the starting location (1st GEN4 core instruction) of the kernel program run by threads spawned by this FF unit. It is specified as a 64-byte-granular offset from the Instruction Base Address.
	5:0	**Reserved** Format: MBZ
3	31	**Single Program Flow** Specifies the initial condition of the kernel program as either a single program flow (SIMDnxm with m = 1) or as multiple program flows (SIMDnxm with m > 1). See CR0 description in ISA Execution Environment.

3DSTATE_GS

Value	Name	Description
0h	Disable	Single Program Flow disabled
1h	Enable	Single Program Flow enabled

30 **Vector Mask Enable**

Format:	Enable Enumerated Type

Upon subsequent GS thread dispatches, this bit is loaded into the EU's Vector Mask Enable (VME, cr0.0[3]) thread state. Refer to EU documentation for the definition and use of VME state.

Value	Name	Description
0h	Dmask	The EU will use the Dispatch Mask (supplied by the GS stage) for instruction execution.
1h	Vmask	The EU will use the Vector Mask (derived from Dispatch Mask) for instruction execution.

Programming Notes
Under normal conditions SW shall specify DMask, as the GS stage will provide a Dispatch Mask appropriate to SIMD4x2 or SIMD8 thread execution (as a function of dispatch mode). E.g., for SIMD4x2 execution, the GS stage will generate a Dispatch Mask that is equal to what the EU would use as the Vector Mask. For SIMD8 execution there is no known usage model for use of Vector Mask (as there is for PS shaders).

29:27 **Sampler Count**

Format:	U3

Specifies how many samplers (in multiples of 4) the geometry shader kernel uses. Used only for prefetching the associated sampler state entries.

Value	Name	Description
0h	No Samplers	No Samplers used
1h	1-4 Samplers	Between 1 and 4 samplers used
2h	5-8 Samplers	Between 5 and 8 samplers used
3h	9-12 Samplers	Between 9 and 12 samplers used
4h	13-16 Samplers	Between 13 and 16 samplers used
5h-7h	Reserved	

26 **Reserved**

25:18 **Binding Table Entry Count**

Format:	U8

When **HW Generated Binding Table** is disabled:

Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state.

Note: For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache.

When **HW Generated Binding Table** bit is enabled:

3DSTATE_GS

This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched.

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.

17 Thread Dispatch Priority

Specifies the priority of the thread for dispatch.

Value	Name	Description
0h	Normal	Normal thread dispatch priority
1h	High	High thread dispatch priority

16 Floating Point Mode

Specifies the initial floating point mode used by the dispatched thread.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 Rules
1h	Alternate	Use alternate rules

15:14 Reserved

Format:	MBZ

13 Illegal Opcode Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See *Exceptions and ISA Execution Environment*.

12 Accesses UAV

Format:	Enable

This field must be set when GS has a UAV access.

Programming Notes
This field must not be set when GS Function Enable is disabled.

11 Mask Stack Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[11]. See *Exceptions and ISA Execution Environment.*

10:8 Reserved

Format:	MBZ

7 Software Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[13] (note the bit # difference). See *Exceptions and ISA Execution Environment.*

3DSTATE_GS

	6	**Reserved** Format: MBZ
	5:0	**Expected Vertex Count** Format: U6 Specifies the number of vertices per input object expected by the GS thread. Input topologies not matching this expect value are discarded. Note that **DiscardAdjacency** is also considered (e.g., if the value programmed is 3 and DiscardAdjacency is set, TRILIST_ADJ and TRISTRIP_ADJ topologies are not discarded as they will pass 3 vertices/object to the GS threads). **Value** [1,32] **Name**
4..5	63:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[63:10]ScratchSpace Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if VS Function Enable is DISABLED.
	9:4	**Reserved** Format: MBZ
	3:0	**Per-Thread Scratch Space** Format: U4 power of 2 Bytes over 1K Bytes Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit. The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. **Value** [0,11] **Name** **Description** indicating [1K Bytes, 2M Bytes]
6	31	**Reserved** Format: MBZ
	30:29	**Dispatch GRF Start Register For URB Data [5:4]** Format: U2 Specifies bit [5:4] of the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload. The **Dispatch GRF Start Register For URB Data [3:0]** field is used to specify bits [3:0] of the starting GRF register number.

3DSTATE_GS

28:23 Output Vertex Size

Format:	U6

[0,63] indicating [1,64] 16B units

Specifies the size of each vertex stored in the GS output entry (following any Control Header data) as a number of 128-bit units (minus one).

Programming Notes

Programming Restrictions: The vertex size must be programmed as a multiple of 32B units with the following exception: Rendering is disabled (as per SOL stage state) and the vertex size output by the GS thread is 16B.

If rendering is enabled (as per SOL state) the vertex size must be programmed as a multiple of 32B units. In other words, the only time software can program a vertex size with an odd number of 16B units is when rendering is disabled.

22:17 Output Topology

Format:	3D_Prim_Topo_Type

This field specifies the topology type (3DPrimType) to be associated with GS-thread output vertices (if any).

16:11 Vertex URB Entry Read Length

Specifies the amount of URB data read and passed in the thread payload for each Vertex URB entry, in 256-bit register increments.

Programming Notes

Programming Restriction:This field must be a non-zero value if Include Vertex Handles is cleared to zero.

10 Include Vertex Handles

Format:	Boolean

If set, all the input Vertex URB handles are included in the payload. These are referred to as "pull model" URB handles, as the thread will use them to read from the URB.

Programming Notes

Programming Restriction: This field must be set if Vertex URB Entry Read Length is cleared to zero.

9:4 Vertex URB Entry Read Offset

Format:	U6

Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB before being included in the thread payload. This offset applies to all Vertex URB entries passed to the thread.

3:0 Dispatch GRF Start Register For URB Data

Format:	U4

3DSTATE_GS

Description
Specifies the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload.
The Dispatch GRF Start Register for URB Data [5:4] field is used to extend the range of the starting GRF register number to [0,63].

Value	Name	Description
[0,15]		indicating bits [3:0] of the GRF number

Programming Notes
If Include Vertex Handles is enabled (pull or hybrid handles case), then For simd4x2: For DUAL_OBJECT dispatch mode this field should be: (((2*numVerticesPerObject) + 8 - 1)/8) + 1 For SINGLE and DUAL_INSTANCE dispatch modes this field should be: ((numVerticesPerObject +8 - 1)/8) + 1 If Include Primitive ID is set, then add 1 to the value obtained by using the above
If Include Vertex Handles is enabled (pull or hybrid handles case), then For simd8: For InstanceCount == 1: numVerticesPerObject 2 For InstanceCount > 1: ((numVerticesPerObject 8 - 1)/8) 2 If Include Primitive ID is set, then add 1 to the value obtained by using the above

7 — 31:26 **Reserved**

Format:	MBZ

25:24 **Reserved**

Format:	MBZ

23:20 **Control Data Header Size**

Format:	U4

Specifies the number of 32B units of control data header located at the start of the GS URB entry. The value 0 indicates there is no control data header, and Control Data Format is ignored. Software must ensure that the Control Data Header Size is sufficient to accommodate the maixumum number of vertices output by the GS thread. It is UNDEFINED for a GS thread to report more output vertices than can be accomodated in a non-zero-sized header. (If the header size is zero, by definition neither cut nor StreamID bits are defined.

Value	Name
[0,8]	32B Units

3DSTATE_GS

19:15 Instance Control

Format:	U5-1 #Instances

Specifies the number of instances (minus one) for each input object. To avoid confusion, this document uses the term **"InstanceCount"** to refer to InstanceControl+1, with a range of [1,32]
If **InstanceCount>1**, DUAL_OBJECT mode is invalid. Software will likely want to use DUAL_INSTANCE mode for higher performance, but SINGLE mode is also supported.
When **InstanceCount=1** (one instance per object), software can decide which dispatch mode to use. DUAL_OBJECT mode would likely be the best choice for performance, followed by SINGLE mode. DUAL_INSTANCE mode is not recommended but is supported.

Value	Name	Description
[0,31]		Indicating [1,31] instances

14:13 Default Stream Id

Format:	U2

When the GS is enabled, unless the GS output entry contains StreamID bits in the control header, this field specifies the default StreamID associated with any GS-thread output vertices. When the GS is disabled, StreamID will be output as 0.

12:11 Dispatch Mode

Format:	U2

This field specifies how the GS unit dispatches multiple instances and/or multiple objects.

Value	Name	Description	Programming Notes
0h	Single	Each thread shades a single instance of one object.	
1h	Dual Instance	Each thread shades possibly two instances of one object. If the InstanceCount is odd, a trailing dispatch of only one instance will be made for each object received. Not recommended if InstanceCount = 1, assuming a kernel optimized for SINGLE or DUAL_OBJECT dispatch would outperform a kernel compiled for DUAL_INSTANCE but only passed one instance.	
2h	Dual Object	Each thread shades one instance of possibly two objects. The GS unit attempt to pair objects together into one dispatch, but under some circumstances only one object may be dispatched (as controlled by the DispatchMask generated by the GS unit). Not valid for objects with more than 16 vertices per object. Not valid if InstanceCount > 1 (more than one instance per object).	

3DSTATE_GS

3h	SIMD8	Each thread shades up to 8 different objects or (if InstanceCount >1) 8 instances of a single object.	The driver must send pipe control with a cs stall after a 3dstate_gs state change and the Dispatch Mode is simd8 and the number of handles allocated to gs is less than 16.

Programming Notes
The GS must be allocated at least two URB handles or behavior is UNDEFINED for Dual Instance or Dual Object mode.

10 **Statistics Enable**

Format:	Enable

This bit controls whether GS-unit-specific statistics register(s) can be incremented.

Value	Name	Description
0h	Disable	GS_INVOCATIONS_COUNT and GS_PRIMITIVES_COUNT cannot increment
1h	Enable	GS_INVOCATIONS_COUNT and GS_PRIMITIVES_COUNT can increment

9:5 **Invocations Increment Value**

Format:	U5

Specifies how much to increment the GS_INVOCATIONS_COUNT for each instance of each object. This control is provided to allow software to process multiple instances (from an API POV) in a single kernel invocation.

In SINGLE dispatch mode, the counter will increment by this value for each dispatch (as it's only one instance of one object).

In DUAL_INSTANCE mode, the counter will be incremented by the value if only one instance is included in the dispatch (i.e., the last odd instance), otherwise the counter will be incremented by twice this value.

In DUAL_OBJECT dispatch mode, the counter will be incremented by the value if only one object is included in the dispatch (i.e., a forced dispatch of one object), otherwise the counter will be incremented by twice this value.

Value	Name	Description
[0,31]		indicating an increment of [1,32]

4 **Include Primitive ID**

Format:	Boolean

If set, R1 of the payload is written with Primitive ID value(s).

If clear, these Primitive ID values are not included in the payload R1.

3 **Hint**

Format:	U1

This state bit is simply passed in GS thread payloads for use by the GS kernel - it has no other impact on hardware operation.

3DSTATE_GS

2 Reorder Mode

This bit controls how vertices of triangle objects resulting from TRISTRIP[_ADJ][_REV] topologies are [re]ordered when passed in the GS thread payload See Object Vertex Ordering table (below).

Value	Name	Description
0h	LEADING	Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the leading (first) vertices are in consecutive order starting at v0. A similar reordering is performed on alternating triangles in a TRISTRIP_REV.
1h	TRAILING	Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the trailing (last) vertices are in consecutive order starting at v2. A similar reordering is performed on alternating triangles in a TRISTRIP_REV.

Programming Notes

Workaround: reorder mode must be set to REORDER_LEADING and reordering must be done in the Geometry shader.

1 Discard Adjacency

Format:	Enable

When set, adjacent vertices will not be passed in the GS payload when objects with adjacency are processed. Instead, only the non-adjacent vertices will be passed in the same fashion as the without-adjacency form of the primitive. Software should set this bit whenever a GS kernel is used that does not expect adjacent vertices. This allows both with-adjacency/without-adjacency variants of the primitive to be submitted to the pipeline (via 3DPRIMITIVE) - the GS unit will silently discard any adjacent vertices and present the GS thread with only the internal object. When clear, adjacent vertices will be passed to the GS thread, as dictated by the incoming primitive type. Software should only clear this bit when a GS kernel is used that does expect adjacent vertices. E.g., if the GS kernel is compiled to expect a TRIANGLE_ADJ object, software must clear this bit. Software should also clear this bit if the GS kernel expects a POINT or PATCHLIST_n object (which don't have with-adjacency variants).

The only hardware assistance is to allow the submission of a with-adjacency variant of a primitive when operating with a GS kernel that expects the without-adjacency variant of the object. (E.g., when the GS kernel is compiled to expect a TRIANGLE object, software should set this bit just in case a TRILIST_ADJ is submitted to the pipeline.) Note that the GS unit is otherwise not aware of the object type that is expected by the GS kernel. It is up to software to ensure that the submitted primitive type (in 3DPRIMITIVE) is otherwise compatible with the object type expected by the GS kernel. (E.g., if the GS kernel expects a LINE_ADJ object, only LINELIST_ADJ or LINESTRIP_ADJ should be submitted, otherwise the GS kernel will produce unpredictable results.) Also note that it is possible to craft a GS kernel which can accept any object type that's thrown at it by first examining the PrimType passed in the payload and then using this info to correctly interpret the number of vertices passed in the payload.

0 Enable

Format:	Enable

Specifies whether the GS stage is enabled or disabled (pass-through).

3DSTATE_GS

8 / 31 — Control Data Format

Format:	U1

This field specifies the format of the control data header (if any).

Value	Name	Description
0h	CUT	The control data header contains cut bits.
1h	SID	The control data header contains StreamID bits. . Output Topology must be set to POINTLIST, or behavior is UNDEFINED.

30 — Static Output

Format:	Enable

Specifies whether the GS shader outputs a static number of vertices per invocation.
If this bit is clear, the number of vertices output by each GS shader invocation is stored by the GS thread at the very beginning of the output URB entry (see GS URB Entry section below).

29:27 — Reserved

Format:	MBZ

26:16 — Static Output Vertex Count

Format:	U11 Count of object vertices

If GSEnable is set and StaticOutput is set, this field specifies the total number of vertices output each GS shader invocation.
If **GSEnable** is set and StaticOutput is clear (variable GS output), the total number of vertices output by a GS shader invocation is stored by the thread at the very beginning of the output URB entry. This field is then ignored. (See GS URB Entry below).

15:9 — Reserved

Format:	MBZ

8:0 — Maximum Number of Threads

Format:	U9-1 Thread count

Specifies the maximum number of simultaneous threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance.

Value	Name	Description
[7,335]		indicating thread count of [8,336]

9 / 31:28 — Reserved

Format:	MBZ

27 — Reserved

3DSTATE_GS

26:21 Vertex URB Entry Output Read Offset

Format:	U6

Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB by SBE.

Value	Name
[0,63]	

20:16 Vertex URB Entry Output Length

Format:	U5

Specifies the amount of URB data written for each Vertex URB entry, in 256-bit register increments.

Value	Name
[1,16]	

Programming Notes
This length does not include the vertex header.

15:8 User Clip Distance Clip Test Enable Bitmask

Format:	Enable[8]

This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept / must clip determination needs to be made.
DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.

7:0 User Clip Distance Cull Test Enable Bitmask

Format:	Enable[8]

This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept determination needs to be made (does not cause a must clip).
DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.

3DSTATE_HIER_DEPTH_BUFFER

3DSTATE_HIER_DEPTH_BUFFER

Source: RenderCS

Length Bias: 2

Description

This command sets the surface state of the hierarchical depth buffer, delivered as a pipelined state command. However, the state change pipelining isn't completely transparent (see restriction below).

WM HW will internally manage the draining pipe and flushing of the caches when this command is issued. The PIPE_CONTROL restrictions are removed.

Programming Notes

Restriction: Prior to changing Depth/Stencil Buffer state (i.e., any combination of 3DSTATE_DEPTH_BUFFER, 3DSTATE_CLEAR_PARAMS, 3DSTATE_STENCIL_BUFFER, 3DSTATE_HIER_DEPTH_BUFFER) SW must first issue a pipelined depth stall (PIPE_CONTROL with Depth Stall bit set, followed by a pipelined depth cache flush (PIPE_CONTROL with Depth Flush Bit set, followed by another pipelined depth stall (PIPE_CONTROL with Depth Stall Bit set), unless SW can otherwise guarantee that the pipeline from WM onwards is already flushed (e.g., via a preceding MI_FLUSH).

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 07h 3DSTATE_HIER_DEPTH_BUFFER Format: OpCode
	15:8	**Reserved** Format: MBZ

	4h	13-16 Samplers	between 13 and 16 samplers used
	5h-7h	Reserved	Reserved

26 Reserved

Format:	MBZ

25:18 Binding Table Entry Count

Format:	U8

When HW Generated Binding Table is disabled:
Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state.
Note: For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache.

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.

17 Thread Dispatch Priority
Specifies the priority of the thread for dispatch

Value	Name	Description
0h	Normal	Normal Priority
1h	High	High Priority

16 Floating Point Mode
Specifies the initial floating point mode used by the dispatched thread.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 Rules
1h	alternate	Use alternate rules

15:14 Reserved

Format:	MBZ

13 Illegal Opcode Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment.

12 Software Exception Enable

Format:	Enable

This bit gets loaded into EU CRO1[13] (note the bit # difference). See Exceptions and ISA Execution Environment.

11:8 Reserved

Format:	MBZ

3DSTATE_HS

	7:0	**Reserved** Format: MBZ
2	31	**Enable** Format: Enable Specifies whether the HS function is enabled or disabled (pass-through). If ENABLED MI_TOPOLOGY_FILTER must be used to silently discard any topologies that the HS kernel is not expecting. E.g., if the HS kernel is expecting PATCHLIST_32 topologies, MI_TOPOLOGY_FILTER must be set to PATCHLIST_32 so only those topologies can reach the enabled HS. **Programming Notes** The tessellation stages (HS, TE and DS) must be enabled/disabled as a group. I.e., draw commands can only be issued if all three stages are enabled or all three stages are disabled, otherwise the behavior is UNDEFINED.
	30	**Reserved** Format: MBZ
	29	**Statistics Enable** Format: Enable This bit controls whether HS-unit-specific statistics register(s) will increment (for each patch).
	28:27	**Reserved** Format: MBZ

	17	**Reserved** Format: MBZ
	16:8	**Maximum Number of Threads** Format: U9-1 Specifies the maximum number of simultaneous threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance. **Value** / **Name** / **Description** [0,335] / / indicating thread count of [1,336]
	7:5	**Reserved** Format: MBZ
	4	**Reserved** Format: MBZ

3DSTATE_HS

	3:0	**Instance Count** Format: U4-1 This field determines the number of threads (minus one) spawned per input patch. If the HS kernel uses a barrier function, software must restrict the **Instance Count** to the number of threads that can be simultaneously active within a subslice. Factors which must be considered includes scratch memory availability. **Value** / **Name** / **Description** [0,15] / / representing [1,16] instances **Programming Notes** Instance Count must be programmed to 0 (1 instance) whenever DispatchMode is programmed to DUAL_PATCH.
3..4	63:6	**Kernel Start Pointer** Format: InstructionBaseOffset[63:6]Kernel This field specifies the starting location (1st GEN core instruction) of the kernel program run by threads spawned by this FF unit. It is specified as a 64-byte-granular offset from the Instruction Base Address.
	5:0	**Reserved** Format: MBZ
5..6	63:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[63:10] **Value** / **Name** / **Description** [0,31] / / Specifies the location of the scratch space area allocated to this FF unit, specified as a 1KB-granular offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space.
	9:4	**Reserved** Format: MBZ
	3:0	**Per-Thread Scratch Space** Format: U4 power of 2 Bytes over 1K Bytes Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit. The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. **Value** / **Name** / **Description** [0,11] / / Indicating[1K Bytes, 2M Bytes

3DSTATE_HS

7 — 31:29 — Reserved

Format:	MBZ

28 — Dispatch GRF Start Register For URB Data [5]

Format:	U1

Specifies bit [5] of the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload. The **Dispatch GRF Start Register For URB Data [4:0]** field is used to specify bits [4:0] of the starting GRF register number.

27 — Single Program Flow

Format:	Enable

Specifies the initial condition of the kernel program as either a single program flow (SIMDnxm with m = 1) or as multiple program flows (SIMDnxm with m > 1). See CR0 description in *ISA Execution Environment*.

Value	Name	Description
0h	Reserved	
1h	Enable	Single Program Flow Enabled

26 — Vector Mask Enable

Format:	U1 Enumerated Type

Upon subsequent HS thread dispatches, this bit is loaded into the EU's Vector Mask Enable (VME, cr0.0[3]) thread state. Refer to the EU documentation for the definition and use of VME state.

Value	Name	Description
0h	Dmask	The EU will use the Dispatch Mask (supplied by the HS stage) for instruction execution.
1h	Vmask	The EU will use the Vector Mask (derived from the Dispatch Mask) for instruction execution.

Programming Notes
Under normal conditions SW shall specify DMask, as the HS stage will provide a Dispatch Mask appropriate to SIMD4x2 or SIMD8 thread execution (as a function of dispatch mode). E.g., for SIMD4x2 thread execution, the HS state will generate a Dispatch Mask that is equal to what the EU would use as a Vector Mask. For SIMD8 execution there is no known usage model for use of Vector Mask (as there is for PS shaders).

25 — Accesses UAV

Format:	Enable

This field must be set when HS has a UAV access

Programming Notes
This field must not be set when HS Function Enable is disabled.

3DSTATE_HS

24 Include Vertex Handles

Format:	Boolean

If set, all the input Vertex URB handles are included in payloads.
This field is ignored if **HS Function Enable** is DISABLED.

Programming Notes

Programming Restriction:
This field must be set if value if **Vertex URB Entry Read Length** is cleared to zero.

23:19 Dispatch GRF Start Register For URB Data

Format:	U5

Description

Specifies the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload.
This field is ignored if **HS Function Enable** is DISABLED.

The Dispatch GRF Start Register for URB Data [5] field is used to extend the range of the starting GRF register number to [0,63].

Value	Name	Description
[0,31]		indicating bits [4:0] of the GRF number

Programming Notes

When Include Vertex Handles is set for non-instanced 8_PATCH dispatch of PATCHLIST_30..32 objects, pushed vertex data and/or pushed constants cannot be used as they would need to start in the payload beyond the range of this field (i.e., beyond R31). When Include PrimitiveID is also set, this issue extends to non-instanced 8_PATCH dispatch of PATCHLIST_29..32 objects.

18:17 Dispatch Mode

Format:	U2

This field is unused to set the current thread dispatch mode for the HS stage.

Value	Name	Description
0h	SINGLE_PATCH	HS threads are passed inputs and an output handle associated with a single input patch.
1h	DUAL_PATCH	HS threads are passed inputs and an output handle associated with (up to) two input patches. Patch 0 data is passed in the four lower channels while Patch 1 data (if present) is passed in the four upper channels. Restrictions: Only valid for 4 or fewer input control points (PATCHLIST_4 and below). SW is expected to use MI_TOPOLOGY_FILTER to ensure only patches with the expected # of ICPs are processed by the pipeline when HS is enabled.
2h	8_PATCH	HS threads are passed inputs and an output handle associated with (up to) 8 patches in SIMD8 fashion. See 8_PATCH Thread Payload.

3DSTATE_HS

		3h Reserved
	16:11	**Vertex URB Entry Read Length** Format: U6 Specifies the amount of URB data read and passed in the thread payload for each Vertex URB entry, in 256-bit register increments. This field is ignored if HS Function Enable is DISABLED. Value: [0,63] — Name: **Programming Notes** **Programming Restriction:** This field must be a non-zero value if **Include Vertex Handles** is cleared to zero.
	10	**Reserved** Format: MBZ
	9:4	**Vertex URB Entry Read Offset** Format: U6 Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB before being included in the thread payload. This offset applies to all Vertex URB entries passed to the thread. This field is ignored if HS Function Enable is DISABLED. Value: [0,63] — Name:
	3:1	**Reserved** Format: MBZ
	0	**Include Primitive ID** Format: Enable If set, R1 of the payload is written with Primitive ID value(s). If clear, these Primitive IDs are not included in the payload R1. **Programming Notes** This field is only used when DUAL_PATCH DispatchMode is specified. In SINGLE_PATCH, the single Primitive ID is always passed in R0.
8	31:0	**Reserved** Format: MBZ

3DSTATE_INDEX_BUFFER

3DSTATE_INDEX_BUFFER

Source: RenderCS

Length Bias: 2

This command is used to specify the current IB state used by the VF function. At most one IB is defined and active at any given time.NOTES: The IB must be specified before any RANDOM 3D_PRIMITIVE commands are issued It is possible to have vertex elements source completely from generated ID values and therefore not require any Index Buffer accesses. In this case, VF function will simply ignore the Index Buffer state.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 0Ah 3DSTATE_INDEX_BUFFER Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 3h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:11	**Reserved** Format: MBZ
	10	**Reserved** Format: MBZ
	9:8	**Index Format** Format: U2 Enumerated type This field specifies the data format of the index buffer. All index values are UNSIGNED. Value: 0h — Name: BYTE

3DSTATE_INDEX_BUFFER

		1h: WORD 2h: DWORD
	7	**Reserved** Format: MBZ
	6:0	**Memory Object Control State** Format: MEMORY_OBJECT_CONTROL_STATE Specifies the memory object control state for this index buffer.
2..3	63:0	**Buffer Starting Address** Format: GraphicsAddress[63:0]Index_Buffer_Entry This field contains the size-aligned (as specified by Index Format) Graphics Address LSBs of the first element of interest within the index buffer. Software must program this value with the combination (sum) of the base address of the memory resource and the byte offset from the base address to the starting structure within the buffer. **Programming Notes** Index Buffers can only be allocated in linear (not tiled) graphics memory.
4	31:0	**Buffer Size** Format: U32 Count of bytes This field specifies the size of the buffer in bytes. Index accesses which straddle or go past the end of the buffer will return 0..Note that BufferSize=0 indicates that there is no valid data in the buffer. **Value** / **Name** [0, FFFFFFFFh]

3DSTATE_LINE_STIPPLE

3DSTATE_LINE_STIPPLE

Source: RenderCS

Length Bias: 2

The 3DSTATE_LINE_STIPPLE command is used to specify state variables used in the Line Stipple function.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 1h 3DSTATE_NONPIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 08h 3DSTATE_LINE_STIPPLE Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**Dword Length** Default Value: 1h Excludes Dword (0,1) Format: =n Total Length - 2
1	31	**Modify Enable (Current Repeat Counter, Current Stipple Index)** Format: Enable Modify enable for **Current Repeat Counter** and **Current Stipple Index** fields. **Programming Notes** It is provided only for HW-generated commands as part of context save/restore. SW must initilize the current repeat counter, current stipple count fields if it sets this bit to enable. SW must set this bit to reset the stipple count.
	30	**Reserved** Format: MBZ
	29:21	**Current Repeat Counter** Format: U9 This field sets the HW-internal repeat counter state. SW must initilize it to 1 if the modify enable is set.

3DSTATE_LINE_STIPPLE

	20	**Reserved** Format: MBZ
	19:16	**Current Stipple Index** Format: U4 This field sets the HW-internal stipple pattern index. SW must initialize it to 0 if the modify enable is set.
	15:0	**Line Stipple Pattern** Format: 16 bit mask Bit 15 = most significant bit, Bit 0 = least significant bit Specifies a pattern used to mask out bit specific pixels while rendering lines.
2	31:15	**Line Stipple Inverse Repeat Count** Format: U1.16 Range: [0.00390625, 1.0] Specifies the inverse (truncated) of the repeat count for the line stipple function.
	14:9	**Reserved** Format: MBZ
	8:0	**Line Stipple Repeat Count** Format: U9 Specifies the repeat count for the line stipple function.

Value	Name
[1, 256]	

3DSTATE_MONOFILTER_SIZE

3DSTATE_MONOFILTER_SIZE

Source: RenderCS

Length Bias: 2

This state specifies the size of the filter which is used when filtering in MAPFILTER_MONO mode.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 1h 3DSTATE_NONPIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 11h 3DSTATE_MONOFILTER_SIZE Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:6	**Reserved** Format: MBZ
	5:3	**Monochrome Filter Width** Format: U3 This field specifies the width of the monochrome filter. It is ignored if the monochrome filter is not enabled. Value: [1,7] — Name:

3DSTATE_MONOFILTER_SIZE		
	2:0	**Monochrome Filter Height** Format: U3 This field specifies the height of the monochrome filter. It is ignored if the monochrome filter is not enabled. **Value** / **Name** [1,7]

3DSTATE_MULTISAMPLE

3DSTATE_MULTISAMPLE

Source: RenderCS

Length Bias: 2

The 3DSTATE_MULTISAMPLE command is used to specify multisample state associated with the current render target/depth buffer.

Programming Notes

It is illegal to render to surfaces with multiple different values of the state fields in this command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 0Dh 3DSTATE_MULTISAMPLE Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:6	**Reserved** Format: MBZ
	5	**Pixel Position Offset Enable** Format: Enable Enables the device to offset pixel positions by 0.5 both in horizontal and vertical directions. **Programming Notes** Setting this field along with setting the Pixel Location to upper left and number of multisamples to greater than one will cause the device to offset pixel postions by 0.5 both in horizontal and vertical directions.

3DSTATE_MULTISAMPLE

It is to be noted this is done to adjust the pixel co-ordinate system to DX9 like, so any WM_HZ_OP screen space rectangles (eg: legacy HiZ Clear, Resolve etc) generated internally by driver in this mode needs to be aware of this offset adjustment and send the rectangles according to alignment restriction taking this offset adjustment into consideration.
SW can choose to set this bit only for DX9 API. DX10/OGL API's should not have any effect by setting or not setting this bit.

4 Pixel Location

Format:	U1

This field specifies where the device evaluates "pixel" (vs. centroid or sample) values/attributes.

Value	Name	Description
0h	CENTER	Use the pixel center (0.5, 0.5 offset)
1h	UL_CORNER	Use the pixel upper-left corner

Programming Notes

The programming of this field is assumed to be a function of the API being supported. Specifically, it is expected that OpenGL and DX10+ APIs require CENTER selection, while DX9- APIs require UL_CORNER selection.

When 3DSTATE_RASTER::**ForcedSampleCount** is other than NUMRASTSAMPLES_0, this field must be 0h.

3:1 Number of Multisamples

Format:	U3

This field specifies how many samples/pixel exist in all RTs and the Depth Buffer, as log2(#samples). This field is valid regardless of the setting of **Multisample Rasterization Mode**.

Value	Name	Description
0h	1	1 sample/pixel
1h	2	2 samples/pixel
2h	4	4 samples/pixel
3h	8	8 samples/pixel
4h	16	16 samples/pixel
5h-7h	Reserved	

Programming Notes

The setting of this field must match the **Number of Multisamples** field in SURFACE_STATE of all bound render targets.

0 Reserved

Format:	MBZ

3DSTATE_POLY_STIPPLE_OFFSET

3DSTATE_POLY_STIPPLE_OFFSET

Source: RenderCS

Length Bias: 2

The 3DSTATE_POLY_STIPPLE_OFFSET command is used to specify the origin of the repeated screen-space Polygon Stipple Pattern as an X, Y offset from the Color Buffer origin.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 1h 3DSTATE_NONPIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 06h 3DSTATE_POLY_STIPPLE_OFFSET Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**Dword Length** Default Value: 0h Excludes Dword (0,1) Format: =n Total Length - 2
1	31:13	**Reserved** Format: MBZ
	12:8	**Polygon Stipple X Offset** Format: U5 Specifies a 5 bit x address offset in the poly stipple pattern Value: [0,31] — Name:
	7:5	**Reserved** Format: MBZ

3DSTATE_POLY_STIPPLE_OFFSET		
	4:0	**Polygon Stipple Y Offset** Format: U5 Specifies a 5 bit y address offset in the poly stipple pattern

Value	Name
[0,31]	

3DSTATE_POLY_STIPPLE_PATTERN

3DSTATE_POLY_STIPPLE_PATTERN

Source: RenderCS

Length Bias: 2

The 3DSTATE_POLY_STIPPLE_PATTERN command is used to specify the 32x32 Polygon Stipple Pattern used in the Polygon Stipple function of the WM unit.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 1h 3DSTATE_NONPIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 07h 3DSTATE_POLY_STIPPLE_PATTERN Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**Dword Length** Default Value: 1Fh Excludes Dword (0,1) Format: =n Total Length - 2
1..32	31:0	**Pattern Row** Format: 32 bit mask Bit 31 = upper left corner, Bit 0 = upper right corner of first row. Specifies a pattern used by Polygon Stipple to mask out specific pixels of every 32x32 area rendered.

3DSTATE_PS_BLEND

3DSTATE_PS_BLEND		
Source:	RenderCS	
Length Bias:	2	

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 4Dh 3DSTATE_PS_BLEND Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31	**Alpha To Coverage Enable** Format: Enable If set, indicates that AlphaToCoverage is on RT[0], since this bit must be set the same for all RTs in the MRT case.
	30	**Has Writeable RT** Format: Enable When set indicates the there is at least one non-null RT w/ at least one channel write enabled
	29	**Color Buffer Blend Enable** Format: Enable When set indicates that RT[0] has color buffer blend enabled.

3DSTATE_PS_BLEND

	28:24	**Source Alpha Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Indicates the "source factor" in alpha Color Buffer Blending stage for RT[0]
	23:19	**Destination Alpha Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Indicates the "destination factor" in alpha Color Buffer Blending stage for RT[0]
	18:14	**Source Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Indicates the "source factor" in Color Buffer Blending stage for RT[0]
	13:9	**Destination Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Indicates the "destination factor" in Color Buffer Blending stage for RT[0]
	8	**Alpha Test Enable** Format: Enable Indicates the AlphaTestEnable for RT[0]
	7	**Independent Alpha Blend Enable** Format: Enable Indicates the Independent Alpha Blend Enable for RT[0] When enabled, the other fields in this instruction control the combination of the alpha components in the Color Buffer Blend stage. When disabled, the alpha components are combined in the same fashion as the color components.
	6:0	**Reserved** Format: MBZ

3DSTATE_PS

3DSTATE_PS

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 20h 3DSTATE_PS Format: OpCode

1..2	63:6	**Kernel Start Pointer 0** Format: InstructionBaseOffset[63:6]Kernel Specifies the 64-byte aligned address offset of the first instruction in the kernel[0]. This pointer is relative to the **Instruction Base Address.**
	5:0	**Reserved** Format: MBZ
3	31	**Single Program Flow** Single Program Flow (SPF) specifies the initial condition of the kernel program as either a single program flow (SIMDnxm with m = 1) or as multiple program flows (SIMDnxm with m > 1). See CR0 description in ISA Execution Environment. Value / Name / Description 0h / Multiple / Multiple Program Flows 1h / Single / Single Program Flows

3DSTATE_PS

30 Vector Mask Enable

Format:	Enable

When SPF=0, Vector Mask Enable (VME) specifies which mask to use to initialize the initial channel enables. When SPF=1, VME specifies which mask to use to generate execution channel enables.

Value	Name	Description
0h	Dmask	Channels are enabled based on the dispatch mask
1h	Vmask	Channels are enabled based on the vector mask

29:27 Sampler Count

Specifies how many samplers (in multiples of 4) the vertex shader 0 kernel uses. Used only for prefetching the associated sampler state entries.

Value	Name	Description
[0,4]		
0h	No Samplers	no samplers used
1h	1-4 Samplers	between 1 and 4 samplers used
2h	5-8 Samplers	between 5 and 8 samplers used
3h	9-12 Samplers	between 9 and 12 samplers used
4h	13-16 Samplers	between 13 and 16 samplers used
5h-7h		Reserved

26 Single Precision Denormal Mode

Specifies the single precision denornal mode used by the dispatched thread.

Value	Name	Description
0h	Flushed to Zero	Single Precision denormals are flushed to zero
1h	Retained	Single Precision denormals are retained

25:18 Binding Table Entry Count

Description
Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state. **Note:** For kernels using a large number of binding table entries, it may be advantageous to set this field to zero to avoid prefetching too many entries and thrashing the state cache. This field is ignored if [PS Function Enable] is DISABLED.
When [HW Generated Binding Table] bit is enabled: This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched. See 3D Pipeline for more information.

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be

3DSTATE_PS

generated at JIT time.

17 Thread Dispatch Priority

Specifies the priority of the thread for dispatch.

Value	Name	Description
0h	Normal	Normal Priority
1h	High	High Priority

16 Floating Point Mode

Specifies the floating point mode used by the dispatched thread.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 rules
1h	Alternate	Use alternate rules

15:14 Rounding Mode

Specifies the rounding mode used by the dispatched thread.

Value	Name	Description
0h	RTNE	Round to Nearest Even
1h	RU	Round toward +infinity
2h	RD	Round toward -infinity
3h	RTZ	Round toward zero

13 Illegal Opcode Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment.

12 Reserved

This bit gets loaded into EU CR0.1[13] (note the bit # difference). See Exceptions and ISA Execution Environment.

6:0 Reserved

3DSTATE_PS

		Format: MBZ
4..5	63:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[63:10]ScratchSpace Specifies the 1k-byte aligned address offset to scratch space for use by the kernel. This pointer is relative to the General State Base Address. **Programming Notes** Scratch Space per slice is computed based on 4 sub-slices. SW must allocate scratch space enough so that each slice has 4 slices allowed.
	9:4	**Reserved** Format: MBZ
	3:0	**Per Thread Scratch Space** Format: U4 Specifies the amount of scratch space allowed to be used by each thread. The driver must allocate enough contiguous scratch space, pointed to by the Scratch Space Pointer, to ensure that the Maximum Number of Threads each get Per Thread Scratch Space size without exceeding the driver-allocated scratch space. **Value** | **Name** [0,11] | indicating [1k bytes, 2M bytes] in powers of two
6	31:23	**Maximum Number of Threads Per PSD** Format: U8-1 Representing Thread Count Range = [1, 63] --> [2, 64] threads. Specifies the maximum number of simultaneous threads allowed to be active per PSD. With one PSD per subslice, the maximum number of PS threads in the system is this field multiplied by the number of enabled subslices in the current configuration. **Programming Notes** If this field is changed between 3DPRIMITIVE commands, a PIPE_CONTROL command with **Stall at Pixel Scoreboard** set is required to be issued.
	22:12	**Reserved** Format: MBZ
	11	**Push Constant Enable** Format: Enable This field must be enabled if the sum of the **PS Constant Buffer [3:0] Read Length** fields in 3DSTATE_CONSTANT_PS is nonzero, and must be disabled if the sum is zero.
	10	**Reserved** Format: MBZ
	9	**Reserved** Format: MBZ

3DSTATE_PS

8 — Render Target Fast Clear Enable

Format:	Enable

This field is set to enable fast clear of the bound render targets. See "Render Target Fast Clear" for restrictions on enabling this field.

Programming Notes
When this bit is set, corresponding BTI for the render target that is being cleared must be equal to 0.
When this bit is set, RENDER_SURFACE_STATE type must not be NULL.

7:6 — Render Target Resolve Type

Format:	U2 Enumerated Type

Specifies what type of Render Target Resolve is needed for the surface to be consumed properly by the end Client. Programming notes below.

Value	Name	Description	Programming Notes
0h	RESOLVE_DISABLED	No Resolve Needed	
1h	RESOLVE_PARTIAL	Partial resolve is for resolving RT for clear values i.e. it leaves no cache lines at implied clear value.	Display engine does not support unresolved clear values in the display buffer, hence this resolve is required before binding any compressed RT to the display via flip commands. If non 0/1 clear values are used, software must perform partial resolve before binding cleared render target as texture.
2h	Reserved		
3h	RESOLVE_FULL	Full Resolve is for Resolving RT for Clear/Compressed to Uncompressed State	

Programming Notes
When this bit is set, corresponding BTI for the render target that is being resolved must be equal to 0.
When this bit is set, RENDER_SURFACE_STATE type must not be NULL.

5 — Reserved

Format:	MBZ

4:3 — Position XY Offset Select

Format:	U2 Enumerated Type

This field specifies if/what Position XY Offset values are passed in the PS payload. Note that these are per-slot (pixel|sample) offsets, and therefore separate from the subspan XY coordinates passed in R1.

3DSTATE_PS

Value	Name	Description
0h	POSOFFSET_NONE	No Position XY Offsets are included in the PS payload.
1h	Reserved	
2h	POSOFFSET_CENTROID	Position XY Offsets will be passed in the PS payload, and these will reflect the Centroid position(s).
3h	POSOFFSET_SAMPLE	Position XY Offsets will be passed in the PS payload, and these will reflect the multisample position(s).

Programming Notes
SW Recommendation: If the PS kernel needs the Position Offsets to compute a Position XY value, this field should match Position ZW Interpolation Mode to ensure a consistent position.xyzw computation
If the PS kernel does not need the Position XY Offsets to compute a Position Value, then this field should be programmed to POSOFFSET_NONE, as the PS kernel should be using the various barycentric inputs to evaluate other-than-position attributes. However, this field can be used to pass Centroid or Sample offsets in the payload for special test modes (e.g., where barycentric coordinates are computed in the PS vs. being HW-generated and passed in the payload).
MSDISPMODE_PERSAMPLE is required in order to select POSOFFSET_SAMPLE.

2

32 Pixel Dispatch Enable

Format:	Enable

Enables the Windower to dispatch 8 subspans in one payload. Variable Pixel Dispatch in Section: Pixel Grouping (Dispatch size) control for valid pixel dispatch combinations.

Programming Notes
When NUM_MULTISAMPLES = 16 or FORCE_SAMPLE_COUNT = 16, SIMD32 Dispatch must not be enabled for PER_PIXEL dispatch mode.

1

16 Pixel Dispatch Enable

Format:	Enable

Enables the Windower to dispatch 4 subspans in one payload. Variable Pixel Dispatch in Section: Pixel Grouping (Dispatch size) control for valid pixel dispatch combinations.

0

8 Pixel Dispatch Enable

Format:	Enable

Enables the Windower to dispatch 2 subspans from 1 object (polygon) in one payload. Variable Pixel Dispatch in Section: Pixel Grouping (Dispatch size) control for valid pixel dispatch combinations.

Programming Notes
When Render Target Fast Clear Enable is ENABLED or Render Target Resolve Type = RESOLVE_PARTIAL or RESOLVE_FULL, this bit must be DISABLED.

3DSTATE_PS

7	31:23	**Reserved** Format: MBZ
	22:16	**Dispatch GRF Start Register For Constant/Setup Data 0** Format: U7 Specifies the starting GRF register number for the Constant/Setup portion of the thread payload for kernel[0]. Value: [0,127] — Name:
	15	**Reserved** Format: MBZ
	14:8	**Dispatch GRF Start Register For Constant/Setup Data 1** Format: U7 Specifies the starting GRF register number for the Constant/Setup portion of the thread payload for kernel[1]. Value: [0,127] — Name:
	7	**Reserved** Format: MBZ
	6:0	**Dispatch GRF Start Register For Constant/Setup Data 2** Format: U7 Specifies the starting GRF register number for the Constant/Setup portion of the thread payload for kernel[2]. Value: [0,127] — Name:
8..9	63:6	**Kernel Start Pointer 1** Format: InstructionBaseOffset[63:6]Kernel Specifies the 64-byte aligned address offset of the first instruction in kernel[1]. This pointer is relative to the Instruction Base Address.
	5:0	**Reserved** Format: MBZ
10..11	63:6	**Kernel Start Pointer 2** Format: InstructionBaseOffset[63:6]Kernel Specifies the 64-byte aligned address offset of the first instruction in kernel[2]. This pointer is relative to the **Instruction Base Address**.
	5:0	**Reserved** Format: MBZ

3DSTATE_PS_EXTRA

3DSTATE_PS_EXTRA

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 4fh 3DSTATE_PS_EXTRA Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31	**Pixel Shader Valid** Format: Enable When set indicates a valid pixel shaderWhen this bit clear the rest of this command should also be clear.
	30	**Pixel Shader Does not write to RT** Format: Enable When set indicates the pixel shader does not write to render target. **Programming Notes** When Pixel Shader writes to UAV but does not write to RT, a dummy render target write is required to convey EOT to the PS dispatch function. Hence, this bit must be reset in this case. Whenever, there is a render target write message even to the NULL render target, this bit must be reset. When Pixel Shader Kills Pixel is set, SW must perform a dummy render target write from the shader and not set this bit, so that Occlusion Query is correct.

3DSTATE_PS_EXTRA

29 **oMask Present to Render Target**

Format:	Enable

This bit is inserted in the PS payload header and made available to the DataPort (either via the message header or via header bypass) to indicate that oMask data from the shader (one or two phases) is included in Render Target Write messages. If present, the oMask data is used to mask off samples.

28 **Pixel Shader Kills Pixel**

Format:	Enable

This bit, if ENABLED, indicates that the PS kernel has the ability to kill (discard) pixels or samples, other than due to depth or stencil testing. This bit is required to be ENABLED in the following situations:

- The API pixel shader program contains "killpix" or "discard" instructions, or other code in the pixel shader kernel that can cause the final pixel mask to differ from the pixel mask received on dispatch.

27:26 **Pixel Shader Computed Depth Mode**

Format:	U2 Enumerated Type

This field specifies the computed depth mode for the pixel shader.

Value	Name	Description
0h	PSCDEPTH_OFF	Pixel shader does not compute depth
1h	PSCDEPTH_ON	Pixel shader computes depth with no guarantee as to its value
2h	PSCDEPTH_ON_GE	
3h	PSCDEPTH_ON_LE	Pixel shader computes depth and guarantees that oDepth <= SourceDepth If the Position ZW interpolation mode in 3DSTATE_WM does not match the DX Multisample Rasterization mode in 3DSTATE_RASTER, HW will internally convert to PSCDEPTH_ON.

Programming Notes

If this field is set to any value other than PSCDEPTH_OFF, a multi-phase shader (i.e. dispatch RATE_COARSE or RATE_PIXEL with pixel/sample loops or sample loop respectively) must output depth and render targets only at the last phase.

25 **Force Computed Depth**

Format:	Enable

Programming Notes

This field should be left DISABLED. This field should not be tested for functional validation.

24 **Pixel Shader Uses Source Depth**

Format:	Enable

This bit, if ENABLED, indicates that the PS kernel requires the source depth value (vPos.z) to be

3DSTATE_PS_EXTRA

		passed in the payload. The source depth value is interpolated according to the Position ZW Interpolation Mode state.
	23	**Pixel Shader Uses Source W** Format: Enable This bit, if ENABLED, indicates that the PS kernel requires the interpolated source W value (vPos.w) to be passed in the payload. The W value is interpolated according to the Position ZW Interpolation Mode state.
	22	**Reserved** Format: MBZ
	21:18	**Reserved** Format: MBZ
	17	**Reserved** Format: MBZ
	16:11	**Reserved** Format: MBZ
	10	**Reserved** Format: MBZ
	9	**Reserved**
	8	**Attribute Enable** Format: Enable This field must be enabled if the Number of SF Output Attributes field in 3DSTATE_SBE is nonzero, and must be disabled if that field is zero.
	7	**Pixel Shader Disables Alpha To Coverage** Format: Enable When set indicates the pixel shader AlphaToCoverage should be disabled due to oMask output. The setting of this bit is API dependent.
	6	**Pixel Shader Is Per Sample** Format: Enable This bit, when ENABLED, indicates that the pixel shader is dispatched at the per sample shading rate. If the bit is DISABLED, the pixel shader is dispatched at the per pixel rate. **Programming Notes** This bit must NOT be set when PS is used to do clear MSRTs with Fast Clear Optimization Enabled. When NUMRASTSAMPLES is other than 1 (i.e. when FORCED_SAMPLE_COUNT is greater than 1, hence Target Independent Rasterization is enabled) , this bit MUST be DISABLED.
	5	**Pixel Shader Computes Stencil** Format: Enable This field when set indicates that the pixel shader computes the stencil reference value.

3DSTATE_PS_EXTRA

Programming Notes

If this field is ENABLED, a multi-phase shader (i.e. dispatch RATE_COARSE or RATE_PIXEL with pixel/sample loops or sample loop respectively) must output stencil and render targets only at the last phase.

4 **Reserved**

Format:	MBZ

3 **Pixel Shader Pulls Bary**

Format:	Enable

This bit indicates if Pixel Shader uses Pull Bary i.e. PI message. If this bit is reset, PS does not do Pull Bary.

2 **Pixel Shader Has UAV**

Format:	Enable
Format:	U1 Enumerated Type

This field when set indicates that the pixel shader has a UAV attached to it.

1:0 **Input Coverage Mask State**

Format:	U2

This field indicates the type of input coverage mask that the PS kernel requires to be passed in the payload.

Value	Name	Description
0h	NONE	Pixel shader does not use input coverage masks.
1h	NORMAL	Input Coverage masks based on outer conservatism and factors in SAMPLE_MASKs. If Pixel is conservatively covered, all samples are enabled.
2h	INNER_CONSERVATIVE	Input Coverage masks based on inner conservatism and factors in SAMPLE_MASKs. If Pixel is conservatively fully covered all samples are enabled.
3h	DEPTH_COVERAGE	Input coverage masks are computed after factoring depth/stencil test results, only if Early Depth Stencil Test is enabled. If Early Depth Stencil Test is not enabled, HW uses NORMAL Input Coverage Masks.

3DSTATE_PUSH_CONSTANT_ALLOC_DS

3DSTATE_PUSH_CONSTANT_ALLOC_DS

Source: RenderCS

Length Bias: 2

This command sets up the URB configuration for DS Push Constant Buffer.

Programming Notes

Programming Restriction:

- The sum of the Constant Buffer Offset and the Constant Buffer Size may not exceed the maximum value of the Constant Buffer Size.
- The sum of the constant length programmed in 3DSTATE_CONSTANT_DS must be equal or smaller then the size of the allocated space in the URB including the buffering for half cachelines. See **Push Constant URB Allocation section for more details**.
- The 3DSTATE_CONSTANT_DS must be committed as state prior to shaders generating thread payloads after programming the 3DSTATE_PUSH_CONSTANT_ALLOC_DS.

When gather at set shader is disabled, 3DSTATE_CONSTANT command is committed when 3DPRIMITIVE command is parsed.
When gather at set shader is enabled, commit point on the 3DSTATE_CONSTANT command is a 3DSTATE_BINDING_TABLE_POINTER command.

The 3DSTATE_BINDING_TABLE_POINTER_DS must be reprogrammed prior to the next 3DPRIMITIVE command after programming the 3DSTATE_PUSH_CONSTANT_ALLOC_DS if 3DSTATE_CONSTANT_VS command is committed on a binding table pointer due to Gather at Set Shader feature.

DWord	Bit	Description
0 **Programming Notes:** Workaround: This command must be followed by a PIPE_CONTROL with CS Stall bit set.,	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode

1	31:21	**Reserved** Format: MBZ
	20:16	**Constant Buffer Offset** Format: U5 Specifies the offset of the DS constant buffer into the URB. Value: [0,31] — Name: (0KB - 31KB) Increments of 2KB
	15:6	**Reserved** Format: MBZ
	5:0	**Constant Buffer Size** Format: U6 Specifies the size of the DS constant buffer. This value will determine the amount of data the command stream can pre-fetch before the buffer is full. Value of zero is only valid when constants are not enabled for DS. Value: [0,32] — Name: (0KB - 32KB) Increments of 2KB

3DSTATE_PUSH_CONSTANT_ALLOC_GS

3DSTATE_PUSH_CONSTANT_ALLOC_GS

Source: RenderCS

Length Bias: 2

This command sets up the URB configuration for GS Push Constant Buffer.

Programming Notes

- The sum of the Constant Buffer Offset and the Constant Buffer Size may not exceed the maximum value of the Constant Buffer Size.
- The sum of the constant length programmed in 3DSTATE_CONSTANT_GS must be equal or smaller then the size of the allocated space in the URB including the buffering for half cachelines.
- The 3DSTATE_CONSTANT_GS must be committed as state prior to shaders generating thread payloads after programming the 3DSTATE_PUSH_CONSTANT_ALLOC_GS.

See Push Constant URB Allocation section for more details.

When gather at set shader is disabled, 3DSTATE_CONSTANT command is committed when 3DPRIMITIVE command is parsed.
When gather at set shader is enabled, commit point on the 3DSTATE_CONSTANT command is a 3DSTATE_BINDING_TABLE_POINTER command.

The 3DSTATE_BINDING_TABLE_POINTER_GS must be reprogrammed prior to the next 3DPRIMITIVE command after programming the 3DSTATE_PUSH_CONSTANT_ALLOC_GS if 3DSTATE_CONSTANT_VS command is committed on a binding table pointer due to Gather at Set Shader feature.

DWord	Bit	Description

3DSTATE_PUSH_CONSTANT_ALLOC_HS

3DSTATE_PUSH_CONSTANT_ALLOC_HS

Source: RenderCS

Length Bias: 2

This command sets up the URB configuration for HS Push Constant Buffer.

Programming Notes

Programming Restriction:

- The sum of the Constant Buffer Offset and the Constant Buffer Size may not exceed the maximum value of the Constant Buffer Size.
- The sum of the constant length programmed in 3DSTATE_CONSTANT_HS must be equal or smaller then the size of the allocated space in the URB including the buffering for half cachelines. See **Push Constant URB Allocation section for more details**.
- The 3DSTATE_CONSTANT_HS must be committed as state prior to shaders generating thread payloads after programming the 3DSTATE_PUSH_CONSTANT_ALLOC_HS.

When gather at set shader is disabled, 3DSTATE_CONSTANT command is committed when 3DPRIMITIVE command is parsed.
When gather at set shader is enabled, commit point on the 3DSTATE_CONSTANT command is a 3DSTATE_BINDING_TABLE_POINTER command.

The 3DSTATE_BINDING_TABLE_POINTER_HS must be reprogrammed prior to the next 3DPRIMITIVE command after programming the 3DSTATE_PUSH_CONSTANT_ALLOC_VS if 3DSTATE_CONSTANT_HS command is committed on a binding table pointer due to Gather at Set Shader feature.

3DSTATE_RASTER

3DSTATE_RASTER

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 50h 3DSTATE_RASTER Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 03h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:28	**Reserved** Format: MBZ
	27	**Reserved** Format: MBZ
	26	**Viewport Z Far Clip Test Enable** Format: Enable This field is used to control whether the Viewport Z Far extent is considered in VertexClipTest.
	25	**Reserved** Format: MBZ
	24	**Conservative Rasterization Enable** Format: Enable This field when set enables conservative rasterization rules for all primitives except rectangles,

3DSTATE_RASTER

points and lines. For rectangle, points and lines, setting this bit is ignored by hardware.

Programming Notes
This bit must not be set for primitives with poly-stippling enabled. When this bit is set, sampling mode must be set to "Centre" sampling i.e 3DSTATE_MULTISAMPLE::Pixel Location set to CENTER

23:22 **API Mode**

Software sets this field according to the API's version. These bits are set for DX9 or OGL/DX10.0/DX10.1+/DX11.1 per the following values.

Value	Name
0h	DX9/OGL
1h	DX10.0
2h	DX10.1+
3h	Reserved

21 **Front Winding**

Determines whether a triangle object is considered "front facing" if the screen space vertex positions, when traversed in the order, result in a clockwise (CW) or counter-clockwise (CCW) winding order. Does not apply to points or lines.

Value	Name	Description
0h	Clockwise	FRONTWINDING_CW
1h	Counter Clockwise **[Default]**	FRONTWINDING_CCW

20:18 **Forced Sample Count**

Format:	U3 Enumerated Type

This field specifies how many samples/pixel exist for RT Independent Rasterization

Value	Name	Description
0h	NUMRASTSAMPLES_0	No RT Independent Rasterization
1h	NUMRASTSAMPLES_1	1 rast-sample/pixel
2h	NUMRASTSAMPLES_2	2 rast-samples/pixel
3h	NUMRASTSAMPLES_4	4 rast-samples/pixel
4h	NUMRASTSAMPLES_8	8 rast-samples/pixel
5h	NUMRASTSAMPLES_16	16 rast-samples/pixel
6h-7h	Reserved	

Programming Notes
When 3DSTATE_MULTISAMPLE::Number of Multisamples !=NUMSAMPLES_1, this field mus be either NUMRASTSAMPLES_0 or NUMRASTSAMPLES_1. When 3DSTATE_MULTISAMPLE::Number of Multisamples == NUMSAMPLES_1, this field mus not be NUMRASTSAMPLES_1.

3DSTATE_RASTER

17:16 Cull Mode

Controls removal (culling) of triangle objects based on orientation. The cull mode only applies to triangle objects and does not apply to lines, points or rectangles.

Value	Name	Description
0h	CULLMODE_BOTH	All triangles are discarded (i.e., no triangle objects are drawn)
1h	CULLMODE_NONE **[Default]**	No triangles are discarded due to orientation
2h	CULLMODE_FRONT	Triangles with a front-facing orientation are discarded
3h	CULLMODE_BACK	Triangles with a back-facing orientation are discarded

Programming Notes
Orientation determination is based on the setting of the Front Winding state.

15 Reserved

Format:	MBZ

14 Force Multisampling

This field provides a work around override for the computation of SF_INT::Multisample Rasterization Mode and WM_INT::Multisample Rasterization Mode.

Value	Name	Description
0h	Normal	Multisampling mode is computed by HW according to formula for signal SF_INT::Multisample Rasterization Mode and WM_INT::Multisample Rasterization Mode in vol2a.11 3D Pipeline Windower > Windower Pipelined State > 3DSTATE_WM > 3DSTATE_WM.
1h	Force	Forces the DX Multisampling mode to be used directly

13 Smooth Point Enable

Format:	Enable

Software sets this according to API. When OGL and smooth point rasterization is required, this bit must be set. HW ignores this bit for primitives other than points.

12 DX Multisample Rasterization Enable

Format:	Enable

Software sets this according to the API's multisample enable

Programming Notes
This state only effects how the SF_INT/WM_INT::Multisample Rasterization Mode are set depending on some other states. This state mainly modifies the how the line rendering is done by setting SF_INT/WM_INT::Multisample Rasterization Mode to either OFF* or ON* . Please refer to table under SF_INT::Multisample Rasterization Mode.

11:10 DX Multisample Rasterization Mode

Format:	U2 enumerated type

This field determines whether multisample rasterization is turned on/off, and how the pixel

3DSTATE_RASTER

sample point(s) are defined. Software sets this according to the API's multisample state setting (if any)

Value	Name
0h	MSRASTMODE_ OFF_PIXEL
1h	MSRASTMODE_ OFF_PATTERN
2h	MSRASTMODE_ ON_PIXEL
3h	MSRASTMODE_ ON_PATTERN

Programming Notes
This field is used to directly set the SF_INT/WM_INT::Multisample Rasterization Mode when DX Multisample Rasterization Enable is set. Please refer to equation of SF_INT::Multisample Rasterization Mode.

9 **Global Depth Offset Enable Solid**

Format:	Enable

Enables computation and application of Global Depth Offset for SOLID objects.

8 **Global Depth Offset Enable Wireframe**

Format:	Enable

Enables computation and application of Global Depth Offset when triangles are rendered in WIREFRAME mode.

7 **Global Depth Offset Enable Point**

Format:	Enable

Enables computation and application of Global Depth Offset when triangles are rendered in POINT mode.

6:5 **Front Face Fill Mode**

Format:	U2 enumerated type

This state controls how front-facing triangle and rectangle objects are rendered.

Value	Name	Description
0h	SOLID	Any triangle or rectangle object found to be front-facing is rendered as a solid object. This setting is required when rendering rectangle (RECTLIST) objects.
1h	WIREFRAME	Any triangle object found to be front-facing is rendered as a series of lines along the triangle boundaries (as determined by the topology type and controlled by the vertex EdgeFlags).
2h	POINT	Any triangle object found to be front-facing is rendered as a set of point primitives at the triangle vertices (as determined by the topology type and controlled by the vertex EdgeFlags).
3h	Reserved	

3DSTATE_RASTER

4:3 Back Face Fill Mode

Format:	U2 enumerated type

This state controls how back-facing triangle and rectangle objects are rendered.

Value	Name	Description
0h	SOLID	Any triangle or rectangle object found to be back-facing is rendered as a solid object. This setting is required when rendering rectangle (RECTLIST) objects.
1h	WIREFRAME	Any triangle object found to be back-facing is rendered as a series of lines along the triangle boundaries (as determined by the topology type and controlled by the vertex EdgeFlags).
2h	POINT	Any triangle object found to be back-facing is rendered as a set of point primitives at the triangle vertices (as determined by the topology type and controlled by the vertex EdgeFlags).
3h	Reserved	

2 Antialiasing Enable

Format:	Enable

This field enables "alpha-based" line antialiasing.

Programming Notes
This field must be disabled if any of the render targets have integer (UINT or SINT) surface format.

1 Scissor Rectangle Enable

Format:	Enable

Enables operation of Scissor Rectangle.

0 Viewport Z Near Clip Test Enable

Format:	Enable

This field is used to control whether the Viewport Z Near extent is considered in VertexClipTest.

2 31:0 Global Depth Offset Constant

Format:	IEEE_Float

Specifies the constant term in the Global Depth Offset function.

3 31:0 Global Depth Offset Scale

Format:	IEEE_Float

Specifies the scale term used in the Global Depth Offset function.

4 31:0 Global Depth Offset Clamp

Format:	IEEE_Float

Specifies the clamp term used in the Global Depth Offset function.

3DSTATE_RS_CONSTANT_POINTER

3DSTATE_RS_CONSTANT_POINTER

Source: RenderCS

Length Bias: 2

The 3DSTATE_RS_CONSTANT_POINTER command allows the driver to program an indirect address to either store or load the global section of the RS constant buffers.

Programming Notes

This command will be treated as a NOOP if the Dx9 Constant Buffer Pool is not enabled by the 3DSTATE_DX9_CONST_POOL command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode

1h-3h	Reserved	
4h	PS	Select PS Global Constants

3DSTATE_RS_CONSTANT_POINTER

		5h-7h: Reserved
	27:13	**Reserved** Format: MBZ
	12	**Operation Load or Store** When this bit is set, the resource streamer will load the global constants to the pointer to the global buffer in the hardware based on the **Shader Select** bit. When this bit is clear, the resource streamer will store the global constants to the pointer from the global buffer in the hardware based on the **Shader Select** bit. **Value** / **Name** / **Description** 0h / Store / Store buffer to memory 1h / Load / Load buffer from memory
	11:0	**Reserved** Format: MBZ
2	31:6	**Global Constant Buffer Address** Format: GraphicsAddress[31:6] Specifies the Cache Line Aligned Graphics address of location in memory of where to load or store a copy of the global constant buffer.
	5:0	**Reserved** Format: MBZ
3	31:0	**Global Constant Buffer Address High** Format: GraphicsAddress[63:32] Specifies the Upper portion of the graphics address location in memory of where to load or store a copy of the global constant buffer. Upper 16 bits MBZ.

3DSTATE_SAMPLE_MASK

3DSTATE_SAMPLE_MASK

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 18h 3DSTATE_SAMPLE_MASK Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**Dword Length** Default Value: 0h Excludes Dword (0,1) Format: =n Total Length - 2
1	31:16	**Reserved** Format: MBZ
	15:0	**Sample Mask** Format: 16 bit mask Right-justified bitmask (Bit 0 = Sample0). Number of bits that are used is determined by Num Multisamples (3DSTATE_MULTISAMPLE) A per-multisample-position mask state variable that is immediately and unconditionally ANDed with the sample coverage mask as part of the rasterization process. This mask is applied prior to centroid selection. This mask must be ignored for centroid selection when RTIR is enabled i.e. Forced_Sample_Count > 0. **Programming Notes** • If **Number of Multisamples** is NUMSAMPLES_1, bits 15:1 of this field will be zeroed by HW. • If N**Number of Multisamples** is NUMSAMPLES_2, bits 15:2 of this field will be zeroed by HW. • If **Number of Multisamples** is NUMSAMPLES_4, bits 15:4 of this field will be zeroed by

3DSTATE_SAMPLE_MASK		
		HW. • If **Number of Multisamples** is NUMSAMPLES_8, bits 15:8 of this field will be zeroed by HW. When pixel shader writes to UAV but does not have actual render target write (i.e. no RT is bound to pixel shader, eventhough, RT write message is sent for EOT), appropriate SAMPLE_MASK must be all set depending on Number of Multisamples.

3DSTATE_SAMPLE_PATTERN

3DSTATE_SAMPLE_PATTERN

Source: RenderCS

Length Bias: 2

The 3DSTATE_SAMPLE_PATTERN command is used to specify the sample offsets for all multisample sample modes.

The set of offset used will be selected based on the multisample mode. This is non-pipelined state.

Programming Notes

When programming the sample offsets (for NUMSAMPLES_4 or _8 and MSRASTMODE_xxx_PATTERN), the order of the samples 0 to 3 (or 7 for 8X, or 15 for 16X) must have monotonically increasing distance from the pixel center. This is required to get the correct centroid computation in the device.

3DSTATE_SAMPLER_PALETTE_LOAD0

3DSTATE_SAMPLER_PALETTE_LOAD0

Source: RenderCS

Length Bias: 2

Description
The 3DSTATE_SAMPLER_PALETTE_LOAD0 instruction is used to load 32-bit values into the first texture palette. The texture palette is used whenever a texture with a paletted format (containing "Px [palette0]") is referenced by the sampler.
This instruction is used to load all or a subset of the 256 entries of the first palette. Partial loads always start from the first (index 0) entry.

DWord	Bit	Description

	28	**Force Vertex URB Entry Read Offset** Format: Enable This field provides a work around override for the computation of SBE_INT::Vertex URB Entry Read Offset. If asserted, 3DSTATE_SBE::Vertex URB Entry Read Offset is be used directly. Otherwise, SBE_INT::Vertex URB Entry Read Offset is computed normally.

3DSTATE_SBE

27:22 Number of SF Output Attributes

Format:	U6 count of attributes

Specifies the number of vertex attributes passed from the SF stage to the WM stage (does not include Position).

Value	Name
[0,32]	

21 Attribute Swizzle Enable

Format:	Enable

Enables the SF to perform swizzling on (up to the first 16) vertex attributes. If DISABLED, all vertex attributes are passed through.

20 Point Sprite Texture Coordinate Origin

This state controls how Point Sprite Texture Coordinates are generated (when enabled on a per-attribute basis by Point Sprite Texture Coordinate Enable).

Value	Name	Description
0h	UPPERLEFT	Top Left = (0,0,0,1)Bottom Left = (0,1,0,1)Bottom Right = (1,1,0,1)
1h	LOWERLEFT	Top Left = (0,1,0,1)Bottom Left = (0,0,0,1)Bottom Right = (1,0,0,1)

19 Primitive ID Override Component W

Format:	Enable

If set, the W component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.

18 Primitive ID Override Component Z

Format:	Enable

If set, the Z component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.

17 Primitive ID Override Component Y

Format:	Enable

If set, the Y component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.

16 Primitive ID Override Component X

Format:	Enable

If set, the X component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.

15:11 Vertex URB Entry Read Length

Format:	U5

Specifies the amount of URB data read for each Vertex URB entry, in 256-bit register increments.

3DSTATE_SBE

Value	Name
[1,16]	

Programming Notes

It is UNDEFINED to set this field to 0 indicating no Vertex URB data to be read.This field should be set to the minimum length required to read the maximum source attribute. The maximum source attribute is indicated by the maximum value of the enabled Attribute # Source Attribute if Attribute Swizzle Enable is set, Number of Output Attributes-1 if enable is not set.
read_length = ceiling((max_source_attr+1)/2)

Vertex URB Entry Read Offset (10:5)

Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB.

Primitive ID Override Attribute Select (4:0)

Specifies which attribute is overridden w/ the Primitive ID

Programming Notes

Set all Primitive ID Override Component Select X/Y/Z/W to 0 to indicate there is no Primitive ID override.

Point Sprite Texture Coordinate Enable (2, 31:0)

Format:	Enable[32]

When processing point primitives, the attributes from the incoming point vertex are typically copied to the point object corner vertices. However, if a bit is set in this field, the corresponding Attribute is selected as a Point Sprite Texture Coordinate, in which case each corner vertex is assigned a pre-defined texture coordinate as defined by the Point Sprite Texture Coordinate Origin state bit. Bit 0 corresponds to output Attribute 0.

Constant Interpolation Enable (3, 31:0)

Format:	Enable[32]

This field is a bitmask containing a Constant Interpolation Enable bit for each corresponding attribute. If a bit is set, that attribute will undergo constant interpolation, and the corresponding WrapShortest Enable bits (if defined) will be ignored. If a bit is clear, components which are not enabled for WrapShortest interpolation (if defined) will be linearly interpolated.

Attribute 15 Active Component Format (4, 31:30)

Format:	Attribute_Component_Format

This state indicates which components of Attribute 15 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

Attribute 14 Active Component Format (29:28)

Format:	Attribute_Component_Format

This state indicates which components of Attribute 14 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is

3DSTATE_SBE

		UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	27:26	**Attribute 13 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 13 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	25:24	**Attribute 12 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 12 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	23:22	**Attribute 11 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 11 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	21:20	**Attribute 10 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 10 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	19:18	**Attribute 9 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 9 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	17:16	**Attribute 8 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 8 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	15:14	**Attribute 7 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 7 are being used by the pixel shader Kernel.

3DSTATE_SBE		
		SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	13:12	**Attribute 6 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 6 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	11:10	**Attribute 5 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 5 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	9:8	**Attribute 4 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 4 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	7:6	**Attribute 3 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 3 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	5:4	**Attribute 2 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 2 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	3:2	**Attribute 1 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 1 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	1:0	**Attribute 0 Active Component Format** Format: **Attribute_Component_Format**

3DSTATE_SBE

		This state indicates which components of Attribute 0 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
5	31:30	**Attribute 31 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 31 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	29:28	**Attribute 30 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 30 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	27:26	**Attribute 29 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 29 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	25:24	**Attribute 28 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 28 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	23:22	**Attribute 27 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 27 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	21:20	**Attribute 26 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 26 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

3DSTATE_SBE		
	19:18	**Attribute 25 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 25 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	17:16	**Attribute 24 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 24 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	15:14	**Attribute 23 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 23 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	13:12	**Attribute 22 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 22 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	11:10	**Attribute 21 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 21 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	9:8	**Attribute 20 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 20 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	7:6	**Attribute 19 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 19 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

3DSTATE_SBE		
	5:4	**Attribute 18 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 18 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	3:2	**Attribute 17 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 17 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	1:0	**Attribute 16 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 16 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

3DSTATE_SCISSOR_STATE_POINTERS

3DSTATE_SCISSOR_STATE_POINTERS

Source: RenderCS

Length Bias: 2

The 3DSTATE_SCISSOR_STATE_POINTERS command is used to define the location of the indirect SCISSOR_RECT state.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 0Fh 3DSTATE_SCISSOR_STATE_POINTERS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h DWORD_COUNT_n Format: =n
1	31:5	**Scissor Rect Pointer** Format: DynamicStateOffset[31:5]SCISSOR_RECT*16 Specifies the 32-byte aligned address offset of the SCISSOR_RECT state. This offset is relative to the **Dynamic State Base Address**.
	4:0	**Reserved** Format: MBZ

3DSTATE_SF

3DSTATE_SF

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 13h 3DSTATE_SF Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 2h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:30	**Reserved** Format: MBZ
	29:12	**Line Width** Format: U11.7 Range: [0.0, 2047.9921875] Controls width of line primitives. Setting a Line Width of 0.0 specifies the rasterization of the "thinnest" (one-pixel-wide), non-antialiased lines. Note that this effectively overrides the effect of AAEnable (though the AAEnable state variable is not modified). **Programming Notes** Software must not program a value of 0.0 when running in MSRASTMODE_ON_xxx modes -

3DSTATE_SF

		zero-width lines are not available when multisampling rasterization is enabled. **Restriction** Line widths higher than 40.0 will appear to be thinner than the programmed line width at certain angles. Software must expose the line widths higher than 40 to APIs only if the loss in quality is acceptable. Software must set the "WM_CHIKEN1" register bits "1 and 3" when rendering the AA lines higher than Line width of "40.0".
	11	**Legacy Global Depth Bias Enable** Format: Enable Enables the SF to use the Global Depth Offset Constant state unmodified. If this bit is not set, the SF will scale the Global Depth Offset Constant as described in section Error! Reference source not found. of this document. **Programming Notes** This bit should be set whenever non zero depth bias (Slope, Bias) values are used. Setting this bit may have some degradation of performance for some workloads.
	10	**Statistics Enable** Format: Enable If ENABLED, this FF unit will increment CL_PRIMITIVES_COUNT on behalf of the CLIP stage. If DISABLED, CL_PRIMITIVES_COUNT will be left unchanged. **Programming Notes** This bit should be set whenever clipping is enabled and the Statistics Enable bit is set in CLIP_STATE. It should be cleared if clipping is disabled or Statistics Enable in CLIP_STATE is clear.
	9:2	**Reserved** Format: MBZ
	1	**Viewport Transform Enable** Format: Enable This bit controls the Viewport Transform function.
	0	**Reserved** Format: MBZ
2	31:29	**Reserved** Format: MBZ
	28	**Reserved**
	27:18	**Reserved** Format: MBZ
	17:16	**Line End Cap Antialiasing Region Width**

3DSTATE_SF

		Format: U2 This field specifies the distances over which the coverage of anti-aliased line end caps are computed. **Value** / **Name** / **Description** 0h / 0.5 pixels / 0.5 pixels 1h / 1.0 pixels / 1.0 pixels 2h / 2.0 pixels / 2.0 pixels 3h / 4.0 pixels / 4.0 pixels
	15	**Reserved** Format: MBZ
	14	**Reserved** Format: MBZ
	13	**Reserved**
	12	**Reserved**
	11:0	**Reserved** Format: MBZ
3	31	**Last Pixel Enable** Format: Enable If ENABLED, the last pixel of a diamond line will be lit. This state will only affect the rasterization of Diamond lines (will not affect wide lines or anti-aliased lines). **Programming Notes** Last pixel is applied to all lines of a LINELIST, and only the last line of a LINESTRIP.
	30:29	**Triangle Strip/List Provoking Vertex Select** Format: U2 Selects which vertex of a triangle (in a triangle strip or list primitive) is considered the "provoking vertex". Used for flat shading of primitives.Does current implementation send provoking vertex first? **Value** / **Name** 0h / 0 1h / 1 2h / 2 3h / Reserved
	28:27	**Line Strip/List Provoking Vertex Select** Format: U2 Selects which vertex of a line (in a line strip or list primitive) is considered the "provoking vertex". **Value** / **Name** / **Description** 0h / 0 / Vertex 0

3DSTATE_SF

1h	1	Vertex 1
2h	Reserved	Reserved
3h	Reserved	Reserved

26:25 **Triangle Fan Provoking Vertex Select**

Format:	U2

Selects which vertex of a triangle (in a triangle fan primitive) is considered the "provoking vertex".

Value	Name
0h	0
1h	1
2h	2
3h	Reserved

24:15 **Reserved**

Format:	MBZ

14 **AA Line Distance Mode**

Format:	U1

This bit controls the distance computation for antialiased lines.

Value	Name	Description
1h	AALINEDISTANCE_TRUE	True distance computation. This is the normal setting which should yield WHQL compliance.

13 **Smooth Point Enable**

Format:	Enable
Double Buffer Armed By:	Enables logic to draw smooth OGL Points

Programming Notes
If Enabled, SF will treat points in the same fashion that AA lines are processed

12 **Vertex Sub Pixel Precision Select**

Format:	U1

Selects the number of fractional bits maintained in the vertex data

Value	Name	Description
0h	8	8 sub pixel precision bits maintained
1h	4	4 sub pixel precision bits maintained

Programming Notes
When Conservative Rasterization is enabled, this bit must be programmed to 0.

11 **Point Width Source**

Controls whether the point width passed on the vertex or from state is used for rendering point

3DSTATE_SF

primitives.

Value	Name	Description
0h	Vertex	Use Point Width on Vertex
1h	State **[Default]**	Use Point Width from State

10:0 **Point Width**

Format:	U8.3

Range: [0.125, 255.875] pixels
This field specifies the size (width) of point primitives in pixels. This field is overridden (though not overwritten) whenever point width information is passed in the FVF

3DSTATE_SO_BUFFER

3DSTATE_SO_BUFFER

Source: RenderCS

Length Bias: 2

Programming Notes

Foreach SO Buffer, the 3DSTATE_SO_BUFFER must only be sent once prior to each 3DPRIMITIVE command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 1h 3DSTATE_NONPIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 18h 3DSTATE_SO_BUFFER Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 6h Excludes DWord (0,1) Format: =n Total Length - 2
1	31	**SO Buffer Enable** Format: Enable If set, stream output to SO Buffer is enabled, , if 3DSTATE_STREAMOUT::SO Function ENABLE is also enabled..If clear, the SO Buffer is considered "not bound" and effectively treated as a zero-length buffer for the purposes of SO output and overflow detection. If an enabled stream's Stream to Buffer Selects includes this buffer it is by definition an overflow condition. That stream will cause no writes to occur, and only SO_PRIM_STORAGE_NEEDED[<stream>] will increment.

3DSTATE_SO_BUFFER

	30:29	**SO Buffer Index** Format: U2 Specifies which of the four SO Buffers is being defined.
	28:22	**SO Buffer Object Control State** Format: MEMORY_OBJECT_CONTROL_STATE Specifies the memory object control state for the SO buffer.
	21	**Stream Offset Write Enable** Format: Enable When set, this field allows the hardware to write SO_WRITE_OFFSET[Buffer#] as specified in the Stream Offset field. **Programming Notes** The field is operates irrespective of whether SO Buffer Enable is set or clear.
	20	**Stream Output Buffer Offset Address Enable** Format: Enable When set, this field allows the hardware to read/write the stream output buffer offset as specified in the "Stream Output Buffer Offset Address" field. **Programming Notes** The field is operates irrespective of whether SO Buffer Enable is set or clear.
	19:12	**Reserved** Format: MBZ
	11:0	**Reserved** Format: MBZ
2..3	63:2	**Surface Base Address** Format: GraphicsAddress63-2 This field specifies the starting address of the buffer in Graphics Memory.
	1:0	**Reserved** Format: MBZ
4	31:30	**Reserved** Format: MBZ
	29:0	**Surface Size** Format: U30-1 This field specifies the size of buffer in number DWords minus 1 of the buffer in Graphics Memory.

3DSTATE_SO_BUFFER		
5..6	63:2	**Stream Output Buffer Offset Address** Format: GraphicsAddress63-2 This field specifies the starting address of the buffer in Graphics Memory where the Stream Output Buffer Offset is stored when all the data has been written. It is also used to fetch the stream Output buffer Offset when needed.
	1:0	**Reserved** Format: MBZ
7	31:0	**Stream Offset** This field specifies the Offset in stream output buffer to start at, or whether to append to the end of an existing buffer. The Offset must be DWORD aligned. If Stream Offset is equal to 0xFFFFFFFF then load the value at the Stream Output Buffer Offset address into SO_WRITE_OFFSET[Buffer#]. Otherwise, SO_WRITE_OFFSET[Buffer#] = Stream Offset.

3DSTATE_SO_DECL_LIST

3DSTATE_SO_DECL_LIST

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 1h 3DSTATE_NONPIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 17h 3DSTATE_SO_DECL_LIST Format: OpCode
	15:9	**Reserved** Format: MBZ
	8:0	**DWord Length** Format: =n Total Length - 2 Value | Name | Description [1,257] | Excludes DWORD (0,1) 0-128 Entries | Value = 2 * (# of SO_DECL quads) + 1
1	31:16	**Reserved** Format: MBZ
	15:12	**Stream to Buffer Selects [3]** Format: U4 bitmask Index of SO Stream Identifies to which SO Buffers stream 3 outputs. See Stream To Buffer Selects [0] field description. Value | Name 1xxxb | SO Buffer 3 x1xxb | SO Buffer 2 xx1xb | SO Buffer 1 xxx1b | SO Buffer 0

3DSTATE_SO_DECL_LIST

	11:8	**Stream to Buffer Selects [2]** Format: U4 bitmask Identifies to which SO Buffers stream 2 outputs. See Stream To Buffer Selects [0] field description. **Value** / **Name** 1xxxb — SO Buffer 3 x1xxb — SO Buffer 2 xx1xb — SO Buffer 1 xxx1b — SO Buffer 0
	7:4	**Stream to Buffer Selects [1]** Format: U4 bitmask Identifies to which SO Buffers stream 1 outputs. See Stream To Buffer Selects [0] field description. **Value** / **Name** 1xxxb — SO Buffer 3 x1xxb — SO Buffer 2 xx1xb — SO Buffer 1 xxx1b — SO Buffer 0
	3:0	**Stream to Buffer Selects [0]** Format: U4 bitmask Identifies to which SO Buffers stream 0 outputs (irrespective of whether those buffers are enabled via 3DSTATE_STREAMOUT). Software is required to scan the SO_DECL list in order to provide this summary information. Note: For "inactive" streams, software must program this field to all zero (no buffers written to) and the corresponding Num Entries field to zero (no valid SO_DECLs). **Value** / **Name** 1xxxb — SO Buffer 3 x1xxb — SO Buffer 2 xx1xb — SO Buffer 1 xxx1b — SO Buffer 0
2	31:24	**Num Entries [3]** Format: U8 #entries Specifies the number of valid SO_DECL entries for Stream 3. (See notes in Num Entries [0] field description). **Value** / **Name** [0,128] — entries

3DSTATE_SO_DECL_LIST

	23:16	**Num Entries [2]** Format: U8 #entries Specifies the number of valid SO_DECL entries for Stream 2. (See notes in Num Entries [0] field description). **Value** [0,128] — **Name** entries
	15:8	**Num Entries [1]** Format: U8 #entries Specifies the number of valid SO_DECL entries for Stream 1. (See notes in Num Entries [0] field description). **Value** [0,128] — **Name** entries
	7:0	**Num Entries [0]** Format: U8 #entries Specifies the number of valid SO_DECL entries for Stream 0.Note that the SO_DECLs are programmed in groups of four (one SO_DECL for each of the four streams). Therefore the number of 2-DWord groups of SO_DECLs supplied in this command is derived from the stream(s) with the most valid SO_DECLs. The NumEntries value specific to each stream will indicate how many SO_DECLS are valid for that particular stream. Any trailing invalid SO_DECLs supplied for streams with fewer valid SO_DECLs will be ignored. It is legal to specify Num Entries = 0 for all four streams simultaneously. In this case there will be no SO_DECLs included in the command (only DW 0-2). Note that all Stream to Buffer Selects bits must be zero in this case (as no streams produce output). **Value** [0,128] — **Name** entries
3..n	63:0	**Entry** Format: SO_DECL_ENTRY

3DSTATE_STENCIL_BUFFER

3DSTATE_STENCIL_BUFFER

Source: RenderCS

Length Bias: 2

Description

This command sets the surface state of the separate stencil buffer, delivered as a pipelined state command. However, the state change pipelining isn't completely transparent (see restriction below).

WM HW will internally manage the draining pipe and flushing of the caches when this command is issued. The PIPE_CONTROL restrictions are removed.

Programming Notes

Restriction: Prior to changing Depth/Stencil Buffer state (i.e., any combination of 3DSTATE_DEPTH_BUFFER, 3DSTATE_CLEAR_PARAMS, 3DSTATE_STENCIL_BUFFER, 3DSTATE_HIER_DEPTH_BUFFER) SW must first issue a pipelined depth stall (PIPE_CONTROL with Depth Stall bit set, followed by a pipelined depth cache flush (PIPE_CONTROL with Depth Flush Bit set, followed by another pipelined depth stall (PIPE_CONTROL with Depth Stall Bit set), unless SW can otherwise guarantee that the pipeline from WM onwards is already flushed (e.g., via a preceding MI_FLUSH).

The stencil buffer is always Tile-W

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 06h 3DSTATE_STENCIL_BUFFER Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**Dword Length** Format: =n Total Length - 2 Value: 3h — Name: Excludes Dword (0,1) **[Default]**

3DSTATE_STENCIL_BUFFER

1	31	**Stencil Buffer Enable** Format: U1 When set indicates that there is a valid stencil buffer. **Programming Notes** This bit should be "0" if Depth buffer surface format is D16_UNORM OR Depth buffer surface type is NULL.
	30:29	**Reserved** Format: MBZ
	28:22	**Stencil Buffer Object Control State** Format: MEMORY_OBJECT_CONTROL_STATE Specifies the memory object control state for the stencil buffer.
	21	**Reserved** Format: MBZ
	20:17	**Reserved** Format: MBZ
	16:0	**Surface Pitch** Format: U17-1 Pitch in Bytes This field specifies the pitch of the stencil buffer in (#Bytes - 1). **Value** / **Name** / **Description** [127, 1FFFFh] / / corresponding to [128B, 128KB]also restricted to a multiple of 128B **Programming Notes** Since this surface is tiled, the pitch specified must be a multiple of the tile pitch, in the range [128B, 128KB]. The pitch must be set to 2x the value computed based on width, as the stencil buffer is stored with two rows interleaved. For details on the separate stencil buffer storage format in memory, see GPU Overview (vol1a), Memory Data Formats, Surface Layout, 2D Surfaces, Stencil Buffer Layout (section 8.20.4.8).
2..3	63:0	**Surface Base Address** Format: GraphicsAddress[63:0]Stencil_Buffer This field specifies the address of the buffer in Graphics Memory. **Programming Notes** The Stencil Buffer can only be mapped to Main Memory (uncached).
4	31:15	**Reserved** Format: MBZ
	14:0	**Surface QPitch** Format: QPitch[16:2]

3DSTATE_STENCIL_BUFFER

Description
This field specifies the distance in rows between array slices. It is used only in the following cases: • **Surface Array** is enabled *OR* • **Number of Mulitsamples** is not NUMSAMPLES_1 and **Multisampled Surface Storage Format** set to MSFMT_MSS *OR* • **Surface Type** is SURFTYPE_CUBE
The interpretation of this field is dependent on **Surface Type** as follows: • SURFTYPE_1D: distance in *pixels* between array slices • SURFTYPE_2D/CUBE: distance in *rows* between array slices • SURFTYPE_3D: distance in *rows* between R-slices

Value	Name	Description
[4h,1FFFCh]		in multiples of 4 (low 2 bits missing)

Programming Notes
This field must be set to an integer multiple of 8 (QPitch[2] MBZ) Software must ensure that this field is set to a value sufficiently large such that the array slices in the surface do not overlap. Refer to the Memory Data Formats section for information on how surfaces are stored in memory.

3DSTATE_STREAMOUT

3DSTATE_STREAMOUT

Source: RenderCS

Length Bias: 2

This command contains pipelined state required by the SOL unit.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 1Eh 3DSTATE_STREAMOUT Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 3h Excludes DWord (0,1) Format: =n Total Length - 2
1	31	**SO Function Enable** Format: U1 If set, the SO function is enabled. Vertex data will be streamed out to memory (subject to overflow detection) as controlled by the various SO-related state variables. If clear, the SO function is disabled, and therefore no vertex data will be streamed out to memory. However, the Rendering Disable and Render Stream Select fields will still be used to determine which vertices (if any) are forwarded down the pipeline for (possible) rendering.
	30	**API Rendering Disable** Format: U1 If set, Indicates the API wants the SO stage not to forward any topologies down the pipeline. If clear, Indicates the API wants the SO stage to forward topologies associated with **Render Stream Select** down the pipeline. This bit is used even if **SO Function Enable** is DISABLED.

3DSTATE_STREAMOUT

		Programming Notes The SOL unit generates an SOL_INT::Render_Enable which ultimately controls whether rendering occurs or not.
	29	**Reserved** Format: MBZ
	28:27	**Render Stream Select** Format: U2 **Description** This field specifies which stream has been selected to be forwarded down the pipeline for possible rendering. Topologies from other streams will not be passed down the pipeline. If Rendering Disable is set, this field is ignored, as no topologies are sent down the pipeline. SO Function Enable must also be ENABLED in order for thiis field to select a stream for rendering. When **SO Function Enable** is DISABLED and Rendering Disable is cleared (i.e., rendering is enabled), StreamID is ignored downstream of the SO stage, allowing any stream to be rendered.
	26	**Reorder Mode** This bit controls how vertices of triangle objects in TRISTRIP[_ADJ] and TRISTRIP_REV are reordered for the purposes of stream-out only (does not impact rendering). See table in Input Buffering. **Value** / **Name** / **Description** 0h / LEADING / Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the leading (first) vertices are in consecutive order starting at v0. A similar reordering is performed on alternating triangles in a TRISTRIP_REV. 1h / TRAILING / Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the trailing (last) vertices are in consecutive order starting at v2. A similar reordering is performed on alternating triangles in a TRISTRIP_REV.
	25	**SO Statistics Enable** Format: Enable This bit controls whether StreamOutput statistics register(s) can be incremented. **Value** / **Name** / **Description** 0h / Disable / SO_NUM_PRIMS_WRITTEN[0..3] and SO_PRIM_STORAGE_NEEDED[0..3] registers cannot increment. 1h / Enable / SO_NUM_PRIMS_WRITTEN[0..3] and SO_PRIM_STORAGE_NEEDED[0..3] registers can increment.

3DSTATE_STREAMOUT

	24:23	**Force Rendering** This field provides a work around override for the computation of SOL_INT::Render_Enable **Value** / **Name** / **Description** 0h / Normal / SOL_INT::Render_Enable is computed normally 1h / Resreved / 2h / Force_Off / Forces the rendering to be disabled. 3h / Force_on / Forces the rendering to be enabled.
	22:21	**Reserved** Format: MBZ
	20:12	**Reserved** Format: MBZ
	11:8	**Reserved** Format: MBZ
	7:0	**Reserved** Format: MBZ
2	31:30	**Reserved** Format: MBZ
	29	**Stream 3 Vertex Read Offset** Format: U1 count of 256-bit units Specifies amount of data to skip over before reading back Stream 3 vertex data. (See **Stream 0 Vertex Read Offset**)
	28:24	**Stream 3 Vertex Read Length** Format: U5-1 count of 256-bit units (See Stream 0 Vertex Read Length)
	23:22	**Reserved** Format: MBZ
	21	**Stream 2 Vertex Read Offset** Format: U1 count of 256-bit units Specifies amount of data to skip over before reading back Stream 2 vertex data. (See Stream 0 Vertex Read Offset)
	20:16	**Stream 2 Vertex Read Length** Format: U5-1 count of 256-bit units
	15:14	**Reserved** Format: MBZ

3DSTATE_STREAMOUT

	13	**Stream 1 Vertex Read Offset** Format: U1 count of 256-bit units Specifies amount of data to skip over before reading back Stream 1 vertex data. (See Stream 0 Vertex Read Offset)
	12:8	**Stream 1 Vertex Read Length** Format: U5-1 count of 256-bit units (See Stream 0 Vertex Read Length)
	7:6	**Reserved** Format: MBZ
	5	**Stream 0 Vertex Read Offset** Format: U1 count of 256-bit units Specifies amount of data to skip over before reading back Stream 0 vertex data. Must be zero if the GS is enabled and the Output Vertex Size field in 3DSTATE_GS is programmed to 0 (i.e., one 16B unit).
	4:0	**Stream 0 Vertex Read Length** Format: U5-1 count of 256-bit units Specifies amount of vertex data to read back for Stream 0 vertices, starting at the Stream 0 Vertex Read Offset location. Maximum readback is 17 256-bit units (34 128-bit vertex attributes). Read data past the end of the valid vertex data has undefined contents, and therefore shouldn't be used to source stream out data. Must be zero (i.e., read length = 256b) if the GS is enabled and the Output Vertex Size field in 3DSTATE_GS is programmed to 0 (i.e., one 16B unit).
3	31:28	**Reserved** Format: MBZ
	27:16	**Buffer 1 Surface Pitch**
	15:12	**Reserved** Format: MBZ
	11:0	**Buffer 0 Surface Pitch** Format: U12 pitch in Bytes This field specifies the pitch of the SO buffer in #Bytes. **Value** / **Name** [0,2048] / Must be 0 or a multiple of 4 Bytes. **Programming Notes**

3DSTATE_STREAMOUT		
		A Surface Pitch of 0 indicates an un-bound buffer. No writes are performed. Surface Base Address is ignored.
4	31:28	**Reserved** Format: MBZ
	27:16	**Buffer 3 Surface Pitch** Format: U12
	15:12	**Reserved** Format: MBZ
	11:0	**Buffer 2 Surface Pitch** Format: U12

3DSTATE_TE

3DSTATE_TE

Source: RenderCS

Length Bias: 2

The state used by TE is defined with this inline state packet.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 1Ch 3DSTATE_TE Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Format: =n Total Length - 2 Value: 2h — Name: Excludes DWord (0,1) **[Default]**
1	31:24	**Reserved** Format: MBZ
	23:22	**Reserved** Format: MBZ
	21	**Reserved** Format: MBZ
	20	**Reserved** Format: MBZ
	19	**Reserved** Format: MBZ

3DSTATE_TE

18:17 Reserved

Format:	MBZ

16 Reserved

Format:	MBZ

15:14 Reserved

Format:	MBZ

13:12 Partitioning

Format:	U2

This field specifies how edges are partitioned based on tessellation factor.

Value	Name	Description
0h	INTEGER	Outside/inside edges are divided into an integer number of equal-sized segments.
1h	ODD_FRACTIONAL	Outside/inside edges are divided into an odd number of possibly-unequal-sized segments.
2h	EVEN_FRACTIONAL	Outside/inside edges are divided into an even number of possibly-unequal-sized segments.

11:10 Reserved

Format:	MBZ

9:8 Output Topology

Format:	U2

This field specifies which primitive types are to be output.

Value	Name	Description
0h	POINT	Points are output (as POINTLIST topologies)
1h	LINE	Lines are output (as LINESTRIP topologies). Only valid if ISOLINE domain is selected.
2h	TRI_CW	Clockwise-ordered triangles are output (either as TRISTRIP, TRISTRIP_REV or TRILIST topologies). Not valid if ISOLINE domain is selected.
3h	TRI_CCW	Count-clockwise-ordered triangles are output (either as TRISTRIP, TRISTRIP_REV or TRILIST topologies). Not valid if ISOLINE domain is selected.

7:6 Reserved

Format:	MBZ

5:4 TE Domain

Format:	U2

This field specifies which type of domain is to be tessellated.

Value	Name	Description
0h	QUAD	2D (U, V) domain is tessellated
1h	TRI	Triangular (U, V, W) domain is tessellated

3DSTATE_TE

		2h	ISOLINE	2D (U, V) domain is tessellated.

3 — Reserved

Format:	MBZ

2:1 — TE Mode

Format:	U2

When TE Enable is ENABLED, this field specifies the overall operation of the TE stage.This field is ignored if TE Enable is DISABLED.

Value	Name	Description
0h	HW_TESS	Normal HW Tessellation Mode. The TessFactors are read from the patch URB entry, and are used to perform fixed-function hardware tessellation of the specified domain.

0 — TE Enable

Format:	Enable

If ENABLED, the TE stage will perform tessellation processing on incoming patch primitives. The TE Mode field determines how this tessellation operation proceeds.If DISABLED, the TE goes into pass-through mode. All other state fields are ignored.

Programming Notes
The tessellation stages (HS, TE and DS) must be enabled/disabled as a group. I.e., draw commands can only be issued if all three stages are enabled or all three stages are disabled, otherwise the behavior is UNDEFINED.

2 — 31:0 — Maximum Tessellation Factor Odd

Format:	IEEE_Float

This field specifies the maximum TessFactor for ODD_FRACTIONAL partitioning when in HW_TESS mode.

Value	Name	Description
[427c0000h,427c0000h]	63 **[Default]**	Per API Spec, For normal operation software should set this value to 63.0

Programming Notes
Note that ISOLINE's LineDensity TF is always subjected to INTEGER partitioning regardless of the Partitioning state.

3 — 31:0 — Maximum Tessellation Factor Not Odd

Format:	IEEE_Float

This field specifies the maximum TessFactor for EVEN_FRACTIONAL or INTEGER partitioning when in HW_TESS mode.

Value	Name	Description
[42800000h,42800000h]	64 **[Default]**	Per API Spec, For normal operation software should set this value to 64.0

3DSTATE_TE		
		Programming Notes
		Note that ISOLINE's LineDensity TF is always subjected to INTEGER partitioning regardless of the Partitioning state.

3DSTATE_URB_CLEAR

3DSTATE_URB_CLEAR

Source: RenderCS

Length Bias: 2

The 3DSTATE_URB_CLEAR command allows SW to clear (write zero) to a section in the URB.

Programming Notes

- The command temporarily halts command execution.
- This command is not a part of context save/restore.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 1h 3DSTATE_NONPIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 1Dh 3DSTATE_URB_CLEAR Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:30	**Reserved** Format: MBZ
	29:16	**URB Clear Length** This field specifies the number of 256b entries in the URB to be cleared to zero.
	15	**Reserved** Format: MBZ

3DSTATE_URB_CLEAR		
	14:0	**URB Address** Format: URBAddress[19:5] 256b aligned This field specifies Bits 19:5 of the URB Address

3DSTATE_URB_DS

3DSTATE_URB_DS

Source: RenderCS

Length Bias: 2

Description

This command may not overlap with the push constants in the URB defined by the 3DSTATE_PUSH_CONSTANT_ALLOC_VS, 3DSTATE_PUSH_CONSTANT_ALLOC_DS, 3DSTATE_PUSH_CONSTANT_ALLOC_HS, and 3DSTATE_PUSH_CONSTANT_ALLOC_GS commands.

The URB Starting Address and Number of URB Entries fields shall be programmed as if there is only one slice enabled. When more than one slice is enabled, hardware will (a) recompute the actual URB Starting Address based on the number of enabled slices and (b) multiply the Number of URB Entries by the number of enabled slices. Software shall ensure that the values programmed do not exceed the URB capacity of a single slice. Refer to the L3 allocation and programming guide for valid URB configurations.

Programming Notes

When programming DS URB state for the RCS 3D pipe, 3DSTATE_URB_VS, 3DSTATE_URB_HS, and 3DSTATE_URB_GS must also be programmed in order for the programming of this state to be valid.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 32h 3DSTATE_URB_DS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h DWORD_COUNT_n Format: =n

3DSTATE_URB_DS

1 — 31:25 — DS URB Starting Address

Format:	U7

Offset from the start of the URB memory where DS starts its allocation, specified in multiples of 8 KB.

Value	Name	Exists If
[0,48]		Device[SliceCount] == 1
[4,48]		Device[SliceCount] GT 1

24:16 — DS URB Entry Allocation Size

Format:	U9-1 Count of 512-bit units

Specifies the length of each URB entry owned by DS. This field is always used (even if DS Function Enable is DISABLED).

Value	Name
[0,9]	

15:0 — DS Number of URB Entries

Description
Specifies the number of URB entries that are used by DS, based on only 1 slice enabled. When multiple slices are enabled, HW will multiply the value programmed by the number of slices in order to determine the total number of entries. SW shall ensure that the total number of entries does not exceed the relevant ValidValue range listed below. This field is always used (even if DS Function Enable is DISABLED).
If Domain Shader Thread Dispatch is Enabled then the minimum number of handles that must be allocated is 34 URB entries.

Value	Name
[0,1120]	

Programming Notes
DS Number of URB Entries must be divisible by 8 if the DS URB Entry Allocation Size is programmed to a value less than 9, which is 10 512-bit URB entries. "2:0" = reserved "000"

3DSTATE_URB_GS

3DSTATE_URB_GS

Source: RenderCS

Length Bias: 2

Description

This command may not overlap with the push constants in the URB defined by the 3DSTATE_PUSH_CONSTANT_ALLOC_VS, 3DSTATE_PUSH_CONSTANT_ALLOC_DS, 3DSTATE_PUSH_CONSTANT_ALLOC_HS, and 3DSTATE_PUSH_CONSTANT_ALLOC_GS commands.

The URB Starting Address and Number of URB Entries fields shall be programmed as if there is only one slice enabled. When more than one slice is enabled, hardware will (a) recompute the actual URB Starting Address based on the number of enabled slices and (b) multiply the Number of URB Entries by the number of enabled slices. Software shall ensure that the values programmed do not exceed the URB capacity of a single slice. Refer to the L3 allocation and programming guide for valid URB configurations

Programming Notes

When programming GS URB state for the RCS 3D pipe, 3DSTATE_URB_VS, 3DSTATE_URB_HS, and 3DSTATE_URB_DS must also be programmed in order for the programming of this state to be valid.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 33h 3DSTATE_URB_GS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h DWORD_COUNT_n Format: =n

3DSTATE_URB_GS

1 — 31:25 — GS URB Starting Address

Format:	U7

Offset from the start of the URB memory where GS starts its allocation, specified in multiples of 8 KB.

Value	Name	Exists If
[0,48]		Device[SliceCount] == 1
[4,48]		Device[SliceCount] GT 1

24:16 — GS URB Entry Allocation Size

Format:	U9-1 512-bit units

Specifies the length of each URB entry owned by GS. This field is always used (even if GS Function Enable is DISABLED).

15:0 — GS Number of URB Entries

Specifies the number of URB entries that are used by GS, based on only 1 slice enabled. When multiple slices are enabled, HW will multiply the value programmed by the number of slices in order to determine the total number of entries. SW shall ensure that the total number of entries does not exceed the relevant ValidValue range listed below.
This field is always used (even if GS Function Enable is DISABLED).

Programming Notes
Only if GS is disabled can this field be programmed to 0. If GS is enabled this field shall be programmed to a value greater than 0. For GS Dispatch Mode "Single", this field shall be programmed to a value greater than or equal to 1. For other GS Dispatch Modes, refer to the definition of Dispatch Mode (3DSTATE_GS) for minimum values of this field.
GS Number of URB Entries must be divisible by 8 if the GS URB Entry Allocation Size is less than 9 512-bit URB entries. "2:0" = reserved "000"
When 3DSTATE_GS:Enable is true, the minimum number of GS Number of URB Entries must be set to 2.

3DSTATE_URB_HS

3DSTATE_URB_HS

Source: RenderCS

Length Bias: 2

Description

This command may not overlap with the push constants in the URB defined by the 3DSTATE_PUSH_CONSTANT_ALLOC_VS, 3DSTATE_PUSH_CONSTANT_ALLOC_DS, 3DSTATE_PUSH_CONSTANT_ALLOC_HS, and 3DSTATE_PUSH_CONSTANT_ALLOC_GS commands.

The URB Starting Address and Number of URB Entries fields shall be programmed as if there is only one slice enabled. When more than one slice is enabled, hardware will (a) recompute the actual URB Starting Address based on the number of enabled slices and (b) multiply the Number of URB Entries by the number of enabled slices. Software shall ensure that the values programmed do not exceed the URB capacity of a single slice. Refer to the L3 allocation and programming guide for valid URB configurations

Programming Notes

When programming HS URB state for the RCS 3D pipe, 3DSTATE_URB_VS, 3DSTATE_URB_DS, and 3DSTATE_URB_GS must also be programmed in order for the programming of this state to be valid.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 31h 3DSTATE_URB_HS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h DWORD_COUNT_n Format: =n
1	31:25	**HS URB Starting Address** Format: U7

3DSTATE_URB_HS

Offset from the start of the URB memory where HS starts its allocation, specified in multiples of 8 KB.

Value	Name	Exists If
[0,48]		Device[SliceCount] == 1
[4,48]		Device[SliceCount] GT 1

24:16 **HS URB Entry Allocation Size**

Format:	U9-1 Count of 512-bit units

Specifies the length of each URB entry owned by HS. This field is always used (even if HS Function Enable is DISABLED).

15:0 **HS Number of URB Entries**

Specifies the number of URB entries that are used by HS, based on only 1 slice enabled. When multiple slices are enabled, HW will multiply the value programmed by the number of slices in order to determine the total number of entries. SW shall ensure that the total number of entries does not exceed the relevant ValidValue range listed below.
This field is always used (even if HS Function Enable is DISABLED).
Programming Restriction:HS Number of URB Entries must be divisible by 8 if the HS URB Entry Allocation Size is less than 9 512-bit URB entries."2:0" = reserved "000"

Value	Name
[0,672]	
[0,128]	

Programming Notes
When 3DSTATE_HS:Enable is true and 3DSTATE_HS:Dispatch Mode is set to 8 patch, the minimum number of HS Number of URB Entries must be set to 16. When 3DSTATE_HS:Enable is true and 3DSTATE_HS:Dispatch Mode is set to dual patch, the minimum number of HS Number of URB Entries must be set to 4.

3DSTATE_URB_VS

3DSTATE_URB_VS

Source: RenderCS, PositionCS

Length Bias: 2

Description

VS URB Entry Allocation Size equal to 4(5 512-bit URB rows) may cause performance to decrease due to banking in the URB. Element sizes of 16 to 20 should be programmed with six 512-bit URB rows.

This command may not overlap with the push constants in the URB defined by the 3DSTATE_PUSH_CONSTANT_ALLOC_VS, 3DSTATE_PUSH_CONSTANT_ALLOC_DS, 3DSTATE_PUSH_CONSTANT_ALLOC_HS, and 3DSTATE_PUSH_CONSTANT_ALLOC_GS commands.

The offset and size should be programmed as if there is only one slice enabled. Hardware will grow the size based on the slice configuration. Software shall ensure that the values programmed do not exceed the URB capacity of one slice. Refer to the L3 allocation and programming guide for valid URB configurations.

Programming Notes

When programming VS URB state for the RCS 3D pipe, 3DSTATE_URB_HS, 3DSTATE_URB_DS, and 3DSTATE_URB_GS must also be programmed in order for the programming of this state to be valid.

DWord	Bit	Description

	23:16	**3D Command Sub Opcode** Default Value: 30h 3DSTATE_URB_VS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h DWORD_COUNT_n Format: =n
1	31:25	**VS URB Starting Address** Format: U7

3DSTATE_URB_VS

Offset from the start of the URB memory where VS starts its allocation, specified in multiples of 8 KB.

Value	Name	Exists If
[0,48]		Device[SliceCount] == 1
[4,48]		Device[SliceCount] GT 1

24:16 **VS URB Entry Allocation Size**

Format:	U9-1 count of 512-bit units

Specifies the length of each URB entry owned by VS. This field is always used (even if VS Function Enable is DISABLED).

Programming Notes
Programming Restriction: As the VS URB entry serves as both the per-vertex input and output of the VS shader, the VS URB Allocation Size must be sized to the maximum of the vertex input and output structures.

15:0 **VS Number of URB Entries**

Format:	U16

Specifies the number of URB entries that are used by VS, based on only 1 slice enabled. When multiple slices are enabled, HW will multiply the value programmed by the number of slices in order to determine the total number of entries. SW shall ensure that the total number of entries does not exceed the relevant ValidValue range listed below.
This field is always used (even if VS Function Enable is DISABLED).

Value	Name
[64,1856]	
[34,352]	

Programming Notes
Programming Restriction: VS Number of URB Entries must be divisible by 8 if the VS URB Entry Allocation Size is less than 9 512-bit URB entries."2:0" = reserved "000b"

3DSTATE_VERTEX_BUFFERS

3DSTATE_VERTEX_BUFFERS

Source: RenderCS

Length Bias: 2

Description

This command is used to specify VB state used by the VF function.

: Can specify from 1 to 33 VBs.

The VertexBufferID field within a VERTEX_BUFFER_STATE structure indicates the specific VB. If a VB definition is not included in this command, its associated state is left unchanged and is available for use if previously defined.

Programming Notes

It is possible to have individual vertex elements sourced completely from generated ID values and therefore not require any vertex buffer accesses for that vertex element. In this case, VF function will simply ignore the VB state associated with that vertex element. If all enabled vertex elements have this characteristic, no VBs are required to process 3DPRIMITIVE commands. For example, this might arise when the user wants to perform all data lookups in the first shader, so only generated index values need to be passed down to it. In this extreme case, SW would not need to program any VB state, and therefore not need to issue any 3DSTATE_VERTEX_BUFFERS commands.

For any 3DSTATE_VERTEX_BUFFERS command, at least one VERTEX_BUFFER_STATE structure must be included.

VERTEX_BUFFER_STATE structures are 4 DWords for both VERTEXDATA buffers and INSTANCEDATA buffers.

Inclusion of partial VERTEX_BUFFER_STATE structures is UNDEFINED.

The order in which VBs are defined within this command can be arbitrary, though a vertex buffer must be defined only once in any given command (otherwise operation is UNDEFINED).

The VF cache (and the VFR cache if POSH is enabled) needs to be invalidated before binding and then using Vertex Buffers that overlap with any previously bound Vertex Buffer (at a 64B granularity) since the last invalidation.
A VF cache invalidate is performed by setting the "VF Cache Invalidation Enable" bit in PIPE_CONTROL.

1..n	127:0	**Vertex Buffer State** Format: VERTEX_BUFFER_STATE

3DSTATE_VERTEX_ELEMENTS

3DSTATE_VERTEX_ELEMENTS

Source: RenderCS

Length Bias: 2

Description
This is a variable-length command used to specify the active vertex elements. Each VERTEX_ELEMENT_STATE structure contains a Valid bit which determines which elements are used.
Up to 34 elements.

Programming Notes
At least one VERTEX_ELEMENT_STATE structure must be included.
Inclusion of partial VERTEX_ELEMENT_STATE structures is UNDEFINED.
SW must ensure that at least one vertex element is defined prior to issuing a 3DPRIMTIVE command, or operation is UNDEFINED.
There are no 'holes' allowed in the destination vertex: NOSTORE components must be overwritten by subsequent components unless they are the trailing DWords of the vertex. Software must explicitly chose some value (probably 0) to be written into DWords that would otherwise be 'holes'.
Within a VERTEX_ELEMENT_STATE structure, if a Component Control field is set to something other than VFCOMP_STORE_SRC, no higher-numbered Component Control fields may be set to VFCOMP_STORE_SRC. In other words, only trailing components can be set to something other than VFCOMP_STORE_SRC.
See additional restrictions listed in the command fields and VERTEX_ELEMENT_STATE description.
Element[0] must be valid.
All elements must be valid from Element[0] to the last valid element. (I.e. if Element[2] is valid then Element[1] and Element[0] must also be valid).
The pitch between elements packed in the URB will always be 128 bits.

DWord	Bit	Description

1..n	63:0	**Element** Format: VERTEX_ELEMENT_STATE

3DSTATE_VF_COMPONENT_PACKING

3DSTATE_VF_COMPONENT_PACKING

Source:	RenderCS
Length Bias:	2

This command is used to specify, separately for Vertex Elements [0-31], which post-conversion, 32-bit components are "enabled" to be stored in the URB , and which are "disabled" (not stored). 128 per-component enable bits are provided. Disabling all four components for a given Vertex Element will result in no data stored for that element. Note that any insertion of SGVs (3DSTATE_VF_SGVS) is performed before the packing operation.

The **Component Packing Enable** bit (3DSTATE_VF) controls the overall packing process. If that bit is set, the packing process is enabled and the bit mask provided in this command is used to control which components are stored. If that bit is clear, the packing process is disabled - all four components of "valid" Vertex Elements will be stored.

Programming Notes

Programming Restrictions:

- The Vertex Elements referenced in this command correspond to the first 32 VERTEX_ELEMENT structures passed in 3DSTATE_VERTEX_ELEMENTS. A Vertex Element must be marked as "Valid" via 3DSTATE_VERTEX_ELEMENTS or be an SGV or an element between the last valid element and the last SGV in order for the corresponding Component Enable bits of this command to be utilized.
- No enable bits are provided for Vertex Elements [32-33], and therefore no packing is performed on these elements (if Valid, all 4 components are stored).
- If a Vertex Element has Edge Flag Enable set no packing is performed for that element and the corresponding packing state is ignored.
- Component packing is probably only useful for SIMD8 VS thread execution.

At least one component of one "valid" Vertex Element must be enabled.

3DSTATE_VF

3DSTATE_VF

Source: RenderCS

Length Bias: 2

Description
This command is used to set various state variables in the VF stage.
The use of the component packing mask is specified via 3DSTATE_VF_COMPONENT_PACKING

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 0Ch 3DSTATE_VF Format: OpCode
	15	**Reserved** Format: MBZ
	14	**Reserved** Format: MBZ
	13	**Reserved** Format: MBZ
	12	**Reserved**
	11	**Reserved** Format: MBZ
	10	**Sequential Draw Cut Index Enable** Format: Enable If ENABLED, vertex indices in SEQUENTIAL 3DPRIMITIVE commands are compared to the Cut Index (specified below). When the vertex index matches the Cut Index any previous topology is terminated. If DISABLED, vertex indices are not compared to the Cut Index. This field can only be enabled for

3DSTATE_VF

		certain primitive topology types. Refer to the table later in this section for details.
	9	**Component Packing Enable** Format: Enable If ENABLED, vertex element component packing (as specified by 3DSTATE_VF_COMPONENT_PACKING) is performed before vertices are written into the URB. If DISABLED, no component packing is performed - all components of valid vertex elements will be stored in the URB.
	8	**Indexed Draw Cut Index Enable** Format: Enable If ENABLED, vertex indices in RANDOM 3DPRIMITIVE commands are compared to the Cut Index (specified below). When the vertex index matches the Cut Index any previous topology is terminated.If DISABLED, vertex indices are not compared to the Cut Index and are used strictly as indices into vertex buffers.This field can only be enabled for certain primitive topology types. Refer to the table later in this section for details.
	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:0	**Cut Index** This field specifies the index value that is considered the "cut index" which vertex indices are compared to if a Cut Index Enable is set. The Cut Index is compared to the fetched (and possibly-sign-extended) vertex index, and if these values are equal, the current primitive topology is terminated. Note that, for index buffers less than 32bpp, it is possible to set the Cut Index to a (large) value that will never match a sign-extended vertex index.

3DSTATE_VF_INSTANCING

3DSTATE_VF_INSTANCING

Source: RenderCS

Length Bias: 2

This command is used to control the "instancing" state associated with a specific vertex element.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 49h 3DSTATE_VF_INSTANCING Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Format: =n Total Length - 2 Value: 1h — Excludes DWord (0,1) **[Default]** Value: 43h — Context Restore
1	31:9	**Reserved** Format: MBZ
	8	**Instancing Enable** Format: Enable Value: 0h — Name: Disabled — Description: This vertex element is not instanced and therefore vertices within instances can each receive different data for this vertex element. Within each instance, the source vertex data for this vertex element is determined according the the Vertex Access Type of the 3DPRIMITIVE command. Instance Data Step Rate is

3DSTATE_VF_INSTANCING

		ignored for this vertex element.
1h	Enabled	This vertex element is instanced and therefore vertices within instances will receive the same data for this vertex element. The source pointer for this particular vertex element will be (a) initialized at the start of 3DPRIMITIVE processing, (b) held constant for all vertices within an instance, and (c) advanced between instances as a function of Instance Data Step Rate.

7:6 Reserved

Format:	MBZ

5:0 Vertex Element Index

Format:	U6

This field identifies which vertex element state is to be modified by this command.

Value	Name
[0,33]	

2 31:0 Instance Data Step Rate

If Instancing Enable is ENABLED, this field determines the rate at which data for this particular vertex element is changed between instances. Only after the number of instances specified by this field is generated is new (sequential) vertex element data provided. This process continues for each group of instances defined in the 3DPRIMTIVE command. For example, a value of 1 in this field causes new data to be supplied for this vertex element with each sequential (instance) group of vertices. A value of 2 causes every other instance group of vertices to be provided with new vertex element data. The special value of 0 causes all vertices of all instances generated by the 3DPRIMITIVE command to be provided with the same data for this vertex element. (The same effect can be achieved by setting this field to its maximum value.) If Instancing Enable is DISABLED, this field is ignored.

3DSTATE_VF_SGVS

3DSTATE_VF_SGVS

Source: RenderCS

Length Bias: 2

Description

This command is used to control the insertion of the VertexID and InstanceID System-Generated Values (SGVs) into an input Vertex URB Entry (VUE) (available as input to a VS thread). VertexID and InstanceID insertion can be individually controlled. The insertion locations are specified as 128-bit element locations (starting at the beginning of the VUE) and the 32-bit component within those specified elements. The SGV values can be inserted either (a) within a valid vertex element (in which case the value overwrites the value specified via 3DSTATE_VERTEX_ELEMENTS) or (b) beyond the last valid vertex element written to the URB. This permits some orthogonality between the programming of vertex elements (which typically is known at draw time) and programming of SGV insertion (which is associated with the shader). There are some restrictions however (see below). If an SGV is inserted beyond the last valid vertex element, zeroes are first inserted in the VUE after the last valid vertex element up to and including the vertex element receiving an SGV. If both of the SGVs are enabled for insertion, the zeroes will extend to the last (largest index) vertex element receiving an SGV. Then the SGV(s) are inserted.

The insertion of SGV values occurs before any component packing (3DSTATE_VF_COMPONENT_PACKING). Therefore the Element Offsets and Component Numbers specified in this command refer to the pre-packed data, following 3DSTATE_VERTEX_ELEMENT processing.

Programming Notes

Programming Restrictions:

- It is INVALID to store both the VertexID and InstanceID in the same element/component location within the VUE.
- The states programmed by this command overwrite the state programmed by any previous commands. I.e., VertexID and InstanceID (if enabled) can only be inserted in one component of a vertex.
- It is INVALID to insert an SGV value past the end of the VUE entry (as determined by VS URB Entry Allocation Size) or past the 33rd vertex element. Therefore the programming of VS URB Entry Allocation Size needs to comprehend any SGV insertion requirements.
- It is INVALID to use this command to overwrite any portion of a 64-bit vertex element component.
- It is INVALID to use this command to overwrite a EdgeFlag vertex element component or any vertex element beyond it.

3DSTATE_VS

3DSTATE_VS

Source: RenderCS, PositionCS

Length Bias: 2

Description
This command specifies most of the state used by the Vertex Shader (VS) stage.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 10h 3DSTATE_VS Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 7h Excludes DWord (0,1) Format: =n Total Length - 2
1..2	63:6	**Kernel Start Pointer** Format: InstructionBaseOffset[63:6]Kernel This field specifies the starting location of the kernel program run by threads spawned by the VS pipeline stage. It is specified as a 64-byte-granular offset from the Instruction Base Address. This field is ignored if VS Function Enable is DISABLED.
	5:0	**Reserved** Format: MBZ
3	31	**Single Vertex Dispatch** Format: U1 Enumerated Type When this bit is set, SIMD4x2 VS threads will only process a single vertex, otherwise SIMD4x2 threads will process either one or two vertices. This field is ignored if **SIMD8 Dispatch Enable** is

3DSTATE_VS

set.

Value	Name	Description
0h	Multiple	Dual vertex SIMD4x2 thread dispatches are allowed.
1h	Single	Single vertex SIMD4x2 thread dispatches are forced.

30 **Vector Mask Enable**

Format:	Enable

Upon subsequent VS thread dispatches, this bit is loaded into the EU's **Vector Mask Enable** (VME, cr0.0[3]) thread state. Refer to EU documentation for the definition and use of VME state.

Value	Name	Description
0h	Dmask	The EU will use the Dispatch Mask (supplied by the VS stage) for instruction execution.
1h	Vmask	The EU will use the Vector Mask (derived from the Dispatch Mask) for instruction execution.

Programming Notes
Under normal conditions SW shall specify DMask, as the VS stage will provide a Dispatch Mask appropriate to SIMD4x2 or SIMD8 thread execution (as a function of SIMD8 Dispatch Enable). E.g., for SIMD4x2 thread execution, the VS stage will generate a Dispatch Mask that is equal to what the EU would use as the Vector Mask. For SIMD8 execution there is no known usage model for use of Vector Mask (as there is for PS shaders).

29:27 **Sampler Count**

Format:	U3

This field specifies (in multiples of 4) the number of sets of sampler state that will be prefetched for use by the VS kernel. While the prefetching of sampler state is optional and does not impact functionality, it may improve performance.
This field is ignored if the Function Enable state is set to DISABLED.

Value	Name	Description
0h	No Samplers	no samplers used
1h	1-4 Samplers	between 1 and 4 samplers used
2h	5-8 Samplers	between 5 and 8 samplers used
3h	9-12 Samplers	between 9 and 12 samplers used
4h	13-16 Samplers	between 13 and 16 samplers used

26 **Reserved**

Format:	MBZ

25:18 **Binding Table Entry Count**

Format:	U8

Description
Specifies how many binding table entries the kernel uses. Used only for prefetching of the

3DSTATE_VS

binding table entries and associated surface state.
Note: For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache.
This field is ignored if VS Function Enable is DISABLED.

When HW Generated Binding Table bit is enabled: This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched.

Value	Name
[0,255]	

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.

17 **Thread Dispatch Priority**

Format:	U1 Enumerated Type

Specifies the priority of the thread for dispatch:
This field is ignored if VS Function Enable is DISABLED.

Value	Name	Description
0h	Normal	Normal Priority
1h	High	High Priority

16 **Floating Point Mode**

Format:	U1 Enumerated Type

Specifies the initial floating point mode used by the dispatched thread.
This field is ignored if VS Function Enable is DISABLED.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 Rules
1h	Alternate	Use Alternate Rules

15:14 **Reserved**

Format:	MBZ

13 **Illegal Opcode Exception Enable**

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment.
This field is ignored if VS Function Enable is DISABLED.

3DSTATE_VS

	12	**Accesses UAV** Format: Enable This field must be set when VS has a UAV access. **Programming Notes** This field must not be set when VS Function Enable is disabled.
	11:8	**Reserved** Format: MBZ
	7	**Software Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[13] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if VS Function Enable is DISABLED.
	6:0	**Reserved** Format: MBZ
4..5	63:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[63:10]ScratchSpace Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if VS Function Enable is DISABLED. In 64b OS all pointers need to be seen by SW as 48b. HW does not support a Scratch Space Base Pointer larger than 32b, therefore SW must ensure Bits<63:32> are set to 0's.
	9:4	**Reserved** Format: MBZ
	3:0	**Per-Thread Scratch Space** Format: U4 power of 2 Bytes over 1K Bytes Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit. The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. This field is ignored if VS Function Enable is DISABLED. **Value** / **Name** / **Description** [0,11] / / Indicating [1K Bytes, 2M Bytes] **Programming Notes**

3DSTATE_VS

		This amount is available to the kernel for information only. It will be passed verbatim (if not altered by the kernel) to the Data Port in any scratch space access messages, but the Data Port will ignore it.
6	31:25	**Reserved** Format: MBZ
	24:20	**Dispatch GRF Start Register For URB Data** Format: U5 Specifies the starting GRF number for the URB portion (URB constants and vertices) of the thread payload. This field is ignored if VS Function Enable is DISABLED. **Value** / **Name** / **Description** [0,31] / / indicating GRF [R0, R31]
	19:17	**Reserved** Format: MBZ
	16:11	**Vertex URB Entry Read Length** Format: U6 Specifies the number of pairs of 128-bit vertex elements to be passed into the payload for each vertex. This field is ignored if VS Function Enable is DISABLED. For SIMD4x2 dispatch, each vertex element requires one GRF of payload data, therefore the number of GRFs with vertex data will be double the value programmed in this field. For SIMD8 dispatch, each vertex element requires 4 GRFs of payload data, therefore the number of GRFs with vertex data will be 8 times the value programmed in this field. The EU limit of 128 GRFs imposes a maximum limit of 30 elements per vertex pushed into the payload, though the practical limit may be lower. If input vertices exceed the practical limit, software must decide between resorting to pulling elements during thread execution or dropping back to SIMD4x2 dispatch. Note that the VUE is used for both input and output, so when using the pull-model software must ensure inputs are not overwritten before last use. **Value** / **Name** / **Description** [1,63] / / if SIMD8 dispatch disabled [0,15] / / if SIMD8 dispatch enabled
	10	**Reserved** Format: MBZ
	9:4	**Vertex URB Entry Read Offset** Format: U6 Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB before being included in the thread payload. This offset applies to all Vertex URB entries passed to the thread. This field is ignored if VS Function Enable is DISABLED. **Value** / **Name**

3DSTATE_VS

		[0,63]
	3:0	**Reserved** Format: MBZ
7	31:23	**Maximum Number of Threads** Format: U9-1 Thread count Specifies the maximum number of simultaneous threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance. This field is ignored if VS Function Enable is DISABLED. **Value** / **Name** / **Description** [0,335] / / indicating thread count of [1,336]
	22	**Reserved** Format: MBZ
	21:13	**Reserved** Format: MBZ
	12:11	**Reserved** Format: MBZ
	10	**Statistics Enable** Format: Enable If ENABLED, the VS stage will perform statistics gathering. See the Statistics Gathering subsection. If DISABLED, statistics information associated with the VS stage will be left unchanged.
	9	**Reserved** Format: MBZ
	8:3	**Reserved** Format: MBZ
	2	**SIMD8 Dispatch Enable** Format: Enable This field determines how VS threads are dispatched and how the thread payloads are generated. The setting of this field must agree with how the VS kernel was compiled. If ENABLED, SIMD8 VS thread dispatches are performed. The **Single Vertex Dispatch** field is ignored. If DISABLED, SIMD4x2 thread dispatches are performed. The **Single Vertex Dispatch** field can be used to force single-vertex dispatches.

3DSTATE_VS

	1	**Vertex Cache Disable** Format: Disable This bit controls the operation of the Vertex Cache. This field is always used. If the Vertex Cache is DISABLED and the VS Function is ENABLED, the Vertex Cache is not used and all incoming vertices will be passed to VS threads. If the Vertex Cache is ENABLED and the VS Function is ENABLED, only incoming vertices that do not hit in the Vertex Cache will be passed to VS threads. If the Vertex Cache is ENABLED and the VS Function is DISABLED, input vertices that miss in the Vertex Cache will be assembled and written to the URB (by the VF stage), and subsequently passed through the VS stage unmodified (i.e, no VS threads are spawned). The Vertex Cache is invalidated whenever the Vertex Cache becomes DISABLED, whenever the VS Function Enable toggles, between 3DPRIMITIVE commands and between instances within a 3DPRIMITIVE command.
	0	**Function Enable** Format: Enable This bit determines whether or not the VS stage spawns VS threads, which comprises the bulk of the VS stage functionality. If ENABLED, VS threads may be spawned to process VF-generated vertices before the resulting vertices are passed down the pipeline. If DISABLED, VF-generated vertices will pass thru the VS function and are sent down the pipeline unmodified. The Vertex Cache (if enabled) is still available.
8	31:28	**Reserved** Format: MBZ
	27	**Reserved** Format: MBZ
	26:21	**Vertex URB Entry Output Read Offset** Format: U6 Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB by the Setup Back-End (SBE) function. The offset programmed will specify the start of Attribute 0 to be passed in subsequent Pixel Shader thread payloads. Refer to the Attribute Interpolator Setup documentation.

Value	Name
[0,63]	

Programming Notes

As the vertex header data located at the start of the Vertex URB entry is typically only used by 3D pipeline FFs (i.e., Clipper, Setup FrontEnd) and not required as interpolated attributes in PIxel Shader threads, it is expected that SW will program this Start Offset skip over the vertex header.

This offset value is ignored if SBE's Number of SF Attributes state is programmed to 0 (i.e., no

3DSTATE_VS

		attributes are defined beyond the position read from the Vertex Header)
	20:16	**Vertex URB Entry Output Length** Format: U5 Specifies the amount of Vertex Attribute URB data to be read by the Setup Back-End function for each Vertex URB entry, in 256-bit units. The attribute data will be read starting at the offset specified by the Vertex URB Entry Output Read Offset state. **Value** [1,16] — **Name** **Programming Notes** This length value is ignored if SBE's Number of SF Attributes state is programmed to 0 (i.e., no attributes are defined beyond the position read from the Vertex Header).
	15:8	**User Clip Distance Clip Test Enable Bitmask** Format: U8 This 8 bit mask field selects which of the 8 Clip Distance Values (if any) are to be included in the Clip stage's trivial reject / trivial accept / must clip determination function. The ClipDistance Values (if present) are located in DW8-15 of the VUE Vertex Header located at the beginning of VUE URB entries. Bit 0 of this field corresponds to Clip Distance Value 0.
	7:0	**User Clip Distance Cull Test Enable Bitmask** Format: U8 This 8 bit mask field selects which of the 8 Clip Distance Values (if any) are to be included in the Clip stage's trivial reject / trivial accept determination function. Note that must clip determination is not included in this function. The ClipDistance Values (if present) are located in DW8-15 of the VUE Vertex Header located at the beginning of VUE URB entries. Bit 0 of this field corresponds to Clip Distance Value 0.

3DSTATE_WM_CHROMAKEY

3DSTATE_WM_CHROMAKEY

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 4Ch 3DSTATE_WM__CHROMAKEY Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**Dword Length** Default Value: 0h Excludes Dword (0,1) Format: =n Total Length - 2
1	31	**ChromaKey Kill Enable** Format: Enable If ENABLED, indicates that at least one of the attached samplers has ChromaKeyKill enabled.
	30:0	**Reserved** Format: MBZ

3DSTATE_WM_DEPTH_STENCIL

3DSTATE_WM_DEPTH_STENCIL

Source: RenderCS

Length Bias: 2

This command replaces the indirect state DEPTH_STENCIL_STATE with an inline state command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 4Eh 3DSTATE_WM_DEPTH_STENCIL Format: OpCode
	15:13	**Reserved** Format: MBZ
	12:8	**Reserved** Format: MBZ
	7:0	**Dword Length** Format: =n Total Length - 2 Value: 02h — Name: Excludes Dword (0,1) **[Default]**
1	31:29	**Stencil Fail Op** Format: 3D_Stencil_Operation This field specifies the operation to perform on the Stencil Buffer when the (front face) stencil test fails. **Programming Notes** if all three stencil ops (Stencil Fail, Stencil Pass Depth Fail, and Stencil Pass Depth Pass) are KEEP, ZERO, or REPLACE, the stencil buffer is not read.
	28:26	**Stencil Pass Depth Fail Op**

3DSTATE_WM_DEPTH_STENCIL

		Format: 3D_Stencil_Operation This field specifies the operation to perform on the Stencil Buffer when the (front face) stencil test passes but the depth pass fails.
	25:23	**Stencil Pass Depth Pass Op** Format: 3D_Stencil_Operation This field specifies the operation to perform on the Stencil Buffer when the (front face) stencil test passes but the depth test passes.
	22:20	**Backface Stencil Test Function** Format: 3D_Compare_Function
	19:17	**Backface Stencil Fail Op** Format: 3D_Stencil_Operation
	16:14	**Backface Stencil Pass Depth Fail Op** Format: 3D_Stencil_Operation This field specifies the operation to perform on the Stencil Buffer when the stencil test passes but the depth pass fails.
	13:11	**Backface Stencil Pass Depth Pass Op** Format: 3D_Stencil_Operation This field specifies the operation to perform on the Stencil Buffer when the stencil test passes and the depth pass passes (or is disabled).
	10:8	**Stencil Test Function** Format: 3D_Compare_Function This field specifies the comparison function used in the (front face) StencilTest function.
	7:5	**Depth Test Function** Format: 3D_Compare_Function Specifies the comparison function used in DepthTest function. **Programming Notes** If the Depth Test Function is ALWAYS or NEVER, the depth buffer is not read.
	4	**Double Sided Stencil Enable** Format: Enable Enable doubled sided stencil operations.

Value	Name	Description
0h	False	Double Sided Stencil Disabled
1h	True	Double Sided Stencil Enabled

3DSTATE_WM_DEPTH_STENCIL

		Programming Notes • Back-facing primitives have a vertex winding order opposite to the currently selected Front Winding state. • Culling of primitives is not affected by the double sided stencil state • Back-facing primitives will be rendered, honoring all current device state, as though it were a front-facing primitive with no implicitly overloaded state.
	3	**Stencil Test Enable** Format: Enable Enables StencilTest function of the Pixel Processing pipeline. **Programming Notes** If any of the render targets are YUV format, this field must be disabled.
	2	**Stencil Buffer Write Enable** Format: Enable Enables writes to the Stencil Buffer. **Programming Notes** If this field is enabled, Stencil Test Enable must also be enabled.
	1	**Depth Test Enable** Format: Enable Enables the DepthTest function of the Pixel Processing pipeline. **Value** / **Name** 0h – Disable 1h – Enable **Programming Notes** If any of the render targets are YUV format, this field must be disabled.
	0	**Depth Buffer Write Enable** Format: Enable Enables writes to the Depth Buffer. **Programming Notes** A Depth Buffer must be defined before enabling writes to it, or operation is UNDEFINED. This bit must not be set when WM_INT::RT Independent Rasterization Enable is true.
2	31:24	**Stencil Test Mask** Format: U8 This field specifies a bit mask applied to stencil test values. Both the stencil reference value and value read from the stencil buffer will be logically ANDed with this mask before the stencil comparison test is performed.

3DSTATE_WM_DEPTH_STENCIL

	23:16	**Stencil Write Mask** Format: U8 This field specifies a bit mask applied to stencil buffer writes. Only those stencil buffer bits corresponding to bits set in this mask will be modified.
	15:8	**Backface Stencil Test Mask** Format: U8 This field specifies a bit mask applied to backface stencil test values. Both the stencil reference value and value read from the stencil buffer will be logically ANDed with this mask before the stencil comparison test is performed.
	7:0	**Backface Stencil Write Mask** Format: U8 This field specifies a bit mask applied to backface stencil buffer writes. Only those stencil buffer bits corresponding to bits set in this mask will be modified.
3	31:16	**Reserved** Format: MBZ
	15:8	**Stencil Reference Value** Format: U8 This field specifies the stencil reference value to compare against in the (front face) StencilTest function.
	7:0	**Backface Stencil Reference Value** Format: U8 This field specifies the stencil reference value to compare against in the StencilTest function.

3DSTATE_WM

3DSTATE_WM

Source: RenderCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode
	26:24	**3D Command Opcode** Default Value: 0h 3DSTATE_PIPELINED Format: OpCode
	23:16	**3D Command Sub Opcode** Default Value: 14h 3DSTATE_WM Format: OpCode
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31	**Statistics Enable** Format: Enable If ENABLED, the Windower and pixel pipeline will engage in statistics gathering. If DISABLED, statistics information associated with this FF stage will be left unchanged. See Statistics Gathering. **Programming Notes** This bit must be disabled if any of these bits is set: 3DSTATE_WM::**Legacy Depth Buffer Clear**, 3DSTATE_WM::**Legacy Hierarchical Depth Buffer Resolve Enable** or 3DSTATE_WM::**Legacy Depth Buffer Resolve Enable**.
	30	**Legacy Depth Buffer Clear Enable** Format: Enable When set, the depth buffer is initialized as a side-effect of rendering pixels.

3DSTATE_WM

Programming Notes

If this field is enabled,

1. the **Depth Test Enable** field in DEPTH_STENCIL_STATE must be disabled.
2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set.
3. 3DSTATE_DEPTH_BUFFER::Stencil Write Enable must be set if 3DSTATE_STENCIL_BUFFER::Stencil buffer enable is set. Additionally the following must be set to the correct values.
    1. DEPTH_STENCIL_STATE::Stencil Write Mask must be 0xFF
    2. DEPTH_STENCIL_STATE::Stencil Test Mask must be 0xFF
    3. DEPTH_STENCIL_STATE::Back Face Stencil Write Mask must be 0xFF
    4. DEPTH_STENCIL_STATE::Back Face Stencil Test Mask must be 0xFF

Refer to section 0 "Depth Buffer Clear" for additional restrictions when this field is enabled. If this field is enabled,**Pixel Shader Kill Pixel** must be disabled.

29 **Reserved**

Format:	MBZ

28 **Legacy Depth Buffer Resolve Enable**

Format:	Enable

When set, the depth buffer is made to be consistent with the hierarchical depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer is to be used as a surface outside of the 3D rendering operation.

Programming Notes

If this field is enabled,

1. the **Legacy Depth Buffer Clear** and **Legacy Hierarchical Depth Buffer Resolve Enable** fields must both be disabled.
2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set.

Refer to section 11.5.4.2 "Depth Buffer Resolve" for additional restrictions when this field is enabled.
If Hierarchical Depth Buffer Enable is disabled, enabling this field will have no effect.

27 **Legacy Hierarchical Depth Buffer Resolve Enable**

Format:	Enable

When set, the hierarchical depth buffer is made to be consistent with the depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer has been modified outside of the 3D rendering operation.

Programming Notes

If this field is enabled,

1. the **Legacy Depth Buffer Clear** and **Legacy Depth Buffer Resolve Enable** fields must both be disabled.
2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set.

3DSTATE_WM

Refer to section 11.5.4.3 "Hierarchical Depth Buffer Resolve" for additional restrictions when this field is enabled.

If **Hierarchical Depth Buffer Enable** is disabled, enabling this field will have no effect.

Performance Note: expect the hierarchical depth buffer's impact on performance to be reduced for some period of time after this operation is performed, as the hierarchical depth buffer is initialized to a state that makes it ineffective. Further rendering will tend to bring the hierarchical depth buffer back to a more effective state.

26 **Legacy Diamond Line Rasterization**

Format:	Enable

This bit, if ENABLED, indicates that the Windower will rasterize zero width lines using the DX9 rasterization rules. If DISABLED, the Windower will rasterize zero width lines using the DX10 rasterization rules (see Strips Fans chapter).

25:23 **Reserved**

Format:	MBZ

22:21 **Early Depth/Stencil Control**

Format:	U2 Enumerated Type

This field specifies the behavior of early depth/stencil test.

Value	Name	Description
0h	NORMAL	Depth/Stencil Test/Write behaves as if it happens post-shader, however the pixel shader is not necessarily executed if the pixel fails depth or stencil test (this is the legacy behavior)
1h	PSEXEC	Depth/Stencil Test/Write behaves as if it happens post-shader, and the pixel shader is executed if the pixel fails depth or stencil test (although pre-shader actions such as primitive inclusion, stipple, etc. will still cause the shader not to execute)
2h	PREPS	Depth/Stencil Test/Write behaves as if it happens pre-shader. The pixel shader is not executed if the pixel fails depth or stencil test. Depth and stencil writes occur even if the pixel is killed by the shader or post-shader by alpha test, etc. Depth output by the pixel shader is ignored.
3h	Reserved	

Programming Notes

The Early Depth/Stencil Control field cannot be set to PREPS (value = 2h) if ForceKillpix = ForceON or Forced Thread Dispatch = ForceON

20:19 **Force Thread Dispatch Enable**

Value	Name	Description
0h	Normal	WM_INT::ThreadDispatchEnable is computed normally
1h	ForceOff	Forces WM_INT::ThreadDispatchEnable Off
2h	ForceON	Forces WM_INT::ThreadDispatchEnable On

3DSTATE_WM

3h	Reserved	

Programming Notes

This should must always be set to Normal. This field should not be tested for functional validation

18:17 **Position ZW Interpolation Mode**

Format:	U2 Enumerated Type

This field elects "interpolation mode" associated with the Position Z (source depth) and W coordinates passed in the PS payload when the PS requires Position as input. This field does not determine whether these coordinates are actually included in the payload (see Pixel Shader Requires Depth, Pixel Shader Requires W).

Value	Name	Description
0h	INTERP_PIXEL	Evaluate Z & W at the pixel center or UL corner (as specified by Pixel Location of 3DSTATE_MULTISAMPLE)
1h	Reserved	
2h	INTERP_CENTROID	
3h	INTERP_SAMPLE	

Programming Notes

WM_INT::RT Independent Rasterization Enable must be disabled in order to select INTERP_SAMPLE.

MSDISPMODE_PERSAMPLE is required in order to select INTERP_SAMPLE.

16:11 **Barycentric Interpolation Mode**

Format:	Enable[6]

Controls which barycentric interpolation terms must be passed into the pixel shader kernel.
Bit 0: Perspective Pixel Location barycentric is required
Bit 1: Perspective Centroid barycentric is required
Bit 2: Perspective Sample barycentric is required
Bit 3: Non-perspective Pixel Location barycentric is required
Bit 4: Non-perspective Centroid barycentric is required
Bit 5: Non-perspective Sample barycentric is required

Programming Notes

If contiguous dispatch modes are enabled, only bit 3 (non-perspective pixel location) can be set, all other bits in this field must be zero.

Pixel Location below refers to either the upper left corner or pixel center depending on the **Pixel Location** state of 3DSTATE_MULTISAMPLING).

MSDISPMODE_PERSAMPLE is required in order to select Perspective Sample or Non-perspective Sample barycentric coordinates.

10 **Reserved**

Format:	MBZ

3DSTATE_WM

9:8 Line End Cap Antialiasing Region Width

Format:	U2

This field specifies the distances over which the coverage of anti-aliased line end caps are computed.

Value	Name	Description
0h	0.5 pixels	0.5 pixels
1h	1.0 pixels	1.0 pixels
2h	2.0 pixels	2.0 pixels
3h	4.0 pixels	4.0 pixels

7:6 Line Antialiasing Region Width

Format:	U2

This field specifies the distance over which the anti-aliased line coverage is computed.

Value	Name	Description
0h	0.5 pixels	0.5 pixels
1h	1.0 pixels	1.0 pixels
2h	2.0 pixels	2.0 pixels
3h	4.0 pixels	4.0 pixels

5 Reserved

Format:	MBZ

4 Polygon Stipple Enable

Format:	Enable

Enables the Polygon Stipple function.

3 Line Stipple Enable

Format:	Enable

Enables the Line Stipple function.

2 Point Rasterization Rule

Format:	3D_RasterizationRule

This field specifies the rasterization rules to be applied whenever the edges of a point primitive fall exactly on a pixel sampling point.

Value	Name	Description
0h	RASTRULE_UPPER_LEFT	To match "normal" upper left rules for surface primitives
1h	RASTRULE_UPPER_RIGHT	To match OpenGL point rasterization rules (round to + infinity, where this is the upper right direction wrt OpenGL screen origin of lower left).

1:0 Force Kill Pixel Enable

Value	Name	Description

3DSTATE_WM

0h	Normal	WM_INT:: Pixel Shader Kill Pixel is computed normally
1h	ForceOff	Forces WM_INT:: Pixel Shader Kill Pixel Off
2h	ForceON	Forces WM_INT:: Pixel Shader Kill Pixel On
3h	Reserved	

Programming Notes

This should must always be set to Normal. This field should not be tested for functional validation

3DSTATE_WM_HZ_OP

3DSTATE_WM_HZ_OP

Source: RenderCS

Length Bias: 2

This command provides for clearing Z and/or stencil or resolving either HZ buffer or Z buffer.

Programming Notes

As this command generates an implicit rectangle, SW must make sure any MMIO register writes following WM_HZ_OP must be preceded by **PIPE_CONTROL** with **Command Streamer Stall Enable** bit set.

3DSTATE_MULTISAMPLE packet must be used prior to this packet to change the Number of Multisamples. This packet must not be used to change Number of Multisamples in a rendering sequence.
3DSTATE_RASTER if used must be programmed prior to using this packet.

This command does NOT support predication from the use of the MI_PREDICATE register. To predicate depth clears and resolves on you must fall back to using the 3D_PRIMITIVE or GPGPU_WALKER commands.

Clear_Value_Test_Enable	Force_Slow_Clear_Enable	Clear_Value_Write_Enable	
0	0	0	Fast Clear; No Clear_value_address update
0	0	1	Fast Clear; Clear_value_address updated
0	1	0	Slow Clear; No Clear_value_address update
0	1	1	Illegal
1	0	0	Conditional Fast Clear; No Clear_value_address update
1	1	0	Illegal
1	X	1	Illegal

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 3h GFXPIPE_3D Format: OpCode

1	31	**Stencil Buffer Clear Enable** Format: Enable When set, the stencil buffer is initialized. **Programming Notes** If this field is enabled, 1. the **Depth Buffer Resolve Enable** and **Hierarchical Depth Buffer Resolve Enable** fields must both be disabled. 2. 3DSTATE_DEPTH_BUFFER::Stencil Write Enable must be set if 3DSTATE_STENCIL_BUFFER::Stencil buffer enable is set.
	30	**Depth Buffer Clear Enable** Format: Enable When set, the depth buffer is initialized. **Programming Notes** If this field is enabled, 1. the **Depth Buffer Resolve Enable** and **Hierarchical Depth Buffer Resolve Enable** fields must both be disabled. 2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set.
	29	**Scissor Rectangle Enable** Format: Enable Enables operation of Scissor Rectangle. **Programming Notes** In order get the functionality right if this bit is disabled, driver must clip the clear rectangle to scissor rectangle if scissor test is

3DSTATE_WM_HZ_OP

		enabled before clearing. **Workaround** Workaround: Due to a Hardware issue this bit must not be set.
	28	**Depth Buffer Resolve Enable** Format: Enable When set, the depth buffer is made to be consistent with the hierarchical depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer is to be used as a surface outside of the 3D rendering operation. **Programming Notes** If this field is enabled, 1. the **Depth Buffer Clear** and **Hierarchical Depth Buffer Resolve Enable** fields must both be disabled. 2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set. Refer to section 11.5.4.2 "Depth Buffer Resolve" for additional restrictions when this field is enabled. If **Hierarchical Depth Buffer Enable** is disabled, enabling this field will have no effect.
	27	**Hierarchical Depth Buffer Resolve Enable** Format: Enable When set, the hierarchical depth buffer is made to be consistent with the depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer has been modified outside of the 3D rendering operation. **Programming Notes** If this field is enabled, 1. the **Depth Buffer Clear** and **Depth Buffer Resolve Enable** fields must both be disabled. 2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set. Refer to section 11.5.4.3 "Hierarchical Depth Buffer Resolve" for additional restrictions when this field is enabled. If **Hierarchical Depth Buffer Enable** is disabled, enabling this field will have no effect. **Performance Note:** expect the hierarchical depth buffer's impact on performance to be reduced for some period of time after this operation is performed, as the hierarchical depth buffer is initialized to a state that makes it ineffective. Further rendering will tend to bring the hierarchical depth buffer back to a more

3DSTATE_WM_HZ_OP

		effective state.
	26	**Pixel Position Offset Enable** Format: Enable Enumerated Type Enables the device to offset pixel positions by 0.5 both in horizontal and vertical directions. **Programming Notes** Setting this field along with setting the Pixel Location to upper left and number of multisamples to greater than one will cause the device to offset pixel postions by 0.5 both in horizontal and vertical directions.It is to be noted this is done to adjust the pixel co-ordinate system to DX9 like, so any WM_HZ_OP screen space rectangles (eg: legacy HiZ Clear, Resolve etc) generated internally by driver in this mode needs to be aware of this offset adjustment and send the rectangles according to alignment restriction taking this offset adjustment into consideration. SW can choose to set this bit only for DX9 API. DX10/OGL API's should not have any effect by setting or not setting this bit.
	25	**Full Surface Depth and Stencil Clear** Format: Enable **Programming Notes** Setting this field to "1" along with "Depth buffer clear" will cause all the pixels/samples in an the HZ and Stencil CLs to be cleared. Software must set this only when the APP requires the entire Depth surface to be cleared. Setting this field to "1" for STC-buffer only clear without "depth buffer clear" will cause all the pixels/samples in the STC-CL to get the stc-ref value.
	24	**Reserved** Format: MBZ
	23:16	**Stencil Clear Value** Format: U8.0 This field specifies the stencil clear value.
	15:13	**Number of Multisamples** Format: U3 Enumerated Type This field specifies how many samples/pixel exist in the Depth Buffer and Stencil buffers, as log2(#samples).

Value	Name	Description
0h	1	1 sample/pixel
1h	2	2 samples/pixel

3DSTATE_WM_HZ_OP

		2h: 4: 4 samples/pixel 3h: 8: 8 samples/pixel 4h: 16: 16 samples/pixel 5h-7h: Reserved
	12:0	**Reserved**
2 **Programming Notes:** The clear rectangle x and y min and max values must be shifted by the LOD level; i.e. the hardware does not include the LOD in this function. Hence to clear any particular X, Y from the base level, to clear the contents at level "LOD" use (X»LOD) and (Y»LOD).	31:16	**Clear Rectangle Y Min** Format: U16 in Pixels from Depth Buffer origin (upper left corner) Specifies Ymin value of (inclusive) of clear rectangle with the Depth Buffer, used for clipping. Pixels with Y coordinates less than Ymin will not be affected. **Value** / **Name** [0,16383] / (Device ignores bits 31:30)
	15:0	**Clear Rectangle X Min** Format: U16 in Pixels from Depth Buffer origin (upper left corner) Specifies Xmin value of (inclusive) of clear rectangle with the Depth Buffer, used for clipping. Pixels with X coordinates less than or equal to Xmin will not be affected. **Value** / **Name** [0,16383] / (Device ignores bits 15:14)
3 **Programming Notes:** See the programming note in the previous DWORD for the Min values. The clear rectangle x and y min and max values must be shifted by the LOD level; i.e. the hardware does not include the LOD in this function. Hence to clear any particular X, Y from the base level, to clear the contents at level "LOD" use (X»LOD) and (Y»LOD). Hence the max values must be less than or equal to: (Surface Width » LOD) and (Surface Height » LOD) for X Max and Y Max respectively.	31:16	**Clear Rectangle Y Max** Format: U16 in Pixels from Depth Buffer origin (lower right corner) Specifies Ymax value of (exclusive) of clear rectangle with the Depth Buffer, used for clipping. Pixels with Y coordinates greater than Ymax will be not be cleared. **Value** / **Name** [0,16383] / (Device ignores bits 31:30)
	15:0	**Clear Rectangle X Max** Format: U16 in Pixels from Depth Buffer origin (lower right corner) Specifies Xmax value of (exclusive) of clear rectangle with the Depth Buffer, used for clipping. Pixels with X coordinates greater than or equal to Xmax will be not be affected. **Value** / **Name** [0,16383] / (Device ignores bits 15:14)

3DSTATE_WM_HZ_OP		
4	31:16	**Reserved** Format: MBZ
	15:0	**Sample Mask** Format: Right-justified bitmask (Bit 0 = Sample0). Number of bits that are used is determined by Num Multisamples (3DSTATE_WM_HZ_OP) A per-multisample-position mask state variable that is immediately and unconditionally ANDed with the sample coverage mask as part of the rasterization process. This mask is applied prior to centroid selection. **Programming Notes** If Number of Multisamples is NUMSAMPLES_1, bits 15:1 of this field will be zeroed by HW.If Number of Multisamples is NUMSAMPLES_2, bits 15:2 of this field will be zeroed by HW.If Number of Multisamples is NUMSAMPLES_4, bits 15:4 of this field will be zeroed by HW.If Number of Multisamples is NUMSAMPLES_8, bits 15:8 of this field will be zeroed by HW.

A64 Byte Scaled Read MSD

MSD2R_A64_BS - A64 Byte Scaled Read MSD

Source:	DataPort 2
Length Bias:	1
Family:	Scaled R/W
Group:	Byte Scaled R/W

DWord	Bit	Description
0	19	**Header Present** Format: MDC_A64_MHP If present, modifies the address calculations.
	18:15	**Message Type** Default Value: 02h Format: Opcode A64 Scattered Read message
	14	**Reserved** Format: MBZ Ignored
	13	**Invalidate After Read** Format: MDC_IAR Specifies if L3 cache lines accessed by the message should be invalidated after the read occurs
	12	**SIMD Mode** Format: MDC_SM2 Specifies the SIMD mode of the message (number of slots processed)
	11:10	**Data Elements** Format: MDC_A64_DS Specifies the number of data elements to be read or written
	9:8	**A64 Scattered Message Subtype** Default Value: 0h Format: Opcode Byte Read/Write subtype

MSD2R_A64_BS - A64 Byte Scaled Read MSD		
	7:0	**Sideband Scaled Offset** Format: MDC_A64_SBSO In combination with Header Present field, specifies the Scale pitch and the Offset for the message.

Addition

add - Addition

Source: Eulsa

Length Bias: 4

The add instruction performs component-wise addition of src0 and src1 and stores the results in dst. Addition of two floating-point numbers follows rules in add (IEEE mode) or add (ALT mode).

Format:
[(pred)] add[.cmod] (exec_size) dst src0 src1

Programming Notes

Use a source modifier with add to implement subtraction.

Syntax

```
[(pred)] add[.cmod] (exec_size) reg reg reg [(pred)] add[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n] + src1.chan[n]; } }
```

	127:64	**ImmSource** Exists If: ([ImmSource][Src1.RegFile]=='IMM') Format: EU_INSTRUCTION_SOURCES_REG_IMM
	63:32	**Operand Controls** Format: EU_INSTRUCTION_OPERAND_CONTROLS
	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Addition with Carry

addc - Addition with Carry

Source: Eulsa

Length Bias: 4

The addc instruction performs component-wise addition of src0 and src1 and stores the results in dst; it also stores the carry into acc.
If the operation produces a carry out, 0x00000001 is stored in acc, else 0x00000000 is stored in acc.

Format:
[(pred)] addc[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : AccWrEn is required. The accumulator is an implicit destination and thus cannot be an explicit destination operand.

Syntax

```
[(pred)] addc[.cmod] (exec_size) reg reg reg [(pred)] addc[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n] + src1.chan[n]; acc.chan[n] = carry(src0.chan[n] + src1.chan[n]); } }
```

Arithmetic Shift Right

asr - Arithmetic Shift Right

Source: Eulsa

Length Bias: 4

Perform component-wise arithmetic right shift of the bits in src0 by the shift count indicated in src1, storing the results in dst. If src0 has a signed type, insert copies of src0's sign bit in the number of MSBs indicated by the shift count. Otherwise insert 0 bits.
The shift count is taken from the low five bits of src1, regardless of the src1 type and treated as an unsigned integer in the range 0 to 31.
In QWord mode, the shift count is taken from the low six bits of src1 regardless of the src1 type and treated as an unsigned integer in the range 0 to 63. Otherwise the shift count is taken from the low five bits of src1 regardless of the src1 type and treated as an unsigned integer in the range 0 to 31. The operation uses QWord mode if src0 or dst has the Q or UQ type but not if src1 is the only operand with the Q or UQ type.
For positive values, this operation is src0 / 2shiftCount and for negative values, this operation is src0 / 2shiftCount - 1.

Format:
[(pred)] asr[.cmod] (exec_size) dst src0 src1

Programming Notes

If src0 is -1, the result is -1 regardless of the shift count.

For unsigned src0 types, asr and shr produce the same result.

Syntax

```
[(pred)] asr[.cmod] (exec_size) reg reg reg [(pred)] asr[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.channel[n] ) {: shiftCnt = src1.chan[n] & 0x1F; // Always use low 5 bits for shift count shiftCnt = src0 or dst has Q or UQ type ? src1.chan[n] & 0x3F : src1.chan[n] & 0x1F if (src0.chan[n] >= 0) { dst.chan[n] = src0.chan[n] » shiftCnt; } else { int maskLSB = pow(2, shiftCnt) - 1; if ( maskLSB & src0.chan[n] == 0 ) { dst.chan[n] = sign(src0.chan[n]) * ((abs)src0.chan[n] » shiftCnt); } else { dst.chan[n] = sign(src0.chan[n]) * ((abs)src0.chan[n] » shiftCnt) - 1; } } } }
```

Average

avg - Average

Source: Eulsa

Length Bias: 4

The avg instruction performs component-wise integer average of src0 and src1 and stores the results in dst. An integer average uses integer upward rounding. It is equivalent to increment one to the addition of src0 and src1 and then apply an arithmetic right shift to this intermediate value.

Format:
The avg instruction performs component-wise integer average of src0 and src1 and stores the results in dst. An integer average uses integer upward rounding. It is equivalent to increment one to the addition of src0 and src1 and then apply an arithmetic right shift to this intermediate value.

Syntax

Bit Field Extract

bfe - Bit Field Extract

Source: Eulsa

Length Bias: 4

Component-wise extract a bit field from src2 using the bit field width from src0 and the bit field offset from src1. Store the extracted bit field value in the low bits of dst and sign extend (if D type) or zero extend (if UD type).

The width and offset values are from the low five bits of src0 and src1 respectively, or src0 & 0x1f and src1 & 0x1f.

If width is zero, the result is zero.

If offset + width > 32 then the extracted bit field is bits offset to 31 of src2, extracting only 32 - offset bits, less than width as the bit field cannot extend past the MSB of the source value. Otherwise extract width bits extending from bit positions offset to offset + width - 1.

Format:

[(pred)] bfe (exec_size) dst src0 src1 src2

Restriction

Restriction : No accumulator access, implicit or explicit.

Restriction : All three-source instructions have certain restrictions, described in Instruction Formats.

Syntax

```
[(pred)] bfe (exec_size) reg reg reg reg
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { UD
width = src0.chan[n][4:0]; UD offset = src1.chan[n][4:0]; if ( width == 0 ) {
dst.chan[n] = 0x00000000; } else if ( (width + offset) < 32 ) { dst.chan[n] =
src2.chan[n] « (32 - width - offset); if (src2 is signed) { dst.chan[n] =
dst.chan[n] » (32 - width); // pad sign bit of dst.chan } else { dst.chan[n] =
dst.chan[n] » (32 - width); // pad 0 } } else { if ( src2 is signed ) {
dst.chan[n] = src2.chan[n] » offset; // pad sign bit } else { dst.chan[n] =
src2.chan[n] » offset; // pad 0 } } } }
```

Bit Field Insert 1

bfi1 - Bit Field Insert 1

Source: Eulsa

Length Bias: 4

The bfi1 instruction is the first instruction in a two-instruction macro for bfi (Bit Field Insert).
The bfi1 instruction component-wise generates mask with control from src0 and src1 and stores the results in dst. The mask is used in the bfi2 instruction to generate the final result of bfi.
Create a bit mask corresponding to the bit field width and offset in src0 and src1. Store the bit mask in dst. The mask has all bits in the bit field set to 1 and all other bits as 0.
The width and offset values are from the low five bits of src0 and src1 respectively, or src0 & 0x1f and src1 & 0x1f.
If width is zero, the result is zero.
The bfi macro has four source operands: src0 - bit field width in low five bits, src1 - bit field offset/starting bit position in low five bits, src2 - bit field value to insert, using only the number of least significant bits given by width in src0, and src3 - overall value into which the bit field is inserted, providing all bits other than the inserted bits for the result value.

```
bfi dst src0 src1 src2 src3
// Translates to these two instructions:
bfi1 dst src0 src1
bfi2 dst dst src2 src3
```

Format:

```
[(pred)] bfi1 (exec_size) dst src0 src1
```

Programming Notes

No accumulator access, implicit or explicit.

Syntax

```
[(pred)] bfi1 (exec_size) reg reg reg [(pred)] bfi1 (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { UD width = src0.chan[n][4:0]; UD offset = src1.chan[n][4:0]; dst = ((1 « width) - 1) « offset; } }

Bit Field Insert 2

bfi2 - Bit Field Insert 2

Source: Eulsa

Length Bias: 4

The bfi2 instruction is the second instruction in a two-instruction macro for bfi (Bit Field Insert).
The bfi2 instruction component-wise performs the bitfield insert operation on src1 and src2 based on the mask in src0.
Use the mask in src0 to take a bit field value from the low bits of src1 and combine it with the value from src2 (so src2 provides all bits other than those masked out and replaced by the bit field value). Store the result in dst.
The bfi macro has four source operands: src0 - bit field width in low five bits, src1 - bit field offset/starting bit position in low five bits, src2 - bit field value to insert, using only the number of least significant bits given by width in src0, and src3 - overall value into which the bit field is inserted, providing all bits other than the inserted bits for the result value.
bfi dst src0 src1 src2 src3
// Translates to these two instructions:
bfi1 dst src0 src1
bfi2 dst dst src2 src3

Format:
[(pred)] bfi2 (exec_size) dst src0 src1 src2

Restriction

Restriction : No accumulator access, implicit or explicit.

Branch Converging

brc - Branch Converging

Source: Eulsa

Length Bias: 4

Description

The brc instruction redirects the execution forward or backward to the instruction pointed by (current IP + offset). The jump will occur if all channels are branched away.
UIP should reference the instruction where all channels are expected to come together. JIP should reference the end of the innermost conditional block.

In GEN binary, JIP and UIP use locations src1 and src0 respectively when immediate and location src0 when reg64, where reg64 is accessed as paired DWord (regioning being <2;2,1>). dst must be IP. When the offsets are immediate, src0 regfile must be immediate.

Format:
[(pred)] brc (exec_size) JIP UIP

Restriction

Restriction : A brc instruction cannot use the Switch instruction option.

Syntax

```
[(pred)] brc (exec_size) imm32 imm32 [(pred)] brc (exec_size) reg64
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < 32; n++ ) { if ( WrEn[n] ) { PcIP[n] = IP + UIP;
} else { PcIP[n] = IP + 1; } } if ( all PcIP != IP + 1 ) { // for all channels
Jump(IP + JIP); }
```

	63:32	**Operand Control** Format: EU_INSTRUCTION_OPERAND_CONTROLS
	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Branch Diverging

brd - Branch Diverging

Source: Eulsa

Length Bias: 4

Description

The brd instruction redirects the execution forward or backward to the instruction pointed by (current IP + offset). The jump will occur if any channels are branched away.

In GEN binary, JIP is at location src1 when immediate and at location src0 when reg32, where reg32 is accessed as a scalar DWord. The ip register must be used (for example, by the assembler) as dst.

Format:
[(pred)] brd (exec_size) JIP

Restriction

Restriction : A brd instruction cannot use the Switch instruction option.

Syntax

```
[(pred)] brd (exec_size) imm32 [(pred)] brd (exec_size) reg32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < 32; n++ ) { if ( WrEn[n] ) { PcIP[n] = IP + JIP;
} else { PcIP[n] = IP + 1; } } if ( any PcIP == ExIP + JIP ) { // any channel
Jump(ExIP + JIP); }

Break

break - Break

Source: Eulsa

Length Bias: 4

Description

The break instruction is used to early-out from the inner most loop, or early out from the inner most switch block.

When used in a loop, upon execution, the break instruction terminates the loop for all execution channels enabled. If all the enabled channels hit the break instruction, jump to the instruction referenced by JIP. JIP should be the offset to the end of the inner most conditional or loop block, UIP should be the offset to the while instruction of the loop block.

If SPF is ON, the UIP must be used to update IP; JIP is not used in this case

The following table describes the two 32-bit instruction pointer offsets. Both the JIP and UIP are signed 32-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at locations src0 and src1 and must be of type DW (signed DWord integer). When the offsets are immediate, src0 regfile must be immediate.

Format:
[(pred)] break (exec_size) JIP UIP

Syntax

```
[(pred)] break (exec_size) imm32 imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.channel[n] ) {
PcIP[n] = IP + UIP; else { PcIP[n] = IP + 1; } } if ( PcIP != (IP + 1) ) { // all
channels Jump(IP + JIP); }

Call

call - Call

Source: Eulsa

Length Bias: 4

Description

The call instruction jumps to a subroutine. It can be predicated or non-predicated. If non-predicated, all enabled channels jump to the subroutine. If predicated, only the channels enabled by PMask jump to the subroutine; the rest of the channels move to the next instruction after the call instruction. If none of the channels jump into the subroutine, the call instruction is treated as a nop.

In case of a jump, the call instruction stores the return IP onto the first DWord of the destination register and stores the CallMask in the second DWord of the destination register.

When SPF is on, the predication control must be scalar.

The following section describes JIP, the jump offset.

JIP can be an immediate or register value. When a jump occurs, this value is added to IP pre-increment. In GEN binary, JIP is at location src1 and src0 must be null. The GRF register must be put (for example, by the assembler) at dst location.

Format: [(pred)] call (exec_size) dst JIP

Format: [(pred)] call (exec_size) dst JIP

Restriction

Restriction : The call instruction must have DWord source and destination type, and the destination must be QWord aligned.

Restriction : A call instruction must target an instruction with Switch set; in addition, the instruction following the call must also have Switch set.

Syntax

```
[(pred)] call (exec_size) reg imm32 [(pred)] call (exec_size) reg reg32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if (WrEn.chan[n] ) { PcIP[n] = IP + JIP; CallMask[n] = 1; } else { PcIP[n] = IP + 1; CallMask[n] = 0; } } if ( PcIP[n] != (IP + 1) ) { // any channel jumped dst.chan[0] = IP + 1; dst.chan[1] = CallMask; Jump(IP + JIP); }
```

Call Absolute

calla - Call Absolute

Source: Eulsa

Length Bias: 4

The calla instruction jumps to a subroutine. It can be predicated or non-predicated. If non-predicated, all enabled channels jump to the subroutine. If predicated, only the channels enabled by PMask jump to the subroutine; the rest of the channels move to the next instruction after the calla instruction. If none of the channels jump into the subroutine, the calla instruction is treated as a nop.

In case of a jump, the call instruction stores the return IP onto the first DWord of the destination register and stores the CallMask in the second DWord of the destination register.

If SPF is ON, none of the PcIP are updated.

When SPF is on, the predication control must be scalar.

The difference between calla and call is that calla uses JIP as the IP value rather than adding it to the IP value.

Format:

[(pred)] calla (exec_size) dst JIP

Restriction

Restriction : The calla instruction must have DWord source and destination type, and the destination must be QWord-aligned.

Restriction : The src0 regioning control must be <2;2,1>,

Syntax

```
[(pred)] calla (exec_size) reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.channel[n] ) {
PcIP[n] = JIP; CallMask[n] = 1; } else { PcIP[n] = IP + 1; CallMask[n] = 0; } }
if ( PcIP[n] != (IP + 1) ) { // any channel jumped dst.chan[0] = IP + 1;
dst.chan[1] = CallMask; Jump(JIP); }

Compare

cmp - Compare

Source: Eulsa

Length Bias: 4

The cmp instruction performs component-wise comparison of src0 and src1 and stores the results in the selected flag register and in dst. It takes component-wise subtraction of src0 and src1, evaluating the conditional code (excluding NS signal) based on the conditional modifier, and storing the conditional bits in bit-packed form in the destination flag register and all bits of dst channels. If the dst is not null, for the enabled channels, then all bits of the destination channel will contain the flag value for the channel. When the instruction operates on packed word format, one general register may store up to 16 such comparison results. In DWord format, one general register may store up to 8 results.

A conditional modifier must be specified; the conditional modifier field cannot be 0000b. The comparison does not use the NS (NaN source) signals, as described in the Creating Conditional Flags section. Accordingly the conditional modifier should not be .u (unordered).

For each enabled channel 0b or 1b is assigned to the appropriate flag bit and 0/all zeros or all ones (e.g, byte 0xFF, word 0xFFFF, DWord 0xFFFFFFFF) is assigned to dst.

When any source type is floating-point, the cmp instruction obeys the rules described in the tables in the Floating Point Modes section of the Data Types chapter.

Format:

[(pred)] cmp[.cmod] (exec_size) dst src0 src1

Syntax

```
[(pred)] cmp[.cmod] (exec_size) reg reg reg [(pred)] cmp[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { bitMask[n] = 0; if ( WrEn.chan[n] ) { results[n] = src0.chan[n] - src1.chan[n]; bitMask[n] = Condition(results[n]); dst.chan[n] = bitMask[n]; // All bits for dst channel } } flag# = bitMask;
```

Compare NaN

cmpn - Compare NaN

Source: Eulsa

Length Bias: 4

The cmpn instruction performs component-wise special-NaN comparison of src0 and src1 and stores the results in the selected flag register and in dst. It takes component-wise subtraction of src0 and src1, evaluating the conditional signals including NS based on the conditional modifier, and storing the conditional flag bits in bit-packed form in the destination flag register and all bits of dst channels. If the dst is not null, for the enabled channels, then all bits of the destination channel will contain the flag value for the channel. When the instruction operates on packed word format, one general register may store up to 16 such comparison results. In DWord format, one general register may store up to 8 results.

A conditional modifier must be specified; the conditional modifier field cannot be 0000b. More information about the conditional signals used is in the Creating Conditional Flags section.

For each enabled channel 0b or 1b is assigned to the appropriate flag bit and 0/all zeros or all ones (e.g, byte 0xFF, word 0xFFFF, DWord 0xFFFFFFFF) is assigned to dst.

Min/Max instructions use cmpn to select the destination from the input sources (see the Min Max of Floating Point Numbers section for details).

Format:

[(pred)] cmpn[.cmod] (exec_size) dst src0 src1

Restriction

Restriction :

.l and .ge are the only two conditional modifiers are supported for this instruction.

Syntax

```
[(pred)] cmpn[.cmod] (exec_size) reg reg reg [(pred)] cmpn[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { bitMask[n] = 0; if ( WrEn.chan[n] ) { results[n] = src0.chan[n] - src1.chan[n]; bitMask[n] = ConditionNaN(results[n]); dst.chan[n][0] = bitMask[n]; // All bits for dst channel } } flag# = bitMask;

Conditional Select

csel - Conditional Select

Source: Eulsa

Length Bias: 4

The csel instruction selectively moves components in src0 or src1 to the dst based on the result of the compare of src2 with zero. If the channel condition is true, data in src0 is moved into dst. Otherwise, data in src1 is moved into dst. The csel instruction provides the function of a cmp followed by sel. The instruction must not be used if cmpn is required. The instruction does not update the flag register.
The comparison follows the same rule as cmp instruction for that data type.

Format:
csel (exec_size) dst src0 src1 src2

Syntax

```
csel[.cmod] (exec_size) reg reg reg reg
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { bitMask[n] = 0; if (

Continue

cont - Continue

Source: Eulsa

Length Bias: 4

Description

The cont instruction disables execution for the subset of channels for the remainder of the current loop iteration. Channels remain disabled until right before the while instuction or right before the condition check code block for the while instruction. If all enabled channels hit this instruction, jump to the instruction referenced by JIP where execution continues.

UIP should always reference the loop's associated while instruction. JIP should point to the last instruction of the inner most conditional block if the cont instruction is inside a conditional block. In case of the break instruction directly under the loop, the JIP and the UIP are the same.

If SPF is ON, the UIP must be used to update IP; JIP is not used in this case.

The following table describes the two 32-bit instruction pointer offsets. Both the JIP and UIP are signed 32-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at locations src0 and src1 and must be of type DW (signed DWord integer). When the offsets are immediate, src0 regfile must be immediate.

Format:
[(pred)] cont (exec_size) JIP UIP

Restriction

Restriction : The execution size must be the same for the while, break, and cont instructions of the same code block.

Syntax

```
[(pred)] cont (exec_size) imm32 imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.channel[n] ) { if ( PMask[n] ) { // PMask is for all channels enabled for the cont instruction. PcIP[n] = IP + UIP; } else { PcIP[n] = IP + 1; } } } for ( n = exec_size; n < 32; n++ ) { PcIP[n] = IP + 1; } if ( PcIP != (IP + 1) ) { // all channels true Jump(IP + JIP); }
```

Predication	Conditional Modifier	Saturation	Source Modifier
Y	N	N	N

DWord	Bit	Description
0..3	127:96	**JIP** Format: S31 The byte-aligned jump distance if a jump is taken for the channel.

cont - Continue		
	95:64	**UIP** Format: S31 The byte aligned jump distance if a jump is taken for the instruction.
	63:32	**Operand Control** Format: EU_INSTRUCTION_OPERAND_CONTROLS
	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Count Bits Set

cbit - Count Bits Set

Source: Eulsa

Length Bias: 4

The cbit instruction counts component-wise the total bits set in src0 and stores the resulting counts in dst.

Format:
[(pred)] cbit (exec_size) dst src0

Restriction

Restriction : No accumulator access, implicit or explicit.

Syntax

```
[(pred)] cbit (exec_size) reg reg [(pred)] cbit (exec_size) reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { UD cnt
= 0; UD val = src0.chan[n]; while ( val ) { if ( val & 1 ) { cnt ++; } val = val
» 1; } dst.chan[n] = cnt; } }
```

Dot Product 2

dp2 - Dot Product 2

Source: Eulsa

Length Bias: 4

The dp2 instruction performs a two-wide dot product on four-tuple vector basis and storing the same scalar result per four tuple to all four channels in dst. This instruction is similar to dp4 except that every third and fourth element of src0 (post-source-swizzle if present) are not involved in the computation.

The dot product of two vectors of equal length is the sum of the products of each pair of corresponding elements.

The dp4 instruction includes all four elements of each vector in the dot product. The dp3 instruction includes the first three elements of each vector in the dot product.

Format:

[(pred)] dp2[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : Execution size cannot be less than 4.

Restriction : Horizontal strides must be 1.

Restriction : Source operands cannot be accumulators.

Syntax

```
[(pred)] dp2[.cmod] (exec_size) reg reg reg [(pred)] dp2[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n += 4 ) { fTmp = src0.chan[n] * src1.chan[n] + src0.chan[n+1] * src1.chan[n+1]; if ( WrEn.chan[n] ) dst.chan[n] = fTmp; if ( WrEn.chan[n+1] ) dst.chan[n+1] = fTmp; if ( WrEn.chan[n+2] ) dst.chan[n+2] = fTmp; if ( WrEn.chan[n+3] ) dst.chan[n+3] = fTmp; }

Else

else - Else

Source: Eulsa

Length Bias: 4

The else instruction is an optional statement within an if/else/endif block of code. It restricts execution within the else/endif portion to the opposite set of channels enabled under the if/else portion. Channels which were inactive prior to entering the if/endif block remain inactive throughout the entire block.

All enabled channels upon arriving the else instruction will be redirected to the matching endif. If all channels are redirected (by else or before else), a relative jump is performed to the location specified by <JIP>. The jump target should be the matching endif instruction for that conditional block.

The following table describes the 32-bit <JIP>. In GEN binary, <JIP> is at location <src1> and must be of type D (signed dword integer). <JIP> must be an immediate operand, it is a signed 32-bit number and is intended to be forward referencing. This value is added to IP pre-increment.

If the <branch_ctrl> bit is set, then the <JIP> points to the first join instruction within the else block and <UIP> points to the endif instruction. If the <branch_ctrl> bit is not set, <JIP> and <UIP>, both point to endif.

Format:

else (<exec_size>) <JIP> <UIP> <branch_ctrl>

Programming Notes

If all channels are redirected (by else or before else), relative jump is performed to the location specified by <JIP> + 1.

Restriction

Restriction : Predication is not allowed.

Restriction : The execution size must be the same for the if, else, and endif instructions of the same code block.

Restriction : The branch_ctrl must be set equal to (JIP != UIP).

Syntax

```
else (<exec_size>) imm32 imm32 branch_ctrl
```

Pseudocode

```
Evaluate(WrEn); for (n = 0; n < 32; n++) { if (WrEn.channel[n] == 1 ||
branch_ctrl) { PcIP[n] = IP + JIP; } else { PcIP[n] = IP + UIP; } } if (PcIP !=
(IP+1)) { // for all channels Jump(IP + JIP); }
```

		Format: S31 The byte-aligned jump distance if a jump is taken for the channel.
	95:64	**UIP** Format: S31 The byte aligned jump distance if a jump is taken for the instruction.
	63:32	**Operand Control** Format: EU_INSTRUCTION_OPERAND_CONTROLS
	31:0	**Header** Format: EU_INSTRUCTION_HEADER

End If

endif - End If

Source: Eulsa

Length Bias: 4

Description

The endif instruction terminates an if/else/endif block of code. It restores execution to the channels that were active prior to the if/else/endif block.
The endif instruction is also used to hop out of nested conditionals by jumping to the end of the next outer conditional block when all channels are disabled.

The following table describes the 32-bit JIP. In GEN binary, JIP is at location src1 and must be of type D (signed DWord integer). JIP must be an immediate operand, it is a signed 32-bit number. This value is added to IP pre-increment.

Format:
endif JIP

Restriction

Restriction : Predication is not allowed.

Restriction : The execution size must be the same for the if, else, and endif instructions of the same code block.

Syntax

```
endif (exec_size) imm32
```

Pseudocode

```
Evaluate(WrEn); if ( WrEn == 0 ) { // all channels false Jump(IP + JIP); }
```

Predication	Conditional Modifier	Saturation	Source Modifier

Extended Math Function

math - Extended Math Function

Source:	Eulsa
Length Bias:	4

The math instruction performs extended math function on the components in src0, or src0 and src1, and write the output to the channels of dst. The type of extended math function are based on the FC[3:0] encoding in the table below.

Format:
[(pred)] math (exec_size) dst src0 src1 <FC>

Restriction
Restriction : Accumulator access is allowed only for ieee macro functions.
Restriction : The math instruction does not support indirect addressing modes.
Restriction : The only supported rounding mode for math instruction is Round to Nearest Even.
Restriction : INT DIV function does not support SIMD16. INT DIV function does not support simulataneous write to two registers. INT DIV function does not support source modifiers.
Restriction : The FDIV function is not supported in ALT_MODE.
Restriction : The math instruction can use GRF or immediates as source. The source formats for immediates must be one of the source formats supported by math operation.
Restriction : DepCtrl must not be used.
Restriction : The math instruction must use GRF as destination.
Restriction : The supported regioning mode for math instruction is align1 and align16. The following restrictions apply for align1 mode: Scalar source is supported. Source and destination horizontal stride must be the same. Regioning must ensure Src.Vstride = Src.Width * Src.Hstride . Source and destination offset must be the same, except the case of scalar source.
Restriction : Half-float denorms are always retained.
Restriction : Math Operation rules when float and half-floats are mixed between source or between source and destination operands. The half-float operand must be interleaved in the register for align1 and the source and destination register offset must be be the same to DW granularity. For align16, the half-float operand is allowed to be packed.
Restriction : The execution size must be no more than 8 when half-floats are used in source or destination operand.
Restriction : The source operand must not span two registers if the destination operand spans just one register Example: Case (a) // Allowed. The source must be strided by 2. the offset is allowed to select between lower/upper 16b math (8) r10:f r11.0<16;8,2>:hf 0x01

math - Extended Math Function

math (8) r10:f r11.1<16;8,2>:hf 0x01
math (8) r10:f r11.0<16;8,2>:hf r12.1<16;8,2>:hf 0x09
Case (b) // Allowed. The destination must be strided by 2. The offset is allowed to selecte between lower/upper 16b
math (8) r10.0<2>:hf r11.0<8;8,1>:f
math (8) r10.1<2>:hf r11.0<8;8,1>:f 0x01
math (8) r10.0<2>:hf r11.0<16;8,2>:hf r12.0<16;8,2>:hf 0x09
Case (c) // Allowed. Destination has stride of 2. The offset is allowed to select between uppoer/lower 16b
math (8) r10.0<2>:hf r11.0<8;8,1>:f r12.1<16;8,2>:hf 0x09
math (8) r10.1<2>:hf r11.1<16;8,2>:hf r12.0<8;8,1>:f 0x09
Case (d) // Not Allowed. Destination is half-float but is not interleaved.
math (8) r10.0<1>:hf r11.0<8;8,1>:f
Case (e) // Not Allowed. Source is half-float but not interleaved
math (8) r10.0<2>:hf r11.0<8;8,1>:f r12.0<8;8,1>:hf 0x09
Case (f) // Not Allowed. Source operand spans 2 registers while destination spans one register.
math (8) r83.8<1>:hf r12.4<4;4,1>:f null 0x02

Restriction : Math Operation rules when half-floats are used on both source and destination operands.
The execution size must be 8.
The half-float source must be packed or interleaved. When interleaving, both source and destination must be interleaved.
Example:
Case (a) // Allowed. The source and destination are packed or interleaved
math (8) r10.0:hf r11.0<8;8,1>:hf 0x01
math (8) r10.0<2>:hf r11.0<16;8,2>:hf 0x01
math (8) r10.8:hf r11.0<8;8,1>:hf 0x01
math (8) r10.8<2>:hf r11.0<16;8,2>:hf 0x01

Restriction : For one source math operations src1 must be NULL.

Syntax

```
[(pred)] math (exec_size) reg reg reg imm4
```

Pseudocode

```
Evaluate(WrEn);
for (n = 0; n < exec_size; n++) {
    if (WrEn.channel[n] == 1) {
        switch FC[3:0] {
            case 1h:
                dst.channel[n] = rcp(src0.channel[n]);
            case 2h:
                dst.channel[n] = log(src0.channel[n]);
            case 3h:
                dst.channel[n] = exp(src0.channel[n]);
            case 4h:
                dst.channel[n] = sqrt(src0.channel[n]);
            case 5h:
                dst.channel[n] = rsq(src0.channel[n]);
            case 6h:
```

math - Extended Math Function

```
                dst.channel[n] = sin(src0.channel[n]);
            case 7h:
                dst.channel[n] = cos(src0.channel[n]);
            case 9h: // src0 / src1
                dst.channel[n] = fdiv(src0.channel[n], src1.channel[n]);
            case Ah:
                dst.channel[n] = pow(src0.channel[n], src1/channel[n]);
            case Bh: // src0 / src1
                idiv(src0.channel[n], src1.channel[n]);
                dst.channel[n] = quotient;
                dst+1.channel[n] = remainder;
            case Ch:
                idiv(src0.channel[n], src1.channel[n]);
                dst.channel[n] = quotient;
            case Dh:
                idiv(src0.channel[n], src1.channel[n]);
                dst.channel[n] = remainder;

Find First Bit from LSB Side

fbl - Find First Bit from LSB Side

Source: Eulsa

Length Bias: 4

The fbl instruction counts component-wise the number of LSB 0 bits before the first 1 bit in src0, storing that number in dst.

Format:
[(pred)] fbl (exec_size) dst src0

Programming Notes

If src0 contains no 1 bits, store 0xFFFFFFFF in dst.

Restriction

Restriction : No accumulator access, implicit or explicit.

Syntax

```
[(pred)] fbl (exec_size) reg reg [(pred)] fbl (exec_size) reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { UD cnt = 0; UD udScalar = src0.chan[n]; while ( (udScalar & 1) == 0 && cnt != 32 ) { cnt ++; udScalar = udScalar » 1; } if ( src0.chan[n] == 0x00000000 ) { dst.chan[n] = 0xFFFFFFFF; } else { dst.chan[n] = cnt; } } }

Fraction

frc - Fraction

Source: Eulsa

Length Bias: 4

The frc instruction computes, component-wise, the truncate-to-minus-infinity fractional values of src0 and stores the results in dst. The results, in the range of [0.0, 1.0], are the fractional portion of the source data. The result is in the range [0.0, 1.0] irrespective of the rounding mode. Floating-point fraction computation follows the rules in the following tables, based on the current floating-point mode.

Format:
[(pred)] frc[.cmod] (exec_size) dst src0

Syntax

```
[(pred)] frc[.cmod] (exec_size) reg reg [(pred)] frc[.cmod] (exec_size) reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) {
dst.chan[n] = src0.chan[n] - floor(src0.chan[n]); } }

Goto

goto - Goto

Source: Eulsa

Length Bias: 4

The goto instruction directs the instruction pointer to the offset specified by the UIP offset or to the next IP based on the BranchCtrl bit in the instruction. The active channels that are predicated on this instruction will take the IP + UIP path when BranchCtrl is set else the channels take IP + 1. The active channels that are not predicated on this instruction will be made inactive and waiting to be joined at the join IP. The join IP is IP + UIP when BranchCtrl is clear else it is the next IP.
When there are no active channels the instruction pointer will move to IP + JIP.
The goto instruction is used in conjunction with a join instruction. A goto deactivates some channels that are reactivated at some program-specified join instruction. See the join instruction for the activation rules.
The goto and join instructions enable unstructured program control flow. These instructions must be used with additional care where dangling channels can result without proper compiler checks, meaning that it is expected that programs will navigate through these paths to reactivate the channels. Hardware does not provide native checks or reconvergence.
The following table describes the two 32-bit instruction pointer offsets. Both the JIP and UIP are signed 32-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at locations src0 and src1 and must be of type DW (signed DWord integer).
If SPF is ON, none of the PcIP are updated.

Format:
[(pred)] goto (exec_size) JIP UIP BranchCtrl

Restriction

Restriction : Cannot have a goto in the body and the corresponding join in the function or the subroutine. Similarly the brd and brc.

Syntax

```
[(pred)] goto (exec_size) imm32 imm32 BranchCtrl
```

Pseudocode

Evaluate(WrEn);

```
 for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { // for the predicated
active channels if ( BranchCtrl ) { PcIP[n] = IP + UIP; } else { PcIP[n] = IP +
1; } } else { // join IP, for the active non predicated channels if ( BranchCtrl
) { PcIP[n] = IP + 1; } else { PcIP[n] = IP + UIP; } } } if ( BranchCtrl ) { //
if (PcIP != (IP + UIP) ) { // for all channels if (PcIP != (IP + 1) ) { // for
all channels Jump(IP + JIP); } else { Jump(IP + 1); } } else { Jump(IP + UIP); }
} else { // if (PcIP != (IP + 1) ) { // for all channels Jump(IP + JIP); } else {
Jump(IP + 1); } }

GPGPU_CSR_BASE_ADDRESS

GPGPU_CSR_BASE_ADDRESS

Source: BSpec

Length Bias: 2

The GPGPU_CSR_BASE_ADDRESS command sets the base pointers for EU and L3 to Context Save and Restore EU State and SLM for **GPGPU** mid-thread preemption.

Programming Notes

Execution of this command causes a full pipeline flush, thus its use should be minimized for higher performance. State and instruction caches are flushed on completion of the flush.

SW must always program PIPE_CONTROL with "CS Stall" and "Render Target Cache Flush Enable" set prior to programming GPGPU_CSR_BASE_ADDRESS command for GPGPU workloads i.e when pipeline select is GPGPU via PIPELINE_SELECT command. This is required to achieve better GPGPU preemption latencies for certain programming sequences. If programming PIPE_CONTROL has performance implications then preemption latencies can be trade off against performance by not implementing this programming note.

	5:0	**Interface Descriptor Offset** Format: U6 This field specifies the offset from the interface descriptor base pointer to the interface descriptor which will be applied to this object. It is specified in units of interface descriptors.
2	31:17	**Reserved** Format: MBZ
	16:0	**Indirect Data Length** Format: U17 in bytes **Description** This field provides the length in bytes of the indirect data. A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect Data Start Address field is ignored. If Indirect Data is enabled, it is assumed that CURBE is not being used except for cross-thread constant data. This field must have the same alignment as the Indirect Object Data Start Address. It must be DQWord (32-byte) aligned. As the indirect data are sent directly to URB, the total size of Indirect data must be less than 63,488 (2048 URB lines - 64 lines for Interface Descriptors).

GPGPU_WALKER

3 — 31:6 — Indirect Data Start Address

Format:	IndirectObjectOffset[31:6]

This field specifies the Graphics Memory starting address of the data to be loaded into the kernel for processing. This pointer is relative to the **Indirect Object Base Address.**
Hardware ignores this field if indirect data is not present.
Alignment of this address depends on the mode of operation.
It is the 64-byte aligned address of the indirect data.

Value	Name	Description
[0 - 512MB]		(Bits 31:29 MBZ)

3 — 5:0 — Reserved

Format:	MBZ

4 — 31:30 — SIMD Size

This field determines the size of the payload and the number of bits of the execution mask that are expected. The kernel pointed to by the interface descriptor should match the SIMD declared here.

Value	Name	Description
0	SIMD8	8 LSBs of the execution mask are used
1	SIMD16	16 LSBs used in execution mask
2	SIMD32	32 bits of execution mask used

4 — 29:22 — Reserved

Format:	MBZ

4 — 21:16 — Thread Depth Counter Maximum

The maximum value of the thread depth counter. Since the counter starts at 0, the depth is this value + 1.
(Thread_Depth_Max+1)*(Thread_Height_Max+1)*(Thread_Width_Max+1) must equal **Number of Threads in GPGPU Thread Group** in the Interface Descriptor.

4 — 15:14 — Reserved

Format:	MBZ

4 — 13:8 — Thread Height Counter Maximum

Format:	U6-1

The maximum value of the thread height counter. The height is this value + 1.

4 — 7:6 — Reserved

Format:	MBZ

4 — 5:0 — Thread Width Counter Maximum

Format:	U6-1

The maximum value of the thread width counter. The width is this value + 1.

5 — 31:0 — Thread Group ID Starting X

This is the initial value of the X component of the thread group. When X reaches the maximum value it rolls around to this value.

GPGPU_WALKER		
6	31:0	**Reserved** Format: MBZ
7	31:0	**Thread Group ID X Dimension** The X dimension of the thread group (maximum X is dimension -1)
8	31:0	**Thread Group ID Starting Y** This is the initial value of the Y component of the thread group. When Y reaches the maximum value it rolls around to this value.
9	31:0	**Reserved** Format: MBZ
10	31:0	**Thread Group ID Y Dimension** The Y dimension of the thread group (maximum Y is dimension -1)
11	31:0	**Thread Group ID Starting/Resume Z** This is the initial value of the Z component of the thread group.
12	31:0	**Thread Group ID Z Dimension** The Z dimension of the thread group (maximum Z is dimension -1)
13	31:0	**Right Execution Mask** The execution mask used for threads on the right (maximum X) of the thread group.
14	31:0	**Bottom Execution Mask** The execution mask used for threads on the bottom (maximum Y) of the thread group.

Half Precision HI8DS Render Target Write MSD

MSD_RTWH_HI8DS - Half Precision HI8DS Render Target Write MSD

Source:	Render Cache DataPort
Length Bias:	1
Family:	Other
Group:	Render Target R/W

DWord	Bit	Description
0	31	**Reserved** Format: MBZ Ignored
	30	**Message Precision Subtype** Default Value: 1h Format: Opcode Half precision data message
	29	**Reserved** Format: MBZ Ignored
	28:25	**Message Length** Format: U4 Specifies the number of 256-bit GRF registers sent as the message payload (including the header). Valid value ranges are 1 to 15.
	24:20	**Response Length** Format: U5 Specifies the number of 256-bit GRF registers expected as the message response payload. Valid value ranges are 0 to 16.
	19	**Header Present** Format: MDC_MHP If set, indicates that the message includes the 2-register header.
	18	**Reserved** Format: MBZ Ignored

MSD_RTWH_HI8DS - Half Precision HI8DS Render Target Write MSD

	17:14	**Message Type** Default Value: 0Ch Format: Opcode Render Target Write message
	13	**Per-Sample PS Enable** Format: Enable If set, PS sends Render Target Write Message that outputs color, depth(optional) and stencil(optional) phases on per sample basis for each slot. **Programming Notes** This bit must be set when PS runs at sample-frequency i.e. pixel shader dispatch mode is PER_SAMPLE. When this bit is set and PS runs at pixel-frequency, i.e. pixel shader dispatch mode is PER_PIXEL, Render Target read and write messages interpret bits 9:6 in MCH_RT_C0 as sample index. In this mode, render target write message payload and render target read writeback payload contain color of a specific sample in all dispatched pixels. RT writes referring to out-of-bound samples have no effect. RT reads from out-of-bound samples return 0. When this bit is clear and PS runs at pixel-frequency, render target write messages contain color value for entire pixel (all samples). When this bit is clear and PS runs at pixel-frequency, render target reads are disallowed per API spec (RT read without specifying sample index forces sample-frequency dispatch). HW behavior is undefined in such case.
	12	**Last Render Target Select** Format: Enable This bit must be set on the last render target write message sent for each group of pixels. For single render target pixel shaders, this bit is set on all render target write messages. For multiple render target pixel shaders, this bit is set only on messages sent to the last render target. This bit must be zero for SIMD8 Image Write message. In general, when threads are not launched by 3D FF, this bit must be zero. **Programming Notes** When a pixel shader has render target writes at finer granularity than the dispatch rate, last render target write to a null surface must be present at the dispatch rate with this bit set. In particular, if a kernel is dispatched at pixel rate and it only writes to render targets at sample-rate, it must include a pixel-rate render target write to a null surface with Last Render Target Select bit enabled.
	11	**Slot Group Select** Format: MDC_RT_SGS This field selects whether slots 15:0 or slots 31:16 are used for bypassed data.

Halt

halt - Halt

Source: Eulsa

Length Bias: 4

Description

The halt instruction temporarily suspends execution for all enabled compute channels. Upon execution, the enabled channels are sent to the instruction at (IP + UIP), if all channels are enabled at HALT, jump to the instruction at (IP + JIP).

If the halt instruction is not inside any conditional code block, the values of JIP and UIP should be the same. If the halt instruction is inside a conditional code block, the UIP should be the end of the program and the JIP should be the end of the inner most conditional code block.

The UIP must point to a HALT Instruction.

If SPF is ON, the UIP must be used to update IP; JIP is not used in this case.

The following table describes the two 32-bit instruction pointer offsets. Both the JIP and UIP are signed 32-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at locations src0 and src1 and must be of type DW (signed DWord integer). When the offsets are immediate, src0 regfile must be immediate and dst must be null.

Format:

[(pred)] halt (exec_size) JIP UIP

Syntax

```
[(pred)] halt (exec_size) imm32 imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < 32; n++ ) { if ( WrEn.channel[n] ) { PcIP[n] =
IP + UIP; else { PcIP[n] = IP + 1; } } if ( PcIP != (IP + 1) ) { // for all
channels Jump(IP + JIP); }
```

Predication	Conditional Modifier	Saturation	Source Modifier
Y	N	N	N

DWord	Bit	Description
0..3	127:96	**JIP** Format: S31 The byte-aligned jump distance if a jump is taken for the channel.
	95:64	**UIP** Format: S31 The byte aligned jump distance if a jump is taken for the instruction.
	63:32	**Operand Control** Format: EU_INSTRUCTION_OPERAND_CONTROLS

halt - Halt			
	31:0	**Header**	
		Format:	EU_INSTRUCTION_HEADER

HCP_BSD_OBJECT

HCP_BSD_OBJECT

Source: VideoCS

Length Bias: 2

The HCP is selected with the **Media Instruction Opcode "7h"** for all HCP Commands. Each HCP command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The HCP_BSD_OBJECT command fetches the HEVC bit stream for a slice starting with the first byte in the slice. The bit stream ends with the last non-zero bit of the frame and does not include any zero-padding at the end of the bit stream. There can be multiple slices in a HEVC frame and thus this command can be issued multiple times per frame.

The HCP_BSD_OBJECT command must be the last command issued in the sequence of batch commands before the HCP starts decoding. Prior to issuing this command, it is assumed that all configuration parameters in the HCP have been loaded including workload configuration registers and configuration tables. When this command is issued, the HCP is waiting for bit stream data to be presented to the shift register.

DWord	Bit	Description

HCP_BSD_OBJECT

1	31:0	**Indirect BSD Data Length** Format: U32 Specifies the length in bytes of the bitstream data for the current slice. It includes the first byte of the slice and the last non-zero byte of the in the slice. Specifically, the zero-padding bytes (if present) and the next start-code are excluded. **Value** / **Name** / **Description** [0,268435455] / Data_Length_with_28_bits_only / Valid range is only from 0 to 268435455, which is corresponding to lower 28 bits.
2	31:29	**Reserved** Format: MBZ
	28:0	**Indirect Data Start Address** Format: U29 Specifies the byte-aligned graphics memory starting address of the slice bit stream relative to the **BSD Indirect Object Base Address**.

HCP_FQM_STATE

HCP_FQM_STATE

Source: VideoCS

Length Bias: 2

The HCP_FQM_STATE command loads the custom HEVC quantization tables into local RAM and may be issued up to 8 times: 4 scaling list per intra and inter.

Driver is responsible for performing the Scaling List division. So, save the division HW cost in HW. The 1/x value is provided in 16-bit fixed-point precision as ((1«17)/QM +1) » 1. .

Note: FQM is computed as (2^16)/QM. If QM=1, FQM=all 1's.

To simplify the design, only a limited number of scaling lists are provided at the PAK interface: default two SizeID0 and two SizeID123 (one set for inter and the other set for intra), and the encoder only allows custom entries for these four matrices. The DC value of SizeID2 and SizeID3 will be provided.

When the scaling_list_enable_flag is set to disable, the scaling matrix is still sent to the PAK, and with all entries programmed to the same value of 16.

This is a picture level state command and is issued in encoding processes only.

Dwords 2-33 form a table for the DCT coefficients, 2 16-bit coefficients/DWord.

- Size 4x4 for SizeID0, DWords 2-9.
- Size 8x8 for SizeID1/2/3, DWords 2-33.

SizeID 0 (Table 4-13)

HCP_IND_OBJ_BASE_ADDR_STATE

HCP_IND_OBJ_BASE_ADDR_STATE

Source: VideoCS

Length Bias: 2

The HCP is selected with the **Media Instruction Opcode "7h"** for all HCP Commands. Each HCP command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The HCP_IND_OBJ_BASE_ADDR_STATE command is used to define the indirect object base address of the stream in graphics memory. This is a frame level command. (Is it frame or picture level?)
This is a picture level state command and is issued in both encoding and decoding processes.

Compressed Header Format

Fields	Bits	
Bin	0	Kernel Binarized Syntax
Probability select	1	0 ->indicates probability 128 1 ->indicates probability 256
	Repeat to pack a Cacheline	

Partition1 and TileSize record

Fields	Bits	
Tile Size	31:0	Partition1 Size is 16-bit value, Tile Size is 32-bit value
AddressOffset	63:32	Cacheline Address Offset to be Modified
Offset	69:64	Byte offset to be Modified
16-bit vs 32-bit update	70	0: Update 16-bit; 1: Update 32-bit
Reserved	511:71	

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline Type** Default Value: 2h Format: OpCode
	26:23	**Media Instruction Opcode** Default Value: 7h Codec/Engine Name Format: OpCode Codec/Engine Name = HCP = 7h
	22:16	**Media Instruction Command** Default Value: 3h HCP_IND_OBJ_BASE_ADDR_STATE Format: OpCode

HCP_IND_OBJ_BASE_ADDR_STATE

	15:12	**Reserved** Format: MBZ
	11:0	**Dword Length** Format: =n (Excludes Dwords 0, 1). Value: Ch — Name:
1..2	63:0	**HCP Indirect Bitstream Object Base Address** Format: SplitBaseAddress4KByteAligned Specifies the 4K-byte aligned memory base address for the read-only indirect data object pointed in the HCP_BSD_OBJECT command for fetching (reading) the compressed Slice Data.
3	31:0	**HCP Indirect Bitstream Object Memory Address Attributes** Format: MemoryAddressAttributes
4..5	63:0	**HCP Indirect Bitstream Object Access Upper Bound** Format: SplitBaseAddress4KByteAligned Decoder only. This field specifies the 4K-byte aligned maximum memory address access by the indirect data object in the HCP_BSD_OBJECT command for the slice bit stream. Indirect data accessed at this address or greater will cause the HCP to stop issuing requests to the GAC and the BSP VLD will then only receive zeros until a slice done is received. Setting this field to 0 will cause this range to be ignored by the HCP.
6..7	63:0	**HCP Indirect CU Object Base Address** Format: BaseAddress4KByteAligned Encoder only. Specifies the 4K-byte aligned data buffer base address for the read-only indirect data object for fetching (reading) per CU data during the encoding process.
8	31:0	**HCP Indirect CU Object Object Memory Address Attributes** Format: MemoryAddressAttributes
9..10	63:0	**HCP PAK-BSE Object Base Address** Format: BaseAddress4KByteAligned Encoder only. Specifies the 4K-byte aligned memory base address for the write-only data pointed by the PAK engine for writing out the compressed bitstream.

HCP_IND_OBJ_BASE_ADDR_STATE		
11	31:0	**HCP PAK-BSE Object Address Memory Address Attributes** Format: **MemoryAddressAttributes** Encoder only.
12..13	63:0	**HCP PAK-BSE Object Access Upper Bound** Format: **SplitBaseAddress4KByteAligned** Encoder only. This field specifies the 4K-byte aligned maximum memory address access by the HCP_PAK_OBJECT command for writing out the slice bit stream. Indirect data accessed at this address and beyond will be blocked by the hardware and ignored. This address must be greater than the HCP PAK-BSE Object Base Address state.

HCP_PAK_INSERT_OBJECT

HCP_PAK_INSERT_OBJECT	
Source:	VideoCS
Length Bias:	2

It is an encoder only command, operating at bitstream level, before and after SliceData compressed bitstream. It is setup by the header and tail present flags in the Slice State command. If these flags are set and no subsequent PAK_INSERT_OBJECT commands are issued, the pipeline will hang.
The HCP_ PAK_ INSERT _OBJECT command supports both inline and indirect data payload, but only one can be active at any time. It is issued to insert a chunk of bits (payload) into the current compressed bitstream output buffer (specified in the HCP_PAK-BSE Object Base Address field of the HCP_IND_OBJ_BASE_ADDR_STATE command) starting at its current write pointer bit position. Hardware will keep track of this write pointer's byte position and the associated next bit insertion position index.
It is a variable length command when the payload (data to be inserted) is presented as inline data within the command itself. The inline payload is a multiple of 32-bit (1 DW), as the data bus to the compressed bitstream output buffer is 32-bit wide.
The payload data is required to be byte aligned on the left (first transmitted bit order) and may or may not be byte aligned on the right (last transmitted bits). The command will specify the bit offset of the last valid DW. Note that : Stitch Command is used if the beginning position of data is in bit position. When PAK Insert Command is used the beginning position must be in byte position.
Multiple insertion commands can be issued back to back in a series. It is host software's responsibility to make sure their corresponding data will properly stitch together to form a valid bitstream.
Internally, HCP hardware will keep track of the very last two bytes' (the very last byte can be a partial byte) values of the previous insertion. It is required that the next Insertion Object Command or the next PAK Object Command to perform the start code emulation sequence check and prevention 0x03 byte insertion with this end condition of the previous insertion.
The payload data may have already been processed for start code emulation byte insertion, except the possibility of the last 2 bytes plus the very last partial byte (if any). Hence, when hardware performing the concatenation of multiple consecutive insertion commands, or concatenation of an insertion command and a PAK object command, it must check and perform the necessary start code emulation byte insert at the junction.
Data to be inserted can be a valid NAL units or a partial NAL unit. It can be any encoded syntax elements bit data before the encoded Slice Data (PAK Object Command) of the current Slice - SPS NAL, PPS NAL, SEI NAL and Other Non-Slice NAL, Leading_Zero_8_bits (as many bytes as there is), Start Code , Slice Header. Any encoded syntax elements bit data after the encoded Slice Data (PAK Object Command) of the current Slice and prior to the next encoded Slice Data of the next Slice or prior to the end of the bitstream, whichever comes first Cabac_Zero_Word or Trailing_Zero_8bits (as many bytes as there is).
Certain NAL unit has a minimum byte size requirement. As such the hardware will optionally (enabled by SLICE STATE Command) determines the number of CABAC_ZERO_WORD to be inserted to the end of the current NAL, based on the minimum byte size of a NAL and the actual bin count of the encoded Slice. Since prior to the CABAC_ZERO_WORD insertion, the RBSP or EBSP is already byte-aligned, so each CABAC_ZERO_WORD insertion is actually a 3-byte sequence 0x00 00 03.
Context switch interrupt is not supported by this command.

HCP_PAK_INSERT_OBJECT

15 **HeaderLengthExcludeFrmSize**

Format:	U1

In case this flag is on, bits are NOT accumulated during current access unit coding neither for Cabac Zero Word insertion bits counting or for output in MMIO register HCP_BITSTREAM_BYTECOUNT_FRAME_NO_HEADER.
When using HeaderLenghtExcludeFrmSize for header insertion, the software needs to make sure that data comes already with inserted start code emulation bytes. SW shouldn't set EmulationFlag bit (Bit 3 of DWORD1 of HCP_PAK_INSERT_OBJECT).

Value	Description
0	All bits accumulated
1	Bits during current call are not accumulated

Value	Name	Description
0	All bits accumulated	
1	Bits during current call are not accumulated	

Programming Notes
Must be set to 0 for JPEG encoder.

13:8 **DataBitsInLastDW - SrCDataEndingBitInclusion[5:0]**

Format:	U6

Source Data to be included in the very last inline DW. Follows the MSBit is the upper bit of each byte within the DW. The lower byte is actually processed first.For example, SrCDataEndingBitInclusion = 9, bit 7:0 and bit 15 are included as valid header data.
For VP9:
The Driver has to give byte aligned Data for the last inline DW. (the driver pads Zeros to next byte boundary to the original header if it was not byte aligned on the last inline DW).

Value	Name
[1,32]	

7:4 **SkipEmulByteCnt - Skip Emulation Byte Count**

Format:	U4

Skip emulation check for number of starting bytes It can be programmed from 0 to 15 bytes. For example, to skip the start code that has already prefixed in the bitstream.
Only valid for HEVC and reserved for VP9.

3 **EmulationFlag - EmulationByteBitsInsertEnable**

Format:	U1

Only valid for HEVC and reserved for VP9.

Value	Name	Description
1	StartCodePrefix	Instruct the hardware to perform Start Code Prefix (0x 00 00 01/02/03/00) Search and Prevention Byte (0x 03) insertion on the

HCP_PAK_INSERT_OBJECT

				insertion data of this command. It is required that hardware will handle a start code prefix crossing the boundary between.
		2	InsertionCommand	Insertion commands, or an insertion command followed by a PAK Object command.
	2	**LastHeaderFlag - LastSrcHeaderDataInsertCommandFlag** Format: U1 To process a series of consecutive insertion commands, this flag (=1) indicates the current command is the last 'header' insertion in the series. In CABAC, hardware must perform the "1" insert for byte align for Slice Header before Slice Data comes in in the next PAK-OBJECT command.
	1	**EndOfSliceFlag - LastDstDataInsertCommandFlag** Format: U1 No more insertion command and no more PAK-OBJECT command follows. Flush data out to memory.
	0	**Reserved** Format: MBZ
2..n	127:0	**Indirect Payload** Exists If: ([Indirect Payload Enable]==1) Format: **HCP_PAK_INSERT_OBJECT_INDIRECT_PAYLOAD**
	31:0	**Inline PayLoad** Exists If: ([Indirect Payload Enable]==0) Format: U32 Actual Data (inline) to be inserted to the output bitstream buffer.

HCP_PIC_STATE

29:27 **bit_depth_luma_minus8**

Format:	U3

This specifies the number of bit allow for Luma pixels. In 8 bit mode, this must be set to 0. Encoder: Suports bit depths 8, 10 and 12 only. Encoder: Does not support 10 or 12 bit Source Pixels and 8bit PAK i.e. the source pixel depth should be less than or equal to PAK bit depth.

Value	Name	Description
0	luma_8bit	
1	luma_9bit	Only HEVC decoder supports 9 bits luma. HEVC encoder does not supports 9 bits luma.
2	luma_10bit	
3	luma_11bit	
4	luma_12bit	

26:24 **bit_depth_chroma_minus8**

Format:	U3

This specifies the number of bit allow for Chroma pixels. In 8 bit mode, this must be set to 0. Encoder: Supports bit depths 8, 10 and 12 only. And also it must be same as Luma. Encoder: Does not support 10 or 12 bit Source Pixels and 8bit PAK. i.e. The source pixel depth should be less than or equal to the PAK bit depth.

Value	Name	Description
0	chroma_8bit	
1	chroma_9bit	Only HEVC decoder supports 9 bits chroma. HEVC encoder does not supports 9 bits chroma.
2	chroma_10bit	
3	chroma_11bit	
4	chroma_12bit	

23:20 **pcm_sample_bit_depth_luma_minus1**

Format:	U4

Description
Encoder support bitdepth 8 only. Must be same for luma and chroma Cb and Cr.

19:16 **pcm_sample_bit_depth_chroma_minus1**

Format:	U4

Description
Encoder support bitdepth 8 only. Must be same for luma and chroma Cb and Cr.

HCP_PIC_STATE

	15:13	**max_transform_hierarchy_depth_inter(or named as tu_max_depth_inter)** Format: U3 Maximum TU split depths for inter blocks **Programming Notes** For encoder, alwasy set to 2 to allow max 2 levels of split. For more splitting rely on CU split to match the content (Intel restriction)
	12:10	**max_transform_hierarchy_depth_intra (or named as tu_max_depth_intra)** Format: U3 Maximum TU split depth for intra blocks. **Programming Notes** For encoder, always set to 2 to allow max 2 levels of split. For more splitting, rely on CU split to match the content (Intel restriction).
	9:5	**pic_cr_qp_offset** Format: S4 Valid range -12 to +12
	4:0	**pic_cb_qp_offset** Format: S4 Valid range -12 to +12
6	31:30	**Reserved** Format: MBZ
	29	**Load Slice Pointer Flag** Format: Enable LoadBitStreamPointerPerSlice (Encoder-only) To support multiple slice picture and additional header/data insertion before and after an encoded slice. When this field is set to 0, bitstream pointer is only loaded once for the first slice of a frame. For subsequent slices in the frame, bitstream data are stitched together to form a single output data stream. When this field is set to 1, bitstream pointer is loaded for each slice of a frame. Basically bitstream data for different slices of a frame will be written to different memory locations.

Value	Name	Description
0	Disable	Load BitStream Pointer only once for the first slice of a frame.
1	Enable	Load/reload BitStream Pointer only once for the each slice, reload the start location of the bitstream buffer from the Indirect PAK-BSE Object Data Start Address field.

Programming Notes

Must be zero for encoder

28:27 **Reserved**

Format:	MBZ

26 **FrameSzUnderStatusEn - FrameBitRateMinReportMask**

Format:	Enable

This is a mask bit controlling if the condition of frame level bit count is less than FrameBitRateMin.

Value	Name	Description
0	Disable	Do not update bit 2 (Frame Bit Count Violate -- under run) of HCP_IMAGE_STATUS control register. NOTE: This bit MUST BE set to zero for the last BRC pass if SAO first pass also enabled. This will ensure that HW picks up right accumulated deltaQP for SAO sencond pass.
1	Enable	Set bit 2 (Frame Bit Count Violate -- under run) of HCP_IMAGE_STATUS control register if the total frame level bit counter is less than or equal to Frame Bit Rate Minimum limit. HW does not use this bit to set the bit in HCP_IMAGE_STATUS_CONTROL register. It's used pass the bit in HCP_IMAGE_STATUS_MASK register

25 **FrameSzOverStatusEn - FrameBitRateMaxReportMask**

Format:	Enable

This is a mask bit controlling if the condition of frame level bit count exceeds FrameBitRateMax.

Value	Name	Description
0	Disable	Do not update bit 1 of HCP_IMAGE_STATUS control register. NOTE: This bit MUST BE set to zero for the last BRC pass if SAO first pass also enabled. This will ensure that HW picks up right accumulated deltaQP for SAO sencond pass.
1	Enable	Set bit 1 of HCP_IMAGE_STATUS control register if the total frame level bit counter is greater than or equal to Frame Bit Rate Maximum limit. HW does not use this bit to set the bit in HCP_IMAGE_STATUS_CONTROL register. It's used pass the bit inHCP_IMAGE_STATUS_MASK register

24 **LCUMaxBitStatusEn - LCUMaxSizeReportMask**

Format:	Enable

This is a mask bit controlling if the condition of any LCU in the frame exceeds LCUMaxSize.

Value	Name	Description
0	Disable	Do not update bit 0 of HCP_IMAGE_STATUS control register. NOTE: This bit MUST BE set to zero for the last BRC pass if SAO first pass also enabled. This will ensure that HW picks up right accumulated

HCP_PIC_STATE

		deltaQP for SAO sencond pass.
1	Enable	Set bit 0 of HCP_IMAGE_STATUS control register if the total bit counter for the current LCU is greater than the LCU Conformance Max size limit. HW does not use this bit to set the bit in HCP_IMAGE_STATUS_CONTROL register.

Programming Notes
Encoder Only

23:17 **Reserved**

Format:	MBZ

16 **NonFirstPassFlag**

Format:	Enable

This signals the current pass is not the first pass. It will imply designate HW behavior.

Value	Name	Description
0	Disable	If it is initial-Pass, this bit is set to 0.
1	Enable	For subsequent passes, this bit is set to 1.

Programming Notes
Encoder Only

15:0 **LCU Max BitSize Allowed**

Format:	U16

This field specifies the Max LCU Bit Size allowed in according to the spec conformance. However, driver can program a different value from the spec for other encoding purpose.

If LCU Limit exceeds, LCUMaxBitStatus in MMIO would be set to 1.
If LCU Limit exceeds, LCUMaxBitStatus in MMIO would be set to 1 and also in CU. Statistics Streamout, LCU Limit exceed field would be set to 1 at the last CU of a LCU.

HCP_PIPE_BUF_ADDR_STATE

HCP_PIPE_BUF_ADDR_STATE

Source: VideoCS

Length Bias: 2

The HCP is selected with the **Media Instruction Opcode "7h"** for all HCP Commands. Each HCP command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

This state command provides the memory base addresses for the row store buffer and reconstructed picture output buffers required by the HCP.
This is a picture level state command and is shared by both encoding and decoding processes.

Programming Notes

All pixel surface addresses must be 4K byte aligned. There is a max of 8 Reference Picture Buffer Addresses, and all share the same third address DW in specifying 48-bit address.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode

36	31:0	**Reserved** Format: MBZ
37..52	63:0	**Reference Picture Base Address (RefAddr[0-7])** Format: SplitBaseAddress64ByteAligned[8] Base address of the reference picture buffer.

HCP_PIPE_BUF_ADDR_STATE

53	31:0	**Reference Picture Base Address** Format: **MemoryAddressAttributes**
54..55	63:0	**Original Uncompressed Picture Source** Format: **SplitBaseAddress64ByteAligned** Buffer address for fetching YUV pixel data from the original uncompressed input picture for encoding. This value is only valid in **encoding** mode.
56	31:0	**Original Uncompressed Picture Source** Format: **MemoryAddressAttributes**
57..58	63:0	**Streamout Data Destination** Exists If: //Decoder Only Format: **SplitBaseAddress64ByteAligned** Buffer address for outputting the per-block indirect data to memory when **StreamOutEnable** is set in the HCP_PIPE_MODE_SELECT command. For Decoder: this field is used for transcoding purpose. For Encoder: this field is used for dynamic repeat of frame in PAK for Rate Control. Also used for feeding coding information back to the Host, Video Preprocessing Unit and ENC Unit. For Encoder: This surface is used to streamout CU records All data are written in fixed formats, and therefore all record sizes are known in the hardware. Hardware can calculate the offset into this base address for per-block data.
59	31:0	**Streamout Data Destination** Exists If: //Decoder Only Format: **MemoryAddressAttributes**
	31:0	**Reserved** Exists If: //Encoder Only Format: MBZ
60..61	63:0	**Decoded Picture Status/Error Buffer Base Address or Encoded slice size streamout Base Address** Format: **SplitBaseAddress64ByteAligned** **Decoder Mode :** Specifies the 64 byte aligned buffer address for writing a single status/error cache-line sized record into memory when the Pic Status/Error Report Enable is set in the HCP_PIPE_MODE_SELECT command. The pic status/error record is written by hardware after the picture is decoded. **Encoder Mode:** This specifies 64 byte aligned buffer address for writing Slice size, when slice size conformance is enabled.

HCP_PIPE_BUF_ADDR_STATE

62	31:0	**Decoded Picture Status/Error Buffer Base Address** Format: **MemoryAddressAttributes**
63..64	63:0	**LCU ILDB Streamout Buffer** Format: **SplitBaseAddress64ByteAligned** Buffer address for writing ILDB parameter per LCU to memory when Deblocker Streamout Enable is set in the HCP_PIPE_MODE_SELECT Command. The ILDB MB control parameters are written by HW at the end of each reconstructed LCU. Only edge information is being streamed out.
65	31:0	**LCU ILDB Streamout Buffer** Format: **MemoryAddressAttributes**
66..81	63:0	**Collocated Motion Vector Temporal Buffer[0-7]** Format: **SplitBaseAddress64ByteAligned[8]** Base address for the Collocated Motion Vector Temporal buffer.
82	31:0	**Collocated Motion Vector Temporal Buffer[0-7] Memory Address Attributes** Format: **MemoryAddressAttributes**
83..84	63:0	**VP9 Probability Buffer Read/Write** Format: **SplitBaseAddress64ByteAligned** Specifies the 64 byte aligned buffer address for VP9 Probability Buffer. Hardware reads in the probability for decode and write out the modified probability for future frames. Driver needs to program the Initial VP9 Probability for decoding the current frame. For Key Frame, it should contain the default Key Frame Probability. For non-Key Frame, it could be a default (non-Key) or one of the 8 Reference Buffers Probability. Driver must provide a valid Initial VP9 Probability buffer.
85	31:0	**VP9 Probability Buffer Read/Write Memory Address Attributes** Format: **MemoryAddressAttributes**
86..87	63:0	**VP9 Segment ID Buffer Read/Write** Specifies the 64 byte aligned buffer address for VP9 SegmentID buffer. This should contain the writeout SegmentID from previous frame and will be used to predict SegmentID for the current frame. Hardware will write out SegmentID of the current frame in the same address for the next frame.
88	31:0	**VP9 Segment ID buffer Read/Write Memory Address Attributes** Format: **MemoryAddressAttributes**
89..90	63:0	**VP9 HVD Line Rowstore Buffer Read/Write** Format: **SplitBaseAddress64ByteAligned** Specifies the 64 byte aligned buffer address for HVD Tile Rowstore Buffer (bitstream decoder).

HCP_PIPE_BUF_ADDR_STATE		
91	31:0	**VP9 HVD Line Rowstore buffer Read/Write Memory Address Attributes** Format: MemoryAddressAttributes

HCP_PIPE_MODE_SELECT

HCP_PIPE_MODE_SELECT

Source: VideoCS

Length Bias: 2

The HCP is selected with the **Media Instruction Opcode "7h"** for all HCP Commands. Each HCP command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The workload for the HCP is based upon a single frame decode. There are no states saved between frame decodes in the HCP. Once the bit stream DMA is configured with the HCP_BSD_OBJECT command, and the bit stream is presented to the HCP, the frame decode will begin.
The HCP_PIPE_MODE_SELECT command is responsible for general pipeline level configuration that would normally be set once for a single stream encode or decode and would not be modified on a frame workload basis.
This is a picture level state command and is shared by both encoding and decoding processes.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline Type** Default Value: 2h Format: OpCode
	26:23	**Media Instruction Opcode** Default Value: 7h Codec/Engine Name Format: OpCode Codec/Engine Name = HCP = 7h
	22:16	**Media Instruction Command** Default Value: 0h HCP_PIPE_MODE_SELECT Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Format: =n (Excludes Dwords 0, 1). Value: 2h — Name: Value_2 Value: 4h — Name: Value_4

HCP_QM_STATE

HCP_QM_STATE

Source: VideoCS

Length Bias: 2

The HCP is selected with the **Media Instruction Opcode "7h"** for all HCP Commands. Each HCP command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The HCP_QM_STATE command loads the custom HEVC quantization tables into local RAM and may be issued up to 20 times: 3x Colour Component plus 2x intra/inter plus 4x SizeID minus 4 for the 32x32 chroma components.
When the scaling_list_enable_flag is set to disable, the scaling matrix is still sent to the decoder, and with all entries programmed to the same value = 16.
This is a picture level state command and is issued in both encoding and decoding processes.

Dwords 2-17 form a table for the DCT coefficients, 4 8-bit coefficients/DWord.

- Size 4x4 for SizeID0, DWords 2-5.
- Size 8x8 for SizeID1/2/3, DWords 2-17.

Length Bias: 2

The HCP is selected with the **Media Instruction Opcode "7h"** for all HCP Commands. Each HCP command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

This is a slice level command used in both encoding and decoding processes. For decoder, it is issued with the HCP_BSD_OBJECT command.

Unlike AVC, HEVC allows 16 reference idx entries in each of the L0 and L1 list for a progressive picture. Hence, a max total 32 reference idx in both lists together. The same when the picture is a field picture. Regardless the number of reference idx entries, there are only max 8 reference pictures exist at any one time. Multiple reference idx can point to the same reference picture and can optionally pic a top or bottom field, or frame.

For P-Slice, this command is issued only once, representing L0 list. For B-Slice, this command can be issued up to two times, one for L0 list and one for L1 list.

10 Header Insertion Enable

Format:	U1

Must be followed by the PAK Insertion Object Command to perform the actual insertion.

Value	Name	Description
0		No header insertion into the output bitstream buffer, before the current slice encoded bits.
1		Header insertion into the output bitstream buffer is present, and is before the current slice encoded bits.

Programming Notes
Must be always enabled. Encoder Only feature

9 SliceData Enable

Format:	U1

Must always be enabled.
Encoder only feature.

Value	Name	Description
0		No operation; no insertion.
1		Slice Data insertion by PAK Object Commands into the output bitstream buffer.

8 Tail Insertion Enable

Format:	U1

Must be followed by the PAK Insertion Object Command to perform the actual insertion.

Value	Name	Description
0		No tail insertion into the output bitstream buffer, after the current slice encoded bits.
1		Tail insertion into the output bitstream buffer is present, and is after the current slice encoded bits. Restriction: Tail insertion is only possible at the end of frame but not in the middle (say slice end)

Programming Notes
Tail Insertion is allowed only at the end of last slice or last tile of a frame but not in the middle of frame. Also, no multiple tail insertions are allowed. Encoder only feature

7:3 Reserved

Format:	MBZ

2 — EmulationByteSliceInsertEnable

Format:	U1

To have PAK outputting SODB or EBSP to the output bitstream buffer.

Value	Name
0	outputting RBSP
1	outputting EBSP

Programming Notes
Encoder Only feature

1 — CabacZeroWordInsertionEnable

Format:	U1

To pad the end of a SliceLayer RBSP to meet the encoded size requirement.

Value	Name	Description
0		No Cabac_Zero_Word Insertion.
1		Allow internal Cabac_Zero_Word generation and append to the end of RBSP (effectively can be used as an indicator for last slice of a picture, if the assumption is only the last slice of a picture needs to insert CABAC_ZERO_WORDs).

Programming Notes
Encoder Only feature

0 — Reserved

Format:	MBZ

8 — 31:29 — Reserved

Format:	MBZ

28:6 — Indirect PAK-BSE Data Start Offset (Write)

Format:	U23

This field specifies the memory starting address (offset) to write out the compressed bitstream data from the BSE processing. This pointer is relative to the HCP PAK-BSE Object Base Address.

It is a cacheline-aligned address for the HEVC bitstream data.

For Write, there is no need to have a data length field. It is assumed the global memory upper bound check specified in the IND_OBJ_BASE_ADDRESS command (Indirect PAK-BSE Object Access Upper Bound) will take care of any illegal write access.

Value	Name

HCP_SURFACE_STATE

HCP_SURFACE_STATE

Source: VideoCS

Length Bias: 2

The HCP is selected with the **Media Instruction Opcode "7h"** for all HCP Commands. Each HCP command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The HCP_SURFACE_STATE command is responsible for defining the frame buffer pitch and the offset of the chroma component.
This is a picture level state command and is shared by both encoding and decoding processes.
Note : Only NV12 and Tile Y are being supported for HEVC. Hence full pitch and interleaved UV is always in use. U and V Xoffset must be set to 0; U and V Yoffset must be 16-pixel aligned. This Surface State is not the same as that of the 3D engine and of the MFX pipeline.

DWord	Bit	Description

HCP_VP9_PIC_STATE

HCP_VP9_PIC_STATE

Source: VideoCS

Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline Type** Default Value: 2h Format: OpCode
	26:23	**Media Instruction Opcode** Default Value: 7h Codec/Engine Name Format: OpCode Codec/Engine Name = HUC = Bh
	22:16	**Media Instruction Command** Default Value: 30h HCP_VP9_PIC_STATE Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**Dword Length** Format: =n (Excludes Dwords 0, 1). Value / Name / Programming Notes: Bh – Decoder DW Length – Only Up to DW12 should be programmed for decoder 1Eh – Encoder DW Length – All DWs should be programmed for encoder
1	31:30	**Reserved** Format: MBZ
	29:16	**Frame Height In Pixels Minus 1** Format: U14 Specifies the height of the decoded picture in units of 8 pixels, which is the minimum coding block size. The decoded picture height in units of luma samples equals (FrameHeightInMinBlocksMinus1+ 1) *8 – 1 *For Encoder Partial SB:* *Kernel, on last SB (at picture edges), splits the SB into as small as possible CUs to have picture boundaries aligned to CU boundary.*

HCP_VP9_PIC_STATE

Kernel does not count/include CUs outside of the picture in PakObj/CU_record respectively.
Driver sets up a SB aligned (both in X/Y direction) surface.

Value	Name
[4096,16383]	4K_TO_16K

Programming Notes

Decoder supports 16K image and 8K video. Encoder only supports upto 8K.

Value	Description
0-6	Invalid (multiple of 8 pixels)
7-8191	8-8K Pixels (Decoder and Encoder)
8192-16383	8K-16K Pixels (Decoder only)

15:14 Reserved

Format:	MBZ

13:0 Frame Width In Pixels Minus 1

Format:	U14

Specifies the width of the decoded picture in units of minimum coding block size. The decoded picture width in units of luma samples equals (FrameWidthInMinBlocksMinus1+ 1) *8 – 1 This should be programmed to a multiple of 8 pixels minus 1.
For Encoder Partial SB:
Kernel, on last SB (at picture edges), splits the SB into as small as possible CUs to have picture boundaries aligned to CU boundary.
Kernel does not count/include CUs outside of the picture in PakObj/CU_record respectively.
Driver sets up a SB aligned (both in X/Y direction) surface.

Value	Name
[4096,16383]	4K_TO_16K

Programming Notes

Decoder supports 16K image and 8K video. Encoder only supports upto 8K.

Value	Description
0-6	Invalid (multiple of 8 pixels)
7-8191	8-8K Pixels (Decoder and Encoder)
8192-16383	8K-16K Pixels (Decoder only)

2 31 Segment ID StreamIn Enable

Format:	Enable

Indicates SegmentID from previous frame needs to be streamIn for Segment ID prediction

Value	Name
0	Disable
1	Enable

HCP_VP9_PIC_STATE

Programming Notes
Deocder Only: SegmentIDStreamInEnable = error_resilient_mode OR intra_only OR VP9_KEY_FRAME

30 **Segment ID StreamOut Enable**

Format:	Enable

Indicates SegmentID of current frame needs to be streamOut for next frame

Value	Name
0	Disable
1	Enable

Programming Notes
Deocder Only: SegmentIDStreamOutEnable = segementation_enabled AND segmentation_update_map

29 **Lossless Mode**

Format:	Enable

This bitSet to indicate lossless coding mode.
In encoder mode, software has to set tx_mode to 4x4only and all tu_size's in CU record as 4x4 for entire frame. Software also has to program such that final_qindex=0 and final_filter_level=0 following the Quant Scale and Filter Level Table in Segmentation State section. Hardware forces Hadamard Tx when this bit is set. When Lossless Mode is on, BRC has to be off.

Value	Name
0	Normal Mode
1	Loless Mode

28 **Segmentation Temporal Update**

Format:	Enable

Indicates whether segID is decoding from bitstream or predicted from previous frame.
In encoder Mode it should use either from previous frame or streamIn

Value	Name
0h	Decode segID from bitstream
1h	Get segID either from bitstream or from previous frame

Programming Notes
Decoder Only: For KEY_FRAME or INTRA_ONLY frame, this bit should be set to "0". Note: Driver should override this flag to "0" in KEY_FRAME or INTRA_ONLY frame even if this

HCP_VP9_PIC_STATE

		bit decoded from bitstream is different. This is for hardware optimization. This override does not affect bitstream decoding other than uncompressed header.
	27	**Segmentation Update Map** Format: Enable Indicates how hardware determines segmentation ID 0h: Intra block: segment ID is zero Inter block: get segment ID from previous frame (streamIN) 1h: Intra block: decode segment ID from bitstream. Inter block: determins from segmentation_temporal_update setting
	26	**Segmentation Enabled** Format: Enable Indicate if segementation is enabled or not 0h: All blocks are implied to belong to segment 0 1h: SegID determination depends on segmentation_update_map setting
	25:23	**Sharpness Level** Format: U3 Specify the sharpness level, as one of regular deblocking strength control. Programming Notes: Set to 0 to disable the use of sharpness control
	22:17	**Filter Level** Format: U6 Specify the Filter level, as one of deblocking strength control Programming Notes: Set to 0 to disable the use of level control
	16	**Frame Parallel Decoding Mode** Indicates if parallel decoding mode is enabled. This bit should come from Uncompressed header. Together with Error Resilient mode, they decide the value of AdaptProbabilityFlag. 0: Disable 1: Enable
	15	**Error Resilient Mode** Indicates if error resilient mode is enabled. This bit should come from Uncompressed header.When error resilient is 1, Frame Parallel Decoding Mode will be 1, and Refresh Frame Context will be 0.When error resilient is 0, Frame Parallel Decoding Mode and Refresh Frame Context read from bit stream.Together with Frame Parallel Decoding mode, they decide the value of AdaptProbabilityFlag.

HCP_VP9_PIC_STATE

Value	Name
0	Disable
1	Enable

Programming Notes

14 **Refresh Frame Context**

Indicates if Frame Context should be refresh. This bit should come from Uncompressed header

Value	Name
0	Disable
1	Enable

Programming Notes
Decoder Only

13 **Last Frame Type**

It indicates the frame type of previous frame (Key or Non-Key Frame)

Value	Name
0	Key Frame
1	Non Key Frame

Programming Notes
Not used in Encoder Mode

12 **Selectable TX Mode**

Format:	U1

Indicates if tx_mode is selectable

Value	Name
0	Encoder does not pack tu_size into bitstream. This helps reduce bitstream size further.
1	Encoder packs tu_size into bitstream.

Programming Notes
HW always picks tu_size from CU record of pak_obj. SW responsibility to set tu_size correct.

11 **Hybrid Prediction Mode**

Format:	U1

Indicates if comp_pred_mode is hybrid

Value	Name
0	comp_prediction_mode!=HYBRID, Encoder does not pack comp_pred_mode [interpred_comp in pak_obj] into bitstream.

HCP_VP9_PIC_STATE

	1	comp_prediction_mode==HYBRID, Encoder packs comp_pred_mode into bitstream. This helps reduce bitstream size further.

10 Use Prev in Find MV References

Format:	Enable

0: Temporal MV buffer is not available for MV prediction
1: Temporal MV buffer is available for MV prediction
This is set to 0 when:
• The last picture has a different size
• Current picture is error-resilient mode
• Current picture is intra_only, or keyframe
• Last picture was intra_only or keyframe
• Last picture was not a displayed picture.

9:7 Ref Frame Sign Bias[0..2]

Format:	U3

Reference Frame sign bias (not including intra reference)
Bit[7] – Sign Bias of Last Frame
Bit[8] – Sign Bias of Golden Frame
Bit[9] – Sign Bias of AltRef Frame

6:4 Mcomp Filter Type

Format:	U3

Indicate Motion Compensation Filter type.
If set to 4, encoder uses modes in pak_obj command.

Value	Name
0h	Eight-tap
1h	Eight-tap-Smooth
2h	Eight-tap-Sharp
3h	Bilinear
4h	Switchable

3 Allow Hi Precision MV

Format:	Enable

Indicate high precision mode for Motion Vector prediction

Value	Name
0h	Normal mode
1h	High Precision mode

HCP_VP9_PIC_STATE

2 — IntraOnly Flag

Format:	Enable

Indicates intra-only for inter pics. MBZ for keyframes.

Programming Notes

Used for Non-displayable picture; SW responsibility to make sure no Inter block in pak_obj of this frame

Value	Description
0	Inter Frame use both intra/inter-blocks
1	Inter frame use only inta-blocks

1 — Adapt Probabilities Flag

Format:	Enable

Indicates that the probabilities used to decode this frame should be adapted

Value	Name
0h	0: Do not adapt (error resilient or frame_parallel_mode are set)
1h	1: Adapt (not error resilient and not frame_ parallel_mode)

Programming Notes

Only forward adaptation is supported in encoder mode.

0 — Frame Type

Format:	U1

Specifies the VP9 frame type

Value	Name
0h	Key Frame
1h	Inter Frame

3 — 31:28 — Profile Level

Format:	U4

This indicates VP9 Profile level from bitstream

Value	Name	Description
0	Profile_0	Profile 0 only supports 8 bit 420 only
2	Profile_2	Profile 2 only supports 10 bits 420 only

27:24 — BitDepthMinus8

Format:	U4

This indicates the bitdepth (minus 8) of the pixels

Value	Name	Programming Notes
0	Bitdepth_8	It indicates pixel bitdepth is 8. Only profile 0 is allowed in this mode.
2	Bitdepth_10	It indicates pixel bitdepth is 10. Only profile 2 is allowed in this mode.
4	Bitdepth_12	It indicates pixel bitdepth is 12. Only profile 2 is allowed in this mode.

HCP_VP9_PIC_STATE

23:22 Chroma Sampling Format

Format:	U2

This indicates the chroma sampling format of the bitstream

Value	Name	Programming Notes
0	Format_420	Chroma Format 420, supported by profile 0 and 2

Programming Notes
Currenly only 420 is supported (in profile 0 and 2). All other modes are not valid. Value 0: Format 420: Profile 0 and 2 only: Supported Value 1: Format 422: Profile 1 and 3 only: Currently NOT supported Value 2: Format 444: Profile 1 and 3 only: Currently NOT supported

21 Reserved

Format:	MBZ

20:10 Reserved

Format:	MBZ

9:8 Log2 Tile Row

Format:	U2

This indicates the number of tile rows (log2).

Value	Name
0h	1 Tile Row
1h	2 Tile Row
2h	4 Tile Row

Programming Notes
In encoder mode, create tiles either in horizontal or vertical direction but not in both directions

7:4 Reserved

Format:	MBZ

3:0 Log2 Tile Column

Format:	U4

This indicates the number of tile rows (log2).

Value	Name	Programming Notes
0h	1 Tile Column	
1h	2 Tile Column	
2h	4 Tile Column	In encoder mode, create tiles either in horizontal or vertical direction but not in both directions
3h	8 Tile Column	

HCP_VP9_PIC_STATE

		4h: 16 Tile Column 5h: 32 Tile Column 6h: 64 Tile Column **Programming Notes** In encoder mode, create tiles either in horizontal or vertical direction but not in both directions
4	31:16	**Horizontal Scale Factor for LAST** Format: U2.14 This indicates the scaling factor between current frame and the last reference frame Set to (LastWidth * 2^14)/CurrentWidth
	15:0	**Vertical Scale Factor for LAST** Format: U2.14 This indicates the scaling factor between current frame and the last reference frame Set to (LastHeight * 2^14)/CurrentHeight
5	31:16	**Horizontal Scale Factor for GOLDEN** Format: U2.14 This indicates the scaling factor between current frame and the golden reference frame Set to (LastWidth * 2^14)/CurrentWidth

HCP_WEIGHTOFFSET_STATE

HCP_WEIGHTOFFSET_STATE

Source: VideoCS

Length Bias: 2

The HCP is selected with the **Media Instruction Opcode "7h"** for all HCP Commands. Each HCP command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

This slice level command is issued in both the encoding and decoding processes, if the weighted_pred_flag or weighted_bipred_flag equals one. If zero, then this command is not issued.
Weight Prediction Values are provided in this command. Only Explicit Weight Prediction is supported in encoder.
For P-Slice, this command is issued only once together with HCP_REF_IDX_STATE Command for L0 list. For B-Slice, this command can be issued up to two times together with HCP_REF_IDX_STATE Command, one for L0 list and one for L1 list.

MSD_RTW_HI8DS - HI8DS Render Target Write MSD

17:14 Message Type

Default Value:	0Ch
Format:	Opcode

Render Target Write message

13 Per-Sample PS Enable

Format:	Enable

If set, PS sends Render Target Write Message that outputs color, depth(optional) and stencil(optional) phases on per sample basis for each slot.

Programming Notes

This bit must be set when PS runs at sample-frequency i.e. pixel shader dispatch mode is PER_SAMPLE.

When this bit is set and PS runs at pixel-frequency, i.e. pixel shader dispatch mode is PER_PIXEL, Render Target read and write messages interpret bits 9:6 in MCH_RT_C0 as sample index. In this mode, render target write message payload and render target read writeback payload contain color of a specific sample in all dispatched pixels. RT writes referring to out-of-bound samples have no effect. RT reads from out-of-bound samples return 0.

When this bit is clear and PS runs at pixel-frequency, render target write messages contain color value for entire pixel (all samples).

When this bit is clear and PS runs at pixel-frequency, render target reads are disallowed per API spec (RT read without specifying sample index forces sample-frequency dispatch). HW behavior is undefined in such case.

12 Last Render Target Select

Format:	Enable

This bit must be set on the last render target write message sent for each group of pixels. For single render target pixel shaders, this bit is set on all render target write messages. For multiple render target pixel shaders, this bit is set only on messages sent to the last render target. This bit must be zero for SIMD8 Image Write message. In general, when threads are not launched by 3D FF, this bit must be zero.

Programming Notes

When a pixel shader has render target writes at finer granularity than the dispatch rate, last render target write to a null surface must be present at the dispatch rate with this bit set.

In particular, if a kernel is dispatched at pixel rate and it only writes to render targets at sample-rate, it must include a pixel-rate render target write to a null surface with Last Render Target Select bit enabled.

11 Slot Group Select

Format:	MDC_RT_SGS

This field selects whether slots 15:0 or slots 31:16 are used for bypassed data.

MSD_RTW_HI8DS - HI8DS Render Target Write MSD

	10:8	**Render Target Message Subtype** Default Value: 3h Format: Opcode SIMD8 dual source message. Use slots [15:8] for pixel enables, X/Y addresses, and oMask. **Programming Notes** The above slots indicated are within the 16 slots selected by Slot Group Select. If SLOTGRP_HI is selected, slots [31:24] are referenced instead of [15:8].
	7:0	**Binding Table Index** Format: MDC_BTS Specifies the Binding Table Index for the message

HUC_CFG_STATE

HUC_CFG_STATE

Source: VideoCS

Length Bias: 2

The HUC is selected with the Media Instruction Opcode "Bh" for all HUC Commands. Each HUC command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The HUC_CFG_STATE command is used to force the P24C (MinuteIA) into a reset condition as well as forcing it out of a reset condition. This command is not normally required since the hardware will handle placing the P24C into a reset condition and releasing it from reset, but there may be conditions that require a forced reset.

DWord	Bit	Description

HUC_DMEM_STATE

HUC_DMEM_STATE

Source: VideoCS

Length Bias: 2

The HUC is selected with the Media Instruction Opcode "Bh" for all HUC Commands. Each HUC command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The HUC_DMEM_STATE command is used to fetch the HUC data from the graphics memory and load it into the HUC 96KB L2 storage RAM. The HUC_DMEM_STATE specifies the data source base address in graphics memory.
When the HUC_DMEM_STATE command is received, the data is loaded by the HUC DMA into the 96KB L2 storage RAM at the location provided in the HUC_DMEM_STATE command. This command also specifies the length of the data, which is specified in bytes but must be in increments of 64 byte cache lines.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode

3	31:0	**HUC Data Source**
4	31:17	**Reserved** Format: MBZ
	16:6	**HUC Data Destination Base Address** Format: GraphicsAddress[16:6] Specifies the HUC Data destination base address in the L2 storage RAM. The base address is 64 byte cache aligned.
	5:0	**Reserved** Format: MBZ
5	31:17	**Reserved** Format: MBZ
	16:6	**HUC Data Length** Format: GraphicsAddress[16:6] Specifies the length in bytes of the HUC Data. The length must be in increments of 64 byte cache lines.
	5:0	**Reserved** Format: MBZ

HUC_IMEM_STATE

HUC_IMEM_STATE

Source: VideoCS

Length Bias: 2

The HUC is selected with the Media Instruction Opcode "Bh" for all HUC Commands. Each HUC command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The HUC_IMEM_STATE command is used to fetch the HUC firmware from the WOPCM region and load it into the HUC 96KB L2 storage RAM. The HUC_IMEM_STATE specifies the firmware's offset in WOPCM which is a cache line aligned 32-bit offset address. The firmware, code and data segment size should always be less than 96KB. If its greater than 96KB then the firmware should be broken into smaller functions so that there is no firmware straddling case.
When the HUC_IMEM_STATE command is received, the hardware confirms that the code has been successfully authenticated by checking the VCR provided authentication successful signal. If this signal is asserted, the firmware is loaded by the HUC DMA into the 96KB L2 storage RAM. Once the firmware is loaded, the VALID IMEM LOADED bit in the HUC_STATUS2 register is asserted high in the. If the authentication signal is not asserted, the DMA aborts the HUC_IMEM_STATE command, the firmware is not loaded, and the VALID IMEM LOADED bit remains low.

HUC_STREAM_OBJECT

1 — 31:0 — Indirect Stream In Data Length

Format:	U32

Specifies the length in bytes of the bit stream input data.

Value	Name	Description
[268435456,2147483547]	Data_Length_beyond_28_bits	This is an added valid range when the bit length is extended from 28 bits to 32 bits. This is added to support 16k x 16k picture size bitstream.

2 — 31 — Reserved

2 — 30:29 — Reserved

Format:	MBZ

2 — 28:0 — Indirect Stream In Start Address

Format:	U29

Specifies the byte-aligned graphics memory starting address of the input bit stream relative to the **HUC Indirect Stream In ObjectBase Address [31:12]**.

3 — 31:29 — Reserved

Format:	MBZ

3 — 28:0 — Indirect Stream Out Start Address

Format:	U29

Specifies the byte-aligned graphics memory starting address of the output bit stream relative to the **HUC Indirect Stream Out ObjectBase Address [31:12]**.

4 — 31:30 — Reserved

Format:	MBZ

4 — 29 — HuC Bitstream Enable

Format:	Enable

Enables the bitstream to be sent to the HuC

Value	Name
0h	Disable
1h	Enable

4 — 28:27 — DRMLengthMode

Format:	U2

Value	Name	Description
00b	Start Code Mode	Stops on a start code
01b	Length Mode	Stops after a number of bytes are reached in the length counter
10b	Reserved	
11b	Reserved	

HUC_STREAM_OBJECT

26 Stream Out

Format:	Enable

Enables the serpent encrypted stream output.

Value	Name	Description
0	Disable	Disable the serpent encrypted stream output.
1	Enable	Enable the serpent encrypted stream output.

25 Emulation Prevention Byte Removal

Format:	Enable

Value	Name	Description
0	Disable	Bypass Emulation Prevention Byte Removal.
1	Enable	Emulation prevention bytes will be removed after the start code search engine.

24 Start Code Search Engine

Format:	Enable

Value	Name	Description
0	Disable	Bypass Start Code Search Engine
1	Enable	Enables the start code search engine to stop on every third byte start code defined by **Start Code Byte [2:0]** defined in this DWord.

23:16 Start Code Byte [2]

Format:	U8

Third byte of the start code

15:8 Start Code Byte [1]

Format:	U8

Second byte of the start code

7:0 Start Code Byte [0]

Format:	U8

First byte of the start code

HUC_VIRTUAL_ADDR_STATE

HUC_VIRTUAL_ADDR_STATE

Source: VideoCS

Length Bias: 2

HUC is selected with the Media Instruction Opcode "Bh" for all HUC Commands. Each HUC command has assigned a media instruction command as defined in DWord 0, BitField 22:16.

The HUC_VIRTUAL_ADDR_STATE command is used to define the 48-bit HUC Surface Base Address and HUC Surface for each region.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline Type** Default Value: 2h Format: OpCode
	26:23	**Media Instruction Opcode** Default Value: Bh Codec/Engine Name Format: OpCode Codec/Engine Name = HUC = Bh

	15:12	**Reserved** Format: MBZ
	11:0	**Dword Length** Format: =n (Excludes Dwords 0, 1). Value: 2Fh — Name:
1..48 Regions 0 through 15 use three DWords each to describe the HUC Surface Base Address and HUC Surface, for a total of 16 regions x 3 DWords/each = 48 DWords.	95:64	**HUC Surface (VirtualAddrRegion[0-15])**
	63:0	**HUC Surface Base Address (VirtualAddrRegion[0-15])** Format: SplitBaseAddress4KByteAligned HUC surface base address for each virtual address region [0-15].

If

if - If

Source: Eulsa

Length Bias: 4

Description

An if instruction starts an if/endif or an if/else/endif block of code. It restricts execution within the conditional block to only those channels that were enabled via the predicate control.

Each if instruction must have a matching endif instruction and may have up to one matching else instruction before the matching endif.

If all channels are inactive (for the if/endif or if/else/endif block), a jump is performed to the instruction referenced by JIP. This jump must be to right after the matching else instruction when present, or otherwise to the matching endif instruction of the conditional block.

If SPF is ON, the UIP must be used to update IP; JIP is not used in this case.

The following table describes the 32-bit exit code <JIP> and <UIP>. If <branch_ctrl> is set, then the JIP points to the first join instruction within the if block. If <branch_ctrl> is not set, <JIP> should point to the instruction right after the matching else instruction if it exsits, otherwise <JIP> should point to the endif instruction. <UIP> should always point to the endif instruction. When a jump occurs, this value is added to IP pre-increment. In GEN instruction binary, <JIP> and <UIP> are at location <src0> & <src1> and must be of type D (signed dword integer).

Format:
[(pred)] if (exec_size JIP UIP <branch_ctrl>

Restriction

Restriction : The execution size must be the same for the if, else, and endif instructions of the same code block.

Syntax

```
[(pred)] if (exec_size) imm32 imm32 <branch_ctrl>
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < 32; n++ ) { if ( WrEn.channel[n] == 0 ) {
PcIP[n] = IP + JIP; } else { PcIP[n] = IP + 1; } } if ( PcIP != (IP + 1) ) { //
for all channels Jump(IP + JIP); }
```

Predication	Conditional Modifier	Saturation	Source Modifier
Y	N	N	N

DWord	Bit	Description
0..3	127:96	**JIP** Format: S31 The byte-aligned jump distance if a jump is taken for the channel.

if - If		
	95:64	**UIP** Format: S31 The byte aligned jump distance if a jump is taken for the instruction.
	63:32	**Operand Control** Format: EU_INSTRUCTION_OPERAND_CONTROLS
	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Illegal

illegal - Illegal

Source: Eulsa

Length Bias: 4

The Illegal Opcode Exception Enable flag in cr0.1 is normally set so the normal processing of an illegal opcode is to transfer control to the System Routine.
Instruction dispatch treats any unused 8-bit opcode (including bit 7 of the instruction, reserved for future opcode expansion) as if it is the illegal opcode.
The illegal opcode is zero because that byte value is more likely than most to be read via a wayward instruction pointer.
The illegal instruction is an instruction only in the same way that a NULL pointer in software is a pointer. Both are special values indicating invalid instances.

Format:
illegal

Restriction

Restriction : The illegal instruction takes no instruction options.

Syntax

```
illegal
```

Pseudocode

```
{ Set the Illegal Opcode Exception Status bit in cr0.1. if ( Illegal Opcode
Exception Enable is set in cr0.1 ) { Transfer control to the System Routine
(return address to AIP, IP = SIP). } }
```

Predication	Conditional Modifier	Saturation	Source Modifier

0..3	127:7	**Reserved** Format: MBZ
	6:0	**Opcode** Format: EU_OPCODE

Integer Subtraction with Borrow

subb - Integer Subtraction with Borrow

Source: Eulsa

Length Bias: 4

The subb instruction performs component-wise subtraction of src0 and src1 and stores the results in dst, it also stores the borrow into acc.
If the operation produces a borrow (src0 < src1), write 0x00000001 to acc, else write 0x00000000 to acc.

Format:
[(pred)] subb[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : AccWrEn is required. The accumulator is an implicit destination and thus cannot be an explicit destination operand.

Syntax

```
[(pred)] subb[.cmod] (exec_size) reg reg reg [(pred)] subb[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n] - src1.chan[n]; acc.chan[n] = borrow(src.chan[n] - src1.chan[n]); } }
```

Predication	Conditional Modifier	Saturation	Source Modifier

	127:64	**ImmSource** Exists If: ([ImmSource][Src1.RegFile]=='IMM') Format: EU_INSTRUCTION_SOURCES_REG_IMM
	63:32	**Operand Controls** Format: EU_INSTRUCTION_OPERAND_CONTROLS
	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Join

join - Join

Source: Eulsa

Length Bias: 4

The join instruction makes the inactive channels active at the join IP if those channels are predicated. Any deactivated channels due to a goto instruction match the join IP are activated (qualified with predicates at join). If no IP is matched at this join, the program goes to the next IP with the active channels which followed the program path up to the join instruction. If no active channels are present after executing the join instruction, the program jumps to the offset specified by JIP instead of next IP.

The join instruction is used in conjunction with a goto instruction. The join activates channels that are deactivated by the goto instruction. See the goto instruction for the deactivation rules.

The goto and join instructions enable unstructured program control flow. These instructions must be used with additional care where dangling channels can result without proper compiler checks, meaning that it is expected that programs will navigate through these paths to reactivate the channels. Hardware does not provide native checks or reconvergence.

The following table describes the 32-bit JIP. In GEN binary, JIP is at location src1 and must be of type D (signed DWord integer). JIP must be an immediate operand and is a signed 32-bit number. This value is added to IP pre-increment.

If SPF is ON, none of the PcIP are updated.

Format:

[(pred)] join (exec_size) JIP

Programming Notes

An index of 0 does nothing, continuing execution with the next instruction.

An index of -16 (if the jmpi instruction is in native format) or -8 (if the jmpi instruction is in compact format) is an infinite loop on the jmpi instruction.

Restriction

Restriction : The {NoMask} instruction option must be specified.

Restriction : The index data type must be D (Signed DWord Integer).

Syntax

```
[(pred)] join (exec_size) imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if (WrEn.chan[n] ) { // for
the predicated channels and the remaining channels PcIP[n] = IP + 1; } } if (
PcIP != (IP + 1) ) { // for all channels when no channels are activated and no
other active channels Jump(IP + JIP); }
```

Jump Indexed

jmpi - Jump Indexed

Source: Eulsa

Length Bias: 4

Description

The jmpi instruction redirects program execution to an index offset relative to the post-incremented instruction pointer. The index is a signed integer value, with positive or zero integers for forward jumps, and negative integers for backward jumps.

Note: Unlike other flow control instructions, the offset used by jmpi is relative to the incremented instruction pointer rather than the IP value for the instruction itself.

In GEN binary, index is at location src1. The ip register must be put (for example, by the assembler) at the dst and src0 locations.

Predication is allowed to provide conditional jump with a scalar condition. As the execution size is 1, the first channel of PMASK (flags post prediction control and negate) is used to determine whether the jump is taken or not. If the condition is false, the jump is not taken and execution continues with the next instruction.

Format:

[(pred)] jmpi (1) index {NoMask}

Programming Notes

An index of 0 does nothing, continuing execution with the next instruction.

An index of -16 (if the jmpi instruction is in native format) or -8 (if the jmpi instruction is in compact format) is an infinite loop on the jmpi instruction.

Restriction

Restriction : The execution size must be 1.

Restriction : The {NoMask} instruction option must be specified.

Restriction : The index data type must be D (Signed DWord Integer).

Restriction : QtrCtrl must not be used for jmpi instruction.

Syntax

```
[(pred)] jmpi (1) reg32 {NoMask} [(pred)] jmpi (1) imm32 {NoMask}
```

Pseudocode

```
Evaluate(WrEn); if ( WrEn != 0 ) { Jump(IP + 1 + index ); // IP + 1 is a
pseudocode idiom for the IP of the following instruction. }
```

Line

line - Line

Source: Eulsa

Length Bias: 4

The line instruction computes a component-wise line equation (v = p * u + q where u, v are vectors and p, q are scalars) of src0 and src1 and stores the results in dst. src1 is the input vector u. src0 provides input scalars p and q, where p is the scalar value based on the region description of src0 and q is the scalar value implied from src0 region. Specifically, q is the fourth component of the 4-tuple (128-bit aligned) that p belongs to.

Format:
[(pred)] line[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : This is a specialized instruction that only supports an execution size (ExecSize) of 8 or 16.

Restriction : The src0 region must be a replicated scalar (with HorzStride == VertStride == 0).

Restriction : src0 must specify .0 or .4 as the subregister number, corresponding to a subregister byte offset of 0 or 16.

Restriction : Source operands cannot be accumulators.

Syntax

```
[(pred)] line[.cmod] (exec_size) reg reg reg [(pred)] line[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { dwP = src0.RegNum.SubRegNum[bits4:2]; // A DWord-aligned scalar. dwQ = src0.RegNum.(SubRegNum[bit4] | 0x8); // Fourth component. if ( WrEn.chan[n] ) { dst.chan[n] = dwP * src1.chan[n] + dwQ; } }
```

	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Linear Interpolation

lrp - Linear Interpolation

Source: Eulsa

Length Bias: 4

The lrp instruction takes component-wise multiplication of src0 and src1, and adds the result to the component-wise multiplication of src2 and (1 - src0), and then stores the final results in dst.

Format:
[(pred)] lrp[.cmod] (exec_size) dst src0 src1 src2

Restriction

Restriction : The vertical stride (VertStride) is overloaded to 4 in HW for 3-source instructions.

Restriction : The overflow conditional modifier (.o) is not allowed.

Restriction : No explicit accumulator access because this is a three-source instruction. AccWrEn is allowed for implicitly updating the accumulator.

Restriction : All three-source instructions have certain restrictions, described in Instruction Formats.

Syntax

```
[(pred)] lrp[.cmod] (exec_size) reg reg reg reg
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) {
dst.chan[n] = src1.chan[n] * src0.chan[n] + src2.chan[n] * (1.0 - src0.chan[n]);
} }
```

	24:20	**Response Length** Format: U5 Specifies the number of 256-bit GRF registers expected as the message response payload. Valid value ranges are 0 to 16.
	19	**Header Present** Format: MDC_MHP If set, indicates that the message includes the 2-register header.
	18	**Reserved** Format: MBZ Ignored

MSD_RTW_LO8DS - LO8DS Render Target Write MSD

17:14 Message Type

Default Value:	0Ch
Format:	Opcode

Render Target Write message

13 Per-Sample PS Enable

Format:	Enable

If set, PS sends Render Target Write Message that outputs color, depth(optional) and stencil(optional) phases on per sample basis for each slot.

Programming Notes

This bit must be set when PS runs at sample-frequency i.e. pixel shader dispatch mode is PER_SAMPLE. When this bit is set and PS runs at pixel-frequency, i.e. pixel shader dispatch mode is PER_PIXEL, Render Target read and write messages interpret bits 9:6 in MCH_RT_C0 as sample index. In this mode, render target write message payload and render target read writeback payload contain color of a specific sample in all dispatched pixels. RT writes referring to out-of-bound samples have no effect. RT reads from out-of-bound samples return 0. When this bit is clear and PS runs at pixel-frequency, render target write messages contain color value for entire pixel (all samples). When this bit is clear and PS runs at pixel-frequency, render target reads are disallowed per API spec (RT read without specifying sample index forces sample-frequency dispatch). HW behavior is undefined in such case.
This bit MUST be 0 for Dual Source Messages.

12 Last Render Target Select

Format:	Enable

This bit must be set on the last render target write message sent for each group of pixels. For single render target pixel shaders, this bit is set on all render target write messages. For multiple render target pixel shaders, this bit is set only on messages sent to the last render target. This bit must be zero for SIMD8 Image Write message. In general, when threads are not launched by 3D FF, this bit must be zero.

Programming Notes

When a pixel shader has render target writes at finer granularity than the dispatch rate, last render target write to a null surface must be present at the dispatch rate with this bit set.
In particular, if a kernel is dispatched at pixel rate and it only writes to render targets at sample-rate, it must include a pixel-rate render target write to a null surface with Last Render Target Select bit enabled.

11 Slot Group Select

Format:	MDC_RT_SGS

This field selects whether slots 15:0 or slots 31:16 are used for bypassed data.

10:8 Render Target Message Subtype

Default Value:	2h
Format:	Opcode

SIMD8 dual source message. Use slots [7:0] for pixel enables, X/Y addresses, and oMask.

MSD_RTW_LO8DS - LO8DS Render Target Write MSD

		Programming Notes The above slots indicated are within the 16 slots selected by Slot Group Select. If SLOTGRP_HI is selected, slots [23:16] are referenced instead of [7:0].
	7:0	**Binding Table Index** Format: MDC_BTS Specifies the Binding Table Index for the message

Logic And

and - Logic And

Source: Eulsa

Length Bias: 4

The and instruction performs component-wise logic AND operation between src0 and src1 and stores the results in dst.
Register source operands can use source modifiers:
Any source modifier is numeric, optionally changing a source value s to -s, abs(s), or -abs(s) before the AND operation.
Any source modifier is logical, optionally changing a source value s to ~s (inverting all source bits). This capability allows expressions like a AND (NOT b) to be calculated with one instruction.
This operation does not produce sign or overflow conditions. Only the .e/.z or .ne/.nz conditional modifiers should be used.

Format:
Source modifier is not allowed if source is an accumulator.

Restriction

Restriction : Source modifier is not allowed if source is an accumulator.

Syntax

```
[(pred)] and[.cmod] (exec_size) reg reg reg [(pred)] and[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n] & src1.chan[n]; } }
```

Logic Not

not - Logic Not

Source: Eulsa

Length Bias: 4

Description

The not instruction performs logical NOT operation (or one's complement) of src0 and storing the results in dst.
This operation does not produce sign or overflow conditions. Only the .e/.z or .ne/.nz conditional modifiers should be used.

A register source operand can use a source modifier:
Any source modifier is logical, optionally changing a source value s to ~s (inverting all source bits). Such a source modifier is not particularly useful with the not instruction, as it changes the effect of not to just copying bits.

Format:
[(pred)] not[.cmod] (exec_size) dst src0

Restriction

Restriction : Source modifier is not allowed if source is an accumulator.

Syntax

```
[(pred)] not[.cmod] (exec_size) reg reg [(pred)] not[.cmod] (exec_size) reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) {
dst.chan[n] = ~ src0.chan[n]; } }
```

Predication	Conditional Modifier	Saturation	Source Modifier

	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Logic Or

or - Logic Or

Source: Eulsa

Length Bias: 4

Description

The or instruction performs component-wise logic OR operation between src0 and src1 and stores the results in dst.
This operation does not produce sign or overflow conditions. Only the .e/.z or .ne/.nz conditional modifiers should be used.

Register source operands can use source modifiers:
Any source modifier is logical, optionally changing a source value s to ~s (inverting all source bits). This capability allows expressions like a OR (NOT b) to be calculated with one instruction.

Format:
[(pred)] or[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : Source modifier is not allowed if source is an accumulator.

Syntax

```
[(pred)] or[.cmod] (exec_size) reg reg reg [(pred)] or[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n] | src1.chan[n]; } }
```

The maximum is 504 DW (equivalent to 63 8-DW registers). When both inline and indirect data are fetched for this command, the total size in 8-DW registers must be less than 112 (with both inline data length N and indirect data length rounded up to 8-DW aligned individually). The minimal inline data length is 0.
1	31:8	**Reserved**
	7:6	**Reserved** Format: MBZ
	5:0	**Interface Descriptor Offset** Format: U6 This field specifies the offset from the interface descriptor base pointer to the interface descriptor which will be applied to this object. It is specified in units of interface descriptors.

MEDIA_OBJECT

2 — 31 — Children Present

Format:	Enable

Indicates that the root thread may send spawn messages to spawn child threads and/or synchronized root threads.

If Children Present is not set, TS signals VFE to dereference the URB handle immediately after it receives acknowledgement from TD that the thread is dispatched.

If Children Present is set, the URB handle is forwarded to the root thread and serves as the return URB handle for the root thread. TS does not signal deference at the time of dispatch. TS signals URB handle deference only when it receives a resource dereference message from the thread.

In order avoid deadlock, such dereference must be issued once and only once for each URB handle.

30:27 — Reserved

Format:	MBZ

26:25 — Reserved

24 — Thread Synchronization

This field when set indicates that the dispatch of the thread originated from this command is based on the "spawn root thread" message.

Value	Name
0	No thread synchronization
1	Thread dispatch is synchronized by the 'spawn root thread' message

23 — Reserved

Format:	MBZ

22 — Force Destination

If set, bits 20:17 are used to determine the destination of this dispatch, if clear the destination will be chosen based on load.

21 — Use Scoreboard

This field specifies whether the thread associated with this command uses hardware scoreboard. Only when this field is set, the scoreboard control fields in the VFE Dword are valid. If this field is cleared, the thread associated with this command bypasses hardware scoreboard.

Value	Name
0	Not using scoreboard
1	Using scoreboard

20:19 — Slice Destination Select

This bit along with the subslice destination select determines the slice that this thread must be sent to. Ignored if **Force Destination** = 0, or if product only has 1 slice.

Value	Name	Description
00b	Slice 0	
01b	Slice 1	Cannot be used in products without a Slice 1.
10b	Slice 2	Cannot be used in products without a Slice 2.

MEDIA_OBJECT

		11b Reserved
	18:17	**SubSlice Destination Select** This field selects the SubSlice that this thread must be sent to. Ignored if **Force Destination** = 0 Value: 11b — Name: Subslice 3 Value: 10b — Name: SubSlice 2 Value: 01b — Name: SubSlice 1 Value: 00b — Name: SubSlice 0
	16:0	**Indirect Data Length** Format: U17 In bytes This field provides the length in bytes of the indirect data. A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect Data Start Address field is ignored. This field must have the same alignment as the Indirect Object Data Start Address. It must be DQWord (32-byte) aligned. As the indirect data are sent directly to URB, range is limited to (URB Entry Allocation Size)*(Number of URB Entries) in the MEDIA_VFE_STATE command. When both inline and indirect data are fetched for this command, enough room should be allowed for at least 1 copy of the indirect and 1 copy of the inline data in the URB.
3	31:0	**Indirect Data Start Address** Format: GraphicsAddress[31:0] **Description** This field specifies the Graphics Memory starting address of the data to be loaded into the kernel for processing. This pointer is relative to the **Indirect Object Base Address**. Hardware ignores this field if indirect data is not present. Alignment of this address depends on the mode of operation. This field specifies the 64-byte aligned address of the indirect data. Value: [0,512MB] — Name: **Programming Notes** Bits 31:29 MBZ
4	31:25	**Reserved** Format: MBZ

	15:8	**Reserved** Format: MBZ
	7:0	**Scoreboard Mask** Format: Boolean Each bit indicates the corresponding dependency scoreboard is dependent on. This field is AND'd with the corresponding Scoreboard Mask field in the MEDIA_VFE_STATE command. **Bit n (for n = 0…7):** Scoreboard n is dependent, where bit 0 maps to n = 0.
6..n	31:0	**Inline Data** Generic Mode: The format of this data is specified by software. Hardware does not interpret this data; it merely passes it to the kernel for processing. The total size for the inline data and indirect data must not exceed 112 registers.

MEDIA_OBJECT_GRPID

MEDIA_OBJECT_GRPID

Source: RenderCS

Length Bias: 2

The MEDIA_OBJECT_GRPID command is a variation of MEDIA_OBJECT which includes a group id which is used to allocate and track Barriers and Shared Local Memory. The Interface Descriptor is used to specify how much SLM is needed and how many threads will be reporting to the Barrier. All MEDIA_OBJECT_GRPIDs with the same group id should have the same interface descriptor and be dispatched to the same Tslice – the dispatcher will ensure this if Force Destination = 0, but software must ensure this if Force Destination = 1. Software should also ensure that all the threads needed for the Barrier will fit into a Tslice, or the Barrier will never be satisfied. Either SLM or a barrier must be used with MEDIA_OBJECT_GRPID, if neither is needed then a MEDIA_OBJECT must be used instead.

MEDIA_OBJECT_GRPID supports the GPGPU version of payload delivery – either indirect or CURBE can be split between the threads in a group (per-thread payload), as well as a section which is sent to all threads (cross-thread payload). See the GPGPU payload section. For indirect, the same pointer must be sent with all the commands associated with the thread group for payload splitting to work properly. Inline data is not split, but the payload attached to each command is sent with that thread. Only one of inline, indirect, or CURBE is allowed, but at least one form of payload must be sent.

MEDIA_STATE_FLUSH with the watermark bit must be placed between groups created by MEDIA_OBJECT_GRPID. The Interface Descriptor associated with the watermark must match the Interface Descriptor used for the following group.

7..n	31:0	**Inline Data** The format of this data is specified by software. Hardware does not interpret this data; it merely passes it to the kernel for processing. The total size for the inline data and indirect data must not exceed 112 registers.

MEDIA_OBJECT_PRT

MEDIA_OBJECT_PRT

Source: RenderCS

Length Bias: 2

command is for generating Persistent Root Thread for the media pipeline. It only supports loading of inline data but not indirect data.
This command should be used for a root thread that might have to be present in the system for a period longer than the certain minimal context-switch interrupt latency. It has to honor the context interrupt signal to terminate upon request. It should also handle replay from theinterrupted point upon context restore (the same thread being dispatched more than once). In contrary, if a thread is not a Persistent Root Thread, if dispatched, it must run to completion.
The command can be used in all VFE modes, except VLD mode.

For simplification, _PRT command has a fixed size of 16 DWORD

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h Media Format: OpCode
	26:24	**Media Command Opcode** Default Value: 1h MEDIA_OBJECT_PRT Format: OpCode
	23:16	**SubOpcode** Default Value: 2h MEDIA_OBJECT_PRT SubOp Format: OpCode
	15:0	**DWord Length** Format: =n Total Length - 2 Note: Regardless of the mode, inline data must be present in this command. The command size must fit within 16 dwords. Value: 0Eh — Name: DWORD_COUNT_n **[Default]** — Description: Excludes DWord (0,1)
1	31:6	**Reserved** Format: MBZ
	5:0	**Interface Descriptor Offset** Format: U6 This field specifies the offset from the interface descriptor base pointer to the interface descriptor which will be applied to this object. It is specified in units of interface descriptors.

MEDIA_OBJECT_PRT

2	31	**Children Present** Format: Enable Indicates that the root thread may send spawn messages to spawn child threads and/or synchronized root threads. If Children Present is not set, TS signals VFE to dereference the URB handle immediately after it receives acknowledgement from TD that the thread is dispatched. If Children Present is set, the URB handle is forwarded to the root thread and serves as the return URB handle for the root thread. TS does not signal deference at the time of dispatch. TS signals URB handle deference only when it receives a resource dereference message from the thread. In order avoid deadlock, such de-reference must be issued once and only once for each URB handle.
	30:24	**Reserved** Format: MBZ
	23	**PRT_Fence Needed** Format: Enable This field specifies that a PRT_Fence is generated after dispatching the thread associated with this MEDIA_OBJECT_PRT. The PRT_Fence prevents additional threads following this persistent root thread until a thread spawn message is sent. The PRT_Fence is generated on first dispatch of the persistent root, as well as on re-dispatches of the persistent root after context restore.
	22	**PRT_FenceType** This field specifies the type of fence the PRT thread uses. If this field is set to 0, the fence is set at the end of the root thread queue. It will block the dispatch of the next root thread, but allowed these root threads to be populated through VFE to the root thread queue in TS. If this field is set to 1, the fence is set at the entry of VFE, similar to the fence set by the MEDIA_STATE_FLUSH command. No more command can go into the media pipe until a thread spawn message is sent (by the PRT). This field is only valid when PRT_Fence Needed is set to 1. Otherwise, it is ignored by hardware. **Value** / **Name** / **Description** 0h / Root thread queue / Root thread queue fence 1h / VFE state flush / VFE state flush fence
	21:0	**Reserved** Format: MBZ
3	31:0	**Reserved** Format: MBZ

	26:24	**Media Command Opcode** Default Value: 1h MEDIA_OBJECT_WALKER Format: OpCode
	23:16	**SubOpcode** Default Value: 03h MEDIA_OBJECT_WALKER SubOp Format: OpCode
	15:0	**DWord Length** Default Value: 0Fh DWORD_COUNT_n Format: =n Total Length - 2 **Note:** If this field is greater than 15, it indicates that inline data is present. If present, inline data is common for all threads generated from this command, If this field is 15, it indicates that inline data is not present. It should be noted that unlike other media object command, inline data is optional for this command.
1	31:8	**Reserved**
	7:6	**Reserved** Format: Reserved
	5:0	**Interface Descriptor Offset** Format: U6 This field specifies the offset from the interface descriptor base pointer to the interface descriptor which will be applied to this object. It is specified in units of interface descriptors.
2	31:25	**Reserved** Format: MBZ
	24	**Thread Synchronization** This field when set indicates that the dispatch of the thread originated from this command is based on the "spawn root thread" message.

MEDIA_OBJECT_WALKER

Value	Name
0	No thread synchronization
1	Thread dispatch is synchronized by the 'spawn root thread' message

23:22 **Masked Dispatch**

Format:	U2

Enable the masking of the dispatch of individual threads based on a bitmask read from CURBE, and specifies the pitch of the CURBE surface.
If enabled, CURBE will not be used for thread payload.

Value	Name	Description
00b		Masked Dispatch Disabled
01b		Masked Dispatch with 128-bit pitch in CURBE
10b		Masked Dispatch with 256-bit pitch in CURBE
11b		Masked Dispatch with 512-bit pitch in CURBE

21 **Use Scoreboard**

This field specifies whether the thread associated with this command uses hardware scoreboard. Only when this field is set, the scoreboard control fields in the VFE Dword are valid. If this field is cleared, the thread associated with this command bypasses hardware scoreboard.

Value	Name
0	Not using scoreboard
1	Using scoreboard

20:17 **Reserved**

Format:	MBZ

16:0 **Indirect Data Length**

Format:	U17 in bytes

This field provides the length in bytes of the indirect data. A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect Data Start Address field is ignored. This field must have the same alignment as the Indirect Object Data Start Address. It must be DQWord (32-byte) aligned. As the indirect data are sent directly to URB, the range is limited to the (URB Entry Allocation Size)*(Number of URB Entries) specified in the MEDIA_VFE_STATE command.

3 31:0 **Indirect Data Start Address**

This field specifies the Graphics Memory starting address of the data to be loaded into the kernel for processing. This pointer is relative to the **Indirect Object Base Address.**
Hardware ignores this field if indirect data is not present.
Alignment of this address depends on the mode of operation.

It is the 64-byte aligned address of the indirect data

Value	Name	Description
[0 - 512MB]		(Bits 31:29 MBZ)

MEDIA_OBJECT_WALKER

4 — 31:0 — Reserved

Format:	MBZ

5 — 31:8 — Group ID Loop Select

This bit field chooses which of the nested loops of the walker are used to identify threads which share a group id and therefore a shared barrier and SLM. The programmer must ensure that each group will fit into a single subslice. When barriers are enabled every group must have the same number of threads matching the number specified in the Interface Descriptor.

Value	Name	Description
0	No_Groups	Groups are not created, barriers and SLM are not allocated
1	Color_Groups	Each complete iteration of the Color loop defines a group, the group id is the concatenation of the Outer global, Inner global, Outer local, Mid local and Inner local loop execution counts.
2	InnerLocal_Groups	Each complete iteration of the Inner local loop and Color loop defines a group, the group id is the concatenation of the Outer global loop to the Mid local loop execution counts.
3	MidLocal_Groups	Each complete iteration of the Mid local loop and lower loops defines a group, the group id is the concatenation of the Outer global loop to the Outer local loop execution counts.
4	OuterLocal_Groups	Each complete iteration of the Outer local loop and lower loops defines a group, the group id is the concatenation of the Outer global loop and the Inner global loop execution counts.
5	InnerGlobal_Groups	Each complete iteration of the Inner global loop and lower loops defines a group, the group id is the Outer global loop execution count.

5 — 7:0 — Scoreboard Mask

Format:	Boolean

Each bit indicates the corresponding dependency scoreboard is dependent on. This field is AND'd with the corresponding Scoreboard Mask field in the MEDIA_VFE_STATE. All threads generated by this walker command share the same dynamic mask.
Bit n (for n = 0...7): Scoreboard n is dependent, where bit 0 maps to n = 0.

6 — 31:28 — Reserved

6 — 27:24 — Color Count Minus One

Format:	U4

This field specifies the number of repeat of the inner most loop of the walker. Each repeated walk position is assigned with an incremental Color number. The Color number together with the X and Y position of the thread is used for dependency scoreboard control.
Usage Example: This allows multiple sets of dependency threads to be dispatched.

MEDIA_STATE_FLUSH

MEDIA_STATE_FLUSH

Source: RenderCS

Length Bias: 2

This command updates the Message Gateway state. In particular, it updates the state for a selected Interface Descriptor.

This command can be considered same as a MI_Flush except that only media parser will get flushed instead of the entire 3D/media render pipeline. The command should be programmed prior to new Media state, curbe and/or interface descriptor commands when switching to a new context or programming new state for the same context. With this command, pipelined state change is allowed for the media pipe.

Be cautious when using this command when child_present flag in the media state is enabled. This is because that CURBE state as well as Interface Descriptor state are shared between root threads and child threads. Changing these states while child threads are generated on the fly may cause unexpected behavior. Combining with MI_ARB_ON/OFF command, it is possible to support interruptability with the following command sequence where interrupt may be allowed only when MI_ARB_ON_OFF is ON:

```
MEDIA_STATE_FLUSH
 VFE_STATE // VFE will hold CS if watermark isn't met
 MI_ARB_OFF // There must be at least one VFE command before this one
 MEDIA_OBJECT ... MI_ARB_ON
```

DWord	Bit	Description

1	31:9	**Reserved** Format: MBZ

MEDIA_STATE_FLUSH

	8	**Reserved**
	7	**Flush to GO** Format: Enable This bit indicates that the write data out of this thread group should be flushed to the point where it is visible to following commands.
	6	**Watermark Required** This is a single bit specifying if the MEDIA_STATE_FLUSH should stall further commands until there is enough room in a half-slice for the following thread group. The characteristics of the thread group are specified in the Interface Descriptor Offset. If set, the MEDIA_STATE_FLUSH stalls CS until there are enough threads in a half-slice, and enough SLM available in the same half-slice, and a free barrier if one is required. An Interface Descriptors can be updated after a Watermarked MEDIA_STATE_FLUSH only if it has not been used in the current context. Reusing an interface desciptor requires that this bit is clear to ensure the ID cache is reloaded. If clear, the MEDIA_STATE_FLUSH stalls CS until the TDL has dispatched the last thread, allowing the CURBE and Interface Descriptors to be updated by following commands. **Programming Notes** The Interface Descriptor Offset used for the flush must be the same as that used for the GPGPU_OBJECTs. GPGPU_WALKER automatically checks the Watermark conditions before starting a thread, so this bit should not be set before GPGPU_WALKER.
	5:0	**Interface Descriptor Offset** Format: U6 This field specifies the offset from the interface descriptor base pointer to the interface descriptor which describes what resources are required to meet the watermark.

MEDIA_VFE_STATE

MEDIA_VFE_STATE

Source: RenderCS

Length Bias: 2

A stalling PIPE_CONTROL is required before MEDIA_VFE_STATE unless the only bits that are changed are scoreboard related: Scoreboard Enable, Scoreboard Type, Scoreboard Mask, Scoreboard * Delta. For these scoreboard related states, a MEDIA_STATE_FLUSH is sufficient.

- MEDIA_STATE_FLUSH (optional, only if barrier dependency is needed)
- MEDIA_INTERFACE_DESCRIPTOR_LOAD (optional)

1	31:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[31:10] Specifies the 1k-byte aligned address offset to scratch space for use by the kernel. This pointer is relative to the **General State Base Address.**
	9:8	**Reserved** Format: MBZ

MEDIA_VFE_STATE

7:4 Stack Size

Value	Name	Description
[0,11]		indicating [1KBytes, 2MBytes]

Programming Notes
Since the stack uses the upper portion of the scratch space, **Stack Size =< Per Thread Scratch Space**

3:0 Per Thread Scratch Space

Format:	U4

Specifies the amount of scratch space allowed to be used by each thread. The driver must allocate enough contiguous scratch space, pointed to by the Scratch Space Pointer, to ensure that the maximum threads in the device each get Per Thread Scratch Space size without exceeding the driver-allocated scratch space.

Value	Name	Description
[0,11]		indicating [1k bytes, 2 Mbytes]: 0=1k, 1=2k, 2=4k, 3=8k ... 11=2M

2 31:16 Reserved

Format:	MBZ

15:0 Scratch Space Base Pointer High

Format:	GeneralStateOffset[47:32]

This field specifies the high 16 bits of starting address of the Scratch Space Base Pointer

3 31:16 Maximum Number of Threads

Format:	U16-1 representing thread count

Range: [0, n-1] where n = (# EUs) * (# threads/EU).
See *Graphics Processing Engine* for listing of #EUs and #threads in each device.

Specifies the maximum number of simultaneous root threads allowed to be active. Used to avoid potential deadlock. If child threads are not planning on being used then this field can be set to its maximum value and there will be no thread limit beyond what is currently available in the system; the maximum value can include threads in slices that have been shut down for power reasons. For GPGPU threads the maximum value must be used.

Programming Notes
MSB will be zero due to the range limit below.

15:8 Number of URB Entries

Format:	U8

Specifies the number of URB entries that are used by the unit.

Value	Name	Description
[1,128]		[1,128] Entries

MEDIA_VFE_STATE

		Programming Notes Please note that 0 is not allowed for this field.
	7	**Reset Gateway Timer** This field controls the reset of the timestamp counter maintained in Message Gateway. Value: 0h — Maintaining the existing timestamp state Value: 1h — Resetting relative timer and latching the global timestamp
	6	**Bypass Gateway Control** This field configures Gateway to use a simple message protocol. Value: 0h — Maintaining OpenGateway/ForwardMsg/CloseGateway protocol (legacy mode) Value: 1h — Bypassing OpenGateway/CloseGateway protocol
	6	**Reserved** Format: MBZ
	5:3	**Reserved** Format: MBZ
	2	**Reserved** Format: MBZ
	1:0	**Reserved**
4	31:8	**Reserved**
	7:4	**Reserved** Format: MBZ
	3:2	**Reserved** Format: MBZ
	1:0	**Slice Disable** This field disables dispatch to slices and subslices for Media and GPGPU applications. It is used to limit the amount of scratch space that needs to be allocated for a context. If a particular configuration doesn't have slice or subslice then there is no impact to disabling it. Value: 00b — Name: All Subslices Enabled — Description: All subslices are enabled. Value: 01b — Name: Only Slice 0 Enabled — Description: Slice 2 and 1 are disabled, only Slice 0 with all subslices is enabled. Value: 11b — Name: Only Slice 0 Subslice 0 Enabled — Description: Slice 2 and 1 are disabled, only Slice 0 with only subslice 0 enabled.

MEDIA_VFE_STATE

5	31:16	**URB Entry Allocation Size** Format: U16-1 **Description** Specifies the length of each URB entry used by the unit, in 256-bit register increments. ROB address for URB starts after CURBE Allocated region. (URB Entry Allocation Size * Number of URB Entries) + CURBE Allocation Size + Number of Interface Descriptors) must be less than (number of bytes allocated for the URB in L3CNTLREG / 32 bytes per entry). Note: Number of Interface Descriptors is 64. If SLM is enabled for GPGPU work then the number of available entries will be 1/2 the maximum URB entries. **Programming Notes** When Inline data is used with MEDIA_OBJECT or MEDIA_OBJECT_WALKER, then the URB entry allocation size must match the Inline data size. If Indirect data is being used with MEDIA_OBJECT or GPGPU_WALKER then the allocation size must be sufficient for the Indirect data. If both Inline and Indirect are being used, then the allocation size must match the sum of the Inline and Indirect.
	15:0	**CURBE Allocation Size** Format: U16-1 **Description** Specifies the total length allocated for CURBE, in 256-bit register increments. ROB address for CURBE starts at address 64. (URB Entry Allocation Size * Number of URB Entries) + CURBE Allocation Size + Interface Descriptor Entries) must be less than or equal to the number of entries in the URB as described in **Configurations**. Interface Descriptor Entries is 64 If SLM is enabled for GPGPU work then the number of available entries will be ½ the maximum URB entries. **Programming Notes** CURBE Allocation Size should be 0 for GPGPU workloads that uses indirect instead of CURBE.
6	31	**Scoreboard Enable** Format: Enable This field enables and disables the hardware scoreboard in the Media Pipeline. If this field is cleared, hardware ignores the following scoreboard state fields.

Value	Name
0h	Scoreboard disabled
1h	Scoreboard enabled

MEDIA_VFE_STATE

30 — Scoreboard Type

This field selects the type of scoreboard in use.

Value	Name
0h	Stalling Scoreboard
1h	Non-Stalling Scoreboard

29:16 — Reserved

Format:	MBZ

15:8 — Reserved

Format:	MBZ

7:0 — Scoreboard Mask

Format:	Enable(8)

Each bit indicates the corresponding dependency scoreboard is enabled. The scoreboard is based on the relative (X, Y) distance from the current threads' (X, Y) position. **Bit n (for n = 0…7):** Score n is enabled.

7 — 31:28 — Scoreboard 3 Delta Y

Format:	S3

Relative vertical distance of the dependent instance assigned to scoreboard 3, in the form of 2's compliment.

Programming Notes
MBZ if scoreboard is disabled.

27:24 — Scoreboard 3 Delta X

Memory Fence MSD

MSD_MEMFENCE - Memory Fence MSD

Source: DataPort 0
Length Bias: 1
Family: Other
Group: Memory Fence

DWord	Bit	Description
0	19	**Header Present** Format: MDC_MHP Indicates that the message requires a header.
	18	**Legacy Message** Default Value: 0h Format: Opcode Legacy Message
	17:14	**Message Type** Default Value: 07h Format: Opcode Memory Fence message
	13	**Commit** Format: Enable Specifies whether control is returned to the thread only after the fence has been honored. Value / Name / Description: 1 / Enabled **[Default]** / The commit writeback register is always required to guarantee ordering. 0 / Reserved / The commit writeback register is always required to guarantee ordering.
	12:9	**L3 Flush** The L3 Flush control is one of the following GSYNC signals. Value / Name / Description: 0h / Disabled **[Default]** / The L3 caches are not flushed. 08h / RW Data / Causes the L3 to flush any RW data. 04h / Constant Data / Causes the L3 to invalidate any Constant data. 02h / Texture Data / Causes the L3 to invalidate any Texture data. 01h / Instructions / Causes the L3 to invalidate all GPU instruction caches.

MSD_MEMFENCE - Memory Fence MSD

		Programming Notes If multiple caches need to be flushed, the commands need to be sent separately. When the memory fence completes, the GSYNC has been started, but may not yet be completed. To know when the GSYNC is completed, Issue any read to the L3 cache after an L3 Flush operation and wait for that data to be returned.
	8	**Reserved** Format: MBZ Ignored
	7:0	**Reserved** Format: MBZ Ignored

MFC_AVC_PAK_OBJECT

MFC_AVC_PAK_OBJECT

Source: VideoCS

Length Bias: 2

The MFC_AVC_PAK_OBJECT command is the second primitive command for the AVC Encoding Pipeline. The same command is used for both CABAC and CAVLC modes. The MV Data portion of the bitstream is loaded as indirect data object.Before issuing a MFC_AVC_PAK_OBJECT command, all AVC MFX states need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of this command.MB record must be consecutive with no gaps, hence we do not need MB(x,y) in each MB command. Internal counter will keep track of the current MB address, starting from the Start_MB_In_Slice loaded at the beginning of each slice. MFC_AVC_PAK_OBJECT command follows the MbType definition like MFD. Many fields in this command are identical to that in VME output. This is intended to reduce software converting overhead from VME to PAK. Encoding statistical data such as the total size of the output bitstream are provided through MMIO registers. Software may access these registers through MI_STORE_REGISTER_MEM command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFC_AVC_PAK_OBJECT Format: OpCode
	26:24	**Media Command Opcode** Default Value: 1h AVC_ENC Format: OpCode

	20:16	**SubOpcode B** Default Value: 9h Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Format: =n Length -2 Value / Name: 0009h DWORD_COUNT_n **[Default]** 000Ah DWORD_COUNT_n **[Default]**

MFC_AVC_PAK_OBJECT

1	31:10	**Reserved** Format: MBZ
	9:0	**Indirect PAK-MV Data Length** This field provides the length in bytes of the indirect data, which contains all the MVs for the current MB (in any partitioning and subpartitioning form). A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect PAK-MV Data Start Address field is ignored. This field must have the same alignment as the Indirect PAK-MV Data Start Address. This field must be DW aligned (since each MV is 4 bytes in size).Driver has to derived this field from MVsize (MVquantity in DXVA, exact size) *4 bytes per MV.
2	31:29	**Reserved** Format: MBZ
	28:0	**Indirect PAK-MV Data Start Address Offset** This field specifies the memory starting address (offset) of the MV data to be fetched into PAK Subsystem for processing. This pointer is relative to the MFC Indirect PAK-MV Object Base Address.Hardware ignores this field if indirect data is not present, i.e. the Indirect PAK-MV Data Length is set to 0. It is a Dword aligned address in all AVC encoding configuration, since each MV is 4 bytes in size. Value: [0,512MB) — Name:
3..10	31:0	**Inline Data** All the required MB level controls and parameters for encoding are captured as inline data of the MFC_AVC_PAK_OBJECT command. It has a fixed size of 8 DWs. Its definition is described in the next section.
12..23	31:0	**Reserved**

MFC_JPEG_ HUFF_TABLE_STATE

MFC_JPEG_ HUFF_TABLE_STATE

Source: VideoCS

Length Bias: 2

This Huffman table commands contains both DC and AC tables for either luma or chroma. Once a Huffman table has been defined for a particular destination, it replaces the previous tables stored in that destination and shall be used in the remaining Scans of the current image.
Two Huffman tables for luma and chroma will be sent to H/W, and chroma table is used for both U and V.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode

1	31:26	**Reserved** Format: MBZ
	25:0	**MCU Count** Format: U26 This field indicates the number of MCUs in the Scan. MCU Count = M_x *X* M_y The number of MCUs in a row: M_x= *(X + (H_1 *8 -1)) / (H_1 *8)* The number of MCUs in a column: M_y= *(Y + (V_1*8 -1)) / (V_1*8)* *X*: The number of samples per line in Y-image *Y*: The number of lines in Y-image *H1*: Horizontal sampling factor of Y-image in the Frame header

MFC_JPEG_SCAN_OBJECT

V1: Vertical sampling factor of Y-image in the Frame header

2 — 31:25 Reserved

Format:	MBZ

24:22 Huffman AC Table

AC Huffman table destination selector specifies one of two possible AC table destinations for each Y, U, V, or R, G, B.
The AC Huffman tables must have been loaded in destination 0 and 1 by the time of issuing MFC_JPEG_HUFF_TABLE_STATE Command.

If AC table 0 is used for Y and AC table 1 is used for U and V, it will be set to 110b. If AC table 0 is used for R, G, and B, it will be set to 000b and so on.
Refer to the table below for the summary of actions.

Value	Name	Description
0XXb	Bit24 (V0)	The third image component must use the AC table 0.
1XXb	Bit24 (V1)	The third image component must use the AC table 1.
X0Xb	Bit23 (U0)	The second image component must use the AC table 0.
X1Xb	Bit23 (U1)	The second image component must use the AC table 1.
XX0b	Bit22 (Y0)	The first image component must use the AC table 0.
XX1b	Bit22 (Y1)	The first image component must use the AC table 1.

Restriction
Restriction : When InputSurfaceFormatYUV = RGB, because the order of input image components can be RGB, GBR, BGR,\ or YUV, **Bit22** is used for the first image component, **Bit23** is used for the second image component, and **Bit24** is used for the third image component.

21 Reserved

Format:	MBZ

20:18 Huffman DC Table

DC Huffman table destination selector specifies one of two possible DC table destinations for each Y, U, V, or R, G, B.
The DC Huffman tables shall have been loaded in destination 0 and 1 by the time of issuing MFC_JPEG_HUFF_TABLE_STATE Command.

if DC table 0 is used for Y and DC table 1 is used for U and V, it will be set to 110b. If DC table 0 is used for R, G, and B, it will be set to 000b and so on.
Refer to the table below for the summary of actions.

Value	Name	Description
0XXb	Bit20 (V0)	The third image component must use the DC table 0.

MFC_JPEG_SCAN_OBJECT

1XXb	Bit20 (V1)	The third image component must use the DC table 1.
X0Xb	Bit19 (U0)	The second image component must use the DC table 0.
X1Xb	Bit19 (U1)	The second image component must use the DC table 1.
XX0b	Bit18 (Y0)	The first image component must use the DC table 0.
XX1b	Bit18 (Y1)	The first image component must use the DC table 1.

Restriction
Restriction : When InputSurfaceFormatYUV = RGB, because the order of input image components can be RGB, GBR, BGR, YUV, **Bit18** is used for the first image component, **Bit19** is used for the second image component, and **Bit20** is used for the third image component.

17 **Head Present Flag**

If this flag is set to 0, then no MFC_JPEG_PAK_INSERT_OBJECT commands will be sent.
If this flag is set to 1, then one or more MFC_JPEG_PAK_INSERT_OBJECT commands will be sent after MFC_JPEG_SCAN_OBJECT command.

Value	Name	Description
0		No insertion into the output bitstream buffer before Scan encoded bitstream
1		Headers, tables, App data insertion into the output bitstream buffer. HW will insert the insertion data before the Scan encoded bitstream.

16 **Is Last Scan**

If this flag is set, then HW will insert EOI (0xFFD9) to the end of Scan encoded bitstream.

Value	Name	Description
0		Not the last Scan.
1		Indicates that the current Scan is the last one.

15:0 **Restart Interval**

Format:	U16

Specifies the number of MCUs in an ECS, except for the last ECS. Restart maker is inserted periodically and it separates the two neighboring ECSs.

Value	Name
0-FFFFh	

Programming Notes
A value of '0' implies that the Scan Data has a single ECS.

MFC_MPEG2_PAK_OBJECT

MFC_MPEG2_PAK_OBJECT

Source: VideoCS

Length Bias: 2

The MFC_MPEG2_PAK_OBJECT command is the second primitive command for the MPEG-2 Encoding Pipeline. Different from AVC, the MV Data portion of the bitstream is loaded as part of MB control data.

Before issuing a MFC_MPEG2_PAK_OBJECT command, all MPEG2_MFX states need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of this command.

MB record must be consecutive with no gaps, hence we do not need MB(x,y) in each MB command. Internal counter will keep track of the current MB address, starting from the Start_MB_In_Slice loaded at the beginning of each slice.

MFC_ MPEG2_PAK_OBJECT command follows the MbType definition like MFD. Many fields in this command are identical to that in VME output. This is intended to reduce software converting overhead from VME to PAK.

Encoding statistical data such as the total size of the output bitstream are provided through MMIO registers. Software may access these registers through MI_STORE_REGISTER_MEM command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFC_AVC_PAK_INSERT_OBJECT Format: OpCode

	23:21	**SubOpcode A** Default Value: 2h ENC Format: OpCode
	20:16	**SubOpcode B** Default Value: 9h MEDIA_ Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 0007h Excludes DWord (0,1) Format: =n Total Length - 2

MFC_MPEG2_PAK_OBJECT		
1..8	31:0	**Inline Data** All the required MB level controls and parameters for encoding are captured as inline data of the MFC_MPEG2_PAK_OBJECT command. It has a fixed size of 8 DWs. Its definition is described in the next section

MFC_MPEG2_SLICEGROUP_STATE

MFC_MPEG2_SLICEGROUP_STATE

Source: VideoCS

Length Bias: 2

This is a slice group level command and can be issued multiple times within a picture that is comprised of multiple slice groups. The same command is used for AVC encoder (PAK mode) and decoder (VLD and IT modes).

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFX_MPEG2_SLICEGROUP_STATE Format: OpCode
	26:24	**Media Command Opcode** Default Value: 3h MPEG2 Format: OpCode
	23:21	**SubOpcode A** Default Value: 2h MEDIA_ Format: OpCode
	20:16	**SubOpcode B** Default Value: 3h MEDIA_ Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 6h Excludes DWord (0,1) Format: =n Total Length - 2
1	31	**MbRateCtrlFlag- RateControlCounterEnable (Encoder-only)** To enable the accumulation of bit allocation for rate controlThis field enables hardware Rate Control logic. The rest of the RC control fields are only valid when this field is set to 1. Otherwise, hardware ignores these fields.Note: To reset MB level rate control (QRC), we need to set both bits MbRateCtrlFlag and MbRateCtrlReset to 1 in the new slice Value: 0h — Name: Disable Value: 1h — Name: Enable

MFC_MPEG2_SLICEGROUP_STATE

30 — MbRateCtrlReset- ResetRateControlCounter (Encoder-only)

To reset the bit allocation accumulation counter to 0 to restart the rate control.

Value	Name	Description
0h	Disable	Not reset
1h	Enable	reset

29:28 — MbRateCtrlMode- RC Triggle Mode (Encoder-only)

Value	Name	Description
00b		Always Rate Control, whereas RC becomes active if sum_act > sum_target or sum_act < sum_target
01b		Gentle Rate Control, whereas RC becomes active if sum_act > upper_midpt or sum_act < lower_midpt
10b		Loose Rate Control, whereas RC becomes active if sum_act > sum_max or sum_act < sum_min
11b		Reserved

27:24 — MbRateCtrlParam- RC Stable Tolerance (Encoder-only)

Format:	U4

This field specifies the tolerance required to deactivate RC once it has been triggered.

Value	Name
[0, 15]	

23 — RateCtrlPanicFlag - RC Panic Enable (Encoder-only)

If this field is set to 1, RC enters panic mode when sum_act > sum_max. RC Panic Type field controls what type of panic behavior is invoked.

Value	Name
0	Disable
1	Enable

22 — RateCtrlPanicType - RC Panic Type (Encoder-only)

This field selects between two RC Panic methods. If it is set to 0, in panic mode, the macroblock QP is maxed out, setting to requested QP + QP_max_pos_mod. If it is set to 1, for an intra macroblock, AC CBPs are set to zero (note that DC CBPs are not modified). For inter macroblocks, AC and DC CBPs are forced to zero.

Value	Name	Description
0h		QP Panic
1h		CBP Panic

21 — Reserved

Format:	MBZ

MFC_MPEG2_SLICEGROUP_STATE

20	**SkipConvDisabled - MB Type Skip Conversion Disable (Encoder-only)** This field is only valid for a P or B slice. It must be zero for other slice types. Rules are provided in Section 2.3.3.1.6

Value	Name	Description
0h	Enable	Enable skip type conversion
1h	Disable	Disable skip type conversion

19	**IsLastSliceGrp** IsLastSliceGrp = 1 if the current slice group is the last slice group of a picture; 0 otherwise.It is used by the zero filling in the Minimum Frame Size test.
18	**BitstreamOutputFlag - Compressed BitStream Output Disable Flag (Encoder-only)**

Value	Name	Description
0h	Enable	enable the writing of the output compressed bitstream
1h	Disable	disable the writing of the output compressed bitstream

17	**HeaderPresentFlag - Header Insertion Present in Bitstream (Encoder-only)**

Value	Name	Description
0h	Disable	no header insertion into the output bitstream buffer, in front of the current slice encoded bits
1h	Enable	header insertion into the output bitstream buffer is present, and is in front of the current slice encoded bits.

16	**SliceData PresentFlag - SliceData Insertion Present in Bitstream (Encoder-only)**

Value	Name	Description
0h	Disable	no Slice Data insertion into the output bitstream buffer
1h	Enable	Slice Data insertion into the output bitstream buffer is present.

15	**TailPresentFlag - Tail Insertion Present in bitstream (Encoder-only)**

Value	Name	Description
0h		no tail insertion into the output bitstream buffer, after the current slice encoded bits
1h		tail insertion into the output bitstream buffer is present, and is after the current slice encoded bits.

14	**FirstSliceHdrDisabled** when this is on, the first slice header of the slice group is expected to be provided by the user via insertion command. PAK HW will skip it.
13	**IntraSlice** intra slice value included in slice headers, when IntraSliceFlag = 1.
12	**IntraSliceFlag** intra slice flag included in slice headers
11:8	**Reserved**

Format:	MBZ for SliceID extension

MFC_MPEG2_SLICEGROUP_STATE

	7:4	**SliceID[3:0] (Encoder-only)** To identify the output data (coding information record) returned for rate control from PAK to ENC and VPP
	3:2	**Reserved** Format: MBZ for StreamID extension
	1:0	**StreamID[1:0] (Encoder-only)** To identify the output data (coding information record) returned for rate control from PAK to ENC and VPP
2	31:24	**NextSgMbYcnt - also NextStartVertPos** Vertical count of the first MB in the next slice group (Encoder-only)Note: This field restricts total number of MB in the Y direction to 255 or less.
	23:16	**NextSgMbXcnt - also NextStartHorzPos** BitFieldDesc
	15:8	**FirstMbYcnt - also CurrStartVertPos** Format: U8 also CurrStartVertPos, Vertical count of the first MB in the current slice group (Encoder-only)
	7:0	**FirstMbXcnt - also CurrStartHorzPos** Format: U8 Horizontal count of the first MB in the current slice group (Encoder-only)
3	31:9	**Reserved** Format: MBZ

CV5	CV5	CV4	CV3	CV2	CV1	CV1	CV0

MFD_AVC_BSD_OBJECT

MFD_AVC_BSD_OBJECT

Source: VideoCS

Length Bias: 2

Description

The MFD_AVC_BSD_OBJECT command is the only primitive command for the AVC Decoding Pipeline. The same command is used for both CABAC and CAVLD modes. The Slice Data portion of the bitstream is loaded as indirect data object.Before issuing a MFD_AVC_BSD_OBJECT command, all AVC states of the MFD Engine need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of a MFD_AVC_BSD_OBJECT command.

Context switch interrupt is not supported by this command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFD_AVC_BSD_OBJECT Format: OpCode
	26:24	**Media Command Opcode** Default Value: 1h AVC_DEC Format: OpCode
	23:21	**SubOpcode A** Default Value: 1h Format: OpCode
	20:16	**SubOpcode B** Default Value: 8h Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Format: =n Total Length - 2 Value: 4h — Name: Excludes DWord (0,1) = 0004 **[Default]**

MFD_AVC_BSD_OBJECT

1 — 31:0 — Indirect BSD Data Length

Format:	U32

This field provides the length in bytes of the indirect data. A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect Data Start Address field is ignored.
This field must have the same alignment as the Indirect Object Data Start Address.
AVC Short Format : It is the length in bytes of the bitstream data for the current slice, including Slice Header + Slice Data + Emulation Prevention Bytes + any filling trailing zeros after the last MB.
Hardware ignores the contents after the last non-zero byte. Trailing zero is allowed and handled correctly in both CABAC and CAVLC modes.

2 — 31:29 — Reserved

Format:	MBZ

2 — 28:0 — Indirect BSD Data Start Address

Format:	U29

This field specifies the Graphics Memory starting address of the data to be fetched into BSD Unit for processing. This pointer is relative to the **MFD Indirect Object Base Address**. Hardware ignores this field if indirect data is not present. It is a byte-aligned address for the AVC bitstream data in both CABAC/CAVLD Modes. In implementing a phantom slice at the end of a picture for automatic error concealment, this field should set to 0. It includes the NAL Header (the NAL Header does not need to perform EMU detection). For AVC Base Layer, it is a single byte. But for MVC, the NAL Header is 4 Bytes long. These NAL Header Unit must be passed to HW in the compressed bitstream buffer.

Value	Name
[0,512MB)	

3..5 — 31:0 — Inline Data

All the required Slice Header parameters and error handling settings are captured as InLine Data of the AVC_BSD_OBJECT command. It has a fixed size of 4 DWs. Its definition is described in the follwoing section: Inline Data Description.

6 — 31:13 — Reserved

Format:	MBZ

6 — 12:9 — Reserved

6 — 8 — AVC Nal Type First Byte Override Bit

Format:	U1

This bit indicates hardware should use the NAL Type (provided below) programmed by driver instead of using the one from bitstream. The NAL byte from bitstream will not be correct.

Value	Name	Description
0	Use Bitstream Decoded NAL Type	NAL Type should come from the first byte of Decoded Bitstream
1	Use Driver Programmed NAL Type	NAL Type should come from "Driver Provided Nal Type" programmed by driver.

MFD_AVC_BSD_OBJECT		
	7:0	**Driver Provided Nal Type Value** Format: U8 This will replace the first byte of the NAL unit, containing forbidden_zero_bit, nal_ref_idc, and nal_unit_type. **Programming Notes** This byte should be ignored if "AVC NAL Type First Byte Override Bit" is programmed to 0

MFD_AVC_DPB_STATE

MFD_AVC_DPB_STATE

Source: VideoCS

Length Bias: 2

This is a frame level state command used only in DXVA2 AVC Short Slice Bitstream Format VLD mode.
RefFrameList[16] of DXVA2 interface is replaced with intel Reference Picture Addresses[16] of MFX_PIPE_BUF_ADDR_STATE command. The LongTerm Picture flag indicator of all reference pictures are collected into LongTermPic_Flag[16].
FieldOrderCntList[16][2] and CurrFieldOrderCnt[2] of DXVA2 interface are replaced with intel POCList[34] of MFX_AVC_DIRECTMODE_STATE command.

MFD_AVC_SLICEADDR

MFD_AVC_SLICEADDR

Source: VideoCS

Length Bias: 2

This is a Slice level command used only for DXVA2 AVC Short Slice Bitstream Format VLD mode.When decoding a slice, H/W needs to know the last MB of the slice has reached in order to start decoding the next slice. It also needs to know if a slice is terminated but the last MB has not reached, error conealment should be invoked to generate those missing MBs. For AVC DXVA2 Short Format, the only way to know the last MB position of the current slice, H/W needs to snoop into the next slice's start MB address (a linear address encoded in the Slice Header). Since each BSD Object command can have only one indirect bitstream buffer address, this command is added to help H/W to snoop into the next slice's slice header and retrieve its Start MB Address. This command will take the next slice's bitstream buffer address as input (exactly the same way as a BSD Object command), and parse only the first_mb_in_slice syntax element. The result will stored inside the H/W, and will be used to decode the current slice specified in the BSD Object command.Only the very first few bytes (max 5 bytes for a max 4K picture) of the Slice Header will be decoded, the rest of the bitstream are don't care. This is because the first_mb_in_slice is encoded in Exponential Golomb, and will take 33 bits to represent the max 256 x 256 = 64K-1 value. The indirect data of MFD_AVC_SLICEADDR is a valid BSD object and is decoded as in BSD OBJECT command.The next Slice Start MB Address is also exposed to the MMIO interface.The Slice Start MB Address (first_mb_in_slice) is a linear MB address count; but it is translated into the corresponding 2D MB X and Y raster position, and are stored internally as NextSliceMbY and NextSliceMbX.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFD_AVC_ SLICEADDR Format: OpCode

	29:27	**Scan Components** Bit0: Y Bit1: U Bit2: V For example, if non-interleaved Y, then it will be set to 001b. If interleaved Y, U, and V, it will be set to 111b.
	26	**Reserved** Format: MBZ
	25:0	**MCU Count** Format: U26 This field indicates the number of MCUs in the Scan.
5	31:16	**Reserved** Format: MBZ

MFD_JPEG_BSD_OBJECT		
	15:0	**RestartInterval(16 bit)** Format: U16 Specifies the number of MCU in restart interval. Valid values are 1->0xFFFFValue of 0 implies that all the SCAN have only one ECS.

MFD_MPEG2_BSD_OBJECT

MFD_MPEG2_BSD_OBJECT

Source: VideoCS

Length Bias: 2

Different from AVC and VC1, MFD_MPEG2_BSD_OBJECT command is pipelinable. This is for performance purpose as in MPEG2 a slice is defined as a group of MBs of any size that must be within a macroblock row.Slice header parameters are passed in as inline data and the bitstream data for the slice is passed in as indirect data. Of the inline data, slice_horizontal_position and slice_vertical_position determines the location within the destination picture of the first macroblock in the slice. The content in this command is identical to that in the MEDIA_OBJECT command in VLD mode described in the Media Chapter.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFD_MPEG2_BSD_OBJECT Format: OpCode
	26:24	**Media Command Opcode** Default Value: 3h MPEG2_DEC Format: OpCode
	23:21	**SubOpcode A** Default Value: 1h Format: OpCode
	20:16	**SubOpcode B** Default Value: 8h Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 0003h Excludes DWord (0,1) Format: =n Total Length - 2

MFD_MPEG2_BSD_OBJECT

1	31:0	**Indirect BSD Data Length** Format: U32 It is the length in bytes of the bitstream data for the current slice. It includes the first byte of the first macroblock and the last non-zero byte of the last macroblock in the slice. Specifically, the zero-padding bytes (if present) and the next start-code are excluded. This field is sized to support beyond MPEG-2 MP@HL bitstream (<4K). According to Table 8-6 of ISO/IEC 13818-2, the maximum number of bits per macroblock for 4:2:0 is 4608. So the maximum slice size for 4K x 4K is 4608 * 256 / 8 = 147,456 bytes (0x24000), which requires 18 bits. **Programming Notes** As MPEG-2 spec does not post any limitation of the size of zero-padding bytes, it is possible to have a slice data with large length (including zero-padding bytes). As the data beyond 0x10E00 would only be zero bytes for a valid slice data zero-padding restriction is removed
2	31:29	**Reserved** Format: MBZ
	28:0	**Indirect Data Start Address** Format: IndirectObjectOffset[28:0] This field specifies the Graphics Memory starting address of the data to be fetched into BSD Unit for processing. This pointer is relative to the BSD Indirect Object Base Address.Hardware ignores this field if indirect data is not present. It is a byte-aligned address for the MPEG2 VLD bitstream data This address points to the first byte of the MB layer data, i.e. not including slice header.
3..4	31:0	**Inline Data** All the required Slice Header parameters and error handling settings are captured as MPEG2_BSD_OBJECT Inline Data Descriptor structures. It has a fixed size of 2 DWs. Its definition is described in the next section.

MFD_VC1_BSD_OBJECT

MFD_VC1_BSD_OBJECT

Source: VideoCS

Length Bias: 2

The MFD_VC1_BSD_OBJECT command is the only primitive command for the VC1 Decoding Pipeline. The macroblock data portion of the bitstream is loaded as indirect data object.Before issuing a MFD_VC1_BSD_OBJECT command, all VC1 states of the MFD Engine need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of a MFD_VC1_BSD_OBJECT command.VC1 deblock filter kernel cross the slice boundary if in the last MB row of a slice, so need to know the last MB row of a slice to disable the edge mask. There is why VC1 BSD hardware need to know the end of MB address for the current slice. As such no more phantom slice is needed for VC1, as long as the driver will program both start MB address in the current slice and the start MB address of the next slice. As a result, we can also support multiple picture state commands in between slices.

	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 0003h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:24	**Reserved** Format: MBZ

MFD_VC1_BSD_OBJECT

	23:0	**Indirect BSD Data Length** Format: U24 This field provides the length in bytes of the indirect data. A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect Data Start Address field is ignored. This field must have the same alignment as the Indirect Object Data Start Address.GEN6 Long Format : It is the length in bytes of the bitstream data for the current slice/picture. It includes the first byte of the first macroblock and the last byte of the last macroblock in the slice/picture. Specifically, the zero-padding bytes (if present) and the next start-code are excluded. Hardware ignores the contents after the last non-zero byte (trailing zeros). This field is sized to support VC1 AP@L4 Level bitstream. It includes the byte that contains the First MB Bit OffsetGEN7 Short Format : It is the length in bytes of the bitstream data for the current slice, including Picture/Slice Header + Emulation Prevention Bytes + any filling trailing zeros after the last MB. Hardware ignores the contents after the last non-zero byte. Trailing zero is allowed and handled correctly.
2	31:29	**Reserved** Format: MBZ
	28:0	**Indirect Data Start Address** Format: IndirectObjectOffset[28:0] This field specifies the Graphics Memory starting address of the data to be fetched into BSD Unit for processing. This pointer is relative to the MFD Indirect Object Base Address.Hardware ignores this field if indirect data is not present. It is a byte-aligned address for the VC1 bitstream data. Value: [0,512MB) — Name:
3	31:24	**Reserved** Format: MBZ
	23:16	**Slice Start Vertical Position** This field specifies the position in y-direction of the first macroblock in the Slice in unit of macroblocks. For SecondField this value is reset to zero as oppoed to the VC1 spec Ref: 9.1.2 Slice Layer.This field is for both Long and Short VC1 Interface Format.
	15:9	**Reserved** Format: MBZ
	8:0	**Next Slice Vertical Position** This field specifies the position in y-direction of the first macroblock in the next Slice in unit of macroblocks.This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set to the height of picture (since y-direction is zero-based numbering)This field is maintained and provided by the driver for both Long and Short VC1 Interface Format.
4	31:16	**First_MB_Byte_Offset of Slice Data or Slice Header** For DXVA2 VC1 Short Format onlyIt gives the byte offset to locate the first MB data in the bitstream for a slice, relative to the Indirect BSD Data Start Address.

MFD_VC1_BSD_OBJECT

	15:5	**Reserved** Format: MBZ
	4	**Emulation Prevention Byte Present** 0h: H/W needs to perform Emulation Byte Removal 1h: H/W does not need to perform Emulation Byte Removal
	3	**Reserved** Format: MBZ
	2:0	**FirstMbBitOffset (First Macroblock Bit Offset)** Format: U3 This field provides the bit offset of the first macroblock of the Slice in the first byte of the input compressed bitstream.It is used with First_MB_Byte_Offset for non-byte aligned position.

MFD_VC1_LONG_PIC_STATE

MFD_VC1_LONG_PIC_STATE

Source: VideoCS

Length Bias: 2

MFX_VC1_LONG PIC_STATE command encapsulates the decoding parameters that are read or derived from bitstream syntax elements above (inclusive) picture header layer. These parameters are static for a picture and when slice structure is present, these parameters are not changed from slice to slice of the same picture. Hence, this command is only issued at the beginning of processing a new picture and prior to the VC1_*_OBJECT command. The values set for these state variables are retained internally across slices.Only the parameters needed by hardware (BSD unit) to decode bit sequence for the macroblocks in a picture layer or a slice layer are presented in this command. Other parameters such as the ones used for inverse transform or motion compensation are provided in MFX_VC1_PRED_PIPE_STATE command.This Long interface format is intel proprietary interface. Driver will need to perform addition operations to generate all the fields in this command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFD_VC1_LONG_PIC_STATE Format: OpCode
	26:24	**Media Command Opcode** Default Value: 2h VC1_DEC Format: OpCode
	23:21	**SubOpcode A** Default Value: 1h Format: OpCode
	20:16	**SubOpcode B** Default Value: 1h Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 0004h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:24	**Reserved** Format: MBZ

MFD_VC1_LONG_PIC_STATE

	23:16	**PictureHeightInMBsMinus1 (Picture Height Minus 1 in Macroblocks)** Format: U8 This field indicates the height of the picture in unit of macroblocks. For example, for a 1920x1080 frame picture, PictureHeightInMBs equals 68 (1080 divided by 16, and rounded up, i.e. effectively specified as 1088 instead).This field is used in VLD and IT modes. **Programming Notes** Note: Even though the Advanced Profile allows frame dimensions (width, height) to not be aligned to macroblock boudary, it doesn't affect the bitstream decoding. And it is preferable to use 'intermediate buffer' that is macroblock aligned for decoding. In order to simplify the out-of-bound reference pixel access, the out-of-bound extrapolation rule in VC1 spec can be used to expand the expected decoded frame to the intermediate buffer dimension.
	15:8	**Reserved** Format: MBZ
	7:0	**PictureWidthInMBsMinus1 (Picture Width Minus 1 in Macroblocks)** Format: U8-1 This field indicates the width of the picture in unit of macroblocks. For example, for a 1920x1080 frame picture, PictureWidthInMBs equals 120 (1920 divided by 16).This field is used in VLD and IT modes
2	31:24	**Bitplane Buffer Pitch Minus 1** Format: U7-1 Pitch in (Bytes - 1). Specifies the bitplane buffer pitch in (#Bytes - 1). Bitplane buffer is a linear buffer. It is needed only when the bitplane is not encoded as raw, and therefore is present in the header explicitly. In VC1 Long Format (Gen6 and Gen7), it is written by an application and later read by the HW. But in VC1 Short Format (Gen7 only), it is written and read by H/W only.This field is specified for better performance **Value** / **Name** [0, FFFFFFFFh] / **Programming Notes** For Gen6 : The pitch must be equal to PictureWidthInMBs/2.For Gen7 VC1 Long Format : The pitch must be equal to PictureWidthInMBs/2.For Gen7 VC1 Short Format : If Pic Width is less than or equal to 2K pixels, bitplane pitch is set to 64 (one cacheline; programmed as 63) bytes per MB row. If Pic Width is greater than 2K pixels, bitplane pitch is set to 128 (two cachelines; programmed as 127) bytes per MB row.This field is not used in IT mode, used in VLD mode only.For VC1 DXVA2 Short Format, the bitplane specification is between H/W and Driver only. For Long Format, application is responsible for allocation with the driver.
	23:16	**Reserved** Format: MBZ

MFD_VC1_LONG_PIC_STATE

	15	**DmvSurfaceValid** Indicated when the DMV read surface is valid. This surface stored the direct motion vectors and Mb type.This field is set for B pictures that can refer to a previous P picture for DMV. If there is an I-picture before a B (in decoding order) then this field is not set (as a result, zero's DMV's will be assumed while decoding the B picture. That is, there is no explicit DMV buffer for an I-picture).Whne the current picture being decoded is an I, P or BI, this bit is set to 0, since there is no DMV read in these picture decoding process.This field is not used in IT mode, used in VLD mode only.
	14	**ImplicitQuantizer** Derived by driver from QUANTIZER.This field is used in intel VC1 VLD Long Format only, not used in IT and DXVA2 VC1.This bit is set to 1 when syntax element QUANTIZER=0, else its set to 0
	13	**Interpolation Rounder Contro** Used only in MC operation. This field specifies the rounding control value used in interpolation operation of motion prediction process.This field is used in VLD and IT modes. **Programming Notes** This bit field is taken from bRcontrol in DXVA_PictureParameters data structure
	12	**SyncMarker** Indicates whether sync markers are enabled/disabled. If enable, sync markers "may be" present in the current video sequence being decoded. It is a sequence level syntax element and is valid only for Simple and Main Profiles. **Value** / **Name** / **Description** 0h / Not Present / Sync Marker is not present in the bitstream 1h / Maybe present / Sync Marker maybe present in the bitstream **Programming Notes** This field is only valid in VLD mode.For Simple Profile, SyncMarker must set to 0.For Main Profile, SyncMarker can be set to 0 or 1.This field is used in both intel and MS DXVA2 VLD interface, but not used in IT mode.
	11:8	**Motion Vector Mode** This field indicates one of the following motion compensation interpolation modes for P and B pictures. The MC interpolation modes apply to prediction values of luminance blocks and are always in quarter-sample. For chrominance blocks, it always performs bilinear interpolation with either half-pel or quarter-pel precision.Before the polarity of Chroma Half-pel or Q-pel is reversed from DXVA2 Spec, now I have fixed it to match with DXVA2 VC1 Spec. **Value** / **Name** / **Description** 0XX0b / / Chroma Quarter -pel + Luma bicubic. (can only be 1MV) 0XX1b / / Chroma Half-pel + Luma bicubic. (can be 1MV or 4MV) 1XX0b / / Chroma Quarter -pel + Luma bilinear. (can only be 1MV) 1XX1b / / Chroma Half-pel + Luma bilinear

MFD_VC1_LONG_PIC_STATE

Programming Notes
Bits 11:8 are taken from bMVprecisionAndChromaRelation in DXVA_PictureParameters data structure.Bit 11 of Motion Vector Mode = 1 for Luma Bilinear MC; = 0 for Luma Bicubic MCBit 8 of Motion Vector Mode = 1 for half-sample Chroma motion = 0 for quarter-sample Chroma motion.This field is used in both VLD and IT modes.

7 **RangeReductionScale**

This field specifies whether the reference picture pixel values should be scaled up or scaled down on-the-fly, if RangeReduction is Enabled.

Value	Name	Description
0h		Scale down reference picture by factor of 2
1h		Scale up reference picture by factor of 2

Programming Notes
This bit is derived by driver for Main Profile only. Ignored in Simple and Advanced Profiles. This field is used in both VLD and IT modes.This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture. RANGERED is the same as (bPicOverflowBlocks » 3) & 1. RANGEREDFRM is the same as (bPicDeblocked » 5) & 1. For the current picture is a B picture, this field represents the state of the forward/preceding reference picture onlyDriver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

6 **RangeReduction Enable**

This field specifies whether on-the-fly pixel value range reduction should be performed for the preceding (or forward) reference picture. Along with RangeReductionScale to specify whether scale up or down should be performed. It is not the same value as RANGEREDFRM Syntax Element (DXVA_PictureParameters bPicDeblocked bit 5) in the Picture Header.

Value	Name	Description
0h	Disable	Range reduction is not performed
1h	Enable	Range reduction is performed

Programming Notes
This field is for Main Profile only. Simple Profile is always disable, and not applicable to Advanced Profile. This field is used in both VLD and IT modes.This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture.RANGERED is the same as (bPicOverflowBlocks » 3) & 1. RANGEREDFRM is the same as (bPicDeblocked » 5) & 1.For the current picture is a B picture, this field represents the state of the forward/preceding reference picture onlyDriver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

MFD_VC1_LONG_PIC_STATE

	5	**LOOPFILTER Enable Flag** This filed is the decoded syntax element LOOPFILTER in bitstream. It indicates if In-loop Deblocking is ON according to picture level bitstream syntax control. This bit affects BSD unit and also the loop filter unit.When this bit is set to 1, PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command must also be set to 1. In this case, in-loop deblocking operation follows the VC1 standard - deblocking doesn't cross slice boundary.When this bit is set to 0, but PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command is set to 1. It indicates the loop filter unit is used for out-of-loop deblocking. In this case, deblocking operation does cross slice boundary.This field is used in VLD mode only, not in IT mode.

Value	Name	Description
0h	Disable	Disables loop filter
1h	Enable	Enables loop filter

	4	**Overlap Smoothing Enable Flag** This field is the decoded syntax element OVERLAP in bitstreamIndicates if Overlap smoothing is ON at the picture levelThis field is used in both VLD and IT modes.

Value	Name	Description
0h	Disable	to disable overlap smoothing filter
1h	Enable	to enable overlap smoothing filter

	3	**Secondfield** This flag is set for the second field in field pictures.This field is used in both VLD and IT modes.
	2:1	**Reserved**

Format:	MBZ

	0	**VC1 Profile** specifies the bitstream profile.This field is used in both VLD and IT modes.

Value	Name	Description
0h	Disable	current picture is in Simple or Main Profile (No need to distinguish Simple and Main Profile)
1h	Enable	current picture is in Advanced Profile

Programming Notes
This is required because 128 is added for intra blocks post inverse transform in advanced profile and also to find out if Motion vectors are adjusted or not.

3	31	**Reserved**

Format:	MBZ

	30:29	**CondOver** This field is the decoded syntax element CONDOVER in a bitstream of advanced profile. It controls the overlap smoothing filter operation for an I frame or an BI frame when the picture level qualization step size PQUANT is 8 or lower.This field is used in intel VC1 VLD mode only, not in DXVA2 VC1 and IT modes.

Value	Name	Description

MFD_VC1_LONG_PIC_STATE

00b		No overlap smoothing
01b		Reserved
10b		Always perform overlap smoothing filter
11b		Overlap smoothing on a per macroblock basis based on OVERFLAGS

28:26 **PicType (Picture Type)**

This field specifies the coding type of the picture according to the Frame Coding Mode. When FCM = 00 | 01 (a Progressive or Interlaced Frame Picture):000 = I001 = P010 = B011 = BI100 = SkippedOther encodings are reservedWhen FCM = 10 | 11 (a Field Picture)000 = I/I001 = I/P010 = P/I011 = P/P100 = B/B101 = B/BI110 = BI/B111 = BI/BIAlthough, for a field picture, it is set for a field-pair, but HW will only look at one field state only, and the other field state is don't care. This field is read and qualified with the SecondField flag internally.This field is unique to intel VC1 VLD Long format, and is used in IT mode as well. For DXVA2 VC1 IT mode, driver needs to convert the DXVA2 interface to intel HW VLD Long Format interface.

25:24 **FCM (Frame Coding Mode)**

This is the same as the variable FCM defined in VC1.This field must be set to 0 for Simple and Main ProfilesThis field is unique to intel VC1 VLD Long format, and is used in IT mode as well. For DXVA2 VC1 IT mode, driver needs to convert the DXVA2 interface to intel HW VLD Long Format interface.

Value	Name	Description
00b	Disable	Progressive Frame Picture
01b	Enable	Interlaced Frame Picture
10b		Field Picture with Top Field First
11b		Field Picture with Bottom Field First

23:21 **Reserved**

Format:	MBZ

20:16 **AltPQuant (Alternative Picture Quantization Value)**

This field is identical to the variable ALTPQUANT which is derived from VOPDQUANT configuration in the VC1 standard.This field must be set to 0 for Simple/Main I and BI pictures as VOPDQUANT is not present.This field is used in intel VC1 VLD Long Format mode only, not used in DXVA2 VC1 VLD and IT modes.

15:13 **Reserved**

Format:	MBZ

12:8 **PQuant (Picture Quantization Value)**

Format:	U5

This is the same as the calculated variable PQUANT in VC1 standard where PQuant = PQINDEX, except when QUANTIZER = 0 and PQINDEX > 8, it is given asPQuant = (PQINDEX < 29) ? PQINDEX - 3 : PQINDEX*2 - 31This field is used in all picture types (I, P, B and BI) and all operating modes (IT mode and intel and DXVA2 VLD modes).

MFD_VC1_LONG_PIC_STATE

	7:0	**BScaleFactor** BScaleFactorThis field is the scale factor for computing Direct-mode motion vectors. It is derived from the variable BFRACTION in the VC1 standard, section 8.4.5.4.There are only 21 valid values corresponding to the 21 encodings of BFRACTION as shown in the table here. Other values are reserved.MSB of this field can be used to determine if BFRACTION is greater than or equal to 1/2, which is used to determine Motion Prediction Type for B pictures. Effectively, condition "BFRACTION >= 1/2" is equivalent to condition "BScaleFactor >= 128".This field is only valid for B pictures. This field is used only in intel VC1 VLD Long format mode, it is not used in DXVA2 VC1 VLD and IT modes.BFRACTION VLCBFRACTIONBScaleFactor0001/21280011/3850102/31700111/4641003/41921011/5511102/510211100003/515311100014/520411100101/64311100115/621511101001/73711101012/77411101103/711111101114/714811110005/718511110016/722211110101/83211110113/89611111005/816011111017/8224
4	31:30	**Reserved** Format: MBZ
	29:28	**UnifiedMvMode (Unified Motion Vector Mode)** This field is a combination of the variables MVMODE and MVMODE2 in the VC1 standard, for parsing Luma MVD from the bitstream. This field is used to signal 1MV vs 4MVallowed (Mixed Mode). This field is also used to signal Q-pel or Half-pel MVD read from the bitstream. The bicubic or bilinear Luma MC interpolation mode is duplicate information from Motion Vector Mode field, and is ignored here.This field is used in intel VC1 VLD Long Format mode only, it is not used in DXVA2 VC1 VLD and IT modes.

Value	Name	Description
00b		Mixed MV, Q-pel bicubic
01b		1-MV, Q-pel bicubic
10b		1-MV half-pel bicubic
11b		1-MV half-pel bilinear

	27	**FourMvSwitch (Four Motion Vector Switch)** This field indicates if 4-MV is present for an interlaced frame P picture. It is identical to the variable 4MVSWITCH (4 Motion Vector Switch) in VC1 standard.This field is used in intel VC1 VLD Long Format mode only, it is not used in DXVA2 VC1 VLD and IT modes.

Value	Name	Description
0h	Disable	only 1-MV
1h	Enable	1, 2, or 4 MVs

	26	**FastUVMCFlag (Fast UV Motion Compensation Flag)** This field specifies whether the motion vectors for UV is rounded to half or full pel position. It is identical to the variable FASTUVMC in VC1 standard.This field is used in both VLD and IT modes.It is derived from FASTUVMC = (bPicSpatialResid8 » 4) & 1 in both VLD and IT modes, and should have the same value as Motion Vector Mode LSBit.

Value	Name	Description
0h		no rounding

MFD_VC1_LONG_PIC_STATE

1h		quarter-pel offsets to half/full pel positions

25 RefFieldPicPolarity (Reference Field Picture Polarity)

This field specifies the polarity of the one reference field picture used for a field P picture. It is derived from the variable REFFIELD defined in VC1 standard and is only valid when one field is referenced (NUMREF = 0) for a field P picture.When NUMREF = 0 and REFFIELD = 0, this field is the polarity of the reference I/P field that is temporally closest; When NUMREF = 0 and REFFIELD = 1, this field is the polarity of the reference I/P field that is the second most temporally closest. The distance is measured based on display order but ignoring the repeated field if present (due to RFF = 1).This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		Top (even) field
1h		Bottom (odd) field

24 NumRef (Number of References)

This field indicates how many reference fields are referenced by the current (field) picture. It is identical to the variable NUMREF in the VC1 standard. This field is only valid for field P picture (FCM = 10 | 11).This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		One field referenced
1h		Two fields referenced

23:20 BwdRefDist (Reference Distance)

This field is valid only in B field pictures giving the value of BRFD. The field is ignored in P Picture.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

19:16 FwdRefDist (Reference Distance)

Format:	U4

This field is the number of frames between the current frame and its reference frame. It is derived from the syntax element REFDIST (P Reference Distance) in the VC1 standard. 0 means that the previous frame is the reference frame.It has the same value as of FRFD for both P and B field pictures.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name
[0, 15]	

15:12 Reserved

Format:	MBZ

11:10 ExtendedDMVRange (Extended Differential Motion Vector Range Flag)

This field specifies the differential motion vector range in interlaced pictures. It is equivalent to the variable DMVRANGE in the VC1 standard. This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

MFD_VC1_LONG_PIC_STATE

Value	Name	Description
00b		No extended range
01b		Extended horizontally
10b		Extended vertically
11b		Extended in both directions

9:8 **ExtendedMVRange (Extended Motion Vector Range Flag)**

This field specifies the motion vector range in quarter-pel or half-pel modes. It is equivalent to the variable MVRANGE in the VC1 standard. This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes

Value	Name	Description
00b		[-256, 255] x [-128, 127]
01b		512, 511] x [-256, 255]
10b		[-2048, 2047] x [-1024, 1023]
11b		[-4096, 4095] x [-2048, 2047]

7:4 **AltPQuantEdgeMask (Alternative Picture Quantization Edge Mask)**

This field is a bit mask for the four edges in clock-wise order, indicating whether AltPQuant is used for the edge macroblocks.It is derived based on the following variables DQUANT, DQUANTFRM, DQPROFILE, DQSBEDGE, DQDBEDGE, and DQBILEVEL defined in the VC1 standard, as shown in Error! Reference source not found..This field is valid only if AltPQuantConfig is 01. Bit 0: Left picture edge macroblocksBit 1: Top picture edge macroblocksBit 2: Right picture edge macroblocksBit 3: Bottom picture edge macroblocksThis field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

3:2 **AltPQuantConfig (Alternative Picture Quantization Configuration)**

This field specifies the way AltPQuant is used in the picture. It determines how to compute the macroblock quantizer step size, MQUANT. It is derived based on the following variables DQUANT, DQUANTFRM, DQPROFILE, DQSBEDGE, DQDBEDGE, and DQBILEVEL defined in the VC1 standard, as shown in Error! Reference source not found..This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
00b		AltPQuant not used
01b		AltPQuant is used and applied to edge macroblocks only
10b		MQUANT is encoded in macroblock layer
11b		AltPQuant and PQuant are selected on macroblock basis

1 **HalfQP**

This field is used for inverse quantization of AC coefficients. It is valid only when PQuant is used.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

0 **PQuantUniform**

Indicating if uniform quantization applies to the picture. It is used for inverse quantization of the AC coefficients.QUANTIZER 001123PQUANTIZER - -01--PQINDEX>=9<=8----

MFD_VC1_LONG_PIC_STATE

PQuantUniform010201ImplicitQuantizer = 0, and PQuantUniform = 0 is used to represent 2 cases : 1) QUANTIZER=01 and PQUANTIZER=0; and 2) QUANTIZER = 10b.ImplicitQuantizer = 0, and PQuantUniform = 1 is used to represent 2 cases : 1) QUANTIZER=01 and PQUANTIZER=1; and 2) QUANTIZER = 11bThis field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		Non-uniform
1h		Uniform

5 | 31 **BitplanePresentFlag (Bitplane Buffer Present Flag)**

This field indicates whether the bitplane buffer is present for the picture. If set, at least one of the fields listed in bits 22:16 is coded in non-raw mode, and Bitplane Buffer Base Address field in the VC1_BSD_BUF_BASE_STATE command points to the bitplane buffer. Otherwise, all the fields that are applicable for the current picture in bits 22:16 must be coded in raw mode.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		bitplane buffer is not present
1h		bitplane buffer is present

30 **ForwardMbRaw**

This field indicates whether the FORWARDMB field is coded in raw or non-raw mode.This field is only valid when PictureType is B.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		non-raw mode
1h		raw mode

29 **MvTypeMbRaw**

This field indicates whether the MVTYPREMB field is coded in raw or non-raw mode.This field is only valid when PictureType is P.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		Non-Raw Mode
1h		Raw Mode

28 **SkipMbRaw**

This field indicates whether the SKIPMB field is coded in raw or non-raw mode.This field is only valid when PictureType is P or B.0 = non-raw mode1 = raw modeThis field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h	Disable	Non-Raw Mode
1h	Enable	Raw Mode

MFD_VC1_LONG_PIC_STATE

	27	**DirectMbRaw** This field indicates whether the DIRECTMB field is coded in raw or non-raw mode.This field is only valid when PictureType is P or B.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		Non-Raw Mode
1h		Raw Mode

	26	**OverflagsRaw** This field indicates whether the OVERFLAGS field is coded in raw or non-raw mode.This field is only valid when PictureType is I or BI.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		Non-Raw Mode
1h		Raw Mode

	25	**AcPredRaw** This field indicates whether the ACPRED field is coded in raw or non-raw mode.This field is only valid when PictureType is I or BI.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h	Disable	Non-Raw Mode
1h	Enable	Raw Mode

	24	**FieldTxRaw** This field indicates whether the FIELDTX field is coded in raw or non-raw mode.This field is only valid when PictureType is I or BI.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h	Disable	Non-Raw Mode
1h	Enable	Raw Mode

	23	**Reserved**

Format:	MBZ

	22:20	**MvTab (Motion Vector Table)**

Format:	U3

This field specifies which motion vector table(s) is (are) used for motion vector (differential) decoding in a P or B picture. This field is the combination of the variables MVTAB and IMVTAB in the VC1 standard. Two bits are defined for progressive frame pictures; And two or three bits are defined for interlaced field/frame pictures depending on NUMREF and P or B picture types.This field is valid for P and B pictures. It is not valid for I pictures.For P or B progressive frame pictures0 = Motion Vector Differential VLD Table 01 = Motion Vector Differential VLD Table 12 = Motion Vector Differential VLD Table 23 = Motion Vector Differential VLD Table 3The other encodings are reservedFor P interlace field pictures with NUMREF = 0 or P/B interlace frame

MFD_VC1_LONG_PIC_STATE

		pictures0 = 1-Reference Table 01 = 1-Reference Table 12 = 1-Reference Table 23 = 1-Reference Table 3The other encodings are reservedFor P interlace field picture with NUMREF = 1 or B interlaced field pictures0 = 2-Reference Table 01 = 2-Reference Table 12 = 2-Reference Table 23 = 2-Reference Table 34 = 2-Reference Table 45 = 2-Reference Table 56 = 2-Reference Table 67 = 2-Reference Table 7The other encodings are reservedThis field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.
	19:18	**FourMvBpTab (4-MV Block Pattern Table)** This field specifies which table is used to decode the 4-MV block pattern (4MVBP) syntax element in 4-MV macroblocks. It is identical to the variables 4MVBPTAB in the VC1 standard, section 9.1.1.37. This field is valid only in interlace frame P, B pictures, or interlace field P, B pictures. It is not valid for I picture.For interlace field P and B pictures, it is only valid if UnifiedMvMode is equal to Mixed-MV Type. For interlace frame P picture, it is only valid if FourMvSwitch is 1.For interlace frame B picture, it is always valid.0 = 4MVBP Table 01 = 4MVBP Table 12 = 4MVBP Table 23 = 4MVBP Table 3This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.
	17:16	**TwoMvBpTab (2MV Block Pattern Table)** This field specifies which table is used to decode the 2MV block pattern (2MVBP) syntax element in 2MV field macroblocks. It is identical to the variables 2MVBPTAB in the VC1 standard, section 9.1.1.36. This field is valid only in interlace frame P/B pictures. It is not valid for I picture, nor for interlace field P or B pictures.0 = 2MVBP Table 01 = 2MVBP Table 12 = 2MVBP Table 23 = 2MVBP Table 3This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.
	15:14	**Reserved** Format: MBZ
	13:12	**TransType (Picture-level Transform Type)** Format: U2 This field specifies the Transform Type at picture level. It is identical to the variable TTFRM in the VC1 standard, section 7.1.1.41.This field is only valid when TransTypeMbFlag is 1. Otherwise, it is reserved and MBZ.This field is set to 00 when VSTRANSFORM is 0 in the entry point layer.00 = 8x8 Transform01 = 8x4 Transform10 = 4x8 Transform11 = 4x4 TransformThis field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.
	11	**TransTypeMbFlag (Macroblock Transform Type Flag)** This field indicates whether Transform Type is fixed at picture level or variable at macroblock level. It is identical to the variable TTMBF in the VC1 standard, section 7.1.1.40.This field is set to 1 when VSTRANSFORM is 0 in the entry point layer.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		variable transform type in macroblock layer
1h		use picture level transform type TransType

MFD_VC1_LONG_PIC_STATE

	10:8	**MbModeTab (Macroblock Mode Table)** This field signals which code table is used to decode the macroblock mode syntax element (MBMODE) in the macroblock layer in a P or B picture. This field is identical to the variables MBMODETAB in the VC1 standard, section 9.1.1.33. This field is valid for interlace frame P, B picture and interlace field P, B picture. It is not valid for I picture, nor progressive frame P, B pictures.Two bits are defined for interlace frame P, B pictures; And three bits are defined for interlaced field P, B pictures.Two bits are defined for interlace frame P, B pictures. There are two set of code tables selected based on if UnifiedMvMode is equal to 4-MV Type or not. 0 = Code Table 01 = Code Table 12 = Code Table 23 = Code Table 3Other encodings are invalidThree bits are defined for interlace field P, B pictures. There are two set of code tables selected based on if UnifiedMvMode is equal to Mixed-MV Type or not. 0 = Code Table 01 = Code Table 12 = Code Table 23 = Code Table 34 = Code Table 45 = Code Table 56 = Code Table 67 = Code Table 7This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.
	7:6	**TransAcY (Picture-level Transform Luma AC Coding Set Index, TRANSACTABLE2** BitFieldDesc
	5:4	**TransAcUV (Picture-level Transform Chroma AC Coding Set Index, TRANSACTABLE)** This field, together with PQINDEX, specifies which intra AC coding set to be used for decoding the non-zero AC coefficients in a coded luma (Y) block. This field is the combination of the variables TRANSACFRM and TRANSACFRM2 in the VC1 standard.For I pictures, TransAcY is the same as TRANSACFRM2. For other pictures, it is the same as TRANSACFRM, and therefore must be programmed to be the same as TransAcUV. This field is valid for all picture types.0 = Coding set index 01 = Coding set index 12 = Coding set index 23 is invalidThis field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.
	3	**TransDcTab (Intra Transform DC Table)** This field specifies whether the low motion tables or the high motion tables are used to decode the Transform DC coefficients in intra-coded blocks. This field is identical to the variable TRANSDCTAB in the VC1 standard, section 8.1.1.2.This field is valid for all picture types.This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.
	2:0	**CbpTab (Coded Block Pattern Table)** This field specifies the table used to decode the CBPCY syntax element for each coded macroblock in P and B pictures. This field is combination of the variable CBPTAB for P and B frame pictures and the variable ICBPTAB in interlace field P, B pictures and interlace frame P, B pictures in the VC1 standard (Table 52 and Table 102).This field is reserved and MBZ for I or BI pictures as I only has a fixed table.000 = Table 0 (Table 169 for P, B frames or Table 124 otherwise)001 = Table 1 (Table 170 for P, B frames or Table 125 otherwise)010 = Table 2 (Table 171 for P, B frames or Table 126 otherwise)011 = Table 3 (Table 172 for P, B frames or Table 127 otherwise)100 = Table 4 (Table 128 for interlace field/frame P, B pictures)101 = Table 5 (Table 129 for interlace field/frame P, B pictures)110 = Table 6 (Table 130 for interlace field/frame P, B pictures)111 = Table 7 (Table 131 for interlace field/frame P, B pictures)This field is unique to intel VC1 VLD Long format mode, and is not used in IT and DXVA2 VC1 modes.

Value	Name	Description
0h		The high motion tables
1h		The low motion tables

MFD_VC1_SHORT_PIC_STATE

MFD_VC1_SHORT_PIC_STATE

Source: VideoCS
Length Bias: 2

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFD_VC1_SHORT_PIC_STATE Format: OpCode
	26:24	**Media Command Opcode** Default Value: 2h VC1_DEC Format: OpCode
	23:21	**SubOpcode A** Default Value: 1h Format: OpCode
	20:16	**SubOpcode B** Default Value: 0h Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 0003h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:24	**Reserved** Format: MBZ
	23:16	**Picture Height** Format: U8-1 Picture Height in Macroblocks This field indicates the height of the picture in unit of macroblocks. For example, for a 1920x1080 frame picture, PictureHeightInMBs equals 68 (1080 divided by 16, and rounded up, i.e. effectively specified as 1088 instead).This field is used in VLD and IT modes.Note: Even though the Advanced Profile allows frame dimensions (width, height) to not be aligned to macroblock boudary, it doesn't affect the bitstream decoding. And it is preferable to use 'intermediate buffer' that is macroblock aligned for decoding. In order to simplify the out-of-bound reference pixel access, the out-of-bound extrapolation rule in VC1 spec can be used to expand the expected decoded frame to the intermediate buffer dimension.

MFD_VC1_SHORT_PIC_STATE

	15:8	**Reserved** Format: MBZ
	7:0	**Picture Width** Format: U8-1 Picture Width in Macroblocks This field indicates the width of the picture in unit of macroblocks. For example, for a 1920x1080 frame picture, PictureWidthInMBs equals 120 (1920 divided by 16).This field is used in VLD and IT modes.
2	31:24	**Bitplane Buffer Pitch Minus 1** Format: U7-1 Pitch in Bytes Specifies the bitplane buffer pitch in (#Bytes - 1). Bitplane buffer is a linear buffer. It is needed only when the bitplane is not encoded as raw, and therefore is present in the header explicitly. In VC1 Long Format (Gen6 and Gen7), it is written by an application and later read by the HW. In VC1 Long Format (Gen6 and Gen7), it is written by an application, and later read by the HW. But in VC1 Short Format (Gen7 only), it is written and read by H/W only.This field is specified for better performanceFor Gen6 : The pitch must be equal to PictureWidthInMBs/2.For Gen7 VC1 Long Format : The pitch must be equal to PictureWidthInMBs/2.For Gen7 VC1 Short Format : If Pic Width is less than or equal to 2K pixels, bitplane pitch is set to 64 (one cacheline; programmed as 63) bytes per MB row. If Pic Width is greater than 2K pixels, bitplane pitch is set to 128 (two cachelines; programmed as 127) bytes per MB row.This field is not used in IT mode, used in VLD mode only.For VC1 DXVA2 Short Format, the bitplane specification is between H/W and Driver only. For Long Format, application is responsible for allocation with the driver.
	23	**Interpolation Rounder Control** Used only in MC operation. This field specifies the rounding control value used in interpolation operation of motion prediction process. Note: This bit field is taken from bRcontrol in DXVA_PictureParameters data structure This field is used in VLD and IT modes.
	22:20	**Reserved** Format: MBZ
	19:16	**Motion Vector Mode** This field indicates one of the following motion compensation interpolation modes for P and B pictures. The MC interpolation modes apply to prediction values of luminance blocks and are always in quarter-sample. For chrominance blocks, it always performs bilinear interpolation with either half-pel or quarter-pel precision.0XX0 = Chroma Quarter -pel + Luma bicubic. (can only be 1MV)0XX1 = Chroma Half-pel + Luma bicubic. (can be 1MV or 4MV)1XX0 = Chroma Quarter -pel + Luma bilinear. (can only be 1MV)1XX1 = Chroma Half-pel + Luma bilinearNote: Bits 19:16 are taken from bMVprecisionAndChromaRelation in DXVA_PictureParameters data structure.Bit 19 of Motion Vector Mode = 1 for Luma Bilinear MC; = 0 for Luma Bicubic MCBit 16 of Motion Vector Mode = 1 for half-sample Chroma motion = 0 for quarter-sample Chroma motion.This field is used in both VLD and IT modes.Before the polarity of Chroma Half-pel or Q-pel is reversed from DXVA2 Spec, now I have fixed it to match with DXVA2 VC1 Spec. ???

MFD_VC1_SHORT_PIC_STATE

	15	**DmvSurfaceValid** Indicated when the DMV read surface is valid. This surface stored the direct motion vectors. This field is set fo B pictures that can refer to a previous P picture for DMV. If there is an I-picture before a B (in decoding order) then this field is not set (as a result, zero's DMV's will be assumed while decoding the B picture. That is, there is no explicit DMV buffer for an I-picture). This field is not used in IT mode, used in VLD mode only.
	14:12	**Reserved** Format: MBZ
	11	**VC1 Profile** specifies the bitstream profile. Note: This is required because 128 is added for intra blocks post inverse transform in advanced profile and also to find out if Motion vectors are adjusted or not. This field is used in both VLD and IT modes. Value / Name / Description 0h / **[Default]** / current picture is in Simple or Main Profile (No need to distinguish Simple and Main Profile) 1h / / current picture is in Advanced Profile
	10:6	**Reserved** Format: MBZ
	5	**Backward Prediction Present Flag** Note : a B picture that only uses forward prediction may have this flag set to 1 as well. Driver may still need to provide a valid reference picture index. This field is used in both DXVA2 VC1 VLD mode and IT mode. It is the same parameter as bPicBackwardPrediction in DXVA2 VC1 spec. The Intra Picture Flag, Backward Prediction Present Flag and RefPicFlag are used to derive the picture type, as specified in PTYPE for a frame, and in FPTYPE for a field, in DXVA2 VC1 VLD and IT mode.
	4	**Intra Picture Flag** This field is used in both DXVA2 VC1 VLD mode and IT mode. It is the same parameter as bPicIntra in DXVA2 VC1 spec. The Intra Picture Flag, Backward Prediction Present Flag and RefPicFlag are used to derive the picture type, as specified in PTYPE for a frame, and in FPTYPE for a field, in DXVA2 VC1 VLD and IT mode. Value / Name / Description 0h / / entire picture can have a mixture of intra and inter MB type or just inter MB type. 1h / / entire picture is coded in intra MB type
	3	**SecondField** This flag is set for the second field in field pictures.This field is used in both VLD and IT modes.

MFD_VC1_SHORT_PIC_STATE

	2	**Reserved** Format: MBZ
	1:0	**Picture Structure** This field is used in both DXVA2 VC1 VLD mode and IT mode. It is the same parameter as bPicStructure in DXVA2 VC1 spec. The Picture Structure and Progressive Pic Type are used to derive the picture structure as specified in FCM, in DXVA2 VC1 VLD and IT mode. **Value** / **Name** / **Description** 01b / / top field (bit 0) 10b / / bottom field (bit 1) 11b / / frame (both fields are present) 00b / / illegal
3	31	**Reserved** Format: MBZ
	30	**Overlap Smoothing Enable Flag** This field is the decoded syntax element OVERLAP in bitstreamIndicates if Overlap smoothing is ON at the picture levelThis field is used in both VLD and IT modes **Value** / **Name** / **Description** 0h / Disable / to disable overlap smoothing filter 1h / Enable / to enable overlap smoothing filter
	29	**Range Reduction Scale** Access: None This field specifies whether the reference picture pixel values should be scaled up or scaled down on-the-fly, if RangeReduction is Enabled.NOTE: This bit is derived by driver for Main Profile only. Ignored in Simple and Advanced Profiles. This field is used in both VLD and IT modes.This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture. RANGERED is the same as (bPicOverflowBlocks » 3) & 1. RANGEREDFRM is the same as (bPicDeblocked » 5) & 1. For the current picture is a B picture, this field represents the state of the forward/preceding reference picture onlyDriver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent. **Value** / **Name** / **Description** 0h / Disable **[Default]** / Scale down reference picture by factor of 2 1h / Enable / Scale up reference picture by factor of 2
	28	**Range Reduction Enable** This field specifies whether on-the-fly pixel value range reduction should be performed for the preceding (or forward) reference picture. Along with RangeReductionScale to specify whether scale up or down should be performed. It is not the same value as RANGEREDFRM Syntax Element (DXVA_PictureParameters bPicDeblocked bit 5) in the Picture Header.This field is for

MFD_VC1_SHORT_PIC_STATE

Main Profile only. Simple Profile is always disable, and not applicable to Advanced Profile. This field is used in both VLD and IT modes.This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture.RANGERED is the same as (bPicOverflowBlocks » 3) & 1. RANGEREDFRM is the same as (bPicDeblocked » 5) & 1.For the current picture is a B picture, this field represents the state of the forward/preceding reference picture onlyDriver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

Value	Name	Description
0h	Disable **[Default]**	Range reduction is not performed
1h	Enable	Range reduction is performed

27:24 **Reserved**

Format:	MBZ

23:22 **Progressive Pic Type**

This field is used in both DXVA2 VC1 VLD mode and IT mode. It is the same parameter as bPicExtrapolation in DXVA2 VC1 spec.The Picture Structure and Progressive Pic Type are used to derive the picture structure as specified in FCM, in DXVA2 VC1 VLD and IT mode.

Value	Name	Description
0		progressive only picture
1		progressive only picture
2		interlace picture (frame-interlace or field-interlace)
3		illegal

21 **Reserved**

Format:	MBZ

20:16 **P-Pic Ref Distance**

Access:	None

This element defines the number of frames between the current frame and the reference frame. It is the same as the REFDIST SE in VC1 interlaced field picture header. It is present if the entry-level flag REFDIST_FLAG == 1, and if the picture type is not one of the following types: B/B, B/BI, BI/B, BI/BI. If the entry level flag REFDIST_FLAG == 0, REFDIST shall be set to the default value of 0.This field is used in DXVA2 VC1 VLD mode only, not used in IT and intel VC1 VLD Long Format modes.

Value	Name
0-16	unsigned integer
0h	**[Default]**

MFD_VC1_SHORT_PIC_STATE

15:14 QUANTIZER

Value	Name	Description
00b		implicit quantizer at frame leve
01b		explicit quantizer at frame level, and use PQUANTIZER SE to specify uniform or non-uniform
10b		explicit quantizer, and non-uniform quantizer for all frames
11b		explicit quantizer, and uniform quantizer for all frames

13 MULTIRES Present Flag (for Simple/Main Profile only)

Value	Name	Description
0h		RESPIC Parameter is present in the picture header
1h		RESPIC Parameter is present in the picture header

12 SYNCMARKER Present Flag (for Simple/Main Profile only)

Value	Name	Description
0		Bitstream for Simple and Main Profile has no sync marker
1		Bitstream for Simple and Main Profile may have sync marker(s)

11 RANGERED Present Flag (for Simple/Main Profile only)

It is needed for Picture Header Parsing.Driver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

Value	Name	Description
0		Range Reduction Parameter (RANGEREDFRM) is not present in the picture header
1		Range Reduction Parameter (RANGEREDFRM) is present in the picture header.

10:8 MAXBFRAMES

Number of consecutive B Frames.

7 PANSCAN Present Flag

Value	Name	Description
0		Pan Scan Parameters are not present in the picture header
1		Pan Scan Parameters are present in the picture header

6 REFDIST_FLAG

For header parsing REFDIST.This is used in DXVA2 VC1 VLD mode only, not used in IT and intel VC1 VLD modes.

5 LOOPFILTER Enable Flag

This filed is the decoded syntax element LOOPFILTER in bitstream. It indicates if In-loop Deblocking is ON according to picture level bitstream syntax control. This bit affects BSD unit and also the loop filter unit.When this bit is set to 1, PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command must also be set to 1. In this case, in-loop deblocking

MFD_VC1_SHORT_PIC_STATE

operation follows the VC1 standard - deblocking doesn't cross slice boundary.When this bit is set to 0, but PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command is set to 1. It indicates the loop filter unit is used for out-of-loop deblocking. In this case, deblocking operation does cross slice boundary.This field is used in VLD mode only, not in IT mode.

Value	Name	Description
0		In-Loop-Deblocking-Filter is disabled
1		In-Loop-Deblocking-Filter is enabled

4

FastUVMCFlag (Fast UV Motion Compensation Flag)

This field specifies whether the motion vectors for UV is rounded to half or full pel position. It is identical to the variable FASTUVMC in VC1 standard.This field is used in both VLD and IT modes.It is derived from FASTUVMC = (bPicSpatialResid8 » 4) & 1 in both VLD and IT modes, and should have the same value as Motion Vector Mode LSBit.

Value	Name	Description
0h		no rounding
1h		quarter-pel offsets to half/full pel positions

3

EXTENDED_MV Present Flag

BitFieldDesc

Value	Name	Description
0h		Extended_MV is not present in the picture header
1h		Extended_MV is present in the picture header

2:1

DQUANT

Access:	None
Format:	U2

Use for Picture Header Parsing of VOPDUANT elements

Value	Name	Description
0h	**[Default]**	
00b		no VOPDQUANT elements; Quantizer cannot vary in frame, same quantization step size PQUANT is used for all MBs in the frame
01b		refer to VC1 Spec. for all the MB position dependent quantizer selection
10b		The macroblocks located on the picture edge boundary shall be quantized with ALTPQUANT while the rest of the macroblocks shall be quantized with PQUANT.
11b	Reserved

MFD_VP8_BSD_OBJECT

MFD_VP8_BSD_OBJECT

Source: VideoCS

Length Bias: 2

The MFD_VP8_BSD_OBJECT command is the only primitive command for the VP8 Decoding Pipeline. The Partitions of the bitstream is loaded as indirect data object.

Before issuing a MFD_VP8_BSD_OBJECT command, all VP8 frame level states of the MFD Engine need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of a MFD_VP8_BSD_OBJECT command.

Context switch interrupt is not supported by this command.

DWord	Bit	Description

MFX_AVC_DIRECTMODE_STATE

		buffer of the associated reference picture in decoding subsequent B-pictures that have MB coded in direct mode. It is a private buffer used by the MPR hardware only. Itscontent is not accessed by software. This buffer must be 64-byte cacheline aligned. The write buffer size is 557,056 bytes for 1 frame. Scalable with frame height, but do not scale with frame width as the hardware assumes frame width (in MBs) fixed at 128 (smallest power of 2 value larger than 120 - 1920x1088 screen resolution) It is only valid if the current picture is a progressive frame, MbAff frame, or a top field. There are a total of 32 reference picture (previously decoded) Direct MV Buffers (0 to 31, not including the DMV write buffer 32 and 33 of the current picture) to read in the corresponding collocated DMV and motion information. For reference picture, these 32 DMV read Buffers can be indexed by the frame_store_ID[4:0], which is obtained from RefPicList L0/L1[RefPicIdx]. frame_Store_IDbit[0] (indicator for Top/Bottiom Field). For writing out motion information during the decoding of the current picture, all 34 DMV buffers can be addressed by [img_dec_fs_idc[4:0]«1 + img_structure[1]].
	5:0	**Reserved** Format: MBZ
3..32	63:6	**Direct MV Buffer Base Address for Reference Frame 1 to 15 (In Frame)** Format: GraphicsAddress63-6 This field is for the Pre-Deblocking Destination Address, and provides the base address of the DMV buffer for reference frames 2 to 31. They are needed if the current B-Picture has MBs coded in direct mode. This is a private buffer used by the MPR hardware only. Its content is not accessed by software. All these buffers must be 64-byte cacheline aligned. There are a total of 32 possible Direct MV Read Buffers (not including the current write buffer of the current picture) to read in the corresponding DMV. Each read buffer size is 557,056 bytes for 1 frame (the selected colPic). Scalable with frame height, but do not scale with frame width as the hardware assumes frame width (in MBs) fixed at 128 (smallest power of 2 value larger than 120 - 1920x1088 screen resolution). The adjacent DMV buffers are paired ([2 and 3], [4 and 5], [N and N+1], ..[30 and 31]). This field is changed to one per frame: both top and bottom field share the same Direct MV Buffer Base Address. **Programming Notes** This field is ignored if PreDeblockOutEnable is set to 0 (disable).
	5:0	**Reserved** Format: MBZ
33	31:15	**Reserved** Format: MBZ
	14:13	**Direct MV Buffer Base Address for Reference Frame - Tiled Resource Mode** **For Media Surfaces:** This field specifies the tiled resource mode.

Value	Name	Description
0h	TRMODE_NONE	No tiled resource
1h	TRMODE_TILEYF	4KB tiled resources
2h	TRMODE_TILEYS	64KB tiled resources

10 Direct MV Buffer Base Address for Reference Frame - Memory Compression Mode

Distinguishes Vertical from Horizontal compression. Please refer to vol1a Memory Data Formats chapter -section Media Memory Compression for more details.

Note: This bit is not used unless Memory Compression Enable is set to "1"

Note: This is a READ Surface. The setting of this bit should match the settings on how this is written out before.

Value	Name
0	Horizontal Compression Mode
1	Vertical Compression Mode

9 Direct MV Buffer Base Address for Reference Frame - Memory Compression Enable

Value	Name
0	Compression Disable

Programming Notes
This surface is linear surface. This bit must be set to "0" since only TileY/TileYf/TileYs surface is allowed to be compressed

8:7 Direct MV Buffer Base Address for Reference Frame - Arbitration Priority Control

Format:	U2

This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.

Value	Name
00b	Highest priority
01b	Second highest priority
10b	Third highest priority
11b	Lowest priority

6:1 Direct MV Buffer Base Address for Reference Frame - Index to Memory Object Control State (MOCS) Tables

Format:	U6

The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers.

The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.

0 Reserved

MFX_AVC_DIRECTMODE_STATE

34..35	63:6	**Direct MV Buffer Base Address for Write (Write-Only Buffer)(in frame)** Format: GraphicsAddress63-6 This field provides the base address of the DMV write-only buffer for the current decoding frame/field. It is a private buffer used by the MPR hardware only. Its content is not accessed by software. All these buffers must be 64-byte cacheline aligned, i.e. the same as the above DMV read/write buffers. These 2 buffers can only be addressed by [img_dec_fs_idc[4:0]«1 + img_structure[1]] for the current picture being decoded. Each write buffer size is 557,056 bytes for 1 frame (the selected colPic). Scalable with frame height, but do not scale with frame width as the hardware assumes frame width (in MBs) fixed at 128 (smallest power of 2 value larger than 120 - 1920x1088 screen resolution). DMV write buffer 32 is valid only if the current picture is a progressive frame, MbAff frame, or a top field. DMV write buffer 33 is valid only if the current picture is a bottom field. GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and MBZ. Some GraphicsAddress fields only specify the upper address bits. For example, GraphicsAddress[47:12] is a 4KB page address.
	5:0	**Reserved** Format: MBZ
36	31:15	**Reserved** Format: MBZ
	14:13	**Direct MV Buffer Base Address for Write - Tiled Resource Mode** **For Media Surfaces:** This field specifies the tiled resource mode.

	0	**Reserved**
37..70	31:0	**POC List, POCList[34][31:0]** Each POC value is a signed 32-bit number. One-to-one correspondence with the 34 Direct MV Buffer Address for Reference and Currrent Frames/Fields There are 34 POC entries in the list. For reference picture, only the lower 32 POC [0-31] entries can be used, and POCList[ ] is indexed by the frame_store_ID[4:0], which is obtained from RefPicList L0/L1[RefPicIdx]. frame_Store_IDbit[0] (indicator for Top/Bottiom Field). For current picture, all 34 POC entries [0-33] can be addressed by POCList[img_dec_fs_idc[4:0]«1 + img_structure[1]]. For frame-only mode, every other entry is skipped. For MBAFF and field-only picture, each entry is a field POC, and every two entries are paired.

MFX_AVC_IMG_STATE

MFX_AVC_IMG_STATE

Source: VideoCS

Length Bias: 2

This must be the very first command to issue after the surface state, the pipe select and base address setting commands. This command supports both Long and Short VLD and IT DXVA2 AVC Decoding Interface.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFX_AVC_IMG_STATE Format: OpCode
	26:24	**Media Command Opcode** Default Value: 1h AVC_COMMON Format: OpCode
	23:21	**SubOpcode A** Default Value: 0h Format: OpCode
	20:16	**SubOpcode B** Default Value: 0h Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 0Ch Excludes DWord (0,1) Format: =n 00Eh, used for normal decode and encode mode000h, a special case to provide a dummy image state for stitch mode operation. In this case, fields in DW1 which is part of the dummy image state command are ignored by hardware.
1	31:16	**Reserved** Format: MBZ

MFX_AVC_IMG_STATE

	15:0	**Frame Size** Format: U16 in MB unit This field is only valid for encoder. Its ignored for decoder.The value for FrameSizeInMBs must match the product of FrameWidthInMBs and FrameHeightInMBs. For encode mode if frame size is 4Kx4K, then we need to specify 65535 in this field as we dont have enough bits to specify 65536. This is used only for cabac zero work insertion when in encode mode. Value: [1,65535] — Name: — Description: representing Number of MBs [1,65535]
2	31:24	**Reserved** Format: MBZ (bit[31:24] must be zero to match the DXVA 16-bit definition for FrameHeightInMBsMinus1)
	23:16	**Frame Height** Format: U8-1 in MB unit It is set to the value of (FrameHeightInMBsMinus1+ 1). Since the max value for FrameHeightInMBs is 255, the max allowed value for FrameHeightInMBsMinus1 is only 254. The min value for FrameHeightInMBs is 1.Although the max. value that can be specified for FrameHeightInMBs is 255 (in the current implementation), FrameWidthInMBs * FrameHeightInMBs must not exceed the max value of FrameSizeInMBs[14:0].e.g. for 1920x1080, FrameHeightInMBs[7:0] is equal to 68 (1080 divided by 16, and rounded up, i.e. effectively specified as 1088 instead).It is derived from FrameHeightInMbs = (2 - frame_mbs_only_flag) * PicHeightInMapUnits and PicHeightInMbs = FrameHeightInMbs / (1 + field_pic_flag) internally done. For MBAFF, PicHeightInMapUnits is in MB pair unit, so the bitstream sends only half frame height. Value: [0,255] — Name: — Description: representing height [1,256]
	15:8	**Reserved** Format: MBZ (bit[15:8] must be zero to match the DXVA 16-bit definition for FrameWidthInMBsMinus1)
	7:0	**Frame Width** Format: U8-1 in MB unit It is set to the value of (FrameWidthInMBsMinus1+ 1). Since the max value for FrameWidthInMBs is 255, the max allowed value for FrameWidthInMBsMinus1 is only 254. The min value for FrameWidthInMBs is 1.Although the max. value that can be specified for FrameWidthInMBs is 255 (in the current implementation), FrameWidthInMBs * FrameWidthInMBs must not exceed the max value of FrameSizeInMBs[14:0].e.g. for 1920x1080, FrameHeightInMBs[7:0] is equal to 68 (1080 divided by 16, and rounded up, i.e. effectively specified as 1088 instead).It is derived from FrameWidthInMbs = (2 - frame_mbs_only_flag) * PicWidthInMapUnits and

MFX_AVC_IMG_STATE

PicWidthInMbs = FrameWidthInMbs / (1 + field_pic_flag) internally done. For MBAFF, PicWidthInMapUnits is in MB pair unit, so the bitstream sends only half frame width.

Value	Name	Description
[0,255]		representing width [1,256]

3 — 31:29 Reserved

Format:	MBZ

(bit[31:29] must be zero to match the DXVA2 8-bit definition for InitQpChroma[1])

28:24 Second Chroma QP Offset

Signed integer value. It should be in the range of -12 to +12 (according to AVC spec).It specifies the offset for determining QP Cr from QP Y. It is set to the upper 5 bits of the value of the syntax element (Chroma_qp_offset[9:0]) read from the current active PPS.Chroma_qp_offset [4:0] - chroma_qp_offset_bits (from the current active PPS)Chroma_qp_offset [9:5] - second_chroma_qp_offset_bits

23:21 Reserved

Format:	MBZ

(bit[23:21] must be zero to match the DXVA2 8-bit definition for InitQpChroma[1])

20:16 First Chroma QP Offset

Signed integer value. It should be in the range of -12 to +12 (according to AVC spec).It specifies the offset for determining QP Cb from QP Y. It is set to the lower 5 bits of the value of the syntax element (Chroma_qp_offset[9:0]) read from the current active PPS.Chroma_qp_offset [4:0] - chroma_qp_offset_bits (from the current active PPS)Chroma_qp_offset [9:5] - second_chroma_qp_offset_bits

15:14 Reserved

Format:	MBZ

13 RhoDomain Rate Control Enable

Format:	Enable

This field indicates if RhoDomain related parameters are present in the MFX_AVC_IMAGE_STATE. (AverageMacroblockQP). It enables the Rho Domain statistics collection.

Value	Name	Description
0	Disable	RhoDomain rate control parameters are not present in MFX_AVC_IMAGE_STATE
1	Enable	RhoDomain rate control parameters are present in MFX_AVC_IMAGE_STATE.

Programming Notes
This field must set to '0' for B pictures.

12 Weighted_Pred_Flag

Format:	Enable

(This field is defined differently from Gen6, Gen7 follows strictly DXVA2 AVC interface.)

MFX_AVC_IMG_STATE

Value	Name	Description
0	Disable **[Default]**	specifies that weighted prediction is not used for P and SP slices
1	Enable	specifies that weighted prediction is used for P and SP slices

Programming Notes
This field must set to '0' for B and I pictures.

11:10 **Weighted_BiPred_Idc**

(This field follows strictly DXVA2 AVC interface.)

Value	Name	Description
0	DEFAULT **[Default]**	Specifies that the default weighted prediction is used for B slices
1	EXPLICIT	Specifies that explicit weighted prediction is used for B slices
2	IMPLICIT	Specifies that implicit weighted prediction is used for B slices.
3	Reserved	Illegal value

Programming Notes
This field must set to 0 for P and I pictures.

9:8 **ImgStruct - Image Structure, img_structure[1:0]**

The current encoding picture structure can only takes on 3 possible values

Value	Name
00b	Frame Picture
01b	Top Field Picture
11b	Bottom Field Picture
10b	Invalid, not allowed.

Programming Notes
img_structure[0] can be used as a flag to distinguish between frame and field structure. It must be consistent with the field_pic_flag setting in the Slice Header.This parameter is specified for Intel interface only, not present in the DXVA as a separate state (instead the img_structure[1] is embedded inside the DXVA picture definition).

7:0 **Reserved**

Format:	MBZ

4 31:16 **MinFrameWSize**

Default Value:	0h
Format:	U16

MFX_AVC_IMG_STATE

Minimum Frame Size [15:0] (in Word, 16-bit)(Encoder Only) Mininum Frame Size is specified to compensate for intel Rate Control Currently zero fill (no need to perform emulation byte insertion) is done only to the end of the CABAC_ZERO_WORD insertion (if any) at the last slice of a picture. Intel encoder parameter, not part of DXVA. The caller should always make sure that the value, represented by Mininum Frame Size, is always less than maximum frame size **FrameBitRateMax (DWORD 10 bits** 29:16).This field is reserved in Decode mode.
The programmable range 0...2^18-1
When MinFrameWSizeUnits is 00.
Programmable range is 0...2^20-1 when MinFrameWSizeUnits is 01.
Programmable range is 0...2^26-1 when MinFrameWSizeUnits is 10.
Programmable range is 0...2^32-1 when MinFrameWSizeUnits is 11.

15 **MbStatEnabled**

Format:	Enable

Enable reading in MB status buffer (a.k.a. encoding stream-out buffer) Note: For multi-pass encoder, all passes except the first one need to set this value to 1. By setting the first pass to 0, it does save some memory bandwidth.

Value	Name	Description
0	Disable	Disable Reading of Macroblock Status Buffer
1	Enable	Enable Reading of Macroblock Status Buffer

14 **LoadSlicePointerFlag**

Format:	Enable

LoadBitStreamPointerPerSlice (Encoder-only)To support multiple slice picture and additional header/data insertion before and after an encoded slice.When this field is set to 0, bitstream pointer is only loaded once for the first slice of a frame. For subsequent slices in the frame, bitstream data are stitched together to form a single output data stream.When this field is set to 1, bitstream pointer is loaded for each slice of a frame. Basically bitstream data for different slices of a frame will be written to different memory locations.

Value	Name	Description
0	Disable	Load BitStream Pointer only once for the first slice of a frame
1	Enable	Load/reload BitStream Pointer only once for the each slice, reload the start location of the bitstream buffer from the Indirect PAK-BSE Object Data Start Address field

13 **Reserved**

12 **MvUnpackedFlag**
MVUnPackedEnable (Encoder Only)This field is reserved in Decode mode.

Value	Name	Description
0	PACKED	use packed MV format (compliant to DXVA)
1	UNPACKED	use unpacked 8MV/32MV format only

MFX_AVC_IMG_STATE

11:10 **ChromaFormatIdc**

Chroma Format IDC, ChromaFormatIdc[1:0]It specifies the sampling of chroma component (Cb, Cr) in the current picture as follows :

Value	Name	Description
00b	monochrome picture	Desc
01b	4:2:0 picture	Desc
10b	4:2:2 picture (not supported)	
11b	4:4:4 picture (not supported)	

Programming Notes
It is set to the value of the syntax element read from the current active SPS.The corresponding Monochrome Flag (monochrome_flag) can be derived from this field.

9 **Reserved**

Format:	MBZ

8 **MbMvFormatFlag**

Use MB level MvFormat flag (Encoder Only)

Value	Name	Description
0	IGNORE	HW PAK ignore MvFormat in the MB data. When bit 12 == 0, all MBs use packed MV formatWhen bit 12 == 1, each MB data must use unpacked MV format, 8MV when there is no minor MV involved, and 32MV if there are some minor MVs.
1	FOLLOW	HW PAK will follow MvFormat value set within each MB data.

Programming Notes
They must take one of the two values: the 8MV unpacked format (MvFormat =101b), and the 32MV unpacked format (MvFormat =110b).This bit can be set only when MvUnpackedFlag (bit 12 of this register) is set otherwise system could hang.

7 **EntropyCodingFlag**

Entropy Coding Flag, entropy_coding_flag

Value	Name	Description
0	CAVLC bit-serial encoding mode	Desc
1	CABAC bit-serial encoding mode.	Desc

Programming Notes
It specifies one of the two possible bit stream encoding modes in the AVC. It is set to the value of the syntax element read from the current active PPS.

MFX_AVC_IMG_STATE

6 **ImgDisposableFlag**

Current Img Disposable Flag or Non-Reference Picture Flag

Value	Name	Description
0	REFERENCE	the current decoding picture may be used as a reference picture for others
1	DISPOSABLE	the current decoding picture is not used as a reference picture (e.g. a B-picture cannot be a reference picture for any subsequent decoding)

Programming Notes
It is derived from ImgDisposableFlag = (nal_ref_idc == 0). nal_ref_idc is a syntax element from a NAL unit. When this flag is set, no reference picture and DMV are written out.This field is only valid for VLD decoding mode.

5 **ConstrainedIPredFlag**

Constrained Intra Prediction Flag, constrained_ipred_flagIt is set to the value of the syntax element in the current active PPS.

Value	Name	Description
0	INTRA_AND_INTER	allows both intra and inter neighboring MB to be used in the intra-prediction encoding of the current MB.
1	INTRA_ONLY	allows only to use neighboring Intra MBs in the intra-prediction encoding of the current MB. If the neighbor is an inter MB, it is considered as not available.

4 **Direct8x8InfFlag**

Direct 8x8 Inference Flag, direct_8x8_inference_flagIt is set to the value of the syntax element in the current active SPS.It specifies the derivation process for luma motion vectors in the Direct MV coding modes (B_Skip, B_Direct_16x16 and B_Direct_8x8). When frame_mbs_only_flag is equal to 0, direct_8x8_inference_flag shall be equal to 1.It must be consistent with the frame_mbs_only_flag and transform_8x8_mode_flag settings.

Value	Name	Description
0	SUBBLOCK	allows subpartitioning to go below 8x8 block size (i.e. 4x4, 8x4 or 4x8)
1	BLOCK	allows processing only at 8x8 block size. MB Info is stored for 8x8 block size.

3 **Transform8x8Flag**

8x8 IDCT Transform Mode Flag, trans8x8_mode_flagSpecifies 8x8 IDCT transform may be used in this pictureIt is set to the value of the syntax element in the current active PPS.

Value	Name	Description
0	4x4	no 8x8 IDCT Transform, only 4x4 IDCT transform blocks are present
1	8x8	8x8 Transform is allowed

MFX_AVC_IMG_STATE

	2	**FrameMbOnlyFlag** Frame MB only flag, frame_mbs_only_flagIt is set to the value of the syntax element in the current active SPS. **Value** / **Name** / **Description** 0 / FALSE / not true ; effectively enables the possibility of MBAFF mode. 1 / TRUE / true, only frame MBs can occur in this sequence, hence disallows the MBAFF mode and field picture.
	1	**MbaffFlameFlag** MBAFF mode is active, mbaff_frame_flag.It is derived from MbaffFrameFlag = (mb_adaptive_frame_field_flag && ! field_pic_flag). mb_adaptive_frame_field_flag is a syntax element in the current active SPS and field_pic_flag is a syntax element in the current Slice Header. They both are present only if frame_mbs_only_flag is 0. Although mbaff_frame_flag is a Slice Header parameter, its value is expected to be the same for all the slices of a picture.It must be consistent with the mb_adaptive_frame_field_flag, the field_pic_flag and the frame_mbs_only_flag settings.This bit is valid only when the img_structure[1:0] indicates the current picture is a frame. **Value** / **Name** / **Description** 0 / FALSE / not in MBAFF mode 1 / TRUE / in MBAFF mode
	0	**FieldPicFlag** Field picture flag, field_pic_flag, specifies the current slice is a coded field or not.It is set to the same value as the syntax element in the Slice Header. It must be consistent with the img_structure[1:0] and the frame_mbs_only_flag settings.Although field_pic_flag is a Slice Header parameter, its value is expected to be the same for all the slices of a picture. **Value** / **Name** / **Description** 0h / FRAME / a slice of a coded frame 1h / FIELD / a slice of a coded field
5 [ExistsIf]Encode Only	31	**Trellis Quantization Enabled (TQEnb)** Format: / Enable The TQ improves output video quality of AVC CABAC encoder by selecting quantized values for each non-zero coefficient so as to minimize the total R-D cost.This flag is only valid AVC CABAC mode. Otherwise, this flag should be disabled. **Value** / **Name** / **Description** 0h / Disable / Use Normal 1h / Enable / Use Trellis quantization

MFX_AVC_IMG_STATE

30:28 **Trellis Quantization Rounding (TQR)**

This rounding scheme is only applied to the quantized coefficients ranging from 0 to 1 when TQEnb is set to 1 in AVC CABAC mode. One of the following values is added to quantized coefficients before truncating fractional part.

Value	Name	Description
000b		Add 1/8
001b		Add 2/8
010b		Add 3/8
011b		Add 4/8 (rounding 0.5)
100b		Add 5/8
101b		Add 6/8
110b	Default	Add 7/8 (Default rounding 0.875)

27 **Trellis Quantization Chroma Disable (TQChromaDisable)**

This signal is used to disable chroma TQ. To enable TQ for both luma and chroma, TQEnb=1, TQChromaDisable=0. To enable TQ only for luma, TQEnb=1, TQChromaDisable=1.

Value	Name	Description
0h		Enable Trellis Quantization chroma
1h	Default	Disable Trellis Quantization chroma

26:17 **Reserved**

Format:	MBZ

16 **NonFirstPassFlag**

This signals the current pass is not the first pass. It will imply designate HW behavior: e.g

Value	Name	Description
0h	Disable	Always use the MbQpY from initial PAK inline object for all passes of PAK
1h	Enable	Use MbQpY from stream-out buffer if MbRateCtrlFlag is set to 1

15:13 **Reserved**

Format:	MBZ

12 **Reserved**

Format:	MBZ

11:10 **MinFrameWSizeUnits**

This field is the Minimum Frame Size Units

Value	Name	Description
00b	compatibility mode	Minimum Frame Size is in old mode (words, 2bytes)
01b	16 byte	Minimum Frame Size is in 16bytes
10b	4Kb	Minimum Frame Size is in 4Kbytes

MFX_AVC_IMG_STATE

11b	16Kb	Minimum Frame Size is in 16Kbytes

9 — MbRateCtrlFlag - MB level Rate Control Enabling Flag

MB Rate Control conformance mask

Value	Name	Description
0h	Disable	Apply accumulative delta QP for consecutive passes on top of the macroblock QP values in inline data
1h	Enable	Apply RC QP delta to suggested QP values in Macroblock Status Buffer except the first pass.

Programming Notes
This field is ignored when MacroblockStatEnable is disabled or MB level Rate control flag for the current MB is disable in Macroblock Status Buffer.

8 — Reserved

Format:	MBZ

7 — Intra/InterMbIpcmFlag - ForceIPCMControlMask

This field is to Force **IPCM** for Intra or Inter Macroblock size conformance mask.

Value	Name	Description
0h	Disable	Do not change intra or Inter macroblocks even
1h	Enable	Change intra or Inter macroblocks MB_type to IPCM

Programming Notes
This field is ignored when MacroblockStatEnable is disabled or MB level Intra MB conformance flag for the current MB is disable in Macroblock Status Buffer.

6:4 — Reserved

Format:	MBZ

3 — FrameSzUnderFlag - FrameBitRateMinReportMask

This is a mask bit controlling if the condition of frame level bit count is less than FrameBitRateMin

Value	Name	Description
0h	Disable	Do not update bit0 of MFC_IMAGE_STATUS control register.
1h	Enable	set bit0 and bit 1of MFC_IMAGE_STATUS control register if the total frame level bit counter is less than or equal to Frame Bit rate Minimum limit.

2 — FrameSzOverFlag - FrameBitRateMaxReportMask

This is a mask bit controlling if the condition of frame level bit count exceeds FrameBitRateMax.

Value	Name	Description
0	Disable	Do not update bit0 of MFC_IMAGE_STATUS control register.

MFX_AVC_IMG_STATE

		1 | Enable | Set bit0 and bit 1 of MFC_IMAGE_STATUS control register if the total frame level bit counter is greater than or equal to Frame Bit rate Maximum limit.
	1	**InterMbMaxBitFlag - InterMBMaxSizeReportMask** This is a mask bit controlling if the condition of any inter MB in the frame exceeds InterMBMaxSize. Value | Name | Description 0 | Disable | Do not update bit0 of MFC_IMAGE_STATUS control register. 1 | Enable | Set bit0 of MFC_IMAGE_STATUS control register if the total bit counter for the current MB is greater than the Inter MB Conformance Max size limit.
	0	**IntraMbMaxBitFlag - IntraMBMaxSizeReportMask** This is a mask bit controlling if the condition of any intra MB in the frame exceeds IntraMBMaxSize. Value | Name | Description 0h | Disable | Do not update bit0 of MFC_IMAGE_STATUS control register. 1 | Enable | set bit0 of MFC_IMAGE_STATUS control register if the total bit counter for the current MB is greater than the Intra MB Conformance Max size limit.

MFX_AVC_REF_IDX_STATE

MFX_AVC_REF_IDX_STATE

Source: VideoCS

Length Bias: 2

This is a slice level command and can be issued multiple times within a picture that is comprised of multiple slices. The same command is used for AVC encoder (PAK mode) and decoder (VLD mode); it is not need in decoder IT mode.
The inline data of this command is interpreted differently for encoder as for decoder. For decoder, it is interpreted as RefIdx List L0/L1 as in AVC spec., and it matches with the DXVA2 AVC API data structure for decoder in VLD mode : RefPicList[2][32] (L0:L1, 0:31 RefPic). But for encoder, it is interpreted as a Reference Index Mapping Table for L0 and L1 reference pictures. For packing the bits at the output of PAK, the syntax elements must follow the definition of RefIdxL0/L1 list according to the AVC spec. However, the decoder pipeline was designed to use a variation of that standard definition, as such a conversion (mapping) is needed to support the hardware design.
The Reference lists are needed in processing both P and B slice in AVC codec. For P-MB, only L0 list is used; for B-MB both L0 and L1 lists are needed. For a B-MB that is coded in L1-only Prediction, only L1 list is used.

Programming Notes

DXVA2 specifies that an application will create the RefPicList L0 and L1 and pass onto the driver. The content of each entry of RefPicList L0/L1[ ] is a 7-bit picture index. This picture index is the same as that of RefFrameList[ ] content. This picture index, however, is not defined the same as the frame store ID (0 to 16, 5-bits) we have implemented in H/W. Hence, driver is required to manage a table to convert between DXVA2 picture index and intel frame store ID. As such, the final RefPicList L0/L1[ ] that the driver passes onto the H/W is not the same as that defined in the DXVA2.

	11:0	**DWord Length** Default Value: 0008h Format: =n Excludes DWords 0,1
1	31:1	**Reserved** Format: MBZ
	0	**RefPicList Select** Num_ref_idx_l1_active is resulted from the specifications in both PPS and Slice Header for the current slice. However, since the full reference list L0 and/or L1 are always sent, only present flags are specified instead. This parameter is specified for Intel interface only, not present in the DXVA. **Value** / **Name** / **Description** 0 / RefPicList 0 / The list that followed represents RefList L0 (Decoder VLD mode) or Ref Idx Mapping Table L0 (Encoder PAK mode) 1 / RefPicList1 / The list that followed represents RefList L1 (Decoder VLD mode) or Ref Idx Mapping Table L1 (Encoder PAK mode)
2..9	31:0	**Reference List Entry** This set of fields is always present whenever this command is issued. It always specifies the full 32 reference pictures in the selected list, regardless they are "existing picture" or not. If a picture is non-existing, the corresponding entry should be set to all ones. Each list entry is 1 byte. A 32-bit DW can hold 4 list entries in the following format • 31:24 entry X+3 (e.g. listY_3) • 23:16 entry X+2 (e.g. listY_2) • 15:8 entry X+1 (e.g. listY_1) • 7:0 entry X (e.g. listY_0) X is replaced by the paddr[2:0] * 4 ; paddr[5:0] with 0x20 and 0x27, and Y is replaced by 0 or 1. The byte definition for a reference picture : • Bit 7 : Non-Existing - indicates that frame store index that should have been at this entry did not exist and was replaced by an index 0 (a valid entry) for error concealment • Bit 6 : Long term bit - set this reference picture to be used as long term reference • Bit 5 : Field picture flag - indicates frame/field • Bit 4:0 : Frame store index or Frame Store ID (Bit 4:1 is used to form the binding table index in intel implementation) This is the final Reference List L0 or L1 after any reordering specified in the Slice Header as well as modified by the driver, and its indices values are all translated to the intel specification. If the reference picture is a frame (Bit5 = 1), frame store ID is always an even number.

MFX_AVC_REF_IDX_STATE		
		This list is used in outputting MV information by the BSD unit in VLD mode. DMV access also reads and writes Mvlist0 using this frame store ID. If this set of fields is interpreted as Reference Index Mapping Table L0/L1, the same field alignment is followed, i.e. 4 mapping entries per DW. Each mapping entry is one byte in size, but only the least significant 5 bits [4:0] is relevant. Driver should zero all the upper bits [7:5] for each entry.

MFX_AVC_SLICE_STATE

MFX_AVC_SLICE_STATE

Length Bias: 2

Description

This is a slice level command and can be issued multiple times within a picture that is comprised of multiple slices. The same command is used for AVC encoder (PAK mode) and decoder (VLD and IT modes).

Programming Notes

MFX_AVC_SLICE_STATE command is not issued for AVC DXVA2 Short Format Bitstream decode, instead MFD_AVC_SLICEADDR command is executed to retrieve the next slice MB Start Address X and Y by H/W itself.

DWord	Bit	Description

MFX_AVC_SLICE_STATE

	3:0	**Slice Type** It is set to the value of the syntax element read from the Slice Header. **Value** / **Name** 0000b – P Slice 0001b – B Slice 0010b – I Slice 0011b-1111b – Reserved **Programming Notes** Bits[3:2] must be 0
2	31:30	**Reserved** Format: MBZ
	29:24	**Number of Reference Pictures in Inter-prediction List 1** Format: U6 This field is valid only for encoding a B Slice, for which it is expected to have at least one entry in the reference list L1; otherwise (if Slice Type is not a B Slice), this field must be set to 0. This field can be derived for a B Slice from the Slice Header syntax element NumRefIdxActiveMinus1 as, Num_Ref_Idx_L1 = NumRefIdxActiveMinus1[1] + 1. **Value** / **Name** 0-32
	23:22	**Reserved** Format: MBZ
	21:16	**Number of Reference Pictures in Inter-prediction List 0** Format: U6 This field is valid for encoding a P or B Slice, for which it is expected to have at least one entry in the reference list L0; otherwise (if Slice Type is not a P or B Slice), this field must be set to 0. This field can be derived for a P or B Slice from the Slice Header syntax element NumRefIdxActiveMinus1 as, Num_Ref_Idx_L0 = NumRefIdxActiveMinus1[0] + 1. **Value** / **Name** 0-32
	15:11	**Reserved** Format: MBZ
	10:8	**Log 2 Weight Denom Chroma** Format: U3 **Value** / **Name** 0-7

MFX_AVC_SLICE_STATE

	7:3	**Reserved** Format: MBZ
	2:0	**Log 2 Weight Denom Luma** Format: U3 **Description**: It is the base 2 logarithm of the denominator for all Luma weighting factors. It is set to the value of the syntax element read from the Slice Header Pred_Weight_Table(). Value: 0-7; Name:
3	31:30	**Weighted Prediction Indicator** This field indicates the Weighted Prediction mode for a P or B Slice. It is a combined field corresponding to the syntax element WeightedBiPredIdc or WeightedPredFlag read from the current active PPS. • If it is a B-Slice, these bits are interpreted as: 00b - Specifies the default weighted inter-prediction to be applied 01b - Specifies the explicit weighted inter-prediction to be applied 10b - Specifies the implicit weighted inter-prediction to be applied 11b - Reserved (not allowed) • If it is a P Slice, these bits are interpreted as: 00b - Disables weighted inter-prediction (Default weighted) 01b - Enables weighted inter-prediction (Explicit weighted) 10b - 11b - Reserved **Programming Notes**: Only when in B Slice with Weighted_Pred_Idc = 1 (explicit weighted prediction), will there be a L1 and/or a L0 weight+offset tables being sent to the BSD unit through the Slice_State command. Only when in P Slice with Weighted_Pred_Idc = 1, will there be a L0 weight+offset table being sent to the BSD. If Weighted_Pred_Idc != 1 for B Slice or Weighted_Pred_Idc =0 for P Slice, no Slice_State command should be issued to send these tables. If still being issued, the data is read but ignored. DXVA specifies Weighted_Bipred and Weighted_Pred in frame-level state. However, these two flags are combined and specified in slice level for both P and B slice type.

MFX_AVC_SLICE_STATE

	29	**Direct Prediction Type** Type of direct prediction used for B Slices. This field is valid only for Slice_Type = B Slice; otherwise, it must be set to 0. **Value** / **Name** 0 / Temporal 1 / Spatial
	28:27	**Disable Deblocking Filter Indicator** **Value** / **Name** / **Description** 00b / / FilterInternalEdgesFlag is set equal to 1 01b / / Disable all deblocking operation, no deblocking parameter syntax element is read; filterInternalEdgesFlag is set equal to 0 10b / / Macroblocks in different slices are considered not available; filterInternalEdgesFlag is set equal to 1 11b / Reserved / Not defined in AVC
	26	**Reserved** Format: MBZ
	25:24	**Cabac Init Idc[1:0]** Specifies the index for determining the initialization table used in the context variable initialization process. **Value** / **Name** 0-2 / **Programming Notes** Cabac initialization is also dependent on the field/frame picture type, Slice type, and the current SliceQP value.
	23:22	**Reserved** Format: MBZ
	21:16	**Slice Quantization Parameter** Quantization Parameter for current slice. Derived from PPS and slice_delta_qp syntax element in Slice Header. It is needed for CABAC context initialization and deblocking filter control. And it is also used as the starting QP value in the very first MB of a slice. It is in the range of unsigned integer 0 to 51, for 8-bit pixel bit-depth.
	15:12	**Reserved** Format: MBZ

MFX_AVC_SLICE_STATE

	11:8	**Slice Beta Offset Div2** Format: S3 2's Complement Range: [-6, 6] Inclusive Specifies the offset used in accessing the deblocking filter strength tables.
	7:4	**Reserved** Format: MBZ
	3:0	**Slice Alpha C0 Offset Div2** Format: S3 2's Complement Range: [-6, 6] Inclusive Specifies the offset used in accessing the deblocking filter strength tables.
4	31:24	**Slice Vertical Position** This field specifies the position in y-direction of the first macroblock in the Slice in unit of macroblocks. The fields (Slice_MB_Start_Hor_Pos, Slice_MB_Start_Vert_Pos) are valid in VLD (decoding) mode only. They are ignored by hardware in decoding IT mode and encoding mode (whereas the position is provided by the per-macroblock object command). Derived **Programming Notes** Error Handling: Driver needs to check if FirstMbY starts at 0 on the first slice of frame. If not, driver needs to add a phantom slice with FirstMbX and FirstMbY set to 0.
	23:16	**Slice Horizontal Position** This field specifies the position in x-direction of the first macroblock in the Slice in unit of macroblocks. Derived **Programming Notes** Error Handling: Driver needs to check if FirstMbY starts at 0 on the first slice of frame. If not, driver needs to add a phantom slice with FirstMbX and FirstMbY set to 0.
	15	**Reserved** Format: MBZ
	14:0	**Slice Start Mb Num** Exists If: //Decoder Only The MB number (linear MB address in a picture) at the start of a Slice, it must match with the Slice Horizontal Position (Slice_MB_Start_Hor_Pos) and Vertical Position (Slice_MB_Start_Vert_Pos) in the picture. **Programming Notes** In creating the Phantom Slice for error concealment, this field should set to the total number of MB in the current picture + 1.

MFX_AVC_SLICE_STATE

5	31:24	**Reserved** Format: MBZ
	23:16	**Next Slice Vertical Position** This field specifies the position in y-direction of the first macroblock in the next Slice in unit of macroblocks. This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set to the height of picture (since y-direction is zero-based numbering).
	15:8	**Reserved** Format: MBZ
	7:0	**Next Slice Horizontal Position** This field specifies the position in x-direction of the first macroblock in the next Slice in unit of macroblocks. This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set to 0.
6 Encoder Only	31	**Rate Control Counter Enable** To enable the accumulation of bit allocation for rate control This field enables hardware Rate Control logic. The rest of the RC control fields are only valid when this field is set to 1. Otherwise, hardware ignores these fields.

Value	Name
0	Disable
1	Enable

	30	**ResetRateControlCounter** To reset the bit allocation accumulation counter to 0 to restart the rate control.

Value	Name
0	Not Reset
1	Reset

	29:28	**RC Triggle Mode**

Value	Name	Description
00b	Always Rate Control	Whereas RC becomes active if sum_act > sum_target or sum_act < sum_target
01b	Gentle Rate Control	whereas RC becomes active if sum_act > upper_midpt or sum_act < lower_midpt
10b	Loose Rate Control	whereas RC becomes active if sum_act > sum_max or sum_act < sum_min
11b	Reserved	

MFX_AVC_SLICE_STATE

27:24 **RC Stable Tolerance**

Format:	U4

This field specifies the tolerance required to deactivate RC once it has been triggered.

Value	Name
0-15	

23 **RC Panic Enable**

If this field is set to 1, RC enters panic mode when sum_act > sum_max. RC Panic Type field controls what type of panic behavior is invoked.

Value	Name
0	Disable
1	Enable

22 **RC Panic Type**

This field selects between two RC Panic methods

Value	Name
0	QP Panic
1	CBP Panic

Programming Notes
If it is set to 0, in panic mode, the macroblock QP is maxed out, setting to requested QP + QP_max_pos_mod. If it is set to 1, for an intra macroblock, AC CBPs are set to zero (note that DC CBPs are not modified). For inter macroblocks, AC and DC CBPs are forced to zero.

21 **MB Type Direct Conversion Disable**

Exists If:	//B-Slice

For all Macroblock type conversions in different slices, refer to Section "Macroblock Type Conversion Rules" in the same volume.

Value	Name
0	Enable direct mode conversion
1	Disable direct mode conversion

Programming Notes
This field is zero for all other slices other than B-Slice.

MFX_AVC_SLICE_STATE

20 **MB Type Skip Conversion Disable**

Exists If:	//P-Slice or B-Slice

For all Macroblock type conversions in different slices, refer to Section "Macroblock Type Conversion Rules" in the same volume.

Value	Name
0	Enable skip type conversion
1	Disable skip type conversion

Programming Notes
This field is zero for all other slices other than P_Slice or B-Slice. \

19 **Is Last Slice**

Description
It is used by the zero filling in the Minimum Frame Size test.
Set this only for the last slice group

Value	Name	Description
1		Current slice is the last slice of a picture
0		Current slice is NOT the last slice of a picture

18 **Reserved**

17 **Header Insertion Present in Bitstream**

Value	Name	Description
0		No header insertion into the output bitstream buffer, in front of the current slice encoded bits.
1		Header insertion into the output bitstream buffer is present, and is in front of the current slice encoded bits.

Programming Notes
This need to be set only for super slice0.

16 **SliceData Insertion Present in Bitstream**

Value	Name	Description
0		No Slice Data insertion into the output bitstream buffer
1		Slice Data insertion into the output bitstream buffer is present.

Programming Notes
This bit should be set for all super-slices.

MFX_AVC_SLICE_STATE

	15	**Tail Insertion Present in bitstream** Value / Name / Description: 0 / / No tail insertion into the output bitstream buffer, after the current slice encoded bits 1 / / Tail insertion into the output bitstream buffer is present, and is after the current slice encoded bits. **Programming Notes** This bit should only be set for the last super slice.
	14	**Reserved** Format: MBZ
	13	**EmulationByteSliceInsertEnable** To have PAK outputting SODB or EBSP to the output bitstream buffer Value / Name / Description: 0 / / outputting RBSP 1 / / outputting EBSP

MFX_AVC_WEIGHTOFFSET_STATE

MFX_AVC_WEIGHTOFFSET_STATE

Source: VideoCS

Length Bias: 2

This is a slice level command and can be issued multiple times within a picture that is comprised of multiple slices. The same command is used for AVC encoder (PAK mode) and decoder (VLD and IT modes). However, since for AVC decoder VLD and IT modes, and AVC encoder mode, the implicit weights are computed in hardware, this command is not issued. For encoder, regardless of the type of weight calculation is active for the current slice (default, implicit or explicit), they are all sent to the PAK as if they were all in explicit mode. However, for implicit weight and offset, each entry contains only a 16-bit weight and no offset (offset = 0 always in implicit mode and can be hard-coded inside the hardware).The weights (and offsets) are needed in processing both P and B slice in AVC codec. For P-MB, at most only L0 list is used; for B-MB both L0 and L1 lists may be needed. For a B-MB that is coded in L1-only Prediction, only L1 list is sent.The content of this command matches with the DXVA2 AVC API data structure for explicit prediction mode only : Weights[2][32][3][2] (L0:L1, 0:31 RefPic, Y:Cb:Cr, W:0)

The full table, one entry for each reference picture, is always specified. Any reference list L0/L1[i] that does not exist, the corresponding weight and offset are set to 0. Weight and Offset are 2 byte each. Apair of Weight and Offset forms a dword, with Weight in the LOWER word and Offset in the HIGHER word. WeightOffset[L0=0][i=0 to 31][Y=0] (i.e. luma_weight_l0[i]) are specified for the weighting and offset factors applied to the luma prediction value for list 0 prediction using RefPicList0[i] (one-to-one correspondence in i). When luma_weight_l0_flag (Slice Header syntax element) is equal to 1, the value of luma_weight_l0[i] shall be in the range of -128 to 127. When luma_weight_l0_flag is equal to 0, luma_weight_l0[i] shall be inferred to be equal to 2luma_log2_weight_denom for RefPicList0[i]. luma_log2_weight_denom is a Slice Header syntax element. WeightOffset[L0=0][i=0 to 31][Cb=1] (i.e. chromaCb_weight_l0[i]) are specified for the weighting and offset factors applied to the chroma Cb prediction values for list 0 prediction using RefPicList0[i] (one-to-one correspondence in i). When chroma_weight_l0_flag (Slice Header syntax element) is equal to 1, the value of chromaCb_weight_l0[i] shall be in the range of -128 to 127. When chroma_weight_l0_flag is equal to 0, chromaCb_weight_l0[i] shall be inferred to be equal to 2chroma_log2_weight_denom for RefPicList0[i]. chroma_log2_weight_denom is a Slice Header syntax element. WeightOffset[L0=0][i=0 to 31][Cr=2] (i.e. chromaCr_weight_l0[i]) are specified for the

MFX_AVC_WEIGHTOFFSET_STATE		
		weighting and offset factors applied to the chroma Cr prediction values for list 0 prediction using RefPicList0[i] (one-to-one correspondence in i). When chroma_weight_l0_flag (Slice Header syntax element) is equal to 1, the value of chromaCr_weight_l0[i] shall be in the range of -128 to 127. When chroma_weight_l0_flag is equal to 0, chromaCr_weight_l0[i] shall be inferred to be equal to 2chroma_log2_weight_denom for RefPicList0[i].

MFX_BSP_BUF_BASE_ADDR_STATE

MFX_BSP_BUF_BASE_ADDR_STATE

Source: VideoCS

Length Bias: 2

This frame-level state command is used to specify all the buffer base addresses needed for the operation of the AVC Bit Stream Processing Units (for decoder, it is BSD Unit; for encoder, it is BSE Unit)

For both encoder and decoder, currently it is assumed that all codec standards can share the same BSP_BUF_BASE_STATE. The simplicity of this command is the result of moving all the direct MV related processing into the ENC Subsystem. Since all implicit weight calculations and directMV calculations are done in ENC and all picture buffer management are done in the Host, there is no need to provide POC (POC List - FieldOrderCntList, CurrPic POC - CurrFieldOrderCnt) information to PAK. For decoder, all the direct mode information are sent in a separate slice-level command (AVC_DIRECTMODE_STATE command).

In addition, in Encoder, the row stores for CABAC encoding and MB Parameters Construction (MPC) are combined into one single row store.

The row stores specified in this command do not combine with those specified in the MFC_PIPE_BUF_ADDR_STATE command for hardware simplification reason.

DWord	Bit	Description

MFX_BSP_BUF_BASE_ADDR_STATE

1	31:6	**BSD/MPC Row Store Scratch Buffer Base Address - Read/Write** This field provides the base address of the scratch buffer used by BSD (decoder) and MPC (encoder) unit to store MB information of the previous row for coding each macroblock in the current row. It is a private buffer used by the BSD (decoder) and MPC (encoder) hardware only. Its content is not accessible by software. ThisRow Store buffer must be 64-byte cacheline aligned. Hardware uses the horizontal address of the current macroblock to address this Row Store. For AVC BSD, 2 cacheline (CL) per MB when in MBAFF mode (row of MB pair); 1 CL per MB for non-MBAFF. So, to support 256 MBs per row (4K screen resolution), 2 * 256 * 64 bytes = 32,768 bytes are required. Cacheline alignment should be followed. For AVC MPC, 1 cachline for non-MBAFF, 2 cachelines for MBAFF per MB. For VC1, the BSD row store is 512-bit (one cacheline) per MB, times the number of MBs per picture MB row. **Programming Notes** This is one of the four RowStore Scratch Buffers which can programmed to use the internal Media Storage (total size 640 CacheLine). When Deblocking Filter Row Store Scratch Buffer Cache Select is programmed to "1", this will be stored inside MFX Media Internal Storage. Driver then needs to program this Base Address between 0 to 639, indicating starting cacheline address location for this buffer. Driver needs to make sure the whole buffer fits into Media Internal Storage. *(Notes: 1 cachelines per MB for non-mbaff; 2 cachelines per MB pair for mbaff, and the buffer needs to have enough space for 1 MB (pair) row).*

MFX_FQM_STATE

MFX_FQM_STATE

Source: VideoCS

Length Bias: 2

This is a common state command for AVC encoder modes. For encoder, it represents both the forward QM matrices as well as the decoding QM matrices.This is a Frame-level state. Only Scaling Lists specified by an application are being sent to the hardware. The driver is responsible for determining the final set of scaling lists to be used for decoding the current slice, based on the AVC Spec Table 7-2 (Fall-Back Rules A and B).In MFX AVC PAK mode, PAK needs both forward Q scaling lists and IQ scaling lists. The IQ scaling lists are sent as in MFD in raster scan order. But the Forward Q scaling lists are sent in column-wise raster order (column-by-column) to simplify the H/W. Driver will perform all the scan order conversion for both ForwardQ and IQ.

MFX_FQM_STATE

	1:0	**AVC** Exists If: //AVC- Decoder Only **For AVC QM Type**: This field specifies which Quantizer Matrix is loaded. Value / Name: 0 – AVC_4x4_Intra_MATRIX, (Y-4DWs, Cb-4DWs, Cr-4DWs, reserved-4DWs) 1 – AVC_4x4_Inter_MATRIX, (Y-4DWs, Cb-4DWs, Cr-4DWs, reserved-4DWs) 2 – AVC_8x8_Intra_MATRIX 3 – AVC_8x8_Inter_MATRIX
	1:0	**MPEG2** Exists If: //MPEG2- Decoder Only **For MPEG2 QM Type**: This field specifies which Quantizer Matrix is loaded. Value / Name: 0 – MPEG_INTRA_QUANTIZER_MATRIX 1 – MPEG_NON_INTRA_QUANTIZER_MATRIX 2-3 – Reserved
	1:0	**JPEG** Exists If: //JPEG- Encoder Only **For JPEG QM Type**:This field specifies which Quantizer Matrix is loaded. Value / Name: 0 – JPEG_Luma_Y_QUANTIZER_MATRIX (or R) 1 – JPEG_Chroma_Cb_QUANTIZER_MATRIX (or G) 2 – JPEG_Chroma_Cr_QUANTIZER_MATRIX (or B) **Programming Notes** For JPEG encoder, each quantization element presents 16-bit 1/QM[i][j]. In RGB encoding, because the order input image components can be RGB, GBR, BGR, YUV, the value 0 is used for the first image component, the value 1 is used for the second image component, and the value 2 is used for the third image component.
2..33	31:0	**Forward Quantizer Matrix** Format: U32 The format of a Quantizer Matrix is an 8x8 matrix in raster order. Each element is an unsigned byte.

MFX_IND_OBJ_BASE_ADDR_STATE

MFX_IND_OBJ_BASE_ADDR_STATE

Source: VideoCS

Length Bias: 2

This state command provides the memory base addresses for all row stores, StreamOut buffer and reconstructed picture output buffers required by the MFD or MFC Engine (that are in addition to the row stores of the Bit Stream Decoding/Encoding Unit (BSD/BSE) and the reference picture buffers). This is a picture level state command and is common among all codec standards and for both encoder and decoder operating modes. However, some fields may only applicable to a specific codec standard. All Pixel Surfaces (original, reference frame and reconstructed frame) in the Encoder are programmed with the same surface state (NV12 and TileY format), except each has its own frame buffer base address. In the tile format, there is no need to provide buffer offset for each slice; since from each MB address, the hardware can calculated the corresponding memory location within the frame buffer directly.

The MFX_IND_OBJ_BASE_ADDR command sets the memory base address pointers for the corresponding Indirect Object Data Start Addresses (Offsets) specified in each OBJECT commands. The characteristic of these indirect object data is their variable size (per MB or per Slice). Hence, each OBJECT command must specify the indirect object data offset from the base address to start fetching or writing object data.

While the use of base address is unconditional, the indirection can be effectively disabled by setting the base address to zero.
For decoder, there are:

- 1 read-only per-slice indirect object in the BSD_OBJECT Command, and
- 2 read-only per-MB indirect objects in the IT_OBJECT Command.

For decoder: the Video Command Streamer (VCS) will perform the memory access bound check automatically using the corresponding MFC Indirect Object Access Upper Bound specification. If any access is at or beyond the upper bound, zero value is returned. The request to memory is still being sent, but the corresponding codec's BSD unit will detect this condition and perform the zeroing return. If the Upper Bound is turned off, the beyond bound request will return whatever on the bus (invalid data).
For encoder, there are:

- 1 read-only per-MB indirect object in the PAK_OBJECT Command, and
- 1 write-only per-slice indirect object in the PAK Slice_State Command

For encoder: whenever an out of bound address accessing request is generated, VMX will detect such requests and snap the address to the corresponding [indirect object base address + indirect data start address]. VMX will return all 0s as the data to the requestor. NotationDefinitionPhysicalAddress[n:m] Corresponding bits of a physical graphics memory byte address (not mapped by a GTT) GraphicsAddress[n:m] Corresponding bits of an absolute, virtual graphics memory byte address (mapped by a GTT).

MFX_JPEG_HUFF_TABLE_STATE

MFX_JPEG_HUFF_TABLE_STATE

Source: VideoCS

Length Bias: 2

This Huffman table commands contains both DC and AC tables for either luma or chroma. Once a Huffman table has been defined for a particular destination, it replaces the previous tables stored in that destination and shall be used in the remaining Scans of the current image. A Huffman table will be sent to H/W only when it is loaded from bitstream.

31:29 — Reserved

Exists If:	//Encoder Only
Format:	MBZ

29 — Output Pixel Normalize

Exists If:	//Decoder Only

JPEG decoded output pixels for Y and U/V in order to adjust display YUV range.

Value	Name	Description	Exists If
0		No Normalization	
1		Normalize output pixels from [0,255] to [16,235]	//Y
1		Normalize output pixels from [0,255] to [16,239]	//U/V

28:16 — Frame Height In Blocks Minus 1

Exists If:	//Decoder Only
Format:	U13-1

(The number of blocks in height) - 1.
This value is calculated using the number of lines Y and vertical sampling factor of the first component V_1 in Frame header. See the note following this table.
For interleaved components, (((Y + (V_1*8 -1)) / (V_1*8)) * V_1) - 1, where "/" is integer division.
For non-interleaved components, ((Y + 7) / 8) - 1.

28:16 — Frame Height In Blks Minus 1

Exists If:	//Encoder Only
Format:	U13-1

(The number of blocks in height) - 1.
This value is calculated using the number of lines Y and vertical sampling factor of the first component V1 in Frame header. See the note following this table.

For interleaved components: (((Y + (V1*8 -1)) / (V1*8)) * V1) - 1
For non-interleaved components: ((Y + 7) / 8) - 1

MFX_JPEG_PIC_STATE

15:13 **Reserved**

101b		(1/2 - 1/32)
110b		(1/2 - 1/16)
111b		(1/2 - 1/8)

12:0 **Frame Width In Blocks Minus 1**

Exists If:	//Decoder Only
Format:	U13-1

(The number of blocks in width) - 1.
This value is calculated using the number of samples per line X and horizontal sampling factor of the first component H_1 in Frame header. See the note following this table.
For interleaved components, (((X + (H_1 *8 -1)) / (H_1 *8)) * H_1) - 1.
For non-interleaved components, ((X + 7) / 8) - 1.

12:0 **Frame Width In Blks Minus 1**

Exists If:	//Encoder Only
Format:	U13-1

(The number of blocks in width) - 1.
This value is calculated using the number of samples per line X and horizontal sampling factor of the first component H1 in Frame header. See the note following this table.

For interleaved components: (((X + (H1 *8 -1)) / (H1 *8)) * H1) - 1
For non-interleaved components: ((X + 7) / 8) - 1

MFX_MPEG2_PIC_STATE

MFX_MPEG2_PIC_STATE

Source: VideoCS

Length Bias: 2

This must be the very first command to issue after the surface state, the pipe select and base address setting commands. For MPEG-2 the encoder is called per slice-group, however the picture state is called per picture.Notice that a slice-group is a group of consecutive slices that no non-trivial slice headers are inserted in between.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode

	15:14	**Intra DC Precision** Format: U2 See ISO/IEC 13818-2 6.3.10 for details.
	13:12	**Picture Structure** This field specifies whether the picture is encoded in the form of a frame picture or one field (top or bottom) picture. See ISO/IEC 13818-2 6.3.10 for details.Format = MPEG_PICTURE_STRUCTURE00 = Reserved01 = MPEG_TOP_FIELD10 = MPEG_BOTTOM_FIELD11 = MPEG_FRAME
	11	**TFF (Top Field First)** When two fields are stored in a picture, this bit indicates if the top field is the first field.For a frame P picture, the value 1 indicates that the top field of the reconstructed frame is the first field output by the decoding process, the same as defined in ISO/IEC 13818-2 6.3.10. Particularly, it is used by the hardware to calculate derivative motion vectors from the dual-prime motion vectors.For a field P picture, hardware uses this bit together with the Picture Structure to determine if the current picture is the Second Field. In this case, the definition of this bit differs from ISO/IEC 13818-2 6.3.10 - software must derive the value for this bit according to the following relation:Picture Structure = top fieldPicture Structure = bottom fieldSecond Field = 0TFF = 1TFF = 0Second Field = 1TFF = 0TFF = 1
	10	**Frame Prediction Frame DCT** This field provides constraints on the DCT type and prediction type. It affects the syntax of the bitstream.
	9	**Concealment Motion Vector Flag** This field indicates if the concealment motion vectors are coded in intra macroblocks. It affects the syntax of the bitstream.
	8	**Quantizer Scale Type** Format: MPEG_Q_SCALE_TYPE This field specifies the quantizer scaling type. Value / Name / Description 0h / / MPEG_QSCALE_LINEAR 1h / / D MPEG_QSCALE_NONLINEAR esc
	7	**Intra VLC Format** This field is used by VLD
	6	**Scan Order** Format: MPEG_INVERSESCAN_TYPE This field specifies the Inverse Scan method for the DCT-domain coefficients in the

MFX_MPEG2_PIC_STATE

blocks of the current picture.

Value	Name	Description
0h		MPEG_ZIGZAG_SCAN
1h		MPEG_ALTERNATE_VERTICAL_SCAN

5:0 **Reserved**

2 31 **I Slice Concealment Mode**

Exists If:	//Decoder

This field controls how MPEG decoder handles MB concealment in I Slice

Value	Name	Description
0h	Intra Concealment	Using Coefficient values to handle MB concealment
1h	Inter Concealment	Using Motion Vectors to handle MB concealment

Programming Notes
If this field is set to "1", driver must provide a valid forward reference picture (both top and bottom Field must be valid)

30 **Reserved**

Format:	MBZ

29:28 **P/B Slice Concealment Mode**

Exists If:	//Decoder

This field controls how MPEG decoder handles MB concealment in P/B Slice.

Value	Name	Description
00b	INTER	If left MB is NOT Intra MB type (including skipMB), use left MB inter prediction mode [frame/field or forward/backward/bi] and MV final values as concealment. Otherwise (left MB is Intra MB), use forward reference (same polarity for field pic) with MV final values set to 0.
01b	LEFT	If left MB is NOT Intra MB type (including skipMB), use left MB inter prediction mode [frame/field or forward/backward/bi] and MV final values as concealment. Otherwise (left MB is Intra MB), use left MB dct_dc_pred[cc] values for concealment (Macroblock is concealed as INTRA MB and dct_dc_pred[cc] are DC predictor for Luma, Cr, Cb data)
10b	ZERO	Always use forward reference (same polarity for field pic) with MV final values set to 0 (Macroblock is concealed as INTER coded)
11b	INTRA	Use left MB dct_dc_pred[cc] values for concealment (Macroblock is concealed as INTRA MB and dct_dc_pred[cc] are DC predictor for Luma, Cr, Cb data

27 **Reserved**

Format:	MBZ

MFX_MPEG2_PIC_STATE

26:25 **P/B Slice Predicted BiDir Motion Type Override - Bi-direction MV Type Override**

Exists If:	//Decoder

This field is only applicable if the Concealment Motion Type is predicted to be Bi-directional.
(It is only possible if "P/B Slice Concealment Mode" is set to "00" or "01" and left MB is a bi-directional MB).

Value	Name	Description
0h	BID	Keep Bi-direction Prediction
1h	RESERVED	
2h	FWD	Only use Forward Prediction (Backward MV is forced to invalid
3h	BWD	Only use Backward Prediction (Forward MV is forced to invalid)

24 **P/B Slice Predicted Motion Vector Override Final MV value Override**

Exists If:	//Decoder

This field is only applicable if the Concealment Motion Vectors are non-zero.
It is only possible if "P/B Slice Concealment Mode" is set to "00" or "01" and left MB has non-zero motion vectors).

Value	Name	Description
0h	Predicted	Motion Vectors use predicted values
1h	ZERO	Motion Vectors force to 0

23:15 **Reserved**

Format:	MBZ

14 **LoadSlicePointerFlag - LoadBitStreamPointerPerSlice**

Exists If:	//Encoder

To support multiple slice picture and additional header/data insertion before and after an encoded slice.When this field is set to 0, bitstream pointer is only loaded once for the first slice of a frame. For subsequent slices in the frame, bitstream data are stitched together to form a single output data stream.When this field is set to 1, bitstream pointer is loaded for each slice of a frame. Basically bitstream data for different slices of a frame will be written to different memory locations.

Value	Name	Description
0h		Load BitStream Pointer only once for the first slice of a frame
1h		Load/reload BitStream Pointer only once for the each slice, reload the start location of the bitstream buffer from the Indirect PAK-BSE Object Data Start Address field

MFX_PAK_INSERT_OBJECT

MFX_PAK_INSERT_OBJECT

Source:	VideoCS
Length Bias:	2

Description

The MFX_PAK_INSERT_OBJECT command is the first primitive command for the AVC, MPEG2, JPEG, and VP8 Encoding Pipeline.

This command is issued to setup the control and parameters of inserting a chunk of compressed/encoded bits into the current bitstream output buffer starting at the specified bit locationto perform the actual insertion by transferring the command inline data to the output buffer max, 32 bits at a time.
It is a variable length command as the data to be inserted are presented as inline data of this command. It is a multiple of 32-bit (1 DW), as the data bus to the bitstream buffer is 32-bit wide.
Multiple insertion commands can be issued back to back in a series. It is host software's responsibility to make sure their corresponding data will properly stitch together to form a valid H.264 bitstream.
Internally, MFX hardware will keep track of the very last two bytes' (the very last byte can be a partial byte) values of the previous insertion. It is required that the next Insertion Object Command or the next PAK Object Command to perform the start code emulation sequence check and prevention 0x03 byte insertion with this end condition of the previous insertion.
Hardware will keep track of an output bitstream buffer current byte position and the associated next bit insertion position index. Data to be inserted can be a valid H.264 NAL units or a partial NAL unit. Certain NAL unit has a minimum byte size requirement. As such the hardware will optionally (enabled by STATE Command) determines the number of CABAC_ZERO_WORD to be inserted to the end of the current NAL, based on the minimum byte size of a NAL and the actual bin count of the encoded Slice. Since prior to the CABAC_ZERO_WORD insertion, the RBSP or EBSP is already byte-aligned, so each CABAC_ZERO_WORD insertion is actually a 3-byte sequence 0x00 00 03. The inline data may have already been processed for start code emulation byte insertion, except the possibility of the last 2 bytes plus the very last partial byte (if any). Hence, when hardware performing the concatenation of multiple consecutive insertion commands, or concatenation of an insertion command and a PAK object command, it must check and perform the necessary start code emulation byte insert at the junction.The inline data is required to be byte aligned on the left (first transmitted bit order) and may or may not be byte aligned on the right (last transmitted bits).
The command will specify the bit offset of the last valid DW.Each insertion state command defines a chunk of bits (compressed data) to be inserted at a specific location of the output compressed bitstream in the output buffer.Depend on CABAC or CAVLC encoding mode (from Slice State), PAK Object Command is always ended in byte aligned output bitstream except for CABAC header insertion which is bit aligned. In the aligned cases, PAK will perform 0 filling in CAVLC mode, and 1 filling in CABAC mode.
Insertion data can include:any encoded syntax elements bit data before the encoded Slice Data (PAK Object Command) of the current SliceSPS NALPPS NALSEI NALOther Non-Slice NALLeading_Zero_8_bits (as many bytes as there is)Start Code PrefixNAL Header ByteSlice HeaderAny encoded syntax elements bit data after the encoded Slice Data (PAK Object Command) of the current Slice and prior to the next encoded Slice Data of the next Slice or prior to the end of the bistream, whichever comes firstCabac_Zero_Word or Trailing_Zero_8bits (as many bytes as there is).
Anything listed above before a Slice DataContext switch interrupt is not supported by this command.

MFX_PAK_INSERT_OBJECT

Programming Notes
Must be set to 0 for JPEG encoder

14 **Slice Header Indicator**

This bit indicates if the insert object is a slice header.

Value	Name	Description
1	SLICE_HEADER	Insertion Object is a Slice Header. The command is stored internally by HW and is used for inserting slice headers.
0	LEGACY	Legacy Insertion Object command. The PAK Insertion Object command is not stored in HW.

Programming Notes
The payload for PAK_INS_OBJ should contain only start code for Slice header followed by NAL_type and slice header (slice_header() in AVC spec). The payload for PAK_INS_OBJ shouldn't contain CABAC Byte alignment bits. HW adds these alignment bits which are part of slice_data. Example PAK_INS_OBJ payload : 00 00 01 <NAL_type> <slice_header_Byte0> .....<slice_header_Byte LAST> Any zero_bytes that are added before slice header can be inserted by any preceding general PAK_INS_OBJ.

13:8 **DataBitsInLastDW - SrCDataEndingBitInclusion[5:0]**

Source Data to be included in the very last inline DW. Follows the MSBit is the upper bit of each byte within the DW. The lower byte is actually processed first.For example, SrCDataEndingBitInclusion = 9, bit 7:0 and bit 15 are included as valid header data.

Value	Name
[1,32]	

7:4 **SkipEmulByteCnt - Skip Emulation Byte Count**

Skip emulation check for number of starting bytesIt can be programmed from 0 to 15 bytes.For example, to skip the start code that has already prefixed in the bitstream.

Programming Notes
Must be set to 0 for JPEG encoder

3 **EmulationFlag - EmulationByteBitsInsertEnable**

Value	Name	Description
0	NONE	No emulation
1	EMULATE	Instruct the hardware to perform Start Code Prefix (0x 00 00 01/02/03/00) Search and Prevention Byte (0x 03) insertion on the insertion data of this command. It is required that hardware will handle a start code prefix crossing the boundary between insertion commands, or an insertion command followed by a PAK Object command.

Programming Notes

MFX_PAK_INSERT_OBJECT

		Must be set to 0 for JPEG encoder
	2	**LastHeaderFlag - LastSrcHeaderDataInsertCommandFlag** To process a series of consecutive insertion commands, this flag (=1) indicates the current command is the last 'header' insertion in the series.In CABAC, hardware must perform the "1" insert for byte align for Slice Header before Slice Data comes in in the next PAK-OBJECT command.In CAVLC, hardware ignores this bit
	1	**EndOfSliceFlag - LastDstDataInsertCommandFlag** No more insertion command and no more PAK-OBJECT command follows.Flush data out to memory
	0	**BitstreamStartReset - ResetBitStreamStartingPos** Value / Name / Description: 1 / RESET / Reset the bitstream buffer insertion position to the bitstream buffer starting position. 0 / INSERT / Insert the current command inline data starting at the current bitstream buffer insertion position **Programming Notes** Must be set to 1 for JPEG encoder
2..n	31:0	**Insert Data PayLoad** Actual Data to be inserted to the output bitstream buffer.

MFX_PIPE_BUF_ADDR_STATE

MFX_PIPE_BUF_ADDR_STATE

Source: VideoCS

Length Bias: 2

This state command provides the memory base addresses for all row stores, StreamOut buffer and reconstructed picture output buffers required by the MFD or MFC Engine (that are in addition to the row stores of the Bit Stream Decoding/Encoding Unit (BSD/BSE) and the reference picture buffers).

This is a picture level state command and is common among all codec standards and for both encoder and decoder operating modes. However, some fields may only applicable to a specific codec standard. All Pixel Surfaces (original, reference frame and reconstructed frame) in the Encoder are programmed with the same surface state (NV12 and TileY format), except each has its own frame buffer base address. In the tile format, there is no need to provide buffer offset for each slice; since from each MB address, the hardware can calculated the corresponding memory location within the frame buffer directly.

Pre Deblocking - Arbitration Priority Control

This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.

Value	Name
00b	Highest priority
01b	Second highest priority
10b	Third highest priority
11b	Lowest priority

MFX_PIPE_BUF_ADDR_STATE

	6:1	**Pre Deblocking - Index to Memory Object Control State (MOCS) Tables:** The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.
	0	**Reserved**
4	31:6	**Post Deblocking Destination Address** Format: GraphicsAddress[31:6] Specifies the 4K byte aligned frame buffer address for outputting the post-loop filtered reconstructed YUV picture (i.e. output of the deblocking filter unit)This field is ignored if PostDeblockOutEnable is set to 0 (disable).
	5:0	**Reserved**
5	31:16	**Reserved** Format: MBZ
	15:0	**Post Deblocking Destination Address High** Format: GraphicsAddress[47:32] This field is for the upper range of Post-Deblocking Destination Address. This field is ignored if **PostDeblockOutEnable** is set to 0 (disable).
6	31:15	**Reserved** Format: MBZ
	14:13	**Post Deblocking - Tiled Resource Mode** **For Media Surfaces:** This field specifies the tiled resource mode.

Value	Name	Description
0h	TRMODE_NONE	No tiled resource
1h	TRMODE_TILEYF	4KB tiled resources
2h	TRMODE_TILEYS	64KB tiled resources
3h	Reserved	

	12:11	**Reserved** Format: MBZ
	10	**Post Deblocking - Memory Compression Mode**

Description
Distinguishes Vertical from Horizontal compression. Please refer to vol1a **Memory Data Formats chapter -section** Media Memory Compression **for more details.**

Value	Name
0	Horizontal Compression Mode

MFX_PIPE_BUF_ADDR_STATE

		Programming Notes **This bit is not used unless Memory Compression Enable is set to "1"** **All Codec except JPEG Vertical Compression Only** Video Mode: AVC Frame Only (No MBAFF or Field) — Compression Mode: Horizontal Video Mode: VP8 (Only Frame is supported — Compression Mode: Horizontal Video Mode: JPEG — Compression Mode: Not Supported
	9	**Post Deblocking - Memory Compression Enable** Format: Enable Memory compression will be attempted for this surface. Value 0: Compression Disable Value 1: Compression Enable **Programming Notes** Video Mode: AVC Frame Only (No MBAFF or Field) — Compression Enable: Yes Video Mode: VP8 (Only Frame is supported — Compression Enable: Yes Video Mode: JPEG — Compression Enable: No (In JPEG mode, this surface is not used)
	8:7	**Post Deblocking - Arbitration Priority Control** This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface. Value 00b: Highest priority Value 01b: Second highest priority Value 10b: Third highest priority Value 11b: Lowest priority
	6:1	**Post Deblocking - Index to Memory Object Control State (MOCS) Tables:** The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.
	0	**Reserved**
7	31:6	**Original Uncompressed Picture Source Address** Format: GraphicsAddress[31:6] Specifies the 64 byte aligned frame buffer address for fetching YUV pixel data from the original uncompressed input picture for encoding. This field is only valid in **encoding** mode.

MFX_PIPE_BUF_ADDR_STATE

	5:0	**Reserved** Format: MBZ
8	31:16	**Reserved** Format: MBZ
	15:0	**Original Uncompressed Picture Source Address High** Format: GraphicsAddress[47:32] This field is for the upper range of Original Uncompressed Picture Source Address. This field is valid for **encoding** mode only.
9	31:15	**Reserved** Format: MBZ
	14:13	**Original Uncompressed Picture - Tiled Resource Mode** **For Media Surfaces:** This field specifies the tiled resource mode.

Value	Name	Description
0h	TRMODE_NONE	No tiled resource
1h	TRMODE_TILEYF	4KB tiled resources
2h	TRMODE_TILEYS	64KB tiled resources
3h	Reserved	

	12:11	**Reserved** Format: MBZ
	10	**Original Uncompressed Picture - Memory Compression Mode**

Description
Distinguishes Vertical from Horizontal compression. Please refer to vol1a Memory Data Formats chapter -section Media Memory Compression for more details. Note: This bit is not used unless Memory Compression Enable is set to "1" Note: This is a READ Surface. The setting of this bit should match the settings on how this is written out before

Value	Name
0	Horizontal Compression Mode
1	Vertical Compression Mode

	9	**Original Uncompressed Picture - Memory Compression Enable** Note: This is a READ Surface. The setting of this bit should match the settings on how this is written out before.

Value	Name
0	Compression Disable

MFX_PIPE_BUF_ADDR_STATE

	8:7	**Original Uncompressed Picture Source - Arbitration Priority Control** This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface. **Value** / **Name** 00b – Highest priority 01b – Second highest priority 10b – Third highest priority 11b – Lowest priority
	6:1	**Original Uncompressed Picture - Index to Memory Object Control State (MOCS) Tables** The index to define the L3 and system cache memory properties. Related control registers can be updated during runtime.
	0	**Reserved**
10	31:6	**StreamOut Data Destination Base Address** Format: GraphicsAddress[31:6] Specifies the 64 byte aligned address for outputting the per-MB indirect data to memory when **StreamOutEnable** is set in the MFX_PIPE_MODE_SELECT command. For Decoder : This field is used for transcoding purpose. For Encoder : This field is used for dynamic repeat of frame in PAK for Rate Control. Also used for feeding coding information back to the Host, Video Preprocessing Unit and ENC Unit. All data are written in fixed formats, and therefore all record sizes are known in the hardware. Hardware can calculate the offset into this base address for per-MB data.
	5:0	**Reserved** Format: MBZ
11	31:16	**Reserved** Format: MBZ
	15:0	**StreamOut Data Destination Base Address High** Format: GraphicsAddress[47:32] This field is for the upper range of Original Uncompressed Picture Source Address
12	31:15	**Reserved** Format: MBZ
	14:13	**StreamOut Data Destination - Tiled Resource Mode** **For Media Surfaces:** This field specifies the tiled resource mode. **Value** / **Name** / **Description** 0h – TRMODE_NONE – No tiled resource 1h – TRMODE_TILEYF – 4KB tiled resources 2h – TRMODE_TILEYS – 64KB tiled resources 3h – Reserved

MFX_PIPE_BUF_ADDR_STATE

	12:11	**Reserved** Format: MBZ
	10	**StreamOut Data Destination - Memory Compression Mode** Description: Distinguishes Vertical from Horizontal compression. Please refer to vol1a Memory Data Formats chapter -section Media Memory Compression for more details. Note: This bit is not used unless Memory Compression Enable is set to "1" Note: This is a READ Surface. The setting of this bit should match the settings on how this is written out before Only horizontal mode is supported. Value 0: Horizontal Compression Mode Value 1: Vertical Compression Mode
	9	**StreamOut Data Destination - Memory Compression Enable** Note: This is a READ Surface. The setting of this bit should match the settings on how this is written out before. Value 0: Compression Disable
	8:7	**StreamOut Data Destination - Arbitration Priority Control** This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface. Value 00b: Highest priority Value 01b: Second highest priority Value 10b: Third highest priority Value 11b: Lowest priority
	6:1	**StreamOut Data Destination - Index to Memory Object Control State (MOCS) Tables** The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.
	0	**Reserved**
13	31:6	**Intra Row Store Scratch Buffer Base Address** Format: GraphicsAddress[31:6] This field provides the base address of the scratch buffer (read/write) used by the AVC/VP8 IntraPrediction unit to store MB information of the previous row for processing of each macroblock in the current row. The Intra Row Store buffer must be 64-byte cacheline aligned.Hardware uses the horizontal address of the current macroblock to address the Intra Row Store. This field is ignored in MPEG2 and VC1 mode.

MFX_PIPE_BUF_ADDR_STATE

Max 256 cachelines for 4K pixels (1 cacheline for either MBAFF or non-MBAFF)Intra Row Store Scratch Buffer - Arbitration Priority Control

Programming Notes

This is one of the four RowStore Scratch Buffers which can be programmed to use the internal Media Cache (total size 640 CacheLine). When Intra Row Store Scratch Buffer Cache Select is programmed to "1", this data will be stored inside MFX Media Internal Stroage. Driver then needs to program this Base Address between 0 to 639, indicating starting cachelines address to Media Cache. Driver needs to make sure the whole buffer fits into MFX Media Internal Storage. *(Notes: 1 cacheline per MB, and the buffer needs to have enough space for 1 MB row).*

	5:0	**Reserved** Format: MBZ
14	31:16	**Reserved** Format: MBZ
	15:0	**Intra Row Store Scratch Buffer Base Address High** Format: GraphicsAddress[47:32] This field is for the upper range of Intra RowStore/Scratch Buffer Base Address This field is ignored in MPEG2 and VC1 mode.
15	31:15	**Reserved** Format: MBZ
	14:13	**Intra Row Store Scratch Buffer - Tiled Resource Mode** **For Media Surfaces:** This field specifies the tiled resource mode.

Value	Name	Description
0h	TRMODE_NONE	No tiled resource
1h	TRMODE_TILEYF	4KB tiled resources
2h	TRMODE_TILEYS	64KB tiled resources
3h	Reserved	

12 — **Intra Row Store Scratch Buffer Cache Select**

This field controls if Intra Row Store is going to store inside Media Cache or to LLC.

Value	Name	Description
0		Buffer going to LLC.
1		Buffer going to Internal Media Storage

11 — **Reserved**

Format: MBZ

10 — **Intra Row Store Scratch Buffer - Memory Compression Mode**

Description
Distinguishes Vertical from Horizontal compression. Please refer to vol1a Memory Data Formats chapter -section Media Memory Compression for more details. Note: This bit is not used unless

MFX_PIPE_BUF_ADDR_STATE

		Memory Compression Enable is set to "1" **Value** / **Name** 0 – Horizontal Compression Mode 1 – Vertical Compression Mode
	9	**Intra Row Store Scratch Buffer - Memory Compression Enable** **Value** / **Name** 0 – Compression Disable **Programming Notes** This surface is linear surface. This bit must be set to "0" since only TileY/TileYf/TileYs surface is allowed to be compressed
	8:7	**Intra Row Store Scratch Buffer - Arbitration Priority Control** This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface. **Value** / **Name** 00b – Highest priority 01b – Second highest priority 10b – Third highest priority 11b – Lowest priority
	6:1	**Intra Row Store Scratch Buffer - Index to Memory Object Control State (MOCS) Tables** The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.
	0	**Reserved**
16	31:6	**Deblocking Filter Row Store Scratch Base Address** Format: GraphicsAddress[31:6] Deblocking Filter Row Store is needed for: • AVC and VC1 In-Loop Deblocking Filter • VC1 Overlap-smoothing Filter • AVC, VC1, and MPEG-2 Out-Of-Loop Deblocking Filter (Intel extension) This field provides the 64 byte aligned base address of the scratch buffer (read and write) used by the deblocking filter unit to store MB information of the previous row for filtering of each macroblock in the current row. The Deblocking Filter Row Store buffer must be 64-byte cacheline aligned. Hardware uses the horizontal address of the current macroblock to address the Deblocking Filter Row Store. Max 6 cachelines for VC1 and MPEG2, and max 4 for AVC (for MBAFF, 2 for non-MBAFF) **Programming Notes**

MFX_PIPE_BUF_ADDR_STATE

		This is one of the four RowStore Scratch Buffers which can programmed to use the internal Media Cache (total size 640 CacheLine). When Deblocking Filter Row Store Scratch Buffer Cache Select is programmed to "1", this will be stored inside MFX Media Internal Storage. Driver then needs to program this Base Address between 0 to 639, indicating starting cachelines address location for this buffer. Driver needs to make sure the whole buffer fits into Media Internal Storage. *(Notes: 2 cachelines per MB for non-mbaff; 4 cahcelines per MB pair for mbaff, and the buffer needs to have enough space for 1 MB (pair) row).*

	47:32	**Reference Picture Address [n] High** <table><tr><td>Format:</td><td>Address[47:32]</td></tr></table> This field is for the upper range of Reference Picture Addresses
	31:6	**Reference Picture Address [n]** <table><tr><td>Format:</td><td>Address[31:6]</td></tr></table> Specifies the 64 byte aligned reference frame buffer addresses for the motion compensation operation in AVC/ /MPEG2. AVC can specify up to 16 YUV frame-based surfaces for both forward and backward references, i.e. L0+L1 total = 16 max. Any entry can be assigned to L0 or L1 or both lists.But VC1 and MPEG2, worst case, can use up to 2 YUV frame-based surfaces for both forward and backward references: • P-MB : RefAddr[0] - temporal closest previous field of a reference frame (can be the current frame)

MFX_PIPE_BUF_ADDR_STATE

- RefAddr[1]- next temporal closest previous field of a reference frame (must be different from the current frame)

It is a variant (without the LongTermRefPic specification) of the RefFrameList[16] defined in AVC DXVA Spec. RefAddr[0-15] is indexed by frame_storeID »1. It is not a packed list, i.e. invalid entries can scatter among the list. All invalid addresses must be set to a valid address RefAddr[0] by the driver. The same applies to VC1 and MPEG2.

Programming Notes
AVC: Always specifies all 16 addresses even some of them are not needed as indicated by the max num of active reference pictures. This is done for preventing data corruption (error, fault condition, etc.) by having all the references being set to a legal location.

Distinguishes Vertical from Horizontal compression. Please refer to vol1a Memory Data Formats chapter -section Media Memory Compression for more details.

Value	Name
0	Horizontal Compression Mode
1	Vertical Compression Mode

9 Scaled Reference Surface - Memory Compression Enable

Format:	Enable

Memory compression shouldnt be enabled for this surface.

8:7 Scale Reference Surface - Arbitration Priority Control

This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.

Value	Name
00b	Highest Priority
01b	Second Highest Priority
10b	Third Highest Priority
11b	Lowest Priority

6:1 Scaled Reference Surface - Index to Memory Object Control State (MOCS) Tables

The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers.

The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.

0 Reserved

MFX_PIPE_MODE_SELECT

MFX_PIPE_MODE_SELECT

Source: VideoCS

Length Bias: 2

Specifies which codec and hardware module is being used to encode/decode the video data, on a per-frame basis.

The MFX_PIPE_MODE_SELECT command specifies which codec and hardware module is being used to encode/decode the video data, on a per-frame basis. It also configures the hardware pipeline according to the active encoder/decoder operating mode for encoding/decoding the current picture. Commands issued specifically for AVC and MPEG2 are ignored when VC1 is the active codec.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFX_COMMON Format: OpCode

	17	**Decoder Short Format Mode** For IT mode, this bit must be 0. **Value** / **Name** / **Description** 0 / Short Format Driver Interface **[Default]** / AVC/VC1/MVC/VP8 Short Format Mode is in use **Note: There is no Short Format for VP8 yet, so this field must be set to 1 for VP8.** 1 / Long Format Driver Interface / AVC/VC1/MVC/VP8 Long Format Mode is in use.
	16:15	**Decoder Mode select** Each coding standard supports two entry points: VLD entry point and IT (IDCT) entry point. This field selects which one is in use.This field is only valid if Codec Select is 0 (decoder). **Value** / **Name** / **Description** 0h / VLD Mode / All codec minimum must support this mode Configure the MFD Engine for VLD Mode Note: All codec minimum must support this mode 1h / IT Mode / Configure the MFD Engine for IT Mode Note: Only VC1 and MPEG2 support this mode 2h / Deblocker Mode / Configure the MFD Engine for Standalone Deblocker Mode. Require streamout AVC edge control information from preceeding decoding pass. 3h / Reserved /
	14	**Reserved**
	13	**Reserved**
	12	**Deblocker Stream-Out Enable** This field indicates if Deblocker information is going to be streamout during VLD decoding. For AVC, it is needed to enable the deblocker streamout as the AVC Disable_DLKFilterIdc is a slice level parameters. Driver needs to determine ahead of time if at least one slice of the current frame/ has deblocker ON.

MFX_PIPE_MODE_SELECT

		Value / **Name** / **Description** 0h / Disable / 1h / Enable /
	11	**Pic Error/Status Report Enable.** This field control whether the error/status reporting is enable or not.0: Disable1: EnableIn decoder modes: Error reporting is written out once per frame. The Error Report frame ID listed in DW3 along with the VLD/IT error status bits are packed into one cache and written to the "Decoded Picture Error/Status Buffer address" listed in the MFX_PIPE_BUF_ADDR_STATE Command. Note: driver shall program different error buffer addresses between pictrues; otherwise, hardware might overwrite previous written data if driver does not read it fast enough.In encoder modes: Not used Please refer to "Media VDBOX -> Video Codec -> Other Codec Functions -> MFX Error Handling -> Decoder" session for the output format. **Value** / **Name** 0h / Disable 1h / Enable
	10	**Stream-Out Enable** This field controls whether the macroblock parameter stream-out is enabled during VLD decoding for transcoding purpose. **Value** / **Name** 0h / Disable 1h / Enable **Programming Notes** In decoder modes: The Stream-Out feature is added to support transcoding. While decoding the input compressed stream, selected decoded information may be used by the encoder for re-compression.In encoder modes: This feature used to perform dynamic Multipass of PAK for conformance pupose. Also it provides feedback to host (ENC) for future needs. Software can use this bit to disable writing PAK steam data to the streamout buffer for last pass of frame in PAK. Thus, save memory bandwidth.
	9	**Post Deblocking Output Enable (PostDeblockOutEnable)** This field controls the output write for the reconstructed pixels AFTER the deblocking filter.In MPEG2 decoding mode, if this is enabled, VC1 deblocking filter is used. **Value** / **Name** 0h / Disable 1h / Enable

MFX_PIPE_MODE_SELECT

8 Pre Deblocking Output Enable (PreDeblockOutEnable)

This field controls the output write for the reconstructed pixels BEFORE the deblocking filter.

Value	Name
0h	Disable
1h	Enable

7 Scaled Surface Enable

This field indicates if the scaled surface is enabled. This field enables the 4x HME downscalar of the reconstructed image. Only supported for AVC and VP8 formats.

Value	Name
0h	Disable
1h	Enable

6 Frame Statistics StreamOut Enable

This field controls the frame level statistics streamout from the PAK.

Value	Name
0h	Disable
1h	Enable

5 Stitch Mode

Exists If:	//CodecSel=Encode and StandardSel=AVC

Value	Name	Description
0h	Not in stitch mode	
1h	In the special stitch mode	This mode can be used for any Codec as long as bitfield conditions are met.

4 Codec Select

Value	Name	Description
0h	Decode	
1h	Encode	Valid only if StandardSel is AVC and MPEG2)

3:0 Standard Select

Value	Name	Description
0000b	MPEG2

4	31:0	**Reserved** Format: MBZ

MFX_QM_STATE

MFX_QM_STATE

Source: VideoCS

Length Bias: 2

This is a common state command for AVC encoder modes. For encoder, it represents both the forward QM matrices as well as the decoding QM matrices.This is a Frame-level state. Only Scaling Lists specified by an application are being sent to the hardware. The driver is responsible for determining the final set of scaling lists to be used for decoding the current slice, based on the AVC Spec Table 7-2 (Fall-Back Rules A and B).In MFX AVC PAK mode, PAK needs both forward Q scaling lists and IQ scaling lists. The IQ scaling lists are sent as in MFD in raster scan order. But the Forward Q scaling lists are sent in column-wise raster order (column-by-column) to simplify the H/W. Driver will perform all the scan order conversion for both ForwardQ and IQ.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFX_MULTI_DW Format: OpCode
	26:24	**Media Command Opcode** Default Value: 0h MFX_COMMON_STATE Format: OpCode
	23:21	**SubOpcode A** Default Value: 0h Format: OpCode
	20:16	**SubOpcode B** Default Value: 7h Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 20h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:2	**Reserved** Format: MBZ
	1:0	**AVC** Exists If: //AVC- Decoder Only

MFX_QM_STATE

For AVC QM Type: This field specifies which Quantizer Matrix is loaded.

Value	Name
0	AVC_4x4_Intra_MATRIX, (Y-4DWs, Cb-4DWs, Cr-4DWs, reserved-4DWs)
1	AVC_4x4_Inter_MATRIX, (Y-4DWs, Cb-4DWs, Cr-4DWs, reserved-4DWs)
2	AVC_8x8_Intra_MATRIX
3	AVC_8x8_Inter_MATRIX

1:0 **MPEG2**

Exists If:	//MPEG2- Decoder Only

For MPEG2 QM Type: This field specifies which Quantizer Matrix is loaded.

Value	Name
0	MPEG_INTRA_QUANTIZER_MATRIX
1	MPEG_NON_INTRA_QUANTIZER_MATRIX
2-3	Reserved

1:0 **JPEG**

Exists If:	//JPEG- Encoder Only

For JPEG QM Type:This field specifies which Quantizer Matrix is loaded.

Value	Name
0	JPEG_Luma_Y_QUANTIZER_MATRIX (or R)
1	JPEG_Chroma_Cb_QUANTIZER_MATRIX (or G)
2	JPEG_Chroma_Cr_QUANTIZER_MATRIX (or B)

Programming Notes
For JPEG encoder, each quantization element presents 16-bit 1/QM[i][j]. In RGB encoding, because the order input image components can be RGB, GBR, BGR, YUV, the value 0 is used for the first image component, the value 1 is used for the second image component, and the value 2 is used for the third image component.

2..33 31:0 **Forward Quantizer Matrix**

Format:	U32

The format of a Quantizer Matrix is an 8x8 matrix in raster order. Each element is an unsigned byte.

MFX_STATE_POINTER

MFX_STATE_POINTER

Source: VideoCS

Length Bias: 2

The MFX_STATE_POINTER command, issued at picture level, is used to set up the indirect pointers for VCS to fetch all the MFX states (Image state, Slice state, etc.) needed for the encoding/decoding process in PAK/IT mode. The encoding/decoding states are presented by state commands, which are grouped into separate sets (picture level, slice level, etc.), and each is stored in its own memory buffer referred by an indirect state pointer. The content of each indirect state buffer is a list of MFX state commands with no special format requirements. The sequence of commands in each indirect state buffer is terminated by a MI_BATCH_BUFFER_END command (acts as the last command marker). Therefore, indirect state buffers can have different and variable length of command sequences.

The indirection is designed to facilitate context switching in the middle of a codec operation. The smallest granularity of interruption is designed to be at a completed MB row in AVC/VC1/MPEG2 IT and AVC PAK operating modes as well as in VC1/MPEG2 VLD mode. There is no support for context switch in AVC VLD mode.

Hardware supports up to 4 separate indirect state pointers, allowing software to manage the grouping of state commands. During context switch, hardware restores (re-issues) the latest version of each indirect state pointer, if present.

MFX_STATE_POINTER command can only program one indirect state pointer at a time. MI_FLUSH will invalidate all indirect state buffer pointers inside VCS.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFX_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h Media Format: OpCode
	26:24	**Media Command Opcode** Default Value: 0h MFX_COMMON_STATE Format: OpCode
	23:21	**SubOpcode A** Default Value: 0h Format: OpCode
	20:16	**SubOpcode B** Default Value: 6h Format: OpCode
	15:12	**Reserved** Format: MBZ

MFX_STATE_POINTER

	11:0	**DWord Length** Default Value: 0h DWORD_COUNT_n Format: =n Total Length - 2
1	31:5	**State Pointer** Format: GeneralStateOffset[31:5]Indirect State Buffer Specifies the 32-byte aligned address of an Indirect State Buffer. This pointer is relative to the General State Base Address.
	4:2	**Reserved** Format: MBZ
	1:0	**State Pointer Index** Specifies one of the four indirect state pointers to program.

Value	Name	Description
00b		indirect state pointer 0 (image state)
01b		indirect state pointer 1 (slice state)sc
10b		indirect state pointer 2
11b		indirect state pointer 3

MFX_STITCH_OBJECT

MFX_STITCH_OBJECT

Source: VideoCS

Length Bias: 2

The MFC_STITCH_OBJECT command is used when stitch-enabled is set to 1, while CodecSel and StandardSel are set to ENCODE and AVC, respectively. This command is used, for example, to stitch multiple bitstreams to form a transport stream.
It is a variable length command as the data to be inserted are presented as either inline data and/or indirect data of this command. Multiple insertion commands can be issued back to back in a series. It is host software's responsibility to make sure their corresponding data will properly stitch together to form a valid output. Hardware keeps track of an output bitstream buffer current byte position and the associated next bit insertion position index. Context switch interrupt is not supported by this command.

The input bitstreams may be elementary streams stored in protected memory.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFC_STITCH_OBJECT Format: OpCode
	26:24	**Media Command Opcode** Default Value: 0h MFX_COMMON Format: OpCode
	23:21	**SubOpcode A** Default Value: 2h Format: OpCode
	20:16	**SubOpcode B** Default Value: Ah Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) = Variable Length in DW (>= 3) Format: =n Total Length - 2 If it is 3, it indicates the absent of inline data.

MFX_STITCH_OBJECT

1	31:18	**Reserved** Format: MBZ
	17:16	**Source Data Starting Byte Offset** Source Data Starting Byte Position within the very first inline DW.
	15:14	**Reserved** Format: MBZ
	13:8	**Source Data Ending Bit Inclusion** Source Data to be included in the very last inline DW. Follows the MSBit is the upper bit of each byte within the DW. The lower byte is actually processed first.For example, SrCDataEndingBitInclusion =9, bit 7:0 and bit 15 are included as valid header data. Value: [1,32] — Name:
	7:4	**Reserved**
	3	**Reserved**
	2	**Last Source Header Data Insert Command Flag** To process a series of consecutive insertion commands, this flag (=1) indicates the current command is the last 'header' insertion in the series.In CABAC, hardware must perform the "1" insert for byte align for Slice Header before Slice Data comes in in the next PAK-OBJECT command.In CAVLC, hardware ignores this bit.
	1	**Last Destination Data Insert Command Flag** THIS FIELD MUST BE THE SAME AS Last Source Header Data Insert Command Flag No more insertion command and no more PAK-OBJECT command follows.Flush data out to memory
	0	**Reserved**
2	31:19	**Reserved** Format: MBZ
	18:0	**Indirect Data Length** Format: U19 This field provides the length in bytes of the indirect data. A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect Data Start Address field is ignored. This field must have the same alignment as the Indirect Object Data Start Address.
3	31:0	**Indirect Data Start Address** Format: MfxIndirectBitstreamObjectAddress[31:0] This field specifies the Graphics Memory starting address of the data to be loaded into the kernel for processing. This pointer is relative to the MFX Indirect Bitstream Object Base Address. Hardware ignores this field if indirect data is not present.
4..n	31:0	**Insert Data PayLoad** Inline data to be inserted to the output bitstream buffer

MFX_SURFACE_STATE

MFX_SURFACE_STATE

Source:	VideoCS
Length Bias:	2

This command is common for all encoding/decoding modes, to specify the uncompressed YUV picture (i.e. destination surface) or intermediate streamout in/out surface (e.g. coefficient/residual) (field, frame or interleaved frame) format for reading and writing:

- Uncompressed, original input picture to be encoded
- Reconstructed non-filtered/filtered display picturec(becoming reference pictures as well for subsequent temporal inter-prediction)

Since there is only one media surface state being active during the entire encoding/decoding process, all the uncompressed/reconstructed pictures are defined to have the same surface state. The primary difference among picture surface states is their individual programmed base addresses, which are provided by other state commands and not included in this command. MFX engine is making the association of surface states and corresponding buffer base addresses.
MFX engine currently supports only one media surface type for video and that is the NV12 (Planar YUV420 with interleaved U (Cb) and V (Cr). For optimizing memory efficiency based on access patterns, only TileY is supported. For JPEG decoder, only IMC1 and IMC3 are supported. Pitch can be wider than the Picture Width in pixels and garbage will be there at the end of each line. The following describes all the different formats that are supported and not supported in Gen7 MFX :

- NV12 - 4:2:0 only; UV interleaved; Full Pitch, U and V offset is set to 0 (the only format supported for video codec); vertical UV offset is MB aligned; UV xoffsets = 0. JPEG does not support NV12 format because non-interleave JPEG has performance issue with partial write (in interleaved UV format)
- IMC 1 & 3 - Full Pitch, U and V are separate plane; (JPEG only; U plane + garbage first in full pitch followed by V plane + garbage in full pitch). U and V vertical offsets are block aligned; U and V xoffset = 0; there is no gap between Y, U and V planes. IMC1 and IMC3 are different by a swap of U and V. This is the only format supported in JPEG for all video subsampling types (4:4:4, 4:2:2 and 4:2:0)
- We are not supporting IMC 2 & 4 - Full Pitch, U and V are separate plane (JPEG only; U plane first in full pitch followed by V plane in full pitch - U and V plane are side-by-side). U and V vertical offsets are 16-pixel aligned; V xoffset is half-pitch aligned; U xoffset is 0; there is no gap between Y, U and V planes. IMC2 and IMC4 are different by a swap of U and V.
- We are not supporting YV12 - half pitch for each U and V plane, and separate planes for Y, U and V (U plane first in half pitch followed by V plane in half pitch). For YV12, U and V vertical offsets are block aligned; U and V xoffset = 0; there is no gap between Y, U and V planes

Note that the following data structures are not specified through the media surface state

- 1D buffers for row-store and other miscellaneous information.
- 2D buffers for per-MB data-structures (e.g. DMV biffer, MB info record, ILDB Control and Tcoeff/Stocoeff).

This surface state here is identical to the Surface State for deinterlace and sample_8x8 messages described in the Shared Function Volume and Sampler Chapter.
For non pixel data, such as row stores, indirect data (Compressed Slice Data, AVC MV record, Coeff record and

MFX_SURFACE_STATE

AVC ILDB record) and streamin/out and output compressed bitstream, a linear buffer is employed. For row stores, the H/W is designed to guarantee legal memory accesses (read and write). For the remaining cases, indirect object base address, indirect object address upper bound, object data start address (offset) and object data length are used to fully specified their corresponding buffer. This mechanism is chosen over the pixel surface type because of their variable record sizes.
All row store surfaces are linear surface. Their addresses are programmed in Pipe_Buf_Base_State or Bsp_Buf_Base_Addr_State

Programming Notes

VC1 I picture scaling: Even though VC1 allows I reconstructed picture scaling (via RESPIC), as such scaling is only allowed at I picture. All subsequent P (and B) pictures must have the same picture dimensions with the preceding I picture. Therefore, all reference pictures for P or B picture can share the same surface state with the current P and B picture. Note : H/W is not processing RESPIC. Application is no longer expecting intel decoder pipelineand kernel to perform this function, it is going to be done in the video post-processing scaler or display controller scale as a separate step and controller.

All video codec surfaces must be NV12 Compliant, except JPEG. U/V vertical must be MB aligned for all video codec (further contrained for field picture), but JPEG can be block aligned. All video codec and JPEG uses Tiled - Y format only, for uncompressed pixel surfaces.

Even for JPEG planar 420 surface, application may provide only 1 buffers, but there is still only one single surface state for all of them. If IMC equal to 1, 2, 3 or 4, U and V have the pitch same as Y. And U and V will have different offset, each offset is block aligned.

DWord	Bit	Description	
0	31:29	**Command Type**

		Format:	MBZ

MFX_SURFACE_STATE

	11:0	**DWord Length** Format: =n Total Length - 2 **Value** / **Name** / **Description** 4h / DWORD_COUNT_n **[Default]** / Excludes DWord (0,1)
1	31:4	**Reserved** Format: MBZ
	3:0	**Surface Id** Format: U4 **Value** / **Name** / **Description** 0000b / Reserved / 0001b / Reserved / 0010b / Reserved / 0011b / Reserved / 0100b / Source Input Picture (encoder) / 8-bit uncompressed data 0101b / Reconstructed Scaled Reference Picture / 8-bit data
2	31:18	**Height** Format: U14-1 Height This field specifies the height of the Picture in units of pixels/residuals. For PLANAR surface formats, this field indicates the height of the Y (luma) plane. Note : Gen7 Video Codecs must program less than and equal to 4K.(In future, it will be ideal to have this field define in a WORD boundary.)AVC - multiple of 2 MB rows for field pictureVC1 - mulitple of 4 pixels for field pictureMPEG2 - multiple of 2 MB rows for field picJPEG - mulitple of integral MCU (8 or 16 pixels) per picture **Value** / **Name** / **Description** [0,16383] / / representing heights [1,16384] **Programming Notes** • For AVC : For frame picture is a multiple of 16; for field picture is a multiple of 32 • For VC1 : For progressive frames, the frame height and frame width is a multiple of 2 pixels. For interlaced frames, the frame height shall be a multiple of 4 pixels, and its width is a multiple of 2 pixels, based on a PLANAR_420 surface.

MFX_SURFACE_STATE

17:4 Width

Format:	U14-1 Width

This field specifies the width of the Picture in units of pixels/residuals. For PLANAR surface formats, this field indicates the width of the Y (luma) plane.

Value	Name	Description
[0,16383]		representing widths [1,16384]

Programming Notes

- The Width specified by this field multiplied by the pixel size in bytes must be less than or equal to the surface pitch (specified in bytes via the Surface Pitch field).
- Width (field value + 1) must be a multiple of 2 for PLANAR_420,
- MFX HW does not use this field, the picture width is read from IMG State instead, because this field may not equal to the actual picture width. This field is used by the KMD to allocate surface in GTT.

3:2 Reserved

Format:	MBZ

1:0 Cr(V)/Cb(U) Pixel Offset V Direction

Format:	U0.2 exactly as shown in the original spec

Specifies the distance to the U/V values with respect to the even numbered Y channels in the V direction

Programming Notes

This field is ignored for all formats except PLANAR_420_8

3 31:28 Surface Format

Format:	U4

Specifies the format of the surface. All of the Y and G channels will use table 0 and all of the Cr/Cb/R/B channels will use table 1.Usage: For 420 planar YUV surface, use 4; for monochrome surfaces, use 12. For monochrome surfaces, hardware ignores control fields for Chroma planes.This field must be set to 4 - PLANAR_420_8, or 12 - Y8_UNORMNot used for MFX, and is ignored. But for JPEG decoding, this field should be programmed to the same format as JPEG_PIC_STATE. For video codec, it should set to 4 always.

Value	Name	Description
0	YCRCB_NORMAL	
1	YCRCB_SWAPUVY	
2	YCRCB_SWAPUV	
3	YCRCB_SWAPY	
4	PLANAR_420_8	(NV12, IMC1,2,3,4, YV12)
5	PLANAR_411_8	Deinterlace Only
6	PLANAR_422_8	Deinterlace Only

MFX_SURFACE_STATE

7	STMM_DN_STATISTICS	Deinterlace Only
8	R10G10B10A2_UNORM	Sample_8x8 Only
9	R8G8B8A8_UNORM	Sample_8x8 Only
10	R8B8_UNORM (CrCb	Sample_8x8 Only
11	R8_UNORM (Cr/Cb)	Sample_8x8 Only
12	Y8_UNORM	Sample_8x8 Only

27 **Interleave Chroma**

Format:	Enable

This field indicates that the chroma fields are interleaved in a single plane rather than stored as two separate planes. This field is only used for PLANAR surface formats.For AVC/VC1/MPEG VLD and IT modes : set to Enable to support interleave U/V only.For JPEG : set to Disable for all formats (including 4:2:0) - because JPEG does not support NV12. (This field is needed only if JPEG will support NV12; otherwise is ignored.)

Value	Name
1	Enable
0	Disable

26:20 **Reserved**

Format:	MBZ

19:3 **Surface Pitch**

Format:	U17-1 pitch in Bytes

This field specifies the surface pitch in (#Bytes).

Value	Name	Description
[0,2047]		to [1B, 2048B]

Programming Notes

For tiled surfaces, the pitch must be a multiple of the tile width (i.e.128 bytes aligned). If Half Pitch for Chroma is set, this field must be a multiple of two tile widths for tiled surfaces, or a multiple of 2 bytes for linear surfaces.For Y-tiled surfaces: Range = [127, 524287] to [128B,256KB] = [1 tile, 2048 tiles]

If Media Memory Compression is enabled, the following max pitch size restriction must be honored. For larger resolution, Media Memory compression Must be disabled.

Tiling Mode	Pixel Format	Max Frame Width (bytes)	Max Frame Width (pixels)	Max Pitch (bytes)
Legacy 4K	8bpp	16k	16k	16k + 127
	16bpp	16k	8k	16k + 127
	32bpp	16k	4k	16k + 127
	64bpp	16k	2k	16k + 127
	128bpp	16k	1k	16k + 127

MFX_SURFACE_STATE

TileYF	8bpp	8k	8k	8k + 63
	16bpp	16k	8k	16k + 127
	32bpp	16k	4k	16k + 127
	64bpp	16k	2k	16k + 255
	128bpp	16k	1k	16k + 255
TileYS	8bpp	16k	16k	16k + 255
	16bpp	16k	8k	16k + 511
	32bpp	16k	4k	16k + 511
	64bpp	16k	2k	16k + 1023
	128bpp	16k	1k	16k + 1023

2 **Half Pitch for Chroma**

Format:	Enable

(This field must be set to Disable)This field indicates that the chroma plane(s) will use a pitch equal to half the value specified in the Surface Pitch field. This field is only used for PLANAR surface formats.This field is igored by MFX (unless we support YV12)

1 **Tiled Surface**

Format:	Boolean

(This field must be set to TRUE: Tiled)This field specifies whether the surface is tiled.This field is ignored by MFX

Value	Name	Description
0	False	Linear
1	True	Tiled

Programming Notes
Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled surfaces can only be mapped to Main Memory.The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit.

0 **Tile Walk**

Format:	3D_Tilewalk

(This field must be set to 1: TILEWALK_YMAJOR)This field specifies the type of memory tiling (XMajor or YMajor) employed to tile this surface. See Memory Interface Functions for details on memory tiling and restrictions.This field is ignored when the surface is linear.This field is ignored by MFX. Internally H/W is always treated this set to 1 for all video codec and for JPEG.

Value	Name	Description
0h	XMAJOR	TILEWALK_XMAJOR
1h	YMAJOR	TILEWALK_YMAJOR

MFX_SURFACE_STATE

		Programming Notes The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit
4	31	**Reserved** Format: MBZ
	30:16	**X Offset for U(Cb)** Format: U15 Pixel Offset This field specifies the horizontal offset in pixels from the Surface Base Address to the start (origin) of the U(Cb) plane or the interleaved UV plane if Interleave Chroma is enabled. This field is only used for PLANAR surface formats. This field must be set to zero.X Offset for U(Cb) in pixel (This field must be zero for NV12 and IMC 1 and 3) **Programming Notes** For PLANAR_420 and PLANAR_422 surface formats, this field must be zero.
	15	**Reserved** Format: MBZ
	14:0	**Y Offset for U(Cb)** Format: U15 Pixel Row Offset This field specifies the veritical offset in rows from the Surface Base Address to the start (origin) of the U(Cb) plane or the interleaved UV plane if Interleave Chroma is enabled. This field is only used for PLANAR surface formats. **Programming Notes** For PLANAR_420 and PLANAR_422 surface formats, this field must be multiple of 16 pixels - i.e. multiple MBs. For JPEG, this field must be a multiple of 16 pixels.
5	31:29	**Reserved** Format: MBZ
	28:16	**X Offset for V(Cr)** Format: U13 Offset in Pixels This field must be zero for NV12 and IMC 1 and 3 This field specifies the horizontal offset in pixels from the Surface Base Address to the start (origin) of the V(Cr) plane. This field is only used for PLANAR surface formats with Interleave Chroma disabled. **Programming Notes** For PLANAR_420 and PLANAR_422 surface formats, this field must indicate an even number of pixels.

MFX_SURFACE_STATE		
	15:0	**Y Offset for V(Cr)** Format: U16 Row Offset in Pixels This field specifies the veritical offset in rows from the Surface Base Address to the start (origin) of the V(Cr) plane. This field is only used for PLANAR surface formats with Interleave Chroma disabled. This field is ignored by all video codec, only used by JPEG. **Programming Notes** For PLANAR_420 surface formats, this field must be multiple of 16 pixels - i.e. multiple MBs. For JPEG, this field must be a multiple of 16 pixels.

MFX_VC1_DIRECTMODE_STATE

MFX_VC1_DIRECTMODE_STATE

Source: VideoCS
Length Bias: 2
Exists If: //VC1 decoding in VLD modes

This is a picture level command and should be issued only once, even for a multi-slices picture.
There is only one DMV buffer for read (when processing a B-picture) and one for write (when processing a P-Picture). Each DMV record is 64 bits per MB, to store the top and bottom field MVs (32-bit MVx,y each).

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode

01b	Second highest priority
10b	Third highest priority
11b	Lowest priority

6:1 — Direct MV Read Buffer - Index to Memory Object Control State (MOCS) Tables

Format:	U6

The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.

0 — Reserved

MFX_VC1_PRED_PIPE_STATE

MFX_VC1_PRED_PIPE_STATE

Source: VideoCS

Length Bias: 2

This command is used to set the operating states of the MFD Engine beyond the BSD unit. It is used with both VC1 Long and Short format.Driver is responsible to take the intensity compensation enable signal, the LumScale and the LumShift provided from the DXVA2 VC1 interface, and maintain a history of these values for reference pictures. Together with these three parameters specified for the current picture being decoded, driver will derive and supply the above sets of LumScaleX, LumShiftX and intensity compensation enable (single or double, forward or backward) signals. H/W is responsible to take these state values, and use them to build the lookup table (including the derivation of iScale and iShift) for remapping the reference frame pixels, as well as perfoming the actual pixel remapping calculations/process.

DWord	Bit	Description

MFX_VP8_PAK_OBJECT

MFX_VP8_PAK_OBJECT

Source: VideoCS

Length Bias: 2

The MFX_VP8_PAK_OBJECT command is the second primitive command for the VP8 Encoding Pipeline.
The MV Data portion of the bitstream is loaded as indirect data object.Before issuing a MFX_VP8_PAK_OBJECT command, all VP8 MFX states need to be valid; therefore the commands used to set these states need to have been issued prior to the issue of this command.
MB record must be consecutive with no gaps, hence we do not need MB(x,y) in each MB command.
Internal counter will keep track of the current MB address, starting from the first MB.
MFX_VP8_PAK_OBJECT command follows the MbType definition like MFD.
Encoding statistical data such as the total size of the output bitstream are provided through MMIO registers. Software may access these registers through MI_STORE_REGISTER_MEM command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h MFX_VP8_PAK_OBJECT Format: OpCode
	26:24	**Media Command Opcode** Default Value: 4h VP8_ENC Format: OpCode
	23:21	**SubOpcode A** Default Value: 2h Format: OpCode
	20:16	**SubOpcode B** Default Value: 9h Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 5h DWORD_COUNT_n Format: =n Length -2
1	31:30	**Reserved** Format: MBZ

MFX_VP8_PAK_OBJECT

	29	**Enable Inline MV data** Format: Enable This field denotes if the MV data will be sent inline following the other inline data instead of being indirect.
	28:10	**Reserved** Format: MBZ
	9:0	**Indirect PAK-MV Data Length** Format: U10 This field provides the length in bytes of the indirect data, which contains all the MVs for the current MB (in any partitioning and subpartitioning form). A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect PAK-MV Data Start Address field is ignored. This field must have the same alignment as the Indirect PAK-MV Data Start Address. This field must be DW aligned (since each MV is 4 bytes in size).Driver has to derived this field from MVsize (MVquantity in DXVA, exact size) *4 bytes per MV.
2	31:29	**Reserved** Format: MBZ
	28:0	**Indirect PAK-MV Data Start Address Offset** This field specifies the memory starting address (offset) of the MV data to be fetched into PAK Subsystem for processing. This pointer is relative to the MFC Indirect PAK-MV Object Base Address.Hardware ignores this field if indirect data is not present, i.e. the Indirect PAK-MV Data Length is set to 0. It is a Dword aligned address in all AVC encoding configuration, since each MV is 4 bytes in size. Value: [0,512MB) — Name:
3..6	127:0	**Inline Data** All the required MB level controls and parameters for encoding are captured as Inline Data Description - VP8 PAK OBJECT. It has a fixed size of 4 DWs. Its definition is described in the next section.

MI_ARB_CHECK

MI_ARB_CHECK

Source: VideoEnhancementCS

Length Bias: 1

Description

The MI_ARB_CHECK is used to check for a change in arbitration. If executed as part of a Ring Buffer the command checks the UHPTR valid bit and if set the head of the ring will jump to the value of the head pointer programmed in the UHPTR.

Programming Notes

This instruction cannot be placed in a batch buffer.

If execlist is enabled, there is a pending execution list and this command is parsed, then the command streamer will preempt the current context and start executing the new execution list.

DWord	Bit	Description
0	31:29	**MI Instruction Type** Default Value: 0h MI_INSTRUCTION Format: OpCode
	28:23	**MI Instruction Opcode** Default Value: 05h MI_ARB_CHECK Format: OpCode

	22:0	**Reserved** Format: MBZ

MI_ARB_CHECK

MI_ARB_CHECK

Source: RenderCS

Length Bias: 1

Description

The MI_ARB_CHECK instruction is used to check the ring buffer double buffered head pointer (register UHPTR). This instruction can be used to pre-empt the current execution of the ring buffer. Note that the valid bit in the updated head pointer register needs to be set for the command streamer to be pre-empted.

Programming Notes

Ring Buffer mode of scheduling:

- The current head pointer is loaded with the updated head pointer register independent of the location of the updated head.
- If the current head pointer and the updated head pointer register are equal, hardware will automatically reset the valid bit corresponding to the UHPTR.
- For pre-emption, the wrap count in the ring buffer head register is no longer maintained by hardware. The hardware updates the wrap count to the value in the UHPTR register.

Execlist mode of scheduling:
MI_ARB_CHK will be used to indicate a command boundary on which Preemption will be honored by Command Streamer in the execlist mode of operation. UHPTR is ignored when processing MI_ARB_CHK in execlist mode.

This instruction can be in either a ring buffer or batch buffer.

MI_ARB_CHK command must not be programmed in INDIRECT_CTX and BB_PER_CTX_PTR buffers.

MI_ARB_ON_OFF

MI_ARB_ON_OFF

Source: CommandStreamer

Length Bias: 1

Description

The MI_ARB_ON_OFF instruction is used to disable/enable context switching. This instruction can be used to prevent submission of a new execlist from interrupting a command sequence, however lite restore preemption is allowed with in the arbitration disabled command execution zone. Note that context switching will remain disabled until re-enabled through use of this command.

This command will also prevent a switch in the case of waiting on events, running out of commands. These will effectively hang the device if allowed to occur while arbitration is off (context switching is disabled.) This command should always be used as an off-on pair with the sequence of instructions to be protected from context switch between MI_ARB_OFF and MI_ARB_ON. Software must use this arbitration control with caution since it has the potential to increase the response time of the Render Engine to pre-emption requests. This is a privileged command; it will not be effective (will be converted to a no-op) if executed from within a non-privileged batch buffer.

Execution List Mode of Scheduling: The MI_ARB_ON_OFF instruction is used to disable/enable context switching. Context swiching could be either due to preemption or un-succesfull wait for events or semaphore waits. This instruction can be used to prevent submission of a new execlist from interrupting a command sequence, however lite restore preemption is allowed with in the arbitration disabled command execution zone. Note that context switching will remain disabled until re-enabled through use of this command. This command will also prevent a switch in the case of waiting on events, running out of commands. These will effectively hang the device if allowed to occur while arbitration is off (context switching is disabled.)
Ring Buffer Mode of Scheduling: The MI_ARB_ON_OFF instruction is used to disable preemption on the preemptable commands. SW can explicitly make section of commands in a command buffer non-preemptable by sandwitching them between ARB_OFF and ARB_ON, HW will ingore preemption request (UHPTR Valid) until arbitration is enabled.

Programming Notes

This command must be always be programmed in pairs of off/on in the same command dispatch. Sequence of instructions to be protected from cntext switch or preemption must be programmed between the MI_ARB_OFF and MI_ARB_ON. Software must use this arbitration control with caution since it has the potential to increase the response time of the Render Engine to pre-emption requests. This is a privileged command; it will not be effective (will be converted to a no-op) if executed from within a non-privileged batch buffer.

MI_ATOMIC

MI_ATOMIC

Source: BSpec

Length Bias: 2

Description

MI_ATOMIC is used to carry atomic operation on data in graphics memory. Atomic operations are supported on data granularity of 4B, 8B and 16B. The atomic operation leads to a read-modify-write operation on the data in graphics memory with the option of returning value. The data in graphics memory is modified by doing arithmetic and logical operation with the inline/indirect data provided with the MI_ATOMIC command. Inline/Indirect provided in the command can be one or two operands based on the atomic operation. Ex: Atomic-Compare operation needs two operands while Atomic-Add operation needs single operand and Atomic-increment requires no operand. Refer "Atomics" sub-section under "L3 Cache and URB" section for detailed atomic operations supported. Atomic operations can be enabled to return value by setting "Return Data Control" field in the command, return data is stored to CS_GPR registers.
CS_GPR4/5 registers are updated with memory Return Data based on the "Data Size". Each GPR register is qword in size and occupies two MMIO registers.
Note: Any references to CS_GPR registers in the command should be understood as the CS_GPR registers belonging to the corresponding engines *CS_GPR registers.

Engine Name	Corresponding GPR Registers
RCS	CS_GPR
BCS	BCS_GPR
VCS	VCS_GPR
VECS	VECS_GPR

Indirect Source Operands:
Operand1 is sourced from [CS_GPR1, CS_GPR0]
Operand2 is sourced from [CS_GPR3, CS_GPR2]
Read return Data is stored in [CS_GPR_5, CS_GPR4]

When "Data Size" is DWORD lower dword of CS_GPR4 (Qword) is updated with the dword data returned from memory. When "Data Size" is QWORD only CS_GPR4 (Qword) is updated with the qword data returned from memory. When the data size is OCTWORD CS_GPR4/5 are updated with the OCTWORD data returned from memory. CS_GPR4 is loaded with lower qword returned from memory and CS_GPR5 is loaded with upper qword returned from memory.

Programming Notes

- When Inline Data mode is not set, Dwords 3..10 must not be included as part of the command. Dword Length field in the header must be programmed accordingly.
- When Inline Data Mode is set, Dwords3..10 must be included based on the Data Size field of the header. Both Operand-1 and Operand-2 dwords must be programmed based on the Data Size field. Operand-2 must be programmed to 0x0 if the atomic operation doesn't require it. Dword Length field in the header must be programmed accordingly.

<table>
<tr><td>Source:</td><td>RenderCS</td></tr>
</table>
<table>
<tr><th>Value</th><th>Name</th><th>Description</th></tr>
<tr><td>0h</td><td>No Post Sync Operation</td><td>Command is executed as usual.</td></tr>
<tr><td>1h</td><td>Post Sync Operation</td><td>MI_ATOMIC command is executed as a pipelined PIPE_CONTROL flush command with Atomics operation as post sync operation. Flush completion only guarantees the workload prior to this command is pushed till Windower unit and completion of any outstanding flushes issued prior to this command.
When this bit set following ristiriciton apply to atomic operation:
• Non-Compare atomic operations are supported on data granularity of 4B and 8B. DW3 is the lower dword of the operand and DW4 is the upper dword of the operand for the atomic operation.
• Compare atomic operations are supported on data granularity of 4B. DW3 is Operand-0 and DW4 is Operand-1 for the atomic operation.</td></tr>
</table></td></tr>
</table>

MI_ATOMIC

		• Atomic operations to GGTT/PPGTT memory surface are supported. • Only Inline data mode for atomic operand is supported, no support for indirect data mode. • No support for Return Data Control functionality. • No support for atomic operations on data granularity of 16B. • No support for compare atomic operations on data granularity of 8B.

Programming Notes
Any desired pipeline flush operation can be achieved by programming PIPE_CONTROL command prior to this command.
AWhen this bit is set Command Streamer sends a flush down the pipe and the atomic operation is saved as post sync operation. Command streamer goes on executing the following commands. Atomic operation saved as post sync operation is executed at some point later on completion of corresponding flush issued.
AWhen this bit is set atomic semaphore signal operation will be out of order with rest of the MI commands programmed in the ring buffer or batch buffer, it will be in order with respect to the post sync operations resulting due to PIPE_CONTROL command.

20:19 **Data Size**

This field indicates the size of the operand in dword/qword/octword on which atomic operation will be performed. Data size must match with the Atomic Opcode. Operation Data size could be 4B, 8B or 16B

Value	Name	Description
0h	DWORD	Operand size used by Atomic Operation is DWORD.
1h	QWORD	Operand Size used by Atomic Operation is QWORD.
2h	OCTWORD	Operand Size used by Atomic Operation is OCTWORD.
3h	RESERVED	

18 **Inline Data**

This bit when set indicates the source operands are provided in line within the command. When reset the source operands are in CS_GPR registers.

Programming Notes
CS_GPR registers must be programmed with appropriate values before issuing MI_ATOMIC command with this field reset.

MI_ATOMIC

17 CS STALL

This bit when set command stream waits for completion of this command before executing the next command.

Programming Notes	Source
Render Command Streamer Only: CS will not guarantee atomic operation to be complete upon setting this bit along with Post Sync Operation set. When Post Sync Operation is set, this bit has no significance.	RenderCS

Workaround
Workaround : When CS STALL bit is set, Return Data Control must also be set in MI_ATOMIC command.

16 Return Data Control

Source:	RenderCS, BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS

Description
When Return Data Control is set the read return feature will be enabled during the atomic operation. Data is stored in CS_GPR5/4 registers unconditionally on completion of the atomic operation. On data return CS_GPR5/4 Registers are updated based on the "Data Size" field. When "Data Size" is DWORD lower dword of CS_GPR4 (Qword) is updated with the dword data returned from memory. When "Data Size" is QWORD only CS_GPR4 (Qword) is updated with the qword data returned from memory. When the data size is OCTWORD CS_GPR4/5 are updated with the OCTWORD data returned from memory. CS_GPR4 is loaded with lower qword returned from memory and CS_GPR5 is loaded with upper qword returned from memory.

Workaround
Workaround: When Return Data Control bit is set, CS STALL must also be set in MI_ATOMIC command.

15:8 ATOMIC OPCODE

This field selects the kind of atomic operation to be performed. Refer "Atomics" sub-section of "L3 Cache and URB" section of the B-spec for atomic opcode encoding and operation.

MI_BATCH_BUFFER_START

MI_BATCH_BUFFER_START

Source: CommandStreamer

Length Bias: 2

The MI_BATCH_BUFFER_START command is used to initiate the execution of commands stored in a batch buffer. For restrictions on the location of batch buffers, see Batch Buffers in the Device Programming Interface chapter of *MI Functions*. The batch buffer can be specified as privileged or non-privileged, determining the operations considered valid when initiated from within the buffer and any attached (chained) batch buffers. See Batch Buffer Protection in the Device Programming Interface chapter of *MI Functions*.

Programming Notes

- A batch buffer initiated with this command must end either with a MI_BATCH_BUFFER_END command or by chaining to another batch buffer with an MI_BATCH_BUFFER_START command.
- It is essential that the address location beyond the current page be populated inside the GTT. HW performs over-fetch of the command addresses and any over-fetch requires a valid TLB entry. A single extra page beyond the batch buffer is sufficient.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 31h MI_BATCH_BUFFER_START Format: OpCode
	22	**Second Level Batch Buffer** The command streamer contains three storage elements; one for the ring head address, one for the batch head address, and one for the second level batch head address. When performing batch buffer chaining, hardware simply updates the head pointer of the first level batch address storage. There is no stack in hardware. When this bit is set, hardware uses the 2nd level batch head address storage element. Upon MI_BATCH_BUFFER_END, it will automatically return to the first level batch buffer address. This allows hardware to mimic a simple 3-level stack. Value / Name / Description 0h / First level batch / Place the batch buffer address in the 1st (traditional) level batch address storage element. 1h / Second / Place the batch buffer address in the

MI_BATCH_BUFFER_START

	level batch	second-level batch address storage element.

Programming Notes
Within a second level batch buffer there can't be any chained batch buffers. MI_BATCH_BUFFER_START command is not allowed inside a second level batch buffer.
Setting this bit when the command is parsed in the ring, will cause the command to be ignored. This bit must only be set in a first level batch buffer.

MI_COPY_MEM_MEM

MI_COPY_MEM_MEM

Source: BlitterCS

Length Bias: 2

The MI_COPY_MEM_MEM command reads a DWord from memory and stores the value of that DWord to back to memory. The source and destination addresses are specified in the command. The command temporarily halts command execution.

Programming Notes

This command should not be used within a "non_privilege"batch buffer to access global virtual space, doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation. This command can be used within ring buffers and/or privilege batch buffers to access global virtual space.

	1:0	**Reserved** Format: MBZ

MI_DISPLAY_FLIP

MI_DISPLAY_FLIP

Source:	RenderCS, BlitterCS
Length Bias:	2

The MI_DISPLAY_FLIP command is used to request a specific display plane to switch (flip) to display a new buffer. The buffer is specified with a starting address and pitch. The tiled attribute of the buffer start address is programmed as part of the packet.

The operation this command performs is also known as a "display flip request" operation - in that the flip operation itself will occur at some point in the future. This command specifies when the flip operation is to occur: either synchronously with vertical retrace to avoid tearing artifacts (possibly on a future frame), or asynchronously (as soon as possible) to minimize rendering stalls at the cost of tearing artifacts.

Programming Notes

1. This command simply requests a display flip operation. Command execution then continues normally. There is no guarantee that the flip (even if asynchronous) will occur prior to subsequent commands being executed. (Note that completion of the MI_FLUSH command does not guarantee that outstanding flip operations have completed). The MI_WAIT_FOR_EVENT command can be used to provide this synchronization - by pausing command execution until a pending flip has actually completed. This synchronization can also be performed by use of the Display Flip Pending hardware status. See Display Flip Synchronization in the Device Programming Interface chapter of MI Functions.
2. After a display flip operation is requested, software is responsible for initiating any required synchronization with subsequent buffer clear or rendering operations. For multi-buffering (e.g., double buffering) operations, this will typically require updating SURFACE_STATE or the binding table to change the rendering (back) buffer. In addition, prior to any subsequent clear or rendering operations, software must typically ensure that the new rendering buffer is not actively being displayed. Again, the MI_WAIT_FOR_EVENT command or Display Flip Pending hardware status can be used to provide this synchronization. See Display Flip Synchronization in the Device Programming Interface chapter of MI Functions.
3. The display buffer command uses the X and Y offset for the tiled buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For tiled buffers, the display subsystem uses the X and Y offset in generation of the final request to memory. The offset is always updated on the next vblank for both Synchronous and Asynch Flips. It is not necessary to have a flip enqueued to update the X and Y offset.
4. The display buffer command uses the linear dword offset for the linear buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For linear buffers, the display subsystem uses the dword offset in generation of the final request to memory.
    - For synchronous flips the offset is updated on the next vblank. It is not necessary to have a sync flip enqueued to update the dword offset.
5. DWord 3 (Left Eye Display Buffer Base Address) must not be set with synchronous flips or asynchronous flips. It is only allowed to be sent with stereo 3D flips.

MI_DISPLAY_FLIP

Asynchronous flip completion time depends greatly on how much data has been prefetched for power savings, and can take up to 1 full frame to complete. For faster flip completion, disable FBC and render compression and allocate a small amount of data buffer for the plane.

"Command Streamer Plane Number" mapping to "Display Plane Name" are listed in dsiplay B-spec -"Plane capability and Interoperability".

	4:2	**Reserved** Format: MBZ
	1	**Force Render Awake** Source: BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS Format: U1 When set, Command Streamer sends message to PM to force awake render engine (next instructions require render engine awake). Command streamer waits for acknowledge from PM before parsing the next command. When reset, command streamer sends message to PM to disable force awake of render engine (next instructions do not require the render engine to be awake. Command streamer waits for acknowledge from PM before parsing the next command. **Programming Notes** Mask bit [17] has to be set for HW to look at this field when MI_FORCE_WAKEUP command is parsed.
	1:0	**Reserved** Source: RenderCS Format: MBZ
	0	**Force Media Awake** Source: BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS Format: U1 When set, Command Streamer sends message to PM to force awake media engine (next instructions require media engine awake). Command streamer waits for acknowledge from PM before parsing the next command. When reset, command streamer sends message to PM to disable force awake of media engine (next instructions do not require the media engine to be awake). Command streamer waits for acknowledge from PM before parsing the next command. **Programming Notes** Mask bit [16] has to be set for HW to look at this field when MI_FORCE_WAKEUP command is parsed.

MI_LOAD_REGISTER_IMM

MI_LOAD_REGISTER_IMM

Source: CommandStreamer

Length Bias: 2

The MI_LOAD_REGISTER_IMM command requests a write of up to a DWord constant supplied in the command to the specified Register Offset (i.e., offset into Memory-Mapped Register Range).
Any offset that is to a destination outside of the GT core will allow the parser to continue once the cycle is at the GT boundry and not destination. Any other address will ensure the destination is updated prior to parsing the next command

Programming Notes	Source
Many MMIO bits require the engine to be IDLE prior to updating the value. Command streamer does not implicitly put in a pipeline flush in the cases a MMIO bit requires the engine to be IDLE. In the case there was a 3DPRIMITIVE command or GPGPU_WALKER command without any stalling PIPE_CONTROL, one must be inserted prior to a MI_LOAD_REGISTER_IMMEDIATE that is updating a bit that requires the engine to be IDLE.	RenderCS
When executed from a non-privileged batch buffer, MMIO writes are only allowed to the registers listed in User Mode Non-Privileged Registers for the corresponding engine, any writes targeting the register not listed in the User Mode Non-Privileged Register will convert this command to a NOOP.	
The following addresses should NOT be used for LRIs: 1. 0x8800 - 0x88FF 2. >= 0xC0000 Limited LRI cycles to the Display Engine (0x40000-0xBFFFF) are allowed, but must be spaced to allow only one pending at a time. This can be done by issuing an SRM to the same address immediately after each LRI.	
Programming an MMIO register is equivalent to programming a non-pipeline state to the hardware and hence an explicit stalling flush needs to be programmed prior to programming this command. However for certain MMIO registers based on their functionality doing an explicit stalling flush is exempted. Listed below are the exempted registers. • 3DPRIM_END_OFFSET - Auto Draw End Offset • 3DPRIM_START_VERTEX - Load Indirect Start Vertex • 3DPRIM_VERTEX_COUNT - Load Indirect Vertex Count • 3DPRIM_INSTANCE_COUNT - Load Indirect Instance Count • 3DPRIM_START_INSTANCE - Load Indirect Start Instance • 3DPRIM_BASE_VERTEX - Load Indirect Base Vertex	RenderCS

2	31:0	**Data DWord** Mask: Bytes Write Disables Format: U32 This field specifies the DWord value to be written to the targeted location.

MI_LOAD_REGISTER_MEM

MI_LOAD_REGISTER_MEM

Source: RenderCS, BlitterCS, VideoCS, VideoEnhancementCS

Length Bias: 2

The MI_LOAD_REGISTER_MEM command requests from a memory location and stores that DWord to a register.

Programming Notes

The command temporarily halts commands that will cause cycles down the 3D pipeline.

The following addresses should NOT be used for MMIO writes:

- 0x8800 - 0x88FF
- >= 0xC0000

Limited MMIO writes cycles to the Display Engine 0x40000-0xBFFFF) are allowed, but must be spaced to allow only one pending at a time. This can be done by issuing an SRM to the same address immediately after each MMIO write.

This command should not be used within a non-privilege batch buffer to access global virtual space, doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation.

This command is not allowed to update the privilege register range when executed from a non-privilege batch buffer.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 29h MI_LOAD_REGISTER_MEM Format: OpCode
	22	**Use Global GTT** Format: Boolean This bit if set when executing from a non-privileged batch buffer will be treated as privilege access violation. It is allowed for this bit to be clear when executing this command from a privileged (secure) batch buffer or ring buffer. This command will use the global GTT to translate the Address and this command must be executing from a privileged (secure) batch buffer.
	21	**Async Mode Enable** Format: Enable If this bit is set then the command stream will not wait for completion of this command before executing the next command. Please refer to the LOAD_INDIRECT and Predicate registers for usage of this bit.

MI_LOAD_REGISTER_MEM

	20	**Reserved**
	19	**Reserved**
	18:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Format: =n Total Length - 2. Excludes DWord (0,1). Value: 2h — Name: Excludes DWord (0,1) **[Default]**
1	31:23	**Reserved** Format: MBZ
	22:2	**Register Address** Format: MMIOAddress[22:2] This field specifies Bits 22:2 of the Register offset the DWord will be written to. As the register address must be DWord-aligned, Bits 1:0 of that address MBZ.
	1:0	**Reserved** Format: MBZ
2..3	63:2	**Memory Address** Format: GraphicsAddress[63:2] This field specifies the address of the memory location where the register value specified in the DWord above will read from. The address specifies the DWord location of the data. Range = GraphicsVirtualAddress[63:2] for a DWord register GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47].
	1:0	**Reserved** Format: MBZ

MI_LOAD_REGISTER_REG

MI_LOAD_REGISTER_REG

Source: CommandStreamer

Length Bias: 2

The MI_LOAD_REGISTER_REG command reads from a source register location and writes that value to a destination register location.

Any offset that is to a destination outside of the GT core will allow the parser to continue once the cycle is at the GT boundry and not destination. Any other address will ensure the destination is updated prior to parsing the next command

Programming Notes

The command temporarily halts commands that will cause cycles down the 3D pipeline.

Destination register with mask implemented will not get updated unless the value read from source register has the bits corresponding to the mask bits set. Note that any mask implemented register when read returns "0" for the bits corresponding to mask location. When the source and destination are mask implemented registers, destination register will not get updated with the source register contents.

This command is not allowed to update the privilege register range when executed from a non-privilege batch buffer.

Workaround

Workaround: Reads to MMIO registers outside GT (Source Register Address > 0x40000) are not supported.

DWord	Bit	Description

MI_LOAD_SCAN_LINES_EXCL

MI_LOAD_SCAN_LINES_EXCL

Source: BlitterCS

Length Bias: 2

The MI_LOAD_SCAN_LINES_EXCL command is used to initialize the Scan Line Window registers for a specific Display Pipe. If the display refresh is *outside* this window the Display Engine asserts a signal that is used by the command parser to process the WAIT_FOR_EVENT command (i.e., the parser will wait while outside). This command overrides the Scan Line Window defined by any previous MI_LOAD_SCAN_LINES_INCL or MI_LOAD_SCAN_LINES_EXCL commands targeting the specific display pipe.

Note: The two scan-line numbers are inclusive. If programmed to the same values, that single line defines the region in question.

Always place an even number of MI_LOAD_SCAN_LINES_EXCL/INCL at a time into the ring buffer. If only a single MI_LOAD_SCAN_LINES_EXCL/INCL is desired, just add a second identical MI_LOAD_SCAN_LINES_EXCL/INCL command.

MI_NOOP

MI_NOOP

Source: VideoEnhancementCS

Length Bias: 1

The MI_NOOP command basically performs a "no operation" in the command stream and is typically used to pad the command stream (e.g., in order to pad out a batch buffer to a QWord boundary). However, there is one minor (optional) function this command can perform - a 22-bit value can be loaded into the MI NOPID register. This provides a general-purpose command stream tagging ("breadcrumb") mechanism (e.g., to provide sequencing information for a subsequent breakpoint interrupt).

DWord	Bit	Description

Value / Name / Description 0h / Disable / Do not write the NOP_ID register. 1h / Enable / Write the NOP_ID register.
	21:0	**Identification Number** Format: U22 This field contains a 22-bit number which can be written to the MI NOPID register.

MI_NOOP

MI_NOOP

Source: VideoCS

Length Bias: 1

The MI_NOOP command basically performs a "no operation" in the command stream and is typically used to pad the command stream (e.g., in order to pad out a batch buffer to a QWord boundary). However, there is one minor (optional) function this command can perform - a 22-bit value can be loaded into the MI NOPID register. This provides a general-purpose command stream tagging ("breadcrumb") mechanism (e.g., to provide sequencing information for a subsequent breakpoint interrupt).

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 00h MI_NOOP Format: OpCode
	22	**Identification Number Register Write Enable** Format: Enable This field enables the value in the Identification Number field to be written into the MI NOPID register. If disabled, that register is unmodified - making this command an effective "no operation" function. Value: 1 — Name: Write the NOP_ID register.
	21:0	**Identification Number** Format: U22 This field contains a 22-bit number which can be written to the MI NOPID register.

MI_PREDICATE

MI_PREDICATE

Source: RenderCS

Length Bias: 1

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 0Ch MI_PREDICATE Format: OpCode
	22:8	**Reserved** Format: MBZ
	7:6	**Load Operation** This field controls if/how the Predicate state bit is modified. 0h KEEP — The Predicate state bit is unmodified. 1h Reserved 2h LOAD — The Predicate state bit is loaded with the combine operation result. 3h LOADINV — The Predicate state bit is loaded with the inverted combine operation result.
	5	**Reserved** Format: MBZ
	4:3	**Combine Operation** This field controls if/how the result of the compare operation is combined with the current Predicate state bit. 0h SET — The combine operation output the compare result unmodified. 1h AND — The combine operation outputs the AND of the compare result and the current Predicate state bit. 2h OR — The combine operation outputs the OR of the compare result and the current Predicate state bit. 3h XOR — The combine operation outputs the XOR of the compare result and the current Predicate state bit.
	2	**Reserved** Format: MBZ

MI_PREDICATE

	1:0	**Compare Operation** This field controls how Data DWord 0 and Data DWord 1 fields are used to generate a compare operation result and possibly modify the PredicateData register.

Value	Name	Description
0h	TRUE	The compare operation outputs TRUE. The PredicateData register is unmodified.
1h	FALSE	The compare operation outputs FALSE. The PredicateData register is unmodified.
2h	SRCS_EQUAL	(MItemp0 - MItemp1) is computed and loaded into the PredicateData register. The compare operation outputs (MItemp0 == MItemp1).
3h	DELTAS_EQUAL	(MItemp0 - MItemp1) is computed and compared to the PredicateData register. If the values are equal, the compare operation outputs TRUE, otherwise it outputs FALSE. The PredicateData register is unmodified.

MI_REPORT_HEAD

MI_REPORT_HEAD

Source: VideoEnhancementCS

Length Bias: 1

The MI_REPORT_HEAD command causes the Head Pointer value of the ring buffer to be written to a cacheable (snooped) system memory location.

When the **Per-Process Virtual Address Space and Execlist Enable bit** is reset: The location written is relative to the address programmed in the Hardware Status Page Address Register. When the **Execlist Enable** is set, the head pointer will be reported to the PP HW Status Page.

Programming Notes

This command must not be executed from a Batch Buffer (Refer to the description of the HWS_PGA register).

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 07h MI_REPORT_HEAD Format: OpCode

MI_REPORT_PERF_COUNT

MI_REPORT_PERF_COUNT

Source: RenderCS

Length Bias: 2

The MI_REPORT_PERF_COUNT command causes the GFX hardware to write out a snap-shot of performance counters to the address specified in this command along with constant ID field supplied and the time-stamp counter. This write is required to be treated as a cacheable write irrespective of GTT entry memory type. This command is specific to the render engine.

Programming Notes

GTT_SELECT must not be set to 1 (i.e. GGTT) when MI_REPORT_PERF_COUNT command is programmed in a non-privileged batch buffer. Refer to the "User Mode Privileged commands" Table in MI_BATCH_BUFFER_START command section for more details.
All batch buffers in PPGTT are considered as Non-privileged.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode

1..2	63:6	**Memory Address** Format: GraphicsAddress[63:6] This field specifies 64B aligned GFX MEM address where the chap counter values are reported. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47] **Programming Notes** This field is ignored if "Report to OABUFFER" bit is set.
	5	**Reserved** Format: MBZ

MI_REPORT_PERF_COUNT

	4	**Core Mode Enable** Format: U1 This bit is set then the address will be offset by the Core ID:If Core ID 0, then there is no offsetIf Core ID 1, then the Memory is offset by the size of the data(64b).
	3:1	**Reserved** Format: MBZ
	0	**Use Global GTT** Format: Boolean This field when set (i.e. bit = 1) selects the GGTT for address translation. When this bit is 0 (default value), HW should use PGTT for address translation.
3	31:0	**Report ID** Format: U32 This field specifies the ID provided by SW for a given report command. It can be tracked to use different flavors of these reports based on where in command-stream they are inserted.This field is reported only when Counter Select Field is 0. **Programming Notes** If a privilege access violation occurs, the REPORT ID field in the report generated by the next legitimate MI_REPORT_PERF_COUNT will be corrupted.

MI_RS_CONTEXT

MI_RS_CONTEXT

Source: RenderCS

Length Bias: 1

The MI_RS_CONTEXT command is used to force a resource streamer context save or restore.

Programming Notes

This command must not be used/programmed in Execution List mode of scheduling.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 0Fh MI_RS_CONTEXT Format: OpCode
	22:1	**Reserved** Format: MBZ
	0	**Resource Streamer Save** Format: U1 This bit specifies whether the MI_RS_CONTEXT command will cause the resource streamer context to be saved or restored. Value / Name / Description 0h / Restore / Resource Streamer context is restored 1h / Save / Resource Streamer context is saved

MI_RS_CONTROL

MI_RS_CONTROL

Source: RenderCS

Length Bias: 1

The MI_RS_CONTROL command is used to start or stop the Resource Streamer.

Programming Notes

- This command must be programmed only inside a Resource Streamer enabled batch buffer.
- This command provides means to selectively disable or enable Resource Streamer for set of commands in a Resource Streamer enabled batch buffer
- On re-enabling the Resource Streamer through this command, command streamer will start Resource Streamer on the next non-sync command of the batch buffer.
- This command status is render context save/restored during context switching.
- The scope of MI_RS_CONTROL is within the batch buffer it is programmed, it doesn't get carried to the following chained batch buffer or second level batch buffer. RS control status goes back to default mode of Resource Streamer Enabled on all batch buffer arbitration boundaries. Batch buffer arbitration boundaries includes calling a chained or a second level batch buffer through MI_BATCH_BUFFER_START command or terminating a batch buffer through MI_BATCH_BUFFER_END command.
- Example:

1. MI_BATCH_START (Primary batch buffer with RS enable)
2. Command 1 --> CS starts RS
3. Command 2
4. :
5. MI_RS_CONTROL (stop option) -> RS will stop on this command, CS sets RS control status to STOP.
6. Command 3
7. MI_BATCH_START (2nd level batch with RS enable not set, RS control status gets reset to default status of START)
8. :
9. MI_BATCH_END (Second Level Batch End)
10. Command 4 --> CS starts RS here as RS control flag gets reset to START at step-7
11. MI_BATCH_BUFFER_END

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode

MI_RS_CONTROL

	28:23	**MI Command Opcode** Default Value: 06h MI_RS_CONTROL Format: OpCode
	22:1	**Reserved** Format: MBZ
	0	**Resource Streamer Control** Format: U1 This bit specifies whether the command is starting or stopping the Resource Streamer.

Value	Name	Description
0h	Stop	Stop and disable the Resource Streamer
1h	Start	Start and enable the Resource Streamer

MI_RS_STORE_DATA_IMM

MI_RS_STORE_DATA_IMM

Source: RenderCS

Length Bias: 2

The MI_RS_STORE_DATA_IMM command requests a write of the DWord constant supplied in the packet to the specified Memory Address.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 2Bh Format: OpCode MI_RS_STORE_DATA_IMM
	22	**Reserved** Format: MBZ
	21	**Reserved**
	20:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Default Value: 2h Format: =n Total Length - 2. Excludes DWord (0,1).
1..2	63:2	**Destination Address** Format: GraphicsAddress[63:2] This field specifies Bits 47:2 of the Address where the DWord will be stored. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47]. When render engine is PPGTT enabled this Address is translated using PPGTT, else GGTT is used for translation.
	1	**Reserved** Format: MBZ
	0	**Core Mode Enable** If this bit is set then the address will be offset by the Core ID: If Core ID 0, then there is no offset If Core ID 1, then the Memory is offset by the size of the data.

MI_RS_STORE_DATA_IMM		
3	31:0	**Data DWord 0** Format: U32 This field specifies the DWord value to be written to the targeted location.

MI_SEMAPHORE_SIGNAL

MI_SEMAPHORE_SIGNAL

Source: CommandStreamer

Length Bias: 2

Description

This command is used to signal the target engine stating the memory semaphore update occurrence to one of its contexts with **Target Context ID.** MI_SEMPHORE_SIGNAL and MI_SEMAPHORE_WAIT together replace the MI_SEMAPHORE_MBOX command. MI_ATOMIC (non-posted) command will be programmed prior to this command to update the semaphore data in memory.

Workaround

Workaround: Post-Sync operation bit must not be set when Target Engine Select is set to RCS.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 1Bh MI_SEMAPHORE_SIGNAL Format: OpCode
	22	**Reserved** Format: MBZ
	21	**Post-Sync Operation** Source: RenderCS

Value	Name	Description
0h	No Post Sync Operation	Command is executed as usual.
1h	Post Sync Operation	MI_SEMAPHORE_SIGNAL command is executed as a pipelined PIPE_CONTROL flush command with Semaphore Signal as post sync operation. Flush completion only guarantees the workload prior to this command is pushed till Windower unit and completion of any outstanding flushes issued prior to this command.

Programming Notes

Any desired pipeline flush operation can be achieved by programming PIPE_CONTROL command prior to this command.

When this bit is set Command Streamer sends a flush down the pipe and the atomic operation is saved as post sync operation. Command streamer goes on executing the following

MI_SEMAPHORE_SIGNAL

		commands. Atomic operation saved as post sync operation is executed at some point later on completion of corresponding flush issued. When this bit is set atomic semaphore signal operation will be out of order with rest of the MI commands programmed in the ring buffer or batch buffer, it will be in order with respect to the post sync operations resulting due to PIPE_CONTROL command.

	7:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2

MI_SEMAPHORE_SIGNAL		
1	31:0	**Target Context ID** **Description** In execlist based scheduling this field contains the Context ID corresponding to the context of the target engine that this command is signaling. Target engine waiting on MI_SEMPHORE_WAIT in signal mode will re-fetch the data from memory or comparison if its context ID is same as this signaled Context ID. When execlists are enabled, Target engine on receiving this Context ID sends message to the SHIM if it doesn't have the context with the same Context ID running. Message send to SHIM carries the Context ID which will be looked at by UC for rescheduling the signaled Context ID. Target engine waiting on MI_SEMAPHORE_WAIT in signal mode will fetch data from memory for comparison on receiving signal irrespective of the context id received. In ring buffer mode of scheduling this field doesn't have any relevance.

MI_SEMAPHORE_WAIT

MI_SEMAPHORE_WAIT

Source: CommandStreamer

Length Bias: 2

Description

This command supports memory based Semaphore WAIT. Memory based semaphores will be used for synchronization between the Producer and the Consumer contexts. Producer and Consumer Contexts could be running on different engines or on the same engine inside GT. Running on the same engine is only possible when execlists are enabled. Producer Context implements a Signal and Consumer context implements a Wait. Command Streamer on parsing this command fetches data from the Semaphore Address mentioned in this command and compares it with the inline Semaphore Data Dword.

- If comparison passes, the command streamer moves to the next command.
- When execlists are enabled, if comparison fails Command streamer switches out the context. Context switch can be inhibited by setting "Inhibit Synchronous Context Switch" in CTXT_SR_CTL register.
- In ring buffer mode of scheduling or Execlist with "Inhibit Synchronous context Switch", if comparison fails, Command Streamer evaluates the Compare Operation based on the Wait Mode until the compare operation is true or Wait is canceled by SW.
- Exec-List Scheduling: CS generates semaphore wait interrupt to the scheduler when MI_SEMAPHORE_WAIT command is un-successful and when "Inhibit Synchronous Context Switch" is set. Scheduler can use this interrupt to preempt the context waiting on semaphore wait.

MI_SEMPHORE_SIGNAL and MI_SEMAPHORE_WAIT together replace the MI_SEMAPHORE_MBOX command.

Workaround

Workaround: [All Command Streamers][Ring Buffer Mode of Scheduling]: MI_SEMAPHORE_WAIT command must be always programmed with “Wait Mode” set to “Polling Mode” Or MI_SEMAPHORE_WAIT command with “Wait Mode” set to “Polling Mode” can be programmed when “Semaphore Wait Event IDLE message Disable” bit in “RC_PSMI_CTRL” register is set to disable Idle messaging on unsuccessful MI_SEMPAHORE_WAIT.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 1Ch MI_SEMAPHORE_WAIT Format: OpCode
	22	**Memory Type** This bit will be ignored and treated as if clear when executing from a non-privileged batch buffer. It is allowed for this bit to be clear when executing this command from a privileged (secure) batch buffer. This bit *must* be 1 if the **Per Process GTT Enable** bit is clear.

MI_SEMAPHORE_WAIT

Value	Name	Description
0h	Per Process Graphics Address	
1h	Global Graphics Address	This command will use the global GTT to translate the Address and this command must be executing from a privileged (secure) batch buffer.

21:18 Reserved

MI_SET_CONTEXT

MI_SET_CONTEXT

Source: RenderCS

Length Bias: 2

The MI_SET_CONTEXT command is used to specify the logical context associated with the hardware context. A logical context is an area in memory used to store hardware context information, and the context is referenced via a 2KB-aligned pointer. If the (new) logical context is different (i.e., at a different memory address), the device saves the current HW context values to the current logical context address, and then restores (loads) the new logical context by reading the context from the new address and loading it into the hardware context state. If the logical context address specified in this command matches the current logical context address, this command is effectively treated as a NOOP. Specific to the Render command stream only. This command also includes some controls over the context save/restore process. The Force Restore bit can be used to refresh the on-chip device state from the same memory address if the indirect state buffers have been modified. The Restore Inhibit bit can be used to prevent the new context from being loaded at all. This must be used to prevent an uninitialized context from being loaded. Once software has initialized a context (by setting all state variables to initial values via commands), the context can then be stored and restored normally. When switching from a generic media context to a 3D context, the generic media state must be cleared via the Generic Media State Clear bit 16 in PIPE_CONTROL (or bit 4 in MI_FLUSH) before saving 3D context. MI_SET_CONTEXT commands are permitted only within a ring buffer (not within a batch buffer).
All context is saved and restored from a GGTT space.
This command does not initiate any interrupt due to context switch of any kind and does not support any workaround batch buffer or indirect context offset feature.

Programming Notes

This command is legal only if Execlist Enable in the GFX_MODE register is reset. Otherwise, execlists must be used to switch context in lieu of MI_SET_CONTEXT.

For ring buffer mode, the first 128B(2 cache lines) of the context image are saved as zeros.

This command needs to be always followed by a single MI_NOOP instruction to workaround a silicon issue.

MI_ARB_ON_OFF with 'Arbitration Enable Reset' set should be programmed before an MI_SET_CONTEXT command. MI_ARB_ON_OFF with 'Arbitration Enable' set should be programmed after an MI_SET_CONTEXT command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 18h MI_SET_CONTEXT Format: OpCode
	22:8	**Reserved** Format: MBZ

MI_SET_CONTEXT

	7:0	**DWord Length** Default Value: 0h Format: =n Total Length - 2. Excludes DWord (0,1).
1	31:12	**Logical Context Address** Format: GraphicsAddress[31:12]LogicalContext **Description** This field contains the 4KB-aligned graphics memory address of the Logical Context that is to be loaded into the hardware context. If this address is equal to the CCID register associated with the current ring, no load will occur. Prior to loading this new context, the device will save the existing context as required. After the context switch operation completes, this address will be loaded into the associated CCID register. This field needs to be 4KB aligned virtual address.
	11:10	**Reserved** Format: MBZ
	9	**Reserved** Format: MBZ
	8	**Reserved, Must be 1** Format: Must Be One
	7:5	**Reserved** Format: MBZ
	4	**Core Mode Enable** Format: Enable If set the Context Image will be offset based off the Core ID: If Core ID 0, no offset If Core ID 1, 36KB Offset
	3	**Resource Streamer State Save Enable** Format: Enable If set, the resource streamer state identified in the Logical Context Data section of the Memory Data Formats chapter is saved as part of switching away from this logical context. This bit will be stored in the associated CCID register to control the context save operation when switching away from this context (as part of a subsequent MI_SET_CONTEXT command).

MI_SET_CONTEXT		
	2	**Resource Streamer State Restore Enable** Format: Enable If set, the resource streamer state identified in the Logical Context Data section of the Memory Data Formats chapter is loaded (or restored) as part of switching to this logical context. This bit affects the switch (if required) to the context specified in Logical Context Address. This bit will also be stored in the associated CCID register to control a subsequent context save operation when switching to this context (as part of a subsequent ring buffer switch).
	1	**Force Restore** When switching to this logical context a comparison between Logical Context Address and the contests of the CCID register is performed. Normally, matching addresses prevent a context restore from occurring; however, when this bit is set a context restore is forced to occur. This bit cannot be set with Restore Inhibit. Note: This bit is not saved in the associated CCID register. It only affects the processing of this command.
	0	**Restore Inhibit** If set, the restore of the HW context from the logical context specified by Logical Context Address is inhibited (i.e., the existing HW context values are maintained). This bit must be used to prevent the loading of an uninitialized logical context. If clear, the context switch proceeds normally. This bit cannot be set with Force Restore. Note: This bit is not saved in the associated CCID register. It only affects the processing of this command.

MI_SET_PREDICATE

MI_SET_PREDICATE

Source: RenderCS

Length Bias: 1

Description

This command sets the Predication Check for the subsequent commands in the command buffer except for MI_SET_PREDICATE itself. Render Command Streamer NOOPs the following commands based on the PREDICATE_ENABLE from MI_SET_PREDICATE, MI_SET_PREDICATE_RESULT and MI_SET_PREDICATE_RESULT_2 status. Resource Streamer doesn't take any action of parsing MI_SET_PREDICATE, this command is similar to any other command which is not meant for resource streamer.

Executing MI_SET_PREDICATE command sets PREDICATE_ENABLE bits in MI_MODE register, MI_MODE register gets render context save restored.

Programming Notes

- MI_SET_PREDICATE predication scope must be confined within a Batch Buffer to set of commands.
- MI_SET_PREDICATE with Predicate Enable Must always have a corresponding MI_SET_PREDICATE with Predicate Disable within the same Batch Buffer.
- MI_ARB_CHK command must be programmed outside the Predication Scope of MI_SET_PREDICATE.
- MI_SET_PREDICATE Predication Scope must not involve any RC6 triggering events.

		Dh, Eh	Reserved	
		Fh	NOOP Always	Following Commands will be NOOPED by RCS unconditionally.

MI_STORE_DATA_IMM

MI_STORE_DATA_IMM

Source: CommandStreamer

Length Bias: 2

The MI_STORE_DATA_IMM command requests a write of the QWord constant supplied in the packet to the specified Memory Address. As the write targets a System Memory Address, the write operation is coherent with the CPU cache (i.e., the processor cache is snooped).

This command supports writing to multiple consecutive dwords or qwords memory locations from the starting address.

Programming Notes

- This command should not be used within a "non-privilege" batch buffer to access global virtual space, doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation. This command can be used within ring buffers and/or privilege batch buffers to access global virtual space.
- This command can be used for general software synchronization through variables in cacheable memory (i.e., where software does not need to poll un-cached memory or device registers).
- This command simply initiates the write operation with command execution proceeding normally. Although the write operation is guaranteed to complete eventually, there is no mechanism to synchronize command execution with the completion (or even initiation) of these operations.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 20h MI_STORE_DATA_IMM Format: OpCode
	22	**Use Global GTT** Format: Boolean If set, this command will use the global GTT to translate the Address and this command must be executing from a privileged (secure) batch buffer. If clear, the PPGTT will be used. It is allowed for this bit to be clear when executing this command from a privileged (secure) batch buffer. This bit must be '1' if the Per Process GTT Enable bit is clear.

MI_STORE_DATA_IMM

	21	**Store Qword** Format: Boolean If set, this command generates Qword writes to memory, two "Data Dword" are paired to form a Qword. Number of qwords generated depends upon the number of "Data Dword" programmed in the command. If 'x' number of "Data Dwords" are programmed in this command it results in "x/2" qword writes to memory. If reset this command generates Dwords writes to memory. Number of dwords generated depends upon the number of "Data Dword" programmed in the command. If 'x' number of "Data Dwords" are programmed in this command it results in "x" dword writes to memory.
	20:10	**Reserved** Format: MBZ
	9:0	**DWord Length** Format: =n Total Length - 2. Excludes DWord (0,1) **Value** / **Name** 2h — Store Dword **[Default]** 3h — Store Qword **Programming Notes** / **Source** DWord Length programmed must not exceed 0x3FE. — If RS is enabled in the batch buffer, then the value of this field must not exceed 0x3F. — RenderCS
1..2	63:48	**Reserved** Format: MBZ
	47:2	**Address** Format: GraphicsAddress[47:2] GraphicsAddress is 64-bit value [63:0], but only a portion of it is used by hardware. The uppermost bits are ignored and MBZ. This field specifies Bits 47:2 of the Address where the DWord will be stored. As the store address must be DWord-aligned, Bits 1:0 of that address MBZ. This address must be 8B aligned for a store "QW" command.
	1	**Reserved** Format: MBZ
	0	**Core Mode Enable** Format: U1 This bit is set then the address will be offset by the Core ID: If Core ID 0, then there is no offset If Core ID 1, then the Memory is offset by the size of the data(32b or 64b based off number of DW length).

MI_STORE_DATA_IMM		
3	31:0	**Data DWord 0** Format: U32 This field specifies the DWord value to be written to the targeted location.For a QWord write this DWord is the lower DWord of the QWord to be reported (DW 0).
4	31:0	**Data DWord 1** Format: U32 This field specifies the upper DWord value to be written to the targeted QWord location (DW 1).

MI_STORE_DATA_INDEX

MI_STORE_DATA_INDEX

Source: VideoEnhancementCS

Length Bias: 2

The MI_STORE_DATA_INDEX command requests a write of the data constant supplied in the packet to the specified offset from the System Address defined by the Hardware Status Page Address Register. As the write targets a System Address, the write operation is coherent with the CPU cache (i.e., the processor cache is snooped).

Programming Notes

- Use of this command with an invalid or uninitialized value in the Hardware Status Page Address Register is UNDEFINED.
- This command can be used for general software synchronization through variables in cacheable memory (i.e., where software does not need to poll uncached memory or device registers).
- This command simply initiates the write operation with command execution proceeding normally. Although the write operation is guaranteed to complete "eventually", there is no mechanism to synchronize command execution with the completion (or even initiation) of these operations.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 21h MI_STORE_DATA_INDEX Format: OpCode
	22	**Reserved** Format: MBZ
	21	**Use Per-Process Hardware Status Page** If this bit is set, this command will index into the per-process hardware status page at offset 0K from the LRCA. If clear, the Global Hardware Status Page will be indexed. This bit must be '0' if the Execlist Enable bit is clear.

MI_STORE_REGISTER_MEM

MI_STORE_REGISTER_MEM

Source: CommandStreamer

Length Bias: 2

The MI_STORE_REGISTER_MEM command requests a register read from a specified memory mapped register location in the device and store of that DWord to memory. The register address is specified along with the command to perform the read.

Programming Notes

- The command temporarily halts command execution.
- The memory address for the write is snooped on the host bus.
- This command should not be used from within a "non-privilege" batch buffer to access global virtual space. doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation. This command can be used within ring buffers and/or "privilege" batch buffers to access global virtual space.
- This command will cause undefined data to be written to memory if given register addresses for the PGTBL_CTL_0 or FENCE registers.

Workaround

Workaround: Reads to MMIO registers outside GT (Register Address > 0x40000) are not supported.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 24h MI_STORE_REGISTER_MEM Format: OpCode
	22	**Use Global GTT** Format: Boolean It is allowed for this bit to be set when executing this command from a privileged (secure) batch or ring buffer. This bit must be clear when programmed from within a non-privileged batch buffer. This bit must be 1 if the Per Process GTT Enable bit is clear. This command will use the global GTT to translate the Address and this command must be executing from a privileged (secure) batch buffer.

MI_UPDATE_GTT

MI_UPDATE_GTT		
Source:	BSpec	
Length Bias:	2	
Description		**Source**
The MI_UPDATE_GTT command is used to update GTT page table entries in a coherent manner and at a predictable place in the command flow. A PIPE_CONTROL flush command with "CS Stall" bit set must be programmed prior to MI_UPDATE_GTT command, since work associated with preceding commands that are still in the pipeline may be referencing GTT entries that will be changed by its execution. The flush must also invalidate TLBs and read caches that may become invalid as a result of the changed GTT entries. A PIPE_CONTROL flush command with "CS Stall" bit set must be programmed post MI_UPDATE_GTT command to ensure the GGTT is updated with modified page table entries before the following workload references the modified entries. PIPE_CONTROL flush is not required if it can be guaranteed that the pipeline is free of any work that relies on changing GTT entries (such as MI_UPDATE_GTT contained in a paging DMA buffer that is doing only update/mapping activities and no rendering). MI_UPDTE_GTT command is privilege operation and will be converted to a no-op and an error flagged if it is executed from within a non-secure batch buffer. PPGTT updates cannot be done via **MI_UPDATE_GTT**, gfx driver will have to use MI_STORE_DATA_IMM for PPGTT inline updates.		RenderCS
The MI_UPDATE_GTT command is used to update GGTT page table entries in a coherent manner and at a predictable place in the command flow. A MI_FLUSH_DWORD flush command with "CS Stall" bit set must be programmed prior to MI_UPDATE_GTT command, since work associated with preceding commands that are still in the pipeline may be referencing GTT entries that will be changed by its execution. MI_WAIT_FOR_EVENT

MI_WAIT_FOR_EVENT

Source: RenderCS, BlitterCS

Length Bias: 1

The MI_WAIT_FOR_EVENT command is used to pause command stream processing until a specific event occurs or while a specific condition exists. Only one event/condition can be specified -- specifying multiple events is UNDEFINED.The effect of the wait operation depends on the source of the command. If executed from a batch buffer, the parser will halt (and suspend command arbitration) until the event/condition occurs. If executed from a ring buffer, further processing of that ring will be suspended, although command arbitration (from other rings) will continue. Note that if a specified condition does not exist (the condition code is inactive) at the time the parser executes this command, the parser proceeds, treating this command as a no-operation.If execution of this command from a primary ring buffer causes a wait to occur, the active ring buffer will effectively give up the remainder of its time slice (required in order to enable arbitration from other primary ring buffers).

Execution List Mode of Scheduling: CS on evaluating MI_WAIT_FOR_EVENT to be unsuccessful (has to wait for event to happen) triggers synchronous context switch stating the switch reason in Context Status Buffer. Note that synchronous context switch can be inhibited through programming “Inhibit Synchronous Context Switch” bit in CTXT_SR_CTL register or by disabling arbitration through MI_ARB_ON_OFF command.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 0h MI_COMMAND Format: OpCode
	28:23	**MI Command Opcode** Default Value: 03h MI_WAIT_FOR_EVENT Format: OpCode
	22	**Reserved** Format: MBZ

MI_WAIT_FOR_EVENT

	21	**Display Plane 1 C Vertical Blank Wait Enable** Format: Enable This field enables a wait until the next Display Plane 1 C "Vertical Blank" event occurs. This event is described as the start of the next Display C vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event in the Device Programming Interface chapter of MI Functions.
	20	**Display Plane 6 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 2 C Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	19	**Display Plane 12 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 4 C Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	18	**Display Plane 11 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 4 B Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	17	**Display Plane 10 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 4 A Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).

MI_WAIT_FOR_EVENT

	16	**Display Plane 9 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 3 C Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	15	**Display Plane 3 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 1 C Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	14	**Display Plane 1 C Scan Line Wait Enable** Format: Enable This field enables a wait while a Display Plane 1 C "Scan Line" condition exists. This condition is defined as the the start of the scan line specified in the Pipe C Display Scan Line Count Range Compare Register.
	13:12	**Reserved** Format: MBZ
	11	**Display Plane 1 B Vertical Blank Wait Enable** Format: Enable This field enables a wait until the next Display Plane 1 B "Vertical Blank" event occurs. This event is described as the start of the next Display B vertical blank period. Note that this can cause a wait for up to an entire refresh period.
	10	**Display Plane 5 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 2 B Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).

MI_WAIT_FOR_EVENT

	9	**Display Plane 2 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane B Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	8	**Display Plane 1 B Scan Line Wait Enable** Format: Enable This field enables a wait while a Display Plane 1 B "Scan Line" condition exists. This condition is defined as the the start of the scan line specified in the Pipe B Display Scan Line Count Range Compare Register.
	7	**Display Plane 8 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 3 B Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	6	**Display Plane 7 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 3 A Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	5:4	**Reserved** Format: MBZ
	3	**Display Plane 1 A Vertical Blank Wait Enable** Format: Enable This field enables a wait until the next Display Plane 1 A "Vertical Blank" event occurs. This event is described as the start of the next Display A vertical blank period. Note that this can cause a wait for up to an entire refresh period.

MI_WAIT_FOR_EVENT

	2	**Display Plane 4 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 2 A Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	1	**Display Plane 1 Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 1 A Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).
	0	**Display Plnae 1 A Scan Line Wait Enable** Format: Enable This field enables a wait while a Display Plane 1 A "Scan Line" condition exists. This condition is defined as the the start of the scan line specified in the Pipe A Display Scan Line Count Range Compare Register.

Move

mov - Move

Source: Eulsa

Length Bias: 4

The mov instruction moves the components in src0 into the channels of dst. If src0 and dst are of different types, format conversion is performed. If src0 is a scalar immediate, the immediate value is loaded into enabled channels of dst.

A mov with the same source and destination type, no source modifier, and no saturation is a raw move. A packed byte destination region (B or UB type with HorzStride == 1 and ExecSize > 1) can only be written using raw move.

When denorm mode is flush to zero, a raw mov instruction with saturation modifier will not flush the denorm input or output to zero (Denorm is preserved).

Format: [(pred)] mov[.cmod] (exec_size) dst src0

Programming Notes

A *mov* instruction with a source modifier always copies a denorm source value to a denorm destination value (in the manner of a raw move).

There is no direct conversion from B/UB to DF or DF to B/UB. Use two instructions and a word or DWord intermediate type.

There is no direct conversion from B/UB to Q/UQ or Q/UQ to B/UB. Use two instructions and a word or DWord intermediate integer type.

There is no direct conversion from HF to DF or DF to HF. Use two instructions and F (Float) as an intermediate type.

There is no direct conversion from HF to Q/UQ or Q/UQ to HF. Use two instructions and F (Float) or a word integer type or a DWord integer type as an intermediate type.

Restriction

Restriction : Raw move is not supported for Float values in ALT mode if any values are infinities or NaNs.

Restriction : An accumulator can be a source or destination operand but not both.

Syntax

```
[(pred)] mov[.cmod] (exec_size) reg reg [(pred)] mov[.cmod] (exec_size) reg imm32
[(pred)] mov[.cmod] (exec_size) reg imm64
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) {
dst.chan[n] = src0.chan[n]; } }
```

	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Move Indexed

movi - Move Indexed

Source: Eulsa

Length Bias: 4

The movi instruction performs a fast component-wise indexed move for subfields from src0 to dst. The source operand must be an indirectly-addressed register. All channels of the source operand share the same register number, which is provided by the register field of the first address subregister, with a possible immediate register offset. The register fields of the subsequent address subregisters are ignored by hardware. The subregister number of a source channel is provided by the subregister field of the corresponding address subregister, with a possible immediate subregister offset.
The destination register may be either a directly-addressed or an indirectly-addressed register.
This instruction effectively performs a subfield shuffling from one register to another. Up to eight subfields can be selected by an instruction.

Format: [(pred)] movi (exec_size) dst src0

Programming Notes

HW Implementation Details:
The source register is calculated by adding the register portion of the first index register with the register portion of the address immediate, a0.0[11:5] + addr_imm[9:5]
For byte movi, byte0 of the destination is selected by (a0.0[4:0]), byte1 is selected by (a0.1[4:0]), ..., and byte7 is selected by (a0.7[4:0]). The rest of the bytes are undefined.
For word movi, byte0 of the destination is selected by (a0.0[4:1] & 0), byte1 is selected by (a0.0[4:1] & 1), byte2 is selected by (a0.1[4:1] & 0), byte3 is selected by (a0.1[4:1] & 1), ..., and byte15 is selected by (a0.7[4:1] & 1). The rest of the bytes are undefined.
For DWord or float movi, byte0 of the destination is selected by (a0.0[4:2] & 00b), byte1 is selected by (a0.0[4:2] & 01b), byte2 is selected by (a0.0[4:2] & 10b), byte3 is selected by (a0.0[4:2] & 11b), byte4 is selected by (a0.1[4:2] & 00b), byte5 is selected by (a0.1[4:2] & 01b), ..., byte31 is selected by (a0.7[4:2] & 11b).
For all 3 conditions above, a0.n[4:0] = a0.n[4:0] + addr_imm[4:0].

Restriction

Restriction : Source operand cannot be accumulators. The source operand must be a general register.

Restriction : The source and destination must have the same type.

Restriction :
The address register for the source must be aligned to the base (a0.0).

Restriction : The destination register (directly or indirectly addressed) must be 16-byte aligned.

Restriction : The destination region (directly or indirectly addressed) must point to the same GRF register.

Restriction : The destination stride in bytes must equal the source element size in bytes.

Restriction : The Align16 access mode is not allowed.

Restriction : All the index registers (address subregisters) used must point to the same GRF register.

Restriction : The instruction must use 1x1 indirect regioning.

movi - Move Indexed

Restriction : The destination offset is only used to create channel enables. Each element of the destination is directly mapped to the index registers for the movi instruction. i.e. a0.0 -> dst.0, a0.1 -> dst.1, a0.2 -> dst.2, etc.

Restriction :
Only 8 address subregisters are used (a0.0-a0.7). Destination element 8 will be sourced from address register zero (a0.0), dst.9 <-a0.1, etc. This is an exception to the above restriction, for example:
movi (8) r31.8:uw r[a0.0,0]<8;8,1>:uw // r31.8:uw<-a0.0:uw, r31.9:uw<-a0.1:uw, etc.

Restriction : Conditional Modifier is not allowed for this instruction.

Syntax

```
[(pred)] movi (exec_size) reg reg imm
```

Pseudocode

```
Evaluate(WrEn); srcregfile = regfile(src0); srcregbase = reg(address[0]) +
reg(addr_imm); for ( n = 0; n < RegWidth; n++ ) { if ( WrEn.chan[n] ) { srcsubreg
= subreg(address[n] + addr_imm); dst.chan[n] = srcregfile.srcreg.srcsubreg; } }
```

	31:0	**Header** Format: EU_INSTRUCTION_HEADER

Multiply

mul - Multiply

Source: Eulsa

Length Bias: 4

The mul instruction performs component-wise multiplication of src0 and src1 and stores the results in dst. When multiplying integer datatypes, if src0 is DW and src1 is W, irrespective of the destination datatype, the accumulator maintains full 48-bit precision. This is required to handle the macro for 32x32 multiplication. The macro described in the mach instruction should be used to obtain the full precision 64-bit multiplication results.

Note: A 32x32 multiply operation is handled natively, without a macro. When operating in this mode, the resulting 64-bit data is packed, unlike the macro, where the lower and upper 32 bits of the result are written to different general registers by two separate instructions. Refer to the macro description for details.

When multiplying integer data types, if one of the sources is a DW, the resulting full precision data is stored in the accumulator. However, if the destination data type is either W or DW, the low bits of the result are written to the destination register and the remaining high bits are discarded. This results in undefined Overflow and Sign flags. Therefore, conditional modifiers and saturation (.sat) cannot be used in this case.

Format:

[(pred)] mul[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : Integer source operands cannot be accumulators.

Restriction : When multiplying a DW and any lower precision integer, the DW operand must on src0.

Syntax

```
[(pred)] mul[.cmod] (exec_size) reg reg reg [(pred)] mul[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn);
 for ( n = 0; n < exec_size; n++ ) {
     if ( WrEn.chan[n] ) {
         dst.chan[n] = src0.chan[n] * src1.chan[n];
     }
 }

Multiply Accumulate

mac - Multiply Accumulate

Source: Eulsa

Length Bias: 4

The mac instruction takes component-wise multiplication of src0 and src1, adds the results with the corresponding accumulator values, and then stores the final results in dst.

Format:
[(pred)] mac[.cmod] (exec_size) dst src0 src1

Programming Notes

When source and destination datatypes are different, the implied datatype for the accumulator operand is always the destination datatype.

Restriction

Restriction : Accumulator is an implicit source and thus cannot be an explicit source operand.

Syntax

```
[(pred)] mac[.cmod] (exec_size) reg reg reg [(pred)] mac[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn);
   for ( n = 0; n < exec_size; n++ ) {
       if ( WrEn.chan[n] ) {
           dst.chan[n] = src0.chan[n] * src1.chan[n] + acc0.chan[n];

Multiply Accumulate High

mach - Multiply Accumulate High

Source: Eulsa

Length Bias: 4

The mach instruction performs DWord integer multiply-accumulate operation and outputs the high DWord (bits 63:32). For each enabled channel, this instruction multiplies the DWord in src0 with the high word of the DWord in src1, left shifts the result by 16 bits, adds it with the corresponding accumulator values, and keeps the whole 64-bit result in the accumulator. It then stores the high DWord (bits 63:32) of the results in dst. This instruction is intended to be used to emulate 32-bit DWord integer multiplication by using the large number of bits available in the accumulator. For example, the following instructions perform vector multiplication of two 32-bit signed integer sources from r2 and r3 and store the resulting vectors with the high 32 bits in r5 and the low 32 bits in r6.

```
mul (8) acc0:d r2.0<8;8,1>:d r3.0<16;8,2>:uw
mach (8) r5.0<1>:d r2.0<8;8,1>:d r3.0<8;8,1>:d
mov (8) r6.0<1>:d acc0:d // Low 32 bits.
```

Here is a different example including negation. An added preliminary mov is required for source modification on src1.

```
mov (8) r3.0<1>:d -r3<8;8,1>:d
mul (8) acc0:d r2.0<8;8,1>:d r3.0<16;8,2>:uw
mach (8) r5.0<1>:d r2.0<8;8,1>:d r3.0<8;8,1>:d // High 32 bits
mov (8) r6.0<1>:d acc0:d // Low 32 bits.
```

The mach should have channel enable from the destHI of IMUL, the mov should have the channel enable from the destLO of IMUL. As mach is used to generate part of the 64-bit DWord integer results, saturation modifier should not be used. In fact, saturation modifier should not be used for any of these four instructions. Source and destination operands must be DWord integers. Source and destination must be of the same type, signed integer or unsigned integer. If dst is UD, src0 and src1 may be UD and/or D. However, if any of src0 and src1 is D, source modifier (abs) must be present to convert it to match with dst. If dst is D, src0 and src1 must also be D. They cannot be UD as it may cause unexpected overflow because the computed results are limited to 64 bits.

Format:
[(pred)] mach[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : Accumulator is an implicit source and thus cannot be an explicit source operand.

Restriction : AccWrEn is required.

Syntax

```
[(pred)] mach[.cmod] (exec_size) reg reg reg [(pred)] mach[.cmod] (exec_size) reg reg imm32
```

Pseudocode

mach - Multiply Accumulate High

```
Evaluate(WrEn);
   for ( n = 0; n < exec_size; n++ ) {
      if ( WrEn.chan[n] ) {
         acc.chan[n][63:0] = (src1.chan[n][31:16] *
            src0.chan[n][31:0]) « 16 + acc.chan[n][63:0];
         dst.chan[n][31:0] = acc.chan[n][63:32];
      }
   }
```

Errata	Description
	A source modifier must not be used on src1 for the macro operation. This applies to both mul and mach of the macro. If source modifier is required, an additional mov instruction may be used before the macro.

Multiply Add

mad - Multiply Add

Source: Eulsa

Length Bias: 4

The mad instruction takes component-wise multiplication of src1 and src2, adds the results with the corresponding src0 values, and then stores the final results in dst.
The conditional modifier and saturation (.sat) must not be used when src1 or src2 are dwords.

Format:
[(pred)] mad[.cmod] (exec_size) dst src0 src1 src2

Restriction

Restriction : No explicit accumulator access because this is a three-source instruction. AccWrEn is allowed for implicitly updating the accumulator.

Restriction : All three-source instructions have certain restrictions, described in Instruction Formats.

Syntax

```
[(pred)] mad[.cmod] (exec_size) reg reg reg reg
```

Pseudocode

```
Evaluate(WrEn);
for ( n = 0; n < exec_size; n++ ) {
   if ( WrEn.chan[n] ) {
      dst.chan[n] = src1.chan[n] * src2.chan[n] + src0.chan[n];
   }
}

Multiply Add for Macro

madm - Multiply Add for Macro

Source: Eulsa

Length Bias: 4

The madm instruction takes component-wise multiplication of src1 and src2, adds the results with the corresponding src0 values, and then stores the final results in dst.

The source and destination operands have a higher precision carried in the exponent for this operation. The madm instruction is used for macro operations, where precision is accumulated over several instructions. This accumulation requires the exponent to increase by 2 extra bits across multiple madm operations.

Refer to Macros Defined in 'Math' Section for usage and restrictions of this operation.

Format:

[(pred)] madm[.cmod] (exec_size) dst src0 src1 src2

Restriction

Restriction : Accumulator access is restricted to the special accumulators (acc2-acc9). Refer to the Accumulator Section for details on the special accumulators.

Syntax

```
[(pred)] madm[.cmod] (exec_size) reg reg reg reg
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) {
dst.chan[n] = src1.chan[n] * src2.chan[n] + src0.chan[n]; } }

No Operation

nop - No Operation

Source: Eulsa

Length Bias: 4

Do nothing. The nop instruction takes an instruction dispatch but performs no operation. It can be used for assembly patching in memory, or to insert a delay in the program sequence.

Format:
nop

Restriction

Restriction : The nop instruction takes no instruction options other than Breakpoint.

Syntax

```
nop
```

Pseudocode

```
{ ; // The null statement, which does nothing. }
```

Predication	Conditional Modifier	Saturation	Source Modifier
N	N	N	N

DWord	Bit	Description
0..3	127:31	**Reserved** Format: MBZ
	30	**DebugCtrl** This field allows the insertion of a breakpoint at the current instruction. When the bit is set, hardware automatically stores the current IP in CR register and jumps to the System IP (SIP) BEFORE executing the current instruction. Value 0: No Breakpoint **[Default]** Value 1: Breakpoint

1	31	**Reserved** Format: MBZ
	30	**Reserved** Format: MBZ
	29	**Reserved** Format: MBZ
	28	**Reserved** Format: MBZ
	27	**Reserved**

PIPE_CONTROL

26 **Flush LLC**

Format:	Enable

If enabled, at the end of the current pipe-control the last level cache is cleared of all the cachelines which have been determined as being part of the Frame Buffer.

Programming Notes
SW must always program Post-Sync Operation to "Write Immediate Data" when Flush LLC is set.

25 **Reserved**

Format:	MBZ

24 **Destination Address Type**

Defines address space of Destination Address

Value	Name	Description
0h	PPGTT	Use PPGTT address space for DW write
1h	GGTT	Use GGTT address space for DW write

Programming Notes
Ignored if ""No Write" is selected in Operation.

23 **LRI Post Sync Operation**

Value	Name	Description
0h	No LRI Operation	No LRI operation occurs as a result of this instruction. The Post-Sync Operation field is valid and may be used to specify an operation.
1h	MMIO Write Immediate Data	Write the DWord contained in Immediate Data Low (DW3) to the MMIO offset specifed in the Address field.

Programming Notes
This bit caues a post sync operation with an LRI (Load Register Immediate) operation. If this bit is set then the Post-Sync Operation field must be cleared.

22 **Reserved**

21 **Store Data Index**

Format:	U1

Description
Ring Buffer Mode Scheduling: This field is valid only if the post-sync operation is not 0. If this bit is set, the store data address is actually an index into the global hardware status page. This bit only applies to the Global HW status page. If this field is 1, the Destination Address Type in this command must be set to 1 (GGTT). Execlist Mode Scheduling: This field is valid only if the post-sync operation is not 0. If this bit is set, the store data address is index into the global hardware status page when destination

PIPE_CONTROL

address type in the command is set to 1 (GGTT). The store data address is index into the per-process hardware status page when destination address type in the command is set to 0 (PPGTT).

20 **Command Streamer Stall Enable**

Format:	U1

If ENABLED, the sync operation will not occur until all previous flush operations pending a completion of those previous flushes will complete, including the flush produced from this command. This enables the command to act similar to the legacy MI_FLUSH command.

19 **Global Snapshot Count Reset**

Format:	U1

Value	Name	Description
0h	Don't Reset	Do not reset the snapshot counts or Statistics Counters.
1h	Reset	Reset the snapshot count in Gen4 for all the units and reset the Statistics Counters except as noted above.

Programming Notes

TIMESTAMP is not reset by PIPE_CONTROL with this bit set.
When Post Sync Operation is set to "Write PS Depth Count" along with Global Snapshot Count Reset, PS Depth Count is Reported first before resetting the value.

18 **TLB Invalidate**

Format:	U1

If ENABLED, all TLBs belonging to Render Engine will be invalidated once the flush operation is complete. Note that if the flush TLB invalidation mode is clear, a TLB invalidate will occur irrespective of this bit setting

If ENABLED, PIPE_CONTROL command will flush the in flight data written out by render engine to Global Observation point on flush done. Also Requires stall bit ([20] of DW1) set.

Programming Notes

If ENABLED, all TLBs belonging to Render Engine will be invalidated once the flush operation is complete. Note that if the flush TLB invalidation mode is clear, a TLB invalidate will occur irrespective of this bit setting.

Post Sync Operation or CS stall must be set to ensure a TLB invalidate occurs. Otherwise no cycle will occur to the TLB cache to invalidate.

17 **Reserved**

Format:	MBZ

PIPE_CONTROL

16 **Generic Media State Clear**

Format:	Disable

If set, all generic media state context information will be invalidated. Any state invalidated will not be saved as part of the render engine context image. The state only only become valid once it is parsed by the command streamer.

15:14 **Post Sync Operation**

Description
This field specifies an optional action to be taken upon completion of the synchronization operation.
This field must be cleared if the LRI Post-Sync Operation bit is set.

Value	Name	Description
0h	No Write	No write occurs as a result of this instruction. This can be used to implement a "trap" operation, etc.
1h	Write Immediate Data	Write the QWord containing Immediate Data Low, High DWs to the Destination Address
2h	Write PS Depth Count	Write the 64-bit PS_DEPTH_COUNT register to the Destination Address
3h	Write Timestamp	Write the 64-bit TIMESTAMP register to the Destination Address

Programming Notes
If executed in non-secure batch buffer, the address given will be in a PPGTT address space. If in a secure ring or batch, address given will be in GGTT space

Workaround
Workaround : PIPECONTROL command with “Command Streamer Stall Enable” must be programmed prior to programming a PIPECONTROL command with Post Sync Op in GPGPU mode of operation (i.e when PIPELINE_SELECT command is set to GPGPU mode of operation).

13 **Depth Stall Enable**

Format:	Enable

This bit must be set when obtaining a "visible pixel" count to preclude the possible inclusion in the PS_DEPTH_COUNT value written to memory of some fraction of pixels from objects initiated after the PIPE_CONTROL command.

Value	Name	Description
0h	Disable	3D pipeline will not stall subsequent primitives at the Depth Test stage.
1h	Enable	3D pipeline will stall any subsequent primitives at the Depth Test stage until the Sync and Post-Sync operations complete.

Programming Notes

PIPE_CONTROL

		This bit must be DISABLED for operations other than writing PS_DEPTH_COUNT. This bit will have no effect (besides preventing write cache flush) if set in a PIPE_CONTROL command issued to the Media pipe.
	12	**Render Target Cache Flush Enable** Format: Enable Setting this bit will force Render Cache to be flushed to memory prior to this synchronization point completing. This bit must be set for all write fence sync operations to assure that results from operations initiated prior to this command are visible in memory once software observes this synchronization. **Value / Name / Description** 0h / Disable Flush / Render Target Cache is NOT flushed. 1h / Enable Flush / Render Target Cache is flushed. **Programming Notes** This bit must be DISABLED for End-of-pipe (Read) fences, PS_DEPTH_COUNT or TIMESTAMP queries. This bit must not be set when Depth Stall Enable bit is set in this packet.
	11	**Instruction Cache Invalidate Enable** Format: Enable Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of the L1 and L2 at the top of the pipe i.e. at the parsing time.
	10	**Texture Cache Invalidation Enable** Format: Enable Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of the texture caches at the top of the pipe i.e. at the parsing time. **Workaround** Workaround : "CS Stall" bit in PIPE_CONTROL command must be always set for GPGPU workloads when "Texture Cache Invalidation Enable" bit is set
	9	**Indirect State Pointers Disable** Format: Enable **Description** At the completion of the post-sync operation associated with this pipe control packet, the indirect state pointers in the hardware are considered invalid; the indirect pointers are not saved in the context. If any new indirect state commands are executed in the command stream while the pipe control is pending, the new indirect state commands are preserved.

PIPE_CONTROL

		Using Invalidate State Pointer (ISP) only inhibits context restoring of Push Constant (3DSTATE_CONSTANT_*) commands. Push Constant commands are only considered as Indirect State Pointers. Once ISP is issued in a context, SW must initialize by programming push constant commands for all the shaders (at least to zero length) before attempting any rendering operation for the same context.
	8	**Notify Enable** Format: Enable If ENABLED, a Sync Completion Interrupt will be generated (if enabled by the MI Interrupt Control registers) once the sync operation is complete. See Interrupt Control Registers in Memory Interface Registers for details.
	7	**Pipe Control Flush Enable** Format: Enable Hardware on parsing PIPECONTROL command with Pipe Control Flush Enable set will wait for all the outstanding post sync operations corresponding to previously executed PIPECONTROL commands are complete before making forward progress.
	6	**Reserved**
	5	**DC Flush Enable** Format: Enable Setting this bit enables flushing of the L3$ portions that caches DC writes. **Programming Notes** DC Flush (L3 Flush) by default doesn't result in flushing/invalidating the IA Coherent lines from L3$, however this can be achieved by setting control bit "**Pipe line flush Coherent lines"** in "L3SQCREG4" register.
	4	**VF Cache Invalidation Enable** Format: Enable Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of VF address based cache at the top of the pipe i.e. at the parsing time. **Programming Notes** If the VF Cache Invalidation Enable is set to a 1 in a PIPE_CONTROL, a separate Null PIPE_CONTROL, all bitfields sets to 0, with the VF Cache Invalidation Enable;set to 0 needs to be sent prior to the PIPE_CONTROL with VF Cache Invalidation Enable set to a 1. As the VF, VFR data caches do not support a full address tag, SW shall invalidate the VF, VFR cache before a draw call that uses modified VERTEX_BUFFER state. Failure to do so may result in erroneous hits in the cache. **Workaround**

PIPE_CONTROL

		Workaround: When VF Cache Invalidate is set "Post Sync Operation" must be enabled to "Write Immediate Data" or "Write PS Depth Count" or "Write Timestamp".
	3	**Constant Cache Invalidation Enable** Format: Enable Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of the constant cache at the top of the pipe i.e. at the parsing time.
	2	**State Cache Invalidation Enable** Format: Enable Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of the L1 and L2 state caches at the top of the pipe i.e. at the parsing time.
	1	**Stall At Pixel Scoreboard** Format: Enable Defines the behavior of PIPE_CONTROL command at the pixel scoreboard.

Value	Name	Description
0h	Disable	Stall at the pixel scoreboard is disabled.
1h	Enable	Stall at the pixel scoreboard is enabled.

Programming Notes
This bit must be DISABLED for End-of-pipe (Read) fences, PS_DEPTH_COUNT or TIMESTAMP queries. This bit is ignored if Depth Stall Enable is set. Further the render cache is not flushed even if Write Cache Flush Enable bit is set.

	0	**Depth Cache Flush Enable** Format: Enable Setting this bit enables flushing (i.e. writing back the dirty lines to memory and invalidating the tags) of depth related caches. This bit applies to HiZ cache, Stencil cache and depth cache.

Value	Name	Description
0h	Flush Disabled	Depth relates caches (HiZ, Stencil and Depth) are NOT flushed.
1h	Flush Enabled	Depth relates caches (HiZ, Stencil and Depth) are flushed.

Programming Notes
Ideally depth caches need to be flushed only when depth is required to be coherent in memory for later use as a texture, source or honoring CPU lock. This bit must be DISABLED for End-of-pipe (Read) fences, PS_DEPTH_COUNT or TIMESTAMP queries.

<table>
<tr><th colspan="3">PIPE_CONTROL</th></tr>
<tr><td rowspan="2">2</td><td>31:2</td><td>Address
<table><tr><td>Format:</td><td>GraphicsAddress[31:2]U32</td></tr></table>If Post Sync Operation is set to 1h LRI Post-Sync Operation must be clear): Bits 31:3 secify the QW address of where the Immediate Data following this DW in the packet to be stored. Bit 2 MBZ Ignored if "No Write" is the selected in Post-Sync Operation. If LRI Post-Sync Operation is set: Bits 22:2 (Bits 31:23 are reserved MBZ) specify the MMIO offset destination for the data in the Immediate Data Low (DW3) field. Only DW writes are valid.</td></tr>
<tr><td>1:0</td><td>Reserved
<table><tr><td>Format:</td><td>MBZ</td></tr></table></td></tr>
<tr><td>3</td><td>31:0</td><td>Address High
<table><tr><td>Format:</td><td>GraphicsAddress[63:32]U32</td></tr></table>This field specifies the 4GB aligned base address of gfx 4GB virtual address space within the host's 64-bit virtual address space.
This field is valid only if the post-sync operation is not 0 and the LRI Post-Sync Operation is clear.</td></tr>
<tr><td>4..5</td><td>63:0</td><td>Immediate Data
<table><tr><td>Format:</td><td>U64</td></tr></table>This field specifies the QWord value to be written to the targeted location.
Only valid when Post-Sync Operation is 1h (Write Immediate Data) or LRI Post-Sync Operation is set.
Ignored if Post-Sync Operation is "No write", "Write PS_DEPTH_COUNT" or "Write TIMESTAMP".</td></tr>
</table>

PIPELINE_SELECT

PIPELINE_SELECT

Source: BSpec

Length Bias: 1

Description

The PIPELINE_SELECT command is used to specify which GPE pipeline is to be considered the 'current' active pipeline. Issuing 3D-pipeline-specific commands when the Media pipeline is selected, or vice versa, is UNDEFINED.

Issuing 3D-pipeline-specific commands when the GPGPU pipeline is selected, or vice versa, is UNDEFINED.

Programming common non pipeline commands (e.g., STATE_BASE_ADDRESS) is allowed in all pipeline modes.

Programming Notes

Software must ensure all the write caches are flushed through a stalling PIPE_CONTROL command followed by another PIPE_CONTROL command to invalidate read only caches prior to programming MI_PIPELINE_SELECT command to change the Pipeline Select Mode.

Example:

... Workload-3Dmode

PIPE_CONTROL (CS Stall, Depth Cache Flush Enable, Render Target Cache Flush Enable, DC Flush Enable)

PIPE_CONTROL (Constant Cache Invalidate, Texture Cache Invalidate, Instruction Cache Invalidate, State Cache invalidate)

PIPELINE_SELECT (GPGPU)

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE Format: OpCode
	28:27	**Command SubType** Default Value: 1h GFXPIPE_SINGLE_DW Format: OpCode
	26:24	**3D Command Opcode** Format: OpCode Value 1h: GFXPIPE_NONPIPELINED **[Default]**
	23:16	**3D Command Sub Opcode** Default Value: 04h PIPELINE_SELECT Format: OpCode

PIPELINE_SELECT

	15:8	**Mask Bits** **Programming Notes** Must be set to modify corresponding bits in Bits 7:0. (For implemented bits)
	7	**Reserved**
	6	**Reserved**
	5	**Force Media Awake** Format: Enable **Value** / **Name** / **Description** 0 / Disabled / Command streamer sends message to PM to disable force awake of media engine (next instructions do not require the media engine to be awake). Command streamer waits for acknowledge from PM before parsing the next command. 1 / Enabled / Command streamer sends message to PM to force awake media engine (next instructions require media engine awake). Command streamer waits for acknowledge from PM before parsing the next command. **Programming Notes** Mask bit [13] has to be set for HW to look at this field when PIPELINE_SELECT command is parsed. Example for usage model: **RCS Ring Buffer**: **PIPELINE_SELECT (Force Media Awake set to '1')** MI_SEMPAHORE_SINGAL (Signal context id 0xABC to Render Command Streamer) **PIPELINE_SELECT (Force Media Awake set to '0')** **MI_BATCH_BUFFER_START** STATE Commands .. .. **PIPELINE_SELECT (Force Media Awake set to '1')** MI_LOAD_REGISTER_IMM (Load register 0x23XX in render command streamer with data 0xFFF) **PIPELINE_SELECT (Force Media Awake set to '0')** ..... **MI_BATCH_BUFFER_END**
	4	**Media Sampler DOP Clock Gate Enable** Format: Enable **Value** / **Name** / **Description** 0 / Disabled / Command Streamer sends message to PM to disable sampler DOP Clock Gating. 1 / Enabled / Command Streamer sends message to PM to enable media sampler DOP Clock Gating.

PIPELINE_SELECT

Programming Notes
Mask bit [12] has to be set for HW to look at this field when PIPELINE_SELECT command is parsed.

3 **Render Sampler Power Gate Enable**

Format:	Enable

Value	Name	Description
0	Disabled	Command Streamer sends message to PM to disable render sampler Power Gating.
1	Enabled	Command Streamer sends message to PM to enable render sampler Power Gating.

Programming Notes
Mask bit [11] has to be set for HW to look at this field when PIPELINE_SELECT command is parsed.

2 **Render Slice common Power Gate Enable**

Format:	Enable

Value	Name	Description
0	Disabled	Command Streamer sends message to PM to disable render slice common Power Gating.
1	Enabled	Command Streamer sends message to PM to enable render slice common Power Gating.

Programming Notes
Mask bit [10] has to be set for HW to look at this field when PIPELINE_SELECT command is parsed.

1:0 **Pipeline Selection**

Value	Name	Description
0	3D	3D pipeline is selected
1	Media	Media pipeline is selected (Includes HD optical disc playback, HD video playback, and generic media workloads)
2	GPGPU	GPGPU pipeline is selected

Programming Notes
Mask bits [9:8] has to be set for HW to look at this field when PIPELINE_SELECT command is parsed. Setting only one of the mask bit [9] or [8] is illegal.

Plane

pln - Plane

Source: Eulsa

Length Bias: 4

The pln instruction computes a component-wise plane equation (w = p*u+q*v+r where u/v/w are vectors and p/q/r are scalars) of src0 and src1 and stores the results in dst. src1 is the input vector u.
src0 provides input scalars p, q, and r, where p is the scalar value based on the region description of src0 and q and r are the scalar values implied from the src0 region. Specifically, q is the second component and r is the fourth component of the 4-tuple (128-bit aligned) that p belongs to.

Format:
[(pred)] pln[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : This is a specialized instruction that only supports an execution size (ExecSize) of 8 or 16.

Restriction : The src0 region must be a replicated scalar (with HorzStride == VertStride == 0).

Restriction : src0 must specify .0 or .4 as the subregister number, corresponding to a subregister byte offset of 0 or 16.

Restriction : If ExecSize is 16 then accumulator cannot be used on src1.

Syntax

```
[(pred)] pln[.cmod] (exec_size) reg reg reg
```

Pseudocode

```
    Evaluate(WrEn);
    for ( n = 0; n < exec_size; n++ ) {
        float dwP = src0.RegNum.SubRegNum[bits4:2];          // A DWord-aligned scalar.
        float dwQ = src0.RegNum.(SubRegNum[bit4:2] | 0x1);   // Second component.
        float dwR = src0.RegNum.(SubRegNum[bit4:2] | 0x3);   // Fourth component.
        if ( ExecSize == 8 ) {
            u = src1.RegNum
            v = src1.(RegNum + 1)
        } else {
            if ( n < 8 ) {
                u = src1.RegNum
                v = src1.(RegNum + 1)
            } else {
                u = src1.(RegNum + 2)
                v = src1.(RegNum + 3)
            }
        }

        if ( WrEn.chan[n] ) {
           dst.chan[n] = dwP * u.chan[n] + dwQ * v.chan[n] + dwR;
        }
    }
```

pln - Plane

Format:	Opcode

Render Target Write message

13 Per-Sample PS Enable

Format:	Enable

If set, PS sends Render Target Write Message that outputs color, depth(optional) and stencil(optional) phases on per sample basis for each slot.

Programming Notes

This bit must be set when PS runs at sample-frequency i.e. pixel shader dispatch mode is PER_SAMPLE.

When this bit is set and PS runs at pixel-frequency, i.e. pixel shader dispatch mode is PER_PIXEL, Render Target read and write messages interpret bits 9:6 in MCH_RT_C0 as sample index. In this mode, render target write message payload and render target read writeback payload contain color of a specific sample in all dispatched pixels. RT writes referring to out-of-bound samples have no effect. RT reads from out-of-bound samples return 0.

When this bit is clear and PS runs at pixel-frequency, render target write messages contain color value for entire pixel (all samples).

When this bit is clear and PS runs at pixel-frequency, render target reads are disallowed per API spec (RT read without specifying sample index forces sample-frequency dispatch). HW behavior is undefined in such case.

12 Last Render Target Select

Format:	Enable

This bit must be set on the last render target write message sent for each group of pixels. For single render target pixel shaders, this bit is set on all render target write messages. For multiple render target pixel shaders, this bit is set only on messages sent to the last render target. This bit must be zero for SIMD8 Image Write message. In general, when threads are not launched by 3D FF, this bit must be zero.

Programming Notes

When a pixel shader has render target writes at finer granularity than the dispatch rate, last render target write to a null surface must be present at the dispatch rate with this bit set.

In particular, if a kernel is dispatched at pixel rate and it only writes to render targets at sample-rate, it must include a pixel-rate render target write to a null surface with Last Render Target Select bit enabled.

11 Slot Group Select

Format:	MDC_RT_SGS

This field selects whether slots 15:0 or slots 31:16 are used for bypassed data.

MSD_RTW_REP16 - REP16 Render Target Write MSD

	10:8	**Render Target Message Subtype** Default Value: 1h Format: Opcode SIMD16 Single source message with replicated data. Use slots [15:0] for pixel enables, X/Y addresses, and oMask. **Programming Notes** The above slots indicated are within the 16 slots selected by Slot Group Select. If SLOTGRP_HI is selected, slots [31:16] are referenced instead of [15:0].
	7:0	**Binding Table Index** Format: MDC_BTS Specifies the Binding Table Index for the message

Return

ret - Return

Source: Eulsa

Length Bias: 4

Description

Return execution to the code sequence that called a subroutine.
The ret instruction can be predicated or non-predicated. If non-predicated, all channels jump to the return IP in the first channel of src0 and restore CallMask from the second channel of src0. If predicated, the enabled channels jump to the return IP from the first channel of src0 and the corresponding bits in the CallMask are cleared to zero; if all CallMask bits are zero after the ret instruction, then execution jumps to the return IP from the first channel of src0.
When SPF is on, the predication control must be scalar.

Format:
[(pred)] ret (exec_size) null src0

Restriction

Restriction : This instruction cannot take accumulator as source.

Syntax

```
[(pred)] ret (exec_size) null reg
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { PcIP[n]
= src0.chan[0]; CallMask[n] = 0; } else { PcIP[n] = IP + 1; } } for ( n =
exec_size; n < 32; n++ ) { PcIP[n] = IP + 1; } if ( CallMask[n:0] == 0) ) { //
all channels are zero Jump(src0.chan[0]); CallMask = src0.chan[1]; }
```

Round Down

rndd - Round Down

Source: Eulsa

Length Bias: 4

The rndd instruction takes component-wise floating point downward rounding (to the integral float number closer to negative infinity) of src0 and storing the rounded integral float results in dst. This is commonly referred to as the floor() function.
Each result follows the rules in the following tables based on the floating-point mode.

Format:
[(pred)] rndd[.cmod] (exec_size) dst src0

Syntax

```
[(pred)] rndd[.cmod] (exec_size) reg reg [(pred)] rndd[.cmod] (exec_size) reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = floor(src0.chan[n]); } }
```

Round to Nearest or Even

rnde - Round to Nearest or Even

Source: Eulsa

Length Bias: 4

The rnde instruction takes component-wise floating point round-to-even operation of src0 with results in two pieces - a downward rounded integral float results stored in dst and the round-to-even increments stored in the rounding increment bits. The round-to-even increment must be added to the results in dst to create the final round-to-even values to emulate the round-to-even operation, commonly known as the round() function. The final results are the one of the two integral float values that is nearer to the input values. If the neither possibility is nearer, the even alternative is chosen.

Each result follows the rules in the following tables based on the floating-point mode.

Format:

[(pred)] rnde[.cmod] (exec_size) dst src0

Syntax

```
[(pred)] rnde[.cmod] (exec_size) reg reg [(pred)] rnde[.cmod] (exec_size) reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { if ( src0.chan[n] - floor(src0.chan[n]) > 0.5f ) { dst.chan[n] = floor(src0.chan[n]) + 1; } else if ( src0.chan[n] - floor(src0.chan[n]) < 0.5f ) { dst.chan[n] = floor(src0.chan[n]); } else { if ( floor(src0.chan[n]) is odd ) { dst.chan[n] = floor(src0.chan[n]) + 1; } else { dst.chan[n] = floor(src0.chan[n]); } } } }

Round to Zero

rndz - Round to Zero

Source: Eulsa

Length Bias: 4

The rndz instruction takes component-wise floating point round-to-zero operation of src0 with results in two pieces - a downward rounded integral float results stored in dst and the round-to-zero increments stored in the rounding increment bits. The round-to-zero increment must be added to the results in dst to create the final round-to-zero values to emulate the round-to-zero operation, commonly known as the truncate() function. The final results are the one of the two closest integral float values to the input values that is nearer to zero.

Format:
[(pred)] rndz[.cmod] (exec_size) dst src0

Syntax

```
[(pred)] rndz[.cmod] (exec_size) reg reg [(pred)] rndz[.cmod] (exec_size) reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = floor(src0.chan[n]); if ( abs(src0.chan[n]) < abs(dst.chan[n]) ) { dst.chan[n] = floor(src0.chan[n]) + 1; } else { dst.chan[n] = floor(src0.chan[n]); } } }

Scattered Move

smov - Scattered Move

Source: Eulsa

Length Bias: 4

The smov instruction moves the components in src0 into dst.
For each enabled channel, copy src0 to dst. The immediate is used to selectively enable channels without using flags.
When predication is enabled, the predicate mask is not generated from the flags. Instead, the immediate is used to mask the execution mask. If any channel is enabled as a result of this masking, the instruction is executed.
When predication is not enabled, the immediate masks the execution mask. This provides flexibility to mask out any channel with an immediate.

Format:
[(pred)] smov[.cmod] (exec_size) dst src0 src1

Programming Notes

When predication is disabled, the immediate provides the flexibility to perform a select operation without the use of flags.

When predication is enabled, the usage model provides flexibility to select any bit in the flag registers for predication for execution size of 1.

Syntax

```
[(pred)] smov[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
if pred emask = OR (emask AND imm32) Else pmask = imm32. Evaluate(WrEn); for ( n
= 0; n < 32; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n]; } }
```

Select

sel - Select

Source: Eulsa

Length Bias: 4

Description

The sel instruction selectively moves the components in src0 or src1 into the channels of dst based on the predication. On a channel by channel basis, if the channel condition is true, data in src0 is moved into dst. Otherwise, data in src1 is moved into dst.

As the predication is used to select the two sources, it is not included in the evaluation of WrEn. The predicate clause is mandatory if cmod is omitted/0000b. If both predication and the conditional modifier are omitted, the results are undefined.

If the conditional modifier is specified (not 0000b, a compare is performed and the resulting condition flag is used for the sel instruction. Conditional modifiers .ge and .l follow the cmpn rules, and all other conditional modifiers follow the cmp rules. Predication is not allowed in this mode.

A sel instruction with cmod .l is used to emulate a MIN instruction.

A sel instruction with cmod .ge is used to emulate a MAX instruction.

For a sel instruction with a .l or .ge conditional modifier, if one source is NaN and the other not NaN, the non-NaN source is the result. If both sources are NaNs, the result is NaN. For all other conditional modifiers, if either source is NaN then src1 is selected.

A sel instruction without a conditional modifier always copies a denorm source value to a denorm destination value (in the manner of a raw move). This applies even if the source modifies are set on the *sel* instruction sources.

The sel instruction uses any conditional modifier internally and does not update the flag register if a conditional modifier is used.

A sel instruction with cmod or source modifier will flush denorm to zero, depending on the denorm mode bit; a sel instruction without cmod and source modifier will retain denorm.

Format:
(pred) sel[.cmod] (exec_size) dst src0 src1

Syntax

```
(pred) sel[.cmod] (exec size) reg reg reg (pred) sel[.cmod] (exec size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn, NoPMask); if (cmod == "0000") { // no CMod Evaluate(PMask); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { if ( PMask.channel[n] ) { dst.chan[n] = src0.chan[n]; } else { dst.chan[n] = src1.chan[n]; } } } } else { // with CMod Evaluate(CMod); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { if ( CMod.chan[n] ) { dst.chan[n] = src0.chan[n]; } else { dst.chan[n] = src1.chan[n]; } } } }

Send Message

send - Send Message

Source: Eulsa

Length Bias: 4

Description
Send a message stored in GRF starting at <src> to a shared function identified by <ex_desc> along with control from <desc> with a GRF writeback location at <dest>.
The send instruction performs data communication between a thread and external function units, including shared functions (Sampler, Data Port Read, Data Port Write, URB, and Message Gateway) and some fixed functions (e.g. Thread Spawner, who also have an unique Shared Function ID). The send instruction adds an entry to the EU's message request queue. The request message is stored in a block of contiguous GRF registers. The response message, if present, will be returned to a block of contiguous GRF registers. The return GRF writes may be in any order depending on the external function units. <src> is the lead GRF register for request. <dest> is the lead GRF register for response. The message descriptor field <desc> contains the Message Length (the number of consecutive GRF registers) and the Response Length (the number of consecutive GRF registers). It also contains the header present bit, and the function control signals. The extend mesage descriptor field <ex_desc> contains the target function ID. WrEn is forwarded to the target function in the message sideband.
The extended message descriptor field <ex_desc> also contains the extended function control field to be sent to the Target Shared Function over message sideband.
The send instruction is the only way to terminate a thread. When the EOT (End of Thread) bit of <ex_desc> is set, it indicates the end of thread to the EU, the Thread Dispatcher and, in most cases, the parent fixed function. Message descriptor field <desc> can be a 32-bit immediate, imm32, or a 32-bit scalar register, <reg32a>. GEN restricts that the 32-bit scalar register <reg32a> must be the leading dword of the address register. It should be in the form of a0.0<0;1,0>:ud. When <desc> is a register operand, only the lower 29 bits of <reg32a> are used.
<ex_desc> is a 32-bit immediate, imm32. The lower 4bits of the <ex_desc> specifies the SFID for the message. The bit5 of the extended message descriptor, the EOT field, always comes from bit 127 of the instruction word. A thread must terminate with a send instruction with EOT turned on. The higher 16bits, bit31:16 specify the 16bit extended function control field. Interpretation of the extended function control signals is subject to the target external function.
<src> is a 256-bit aligned GRF register. It serves as the leading GRF register of the request.
The source dependency control, {NoSrcDepSet} is used to control the setting of source dependency for the source.
<dest> serves for two purposes: to provide the leading GRF register location for the response message if present, and to provide parameters to form the channel enable sideband signals. <dest> signals whether there is a response to the message request. It can be either a null register, a direct-addressed GRF register or a register-indirect GRF register. Otherwise, hardware behavior is undefined. If <dest> is null, there is no response to the request. Meanwhile, the Response Length field in <desc> must be 0. Certain types of message requests, such as memory write (store) through the Data Port, do not want response data from the function unit. If so, the posted destination operand can be null. If <dest> is a GRF register, the register number is forwarded to the

send - Send Message

shared function. In this case, the target function unit must send one or more response message phases back to the requesting thread. The number of response message phases must match the Response Length field in <desc>, which of course cannot be zero. For some cases, it could be an empty return message. An empty return message is defined as a single phase message with all channel enables turned off. The subregister number, horizontal stride, destination mask and type fields of <dest> are always valid and are used in part to generate on the WrEn. This is true even if <dest> is a null register (this is an exception for null as for most cases these fields are ignored by hardware). The 16-bit channel enables of the message sideband are formed based on the WrEn. Interpretation of the channel enable sideband signals is subject to the target external function. In general for a 'send' instruction with return messages, they are used as the destination dword write mask for the GRF registers starting at <dest>. For a message that has multiple return phases, the same set of channel enable signals applies to all the return phases. The destination dependency control, {NoDDClr}, can be used in this instruction. This allows software to control the destination dependencies for multiple 'read'-type messages similar to that for multiple instructions using EU execution pipeline. As send does not check register dependencies for the post destination, {NoDDChk} should not be used for this instruction.

Restriction

Restriction : Software must obey the following rules in signaling the end of thread using the send instruction: The posted destination operand must be null. No acknowledgement is allowed for the send instruction that signifies the end of thread. This is to avoid deadlock as the EU is expecting to free up the terminated thread's resource. A thread must terminate with a send instruction with message to a shared function on the output message bus; therefore, it cannot terminate with a send instruction with message to the following shared functions: Sampler unit, NULL function For example, a thread may terminate with a URB write message or a render cache write message. A root thread originated from the media (generic) pipeline must terminate with a send instruction with message to the Thread Spawner unit. A child thread should also terminate with a send to TS. Please refer to the Media Chapter for more detailed description. The send instruction can not update accumulator registers. Saturate is not supported for send instruction. ThreadCtrl encodings Switch is not supported for send instruction. The send with EOT should use register space R112-R127 for <src>. This is to enable loading of a new thread into the same slot while the message with EOT for current thread is pending dispatch. Any instruction updating the ARF must use a {Switch} if the ARF is not used before EOT. DepCtrl Must not be used with Send Instruction. When pagefault is enabled, the source and destination operands must not overlap. This is required to ensure the messages can be replayed.</src>

Restriction :
The source dependency control, {NoSrcDepSet}, must not be set for the send instruction preceding a send instruction with EOT.

Syntax

```
[(pred)] send (exec_size) reg reg imm32 reg32a [(pred)] send (exec_size) reg reg imm32 imm32
```

Pseudocode

```
Evaluate(WrEn); <MsgChEnable> = WrEn; <SourceReg> = <src>.RegNum;
MessageEnqueue(<MsgChEnable>, <ResponseReg>, <SourceReg>, <desc>, <ex_dest>);

	20:16	**SubOpcodeB** Default Value: 0h SFC Lock Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Default Value: 0h Excludes DWord (0,1) Format: =n Total Length - 2
1	31:2	**Reserved** Format: MBZ
	1	**Pre-Scaled Output Surface Output Enable** **VD - Reconstructed Pixel Output Enable** For VD Mode, this field specifies the enabling of writing out the display reconstructed pixel to memory. It could be pre or post- ILDB filter pixel output based on the pre- and post- filter setting in the AVC state command.

SFC_LOCK

Pre-Deblock Flag	Post-Deblock Flag	VD Pixels Output to Memory	VD Pixels Output to SFC
0	0	Invalid for SFC Mode	Invalid for SFC Mode
0	1	Filtered Pixels (allow ON/OFF)	Filter Pixels Sent to SFC for Scaling
1	0	Non-filter (bypass) pixels (allow ON/OFF)	Non-Filter Pixels Sent to SFC for Scaling
1	1	Non-filter (bypass) pixels (allow ON/OFF) Filtered pixels (always OFF)	Filter Pixels Sent to SFC for Scaling.

VE - image enhanced pixel Output Enable

For VE Mode, this field indicates if the VEBOX will enable writing out the image enhanced pixels to memory which is streamed to SFC pipeline for scaling.Filtered data is streamed directly from VEBOX to SFC through a dedicated internal interface. The pixel data send from VE to SFC is YUV format in 12-bit precision irrespective of VEBOX input surface type, pixel precision, chroma format, and color format (RGBA/YUVA). The following table shows allowed usage with VE -image enhanced pixel output enable along with SFC being enabled.

VE Output Surface Format	Bits per channel	Can SFC be enabled ?
Y8/ NV12/ AYUV/ YUYV/YVYU/UYVY/VYUY	8bit	Yes
RGBA8	8bit	No
RGBA10	10bit	No
RGBA16	16bit	No
Y16/ P216/P016/ Y216/ Y416	16bit	Yes

When DN is enabled, DN output is always on.

When DI is Enabled, VE must send the first DI constructed surface to SFC in case VEBOX state indicate two DI frames output, while stream out the second DI constructed surface to memory.

Else the DI output which is enabled will be sent out to SFC. VE output surface Type is programmed in VE_State command.

However, each sub-IECP feature can be turned on/off independently.

2 31:28 Reserved

Format:	MBZ

27:16 Input Frame Resolution Height

Format:	U12-1

Minus 1 in unit of pixel [11:0]. It is set to the value of the output resolution or number of pixels streaming into SFC from VD or VEBox. Since the max value support is 4k pixels, the max value allowed is 4K minus 1.

- VDBOX frame height is multiple of 16 for Video source and JPEG formats other than 400, 444 and 422H_2Y.
- VDBOX frame height is multiple of 8 for JPEG formats 400, 444 and 422H_2Y.
- VEBOX frame height is multiple of 4.

Min Resolution is 128 pixels. *Max Resolution* is upto 4K pixels. e.g. for 1920x1080 content, FrameHeightInMBsMinus1 is equal to1087 (1080 rounded up 16 pixel boundary, minus 1. i.e. effectively specified as 1088 instead).

Restriction

Restriction : For Integral Image Mode, this field is Reserved and MBZ.

15:12 Reserved

Format:	MBZ

111b	7/8	7 (fraction_in_integer)

7:6 **Pre- AVS Chroma Downsampling Enable**

Format:	U2

This is set to enable chroma downsample bilinear filtering prior to AVS scaling operation. This should be set only if the input chroma format has higher sampling than the chroma format used in the AVS filtering.

Value	Name
00b	Disable
01b	444 -> 420
10b	444 -> 422
11b	422 -> 420

Programming Notes
For Integral Image Mode, this field is Reserved and MBZ. The programming of this field should match the input format of VEBox.

5 **RGBA_Channel_Swap Enable**

Default Value:	0
Format:	Enable

This bit should only be used with RGB output formats and CSC conversion is turned on. When this bit is set, the R and B channels are swapped into the output RGB channels as shown in the following table:

Name	Bits	MSB Color Order	Swapped
RGBA8	8:8:8:8	A:B:G:R	A:R:G:B
RGBA10	2:10:10:10	A:R:G:B	A:B:G:R
RGB 5:6:5	5:6:5	R:G:B	B:G:R

SFC_STATE

6		Packed UYVY 4:2:2 8-bit	//Tile-Y/ Tile-X/Linear
7		Packed integral Image 32-bit	//Linear
8		Packed integral Image 64-bit	//Linear

Restriction

Restriction : For Integral Image Mode, output surface format type must be set to 32/64-bit Integral Image Plane.
Driver/SW must ensure the max accumulated integral image value does not exceed the programmable output precision.
HW will simply generate wrong value once it overflow in wrap around case.

4 — 31:22 — Reserved

Format:	MBZ

21:20 — Reserved

Format:	MBZ

19 — CSC Enable

Description

This field specifies the scaled pixels are converted from YUV to RGB. The output format type must be programmed in one of the RGBAx type.

Restriction

Restriction : For Integral Image Mode, this field is Reserved and MBZ.

18 — Color Fill Enable

Programming Notes

This field could be enabled only if the scaled resolution is smaller than the output/display resolution.

SFC_STATE

If enabled, HW will fill the gap with programmable pixel values. Else, nothing will be filled in the gap region.

Usage: Color fill must be enabled for the first time/pass when a new surface is allocated/ used. Optional for subsequence frames since the gap region is filled with default pixels by prior passes.

17:16 **Rotation Mode**

Format:	U2

Value	Name
00b	0 (degrees)
01b	90 Clockwise
10b	180 Clockwise
11b	270 Clockwise

Programming Notes

SFC rotation (90, 180 and 270) should be set only on VEBox input mode and SFC output set to TileY.
Restriction:

- For Integral Image Mode, this field is Reserved and MBZ.
- For VDBox Mode, this field is Reserved and MBZ.
- For linear or TileX SFC output, this field is Reserved and MBZ.

15:13 **Reserved**

Format:	MBZ

12 **Chroma Upsampling Enable**

This field enables the high-quality UV channel upsampler prior to IEF filter process.
This field should be disabled when the source pixels and output pixels are kept with the same chroma sub-sample type and IEF is disabled.

Restriction

Restriction : For Integral Image Mode, this field is Reserved and MBZ.

11:10 **Reserved**

Format:	MBZ

9 **Bypass X Adaptive Filtering**

Value	Name	Description
0	Enable X Adaptive Filtering	
1	Disable X Adaptive Filtering	The X direction will use **Default Sharpness Level** to blend between the smooth and sharp filters rather than the calculated value.

SFC_STATE

8 Bypass Y Adaptive Filtering

Value	Name	Description
0	Enable Y Adaptive Filtering	
1	Disable Y Adaptive Filtering	The Y direction will use **Default Sharpness Level** to blend between the smooth and sharp filters rather than the calculated value.

7 AVS Scaling Enable

Value	Name	Description
1	Enable	
0	Disable	The scaling factor is ignored and a scaling ratio of 1:1 is assumed.

6 Adaptive Filter for all Channels

Value	Name	Description
1	Enable Adaptive Filter on UV/RB Channels	8-tap Adaptive Filter Mode is on
0	Disable Adaptive Filter on UV/RB Channels	

5:4 AVS Filter Mode

Value	Name
0	5x5 Poly-phase filter + Bilinear (adaptive)
1	8x8 poly-phase filter + Bilinear (adaptive)
2	Bilinear filter only
3	Reserved

Programming Notes
In VD-to-SFC mode, value of 1 is not allowed.

3 Reserved

Format:	MBZ

2 IEF4Smooth_Enable

Value	Name	Description
0	**[Default]**	IEF is operating as a content adaptive detail filter based on 5x5 region.
1		IEF is operating as a content adaptive smooth filter based on 3x3 region

Restriction
Restriction : For Integral Image Mode, this field is Reserved and MBZ.

Exists If:	//IEF Enable = 1

Restriction
Restriction : For Integral Image Mode, this field is Reserved and MBZ.

SFC_STATE

0 — IEF Enable

Value	Name	Description
1	Enable	IEF Filter is Enabled
0	Disable	IEF Filter is Disabled

Restriction
Restriction : For Integral Image Mode and VD Mode, this field is Reserved and MBZ.

5 — 31:28 — Reserved

Format:	MBZ

5 — 27:16 — Source Region Height

Format:	U12-1

Source/Crop Region Height Minus 1 of the Input Frame in Unit of Pixel [11:0].
This field specifies the source/crop region of the input frame used for scaling of the graphic view. It defines the out-of-frame boundary used prior to AVS/IEF interpolation operation. The max value should be programmed to be equal or small than the input FrameHeightinMBminus 1 field. e.g. for 1920x1080 content, FrameHeightInMBsMinus1 is equal to1087 (1088 lines); however, the crop region height should be set to 1079(1080 lines). The last 8 lines are assumed to be not usable and should not be used as source pixels for Scaling or IEF operations. Otherwise, the bad pixels will breach and cause artifacts into the scaled output frame.

Restriction
Restriction : For Integral Image Mode, this field is Reserved and MBZ.
Restriction : For AVS mode, the restriction is tied to chroma output format type: 420 - multiple of 2. 422/444/400 - no restrictions. **Min Resolution** is 128 pixels. **Max Resolution** is 4K pixels.

5 — 15:12 — Reserved

Format:	MBZ

5 — 11:0 — Source Region Width

Format:	U12-1

Source/Crop Region Width Minus 1 of the Input Frame in Unit of Pixel [11:0].
This field specifies the source/crop region of the input frame used for scaling of the graphic view. It defines the out-of-frame boundary used prior to AVS/IEF interpolation operation. The max value should be programmed to be equal or small than the input FrameWidthinMBminus 1 field. e.g. for 1920x1080 content, FrameWidthInMBsMinus1 is equal to1919 (1920 pixel wide); however, the crop region width should be set to less than 1909(1910 pixel wide). The last 10 pixels of the frame are assumed to be not usable and should not be used as source pixels for Scaling or IEF operations. Otherwise, the bad pixels will breach and cause artifacts into the scaled output frame.

Restriction
Restriction : For Integral Image Mode, this field is Reserved and MBZ.

SFC_STATE

		Restriction : For AVS mode, the restriction is tied to chroma output format type: 420 - multiple of 2. 422 - multiple of 2. 444/400 - no restrictions. **Min Resolution** is 128 pixels. **Max Resolution** is 4K pixels.
6	31:28	**Reserved** Format: MBZ
	27:16	**Source Region Vertical Offset** Format: U12 **Vertical Offset Of The SRC Region Relative To The Starting Position Of The Input Frame In Unit Of Pixel [11:0]** This field specifies the vertical offset of the starting position of the scaled region relatives to the starting position (pixel 0,0) of the output frame. It defines the out-of-frame boundary used prior to AVS/IEF interpolation operation. This value should be set to zero if the starting corner of the crop region is same as the input frame region. The sum of this value and the src/crop region size heightminus1 must be programmed to be equal or small than the input FrameHeightinMBminus 1 field. **Restriction** Restriction : For Integral Image Mode, this field is Reserved and MBZ. Restriction : For AVS mode, the restriction is tied to chroma output format type: 420 - multiple of 2. 422/444/400 - no restrictions.

Format:	Enable

Memory compression will be attempted for this surface.

8:7 Output Frame Surface Base Address - Arbitration Priority Control

Format:	HEVC_ARBITRATION_PRIORITY

6:1 Output Frame Surface Base Address - Index to Memory Object Control State (MOCS) Tables

Format:	U6

The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers.
The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.

0 Reserved

SFC_STATE

20	31:12	**AVS Line Buffer Surface Base Address** Specifies the 4K byte aligned frame buffer address for scratch space used for row/column store. This surface is used only if the internal buffer inside the SFC HW is not large enough to contain all row/column memory accesses. The AVS line buffer needs to be a valid address even for 1:1 scaling if SFC is used.
	11:0	**Reserved** Format: MBZ
21	31:16	**Reserved** Format: MBZ
	15:0	**AVS Line Buffer Surface Base Address High** This field is for the upper range [47:32] of AVS Line Buffer Surface Base Address. AVS Line buffer address needs to be valid even for 1:1 scaling if SFC is used.
22	31:15	**Reserved** Format: MBZ
	14:13	**AVS Line Buffer Tiled Mode** Format: U2 **For Media Surfaces:** This field specifies the tiled resource mode.

Value	Name	Description
0h	TRMODE_NONE	No tiled resource
1h	TRMODE_TILEYF	4KB tiled resources
2h	TRMODE_TILEYS	64KB tiled resources
3h	Reserved	

	12	**AVS Line Buffer Base Address - Row Store Scratch Buffer Cache Select** Format: U1 This field controls if the Row Store is going to store inside Media Cache (rowstore cache) or to LLC.

Value	Name	Description
0	LLC **[Default]**	Buffer going to LLC

Programming Notes
This suface does not support to put in Row Store Scratch Buffer. Must be set to 0

	11	**Reserved** Format: MBZ

SFC_STATE

	10	**AVS Line Buffer Base Address - Memory Compression Mode** Default Value: 0 Horizontal Compression Mode Format: U1 Distinguishes vertical from horizontal compression. Please refer to vol1a **Memory Data Formats chapter - section** media Memory Compression for more details. **Programming Notes** Memory compression is not supported. This bit is not used. Default to 0
	9	**AVS Line Buffer Base Address - Memory Compression Enable** Default Value: 0 Disable Format: Enable This bit control memory compression for this surface **Programming Notes** This bit must be set to 0 (Memory compression is not supported in this surface)
	8:7	**AVS Line Buffer Base Address - Arbitration Priority Control** Format: HEVC_ARBITRATION_PRIORITY
	6:1	**AVS Line Buffer Base Address - Index to Memory Object Control State (MOCS) Tables** Format: U6 The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.
	0	**Reserved**
23	31:12	**IEF Line Buffer Surface Base Address** Specifies the 4K byte aligned frame buffer address for the scratch space used for row/column store. This surface is used only if the internal buffer inside SFC HW is not large enough to contain all row/column memory accesses. **Restriction** Restriction : For Integral Image Mode, this field is Reserved and MBZ.
	11:0	**Reserved** Format: MBZ
24	31:16	**Reserved** Format: MBZ

SFC_STATE

15:0 IEF Line Buffer Surface Base Address High

This field is for the upper range [47:32] of IEF Line Buffer Surface Base Address.

Restriction
Restriction : For Integral Image Mode, this field is Reserved and MBZ.

25 31:15 Reserved

Format:	MBZ

14:13 IEF Line Buffer Tiled Mode

Format:	U2

For Media Surfaces:

This field specifies the tiled resource mode.

Value	Name	Description
0h	TRMODE_NONE	No tiled resource
1h	TRMODE_TILEYF	4KB tiled resources
2h	TRMODE_TILEYS	64KB tiled resources
3h	Reserved	

12 IEF Line Buffer Base Address - Row Store Scratch Buffer Cache Select

Format:	U1

This field controls if the Row Store is going to store inside Media Cache (rowstore cache) or to LLC.

Value	Name	Description
0	LLC **[Default]**	Buffer going to LLC

Programming Notes
This surface does not support Rowstore Scratch Buffer Cache. Must be programmed to 0

11 Reserved

Format:	MBZ

10 IEF Line Buffer Base Address - Memory Compression Mode

Default Value:	0
Format:	U1

Distinguishes vertical from horizontal compression. Please refer to vol1a **Memory Data Formats chapter - section** media Memory Compression for more details.

Programming Notes
Must be zero; memory compression is not supported for this surface. Default to0

9 IEF Line Buffer Base Address - Memory Compression Enable

Default Value:	0 Disable
Format:	Enable

SFC_STATE

		Programming Notes Memory compression is not supported for this surface Must be 0.
	8:7	**IEF Line Buffer Base Address - Arbitration Priority Control** Format: HEVC_ARBITRATION_PRIORITY
	6:1	**IEF Line Buffer Base Address - Index to Memory Object Control State (MOCS) Tables** Format: U6 The index to define the L3 and system cache memory properties. 	128bpp	16k	1k	16k + 1023

2

Output Surface Half Pitch For Chroma

Exists If:	//PLANAR Surface Formats Only
Format:	Enable

This field indicates that the chroma plane(s) will use a pitch equal to half the value specified in the Surface Pitch field.

1

Output Surface Tiled

Format:	Boolean

This field specifies whether the surface is tiled.

Value	Name	Description
1	True	Tiled
0	FALSE	Linear

Programming Notes

- Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled surfaces can only be mapped to Main Memory.

SFC_STATE

- The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit.
- The tiled surfaces of current picture and reference picture should be declared as the identical type in VDI mode with the identical Height, Width and Format.

0 — Output Surface Tile Walk

Format:	SFC_Tile_Walk

This field specifies the type of memory tiling (XMajor or YMajor) employed to tile this surface. See *Memory Interface Functions* for details on memory tiling and restrictions.

Value	Name
0	TILEWALK_XMAJOR
1	TILEWALK_YMAJOR

Programming Notes

- The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit.

This field is ignored when the surface is linear.

31:30 — Reserved

Format:	MBZ

29:16 — Output Surface X Offset For U

Exists If:	//PLANAR Surface Formats Only
Format:	U14 Pixel Offset

This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the U(Cb) plane or the interleaved UV plane if **Interleave Chroma** is enabled.

Programming Notes

For PLANAR_420 and PLANAR_422 surface formats, this field must be zero.

15:14 — Reserved

Format:	MBZ

13:0 — Output Surface Y Offset For U

Exists If:	//PLANAR Surface Formats Only
Format:	U14 Pixel Row Offset

This field specifies the veritical offset in rows from the **Surface Base Address** to the start (origin) of the U(Cb) plane or the interleaved UV plane if **Interleave Chroma** is enabled.

Programming Notes

For PLANAR_420 and PLANAR_422 surface formats, this field must be multiple of 16 pixels - i.e. multiple MBs.

31:30 — Reserved

Format:	MBZ

Shift Left

shl - Shift Left

Source: Eulsa

Length Bias: 4

Description

Perform component-wise logical left shift of the bits in src0 by the shift count indicated in src1, storing the results in dst, inserting zero bits in the number of LSBs indicated by the shift count.
Hardware detects overflow properly and uses it to perform any saturation operation on the result, as long as the shifted result is within 33 bits. Otherwise, the result is undefined.
Note: For word and DWord operands, the accumulators have 33 bits.

In QWord mode, the shift count is taken from the low six bits of src1 regardless of the src1 type and treated as an unsigned integer in the range 0 to 63. Otherwise the shift count is taken from the low five bits of src1 regardless of the src1 type and treated as an unsigned integer in the range 0 to 31. The operation uses QWord mode if src0 or dst has the Q or UQ type but not if src1 is the only operand with the Q or UQ type.

Format:
[(pred)] shl[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : Accumulator cannot be destination, implicit or explicit.

Syntax

```
[(pred)] shl[.cmod] (exec_size) reg reg reg [(pred)] shl[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { shiftCnt = src0 or dst has Q or UQ type ? src1.chan[n] & 0x3F : src1.chan[n] & 0x1F dst.chan[n] = src0.chan[n] « shiftCnt; } }
```

Shift Right

shr - Shift Right

Source: Eulsa

Length Bias: 4

Description

Perform component-wise logical right shift with zero insertion of the bits in src0 by the shift count indicated in src1, storing the results in dst. Insert zero bits in the number of MSBs indicated by the shift count.
src0 and dst can have different types and can be signed or unsigned.
Note: For word and DWord operands, the accumulators have 33 bits.
Note: For unsigned src0 types, shr and asr produce the same result.

In QWord mode, the shift count is taken from the low six bits of src1 regardless of the src1 type and treated as an unsigned integer in the range 0 to 63. Otherwise the shift count is taken from the low five bits of src1 regardless of the src1 type and treated as an unsigned integer in the range 0 to 31. The operation uses QWord mode if src0 or dst has the Q or UQ type but not if src1 is the only operand with the Q or UQ type.

Format:

	18	**Reserved** Format: MBZ Ignored

MSD_RTW_SIMD8 - SIMD8 Render Target Write MSD

17:14 **Message Type**

Default Value:	0Ch
Format:	Opcode

Render Target Write message

13 **Per-Sample PS Enable**

Format:	Enable

If set, PS sends Render Target Write Message that outputs color, depth(optional) and stencil(optional) phases on per sample basis for each slot.

Programming Notes

This bit must be set when PS runs at sample-frequency i.e. pixel shader dispatch mode is PER_SAMPLE.

When this bit is set and PS runs at pixel-frequency, i.e. pixel shader dispatch mode is PER_PIXEL, Render Target read and write messages interpret bits 9:6 in MCH_RT_C0 as sample index. In this mode, render target write message payload and render target read writeback payload contain color of a specific sample in all dispatched pixels. RT writes referring to out-of-bound samples have no effect. RT reads from out-of-bound samples return 0.

When this bit is clear and PS runs at pixel-frequency, render target write messages contain color value for entire pixel (all samples).

When this bit is clear and PS runs at pixel-frequency, render target reads are disallowed per API spec (RT read without specifying sample index forces sample-frequency dispatch). HW behavior is undefined in such case.

12 **Last Render Target Select**

Format:	Enable

This bit must be set on the last render target write message sent for each group of pixels. For single render target pixel shaders, this bit is set on all render target write messages. For multiple render target pixel shaders, this bit is set only on messages sent to the last render target. This bit must be zero for SIMD8 Image Write message. In general, when threads are not launched by 3D FF, this bit must be zero.

Programming Notes

When a pixel shader has render target writes at finer granularity than the dispatch rate, last render target write to a null surface must be present at the dispatch rate with this bit set.

In particular, if a kernel is dispatched at pixel rate and it only writes to render targets at sample-rate, it must include a pixel-rate render target write to a null surface with Last Render Target Select bit enabled.

11 **Slot Group Select**

Format:	MDC_RT_SGS

This field selects whether slots 15:0 or slots 31:16 are used for bypassed data.

	10:8	**Render Target Message Subtype** Default Value: 0h Format: Opcode SIMD16 Single source message. Use slots [15:0] for pixel enables, X/Y addresses, and oMask. **Programming Notes** The above slots indicated are within the 16 slots selected by Slot Group Select. If SLOTGRP_HI is selected, slots [31:16] are referenced instead of [15:0].
	7:0	**Binding Table Index** Format: MDC_BTS Specifies the Binding Table Index for the message

Split Send Message

sends - Split Send Message

Source: Eulsa

Length Bias: 4

Description

The sends instruction performs data communication between a thread and external function units, including shared functions (Sampler, Data Port Read, Data Port Write, URB, and Message Gateway) and some fixed functions (e.g. Thread Spawner, who also have an unique Shared Function ID). The sends instruction adds an entry to the EU's message request queue. The request message is stored in a block of contiguous GRF registers. The response message, if present, will be returned to a block of contiguous GRF registers. The return GRF writes may be in any order depending on the external function units. <src0> and <src1> are the lead GRF registers for the first and second block of the request respectively. <dest> is the lead GRF register for response. The message descriptor field <desc> contains the Message Length (the number of consecutive GRF registers corresponding to src0) and the Response Length (the number of consecutive GRF registers). It also contains the header present bit, and the function control signals. The extend message descriptor field <ex_desc> contains the target function ID, the Extended Message Length (the number of consecutive GRF registers corresponding to src1) and the extended function control signals. WrEn is forwarded to the target function in the message sideband.

The sends instruction is the only way to terminate a thread. When the EOT (End of Thread) bit of <ex_desc> is set, it indicates the end of thread to the EU, the Thread Dispatcher and, in most cases, the parent fixed function.

Message descriptor field <desc> can be a 32-bit immediate, imm32, or a 32-bit scalar register, <reg32a>. GEN restricts that the 32-bit scalar register <reg32a> must be the leading dword of the address register. It should be in the form of a0.0<0;1,0>:ud. When <desc> is a register operand, only the lower 31 bits of <reg32a> are used.

Extended Message descriptor field <ex_desc> can be a 32-bit immediate, imm32 or a 32bit scalar register, <reg32a>. The bits3:0 of the <ex_desc> specifies the SFID for the message.The EOT field always comes from bit127 of the instruction word, which is the bit5 of <ex_desc>. A thread must terminate with a sends instruction with EOT turned on. The bits9:6 of <ex_desc> specify the extended message length and bits31:12 specify the 20bit extended function control. Interpretation of the extended function control signals is subject to the target external function. The scalar register <reg32a> is selected when SelReg32ExDesc is set, ExDesc.RegNum[3:0] provides the addressing for reg32a for extended message descriptor. This selects one of the index sub registers. Subregisters selected are always aligned to dword. This implies, the even index subregisters must be used.</reg32a></ex_desc></ex_desc></ex_desc></reg32a></ex_desc>

Function control is now extended to 20 bits as specified in the below definition.

<src0> is a 256-bit aligned GRF register. It serves as the leading GRF register of the request.
<src1> is a 256-bit aligned GRF register or a null register. It serves as the leading GRF register for the second block of the request when it is not a null register. It is required that the second block of GRFs does not overlap with the first block. If it is a null register the Extended Message Length must be 0. The sum of Message Length and Extended Message Length must not be greater than 15.
The source dependency control, {NoSrcDepSet} is used to control the setting of source dependency for both the sources.
<dest> serves for two purposes: to provide the leading GRF register location for the response message if

sends - Split Send Message

present, and to provide parameters to form the channel enable sideband signals.
<dest> signals whether there is a response to the message request. It can be either a null register, a direct-addressed GRF register or a register-indirect GRF register. Otherwise, hardware behavior is undefined.
If <dest> is null, there is no response to the request. Meanwhile, the Response Length field in <desc> must be 0. Certain types of message requests, such as memory write (store) through the Data Port, do not want response data from the function unit. If so, the posted destination operand can be null.
If <dest> is a GRF register, the register number is forwarded to the shared function. In this case, the target function unit must send one or more response message phases back to the requesting thread. The number of response message phases must match the Response Length field in <desc>, which of course cannot be zero. For some cases, it could be an empty return message. An empty return message is defined as a single phase message with all channel enables turned off.
The destination type field is always valid and is used to generate the WrEn. This is true even if <dest> is a null register (this is an exception for null as for most cases these fields are ignored by hardware).
The address immediates for indirect sources and destination must be oword aligned.
The 16-bit channel enables of the message sideband are formed based on the WrEn. Interpretation of the channel enable sideband signals is subject to the target external function. In general for a 'sends' instruction with return messages, they are used as the destination dword write mask for the GRF registers starting at <dest>. For a message that has multiple return phases, the same set of channel enable signals applies to all the return phases.
NoDDClr and NoDDChk must not be used for send instruction.

Send a message stored in GRF locations starting at <src0> followed by <src1> to a shared function identified by <ex_desc> along with control from <desc> and <ex_desc> with a GRF writeback location at <dest>.

Format:
[(pred)] sends (exec_size) <dest> <src0> <src1> <ex_desc> <desc>

Restriction

Restriction : Software must obey the following rules in signaling the end of thread using the sends instruction: The posted destination operand must be null. No acknowledgement is allowed for the sends instruction that signifies the end of thread. This is to avoid deadlock as the EU is expecting to free up the terminated thread's resource. A thread must terminate with a sends instruction with message to a shared function on the output message bus; therefore, it cannot terminate with a sends instruction with message to the following shared functions: Sampler unit, NULL function For example, a thread may terminate with a URB write message or a render cache write message. A root thread originated from the media (generic) pipeline must terminate with a sends instruction with message to the Thread Spawner unit. A child thread should also terminate with a sends to TS. Please refer to the Media Chapter for more detailed description. The sends instruction can not update accumulator registers. Saturate is not supported for sends instruction. ThreadCtrl encodings Switch is not supported for sends instruction. The sends with EOT should use register space R112-R127 for <src>. This is to enable loading of a new thread into the same slot while the message with EOT for current thread is pending dispatch. Any instruction updating the ARF must use a {Switch} if the ARF is not used before EOT.</src>

Syntax

```
[(pred)] sends (exec size) reg greg greg imm32 imm32 [(pred)] sends (exec size)
reg greg greg imm32 reg32a [(pred)] sends (exec_size) reg greg reg reg32a imm32

STATE_BASE_ADDRESS

STATE_BASE_ADDRESS

Source: BSpec

Length Bias: 2

The STATE_BASE_ADDRESS command sets the base pointers for subsequent state, instruction, and media indirect object accesses by the GPE.
For more information see the Base Address Utilization table in the Memory Access Indirection narrative topic.

Programming Notes

The following commands must be reissued following any change to the base addresses:

- 3DSTATE_CC_POINTERS
- 3DSTATE_BINDING_TABLE_POINTERS
- 3DSTATE_SAMPLER_STATE_POINTERS
- 3DSTATE_VIEWPORT_STATE_POINTERS
- MEDIA_STATE_POINTERS

Execution of this command causes a full pipeline flush, thus its use should be minimized for higher performance.

SW must always program PIPE_CONTROL with "CS Stall" and "Render Target Cache Flush Enable" set before programming STATE_BASE_ADDRESS command for GPGPU workloads i.e when pipeline select is GPGPU via PIPELINE_SELECT command. This is required to achieve better GPGPU preemption latencies in certain workload programming sequences. If programming PIPE_CONTROL has performance implications then preemption latencies can be traded off against performance by not implementing this programming note.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE
	28:27	**Command SubType** Default Value: 0h GFXPIPE_COMMON
	26:24	**3D Command Opcode** Default Value: 1h GFXPIPE_NONPIPELINED
	23:16	**3D Command Sub Opcode** Default Value: 01h STATE_BASE_ADDRESS
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Format: =n Total Length - 2 Value / Name / Description

STATE_BASE_ADDRESS

		11h	DWORD_COUNT_n **[Default]**	Excludes DWord (0,1)
		10h	DWORD_COUNT_modify	Excludes DWord (0,1) To avoid updating the "Bindless Surface State Base Size" when the "Bindless Surface State Base Address Modify Enable" bit is cleared then the size of the command must be reduced to one less than the size of the instruction.

1..2 — 63:12 — General State Base Address

Format:	GraphicsAddress[63:12]

Specifies the 4K-byte aligned base address for general state accesses. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47].

Programming Notes

Bounds checking is performed on general state accesses by Data Port Shared Functions for stateless A32 messages.
Bounds checking is enabled when General State Base Address [46:12] + General State Buffer Size [31:12] is <= 2^47. This ensures that the General State Buffer does not straddle the canonical address boundary where GraphicsAddress [47] changes.

Restriction

Restriction :
General State Base Address [47:12] + General State Buffer Size [31:12] must be < 2^48. It is illegal programming for this to be >= 2^48.

Restriction : When using stateless (A32) Data Port messages, General State Base Address [47:12] + Buffer Base Address [31:0] must be < 2^48. It is illegal for this to be >= 2^48.

11 — Reserved

Format:	MBZ

10:4 — General State Memory Object Control State

Value	Name	Description
0h	Disable	Ignore the updated address.
1h	Enable	Modify the address.

Programming Notes
Setting this bit to 1 in a batch buffer causes the resource streamer to stop; for performance reasons the SW should only place commands with this bit set in the ring buffer.
Before programming the Surface State Base Address, the RS must be disabled. Within a batch buffer where the RS is enabled, RS may be disabled thru a MI_RS_CONTROL command with Resource Streamer Control cleared prior to the STATE_BASE_ADDRESS with Surface State Base Address Modify Enable set and then re-enabled with another MI_RS_CONTROL with Resource Streamer Control set.

STATE_BASE_ADDRESS

6..7 | 63:12 | Dynamic State Base Address

Format:	GraphicsAddress[63:12]

Specifies the 4K-byte aligned base address for sampler and viewport state accesses. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47].

11 | Reserved

Format:	MBZ

10:4 | Dynamic State Memory Object Control State

		This field indicates the size-1 of the Bindless Surface State buffer in 64-Byte increments. Any SSO beyond this maximum size points to offset 0. Example: If the buffer contains 512 surface states, then this field must be programmed to 0x1FF (511 decimal).		
	11:0	**Reserved**		
		Format:		MBZ

STATE_PREFETCH

STATE_PREFETCH

Source: BSpec

Length Bias: 2

(This command is provided strictly for performance optimization opportunities, and likely requires some experimentation to evaluate the overall impact of additional prefetching.)

The STATE_PREFETCH command causes the GPE to attempt to prefetch a sequence of 64-byte cache lines into the GPE-internal cache ("L2 ISC") used to access EU kernel instructions and fixed/shared function indirect state data. While state descriptors, surface state, and sampler state are automatically prefetched by the GPE, this command may be used to prefetch data not automatically prefetched, such as: 3D viewport state; Media pipeline Interface Descriptors; EU kernel instructions.

Restriction
Due to know HW issue this command doesn't achieve its intended purpose and must not be exercised/programmed by SW.

DWord	Bit	Description

STATE_SIP

STATE_SIP

Source: BSpec

Length Bias: 2

The STATE_SIP command specifies the starting instruction location of the System Routine that is shared by all threads in execution.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h GFXPIPE
	28:27	**Command SubType** Default Value: 0h GFXPIPE_COMMON
	26:24	**3D Command Opcode** Default Value: 1h GFXPIPE_NONPIPELINED
	23:16	**3D Command Sub Opcode** Default Value: 02h STATE_SIP
	15:8	**Reserved** Format: MBZ
	7:0	**DWord Length** Format: =n Total Length - 2 Value / Name / Description 1h / DWORD_COUNT_n **[Default]** / Excludes DWord (0,1)
1..2	63:4	**System Instruction Pointer** Format: InstructionBaseOffset[63:4]Kernel Specifies the instruction address of the system routine associated with the current context as a 128-bit granular offset from the Instruction Base Address. SIP is shared by all threads in execution. The address specifies the double quadword aligned instruction location. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47]. **Programming Notes** This portion of the command is not context save/restored. The context image may restore this command as a 2 dword command rather than a 3 dword command.
	3:0	**Reserved** Format: MBZ

Sum of Absolute Difference 2

sad2 - Sum of Absolute Difference 2

Source: Eulsa

Length Bias: 4

The sad2 instruction takes source data channels from src0 and src1 in groups of 2-tuples. For each 2-tuple, it computes the sum-of-absolute-difference (SAD) between src0 and src1 and stores the scalar result in the first channel of the 2-tuple in dst.

The results are also stored in the accumulator register. The destination operand and the accumulator maintain 16 bits per channel precision.

The destination register must be aligned to even word (DWord). The even words in the destination region will contain the correct data. The odd words are also written but with undefined values.

Format:

[(pred)] sad2[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : Source operands cannot be accumulators.

Restriction : The execution size cannot be 1 as the computation requires at least two data channels.

Syntax

```
[(pred)] sad2[.cmod] (exec_size) reg reg reg [(pred)] sad2[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn);
     for ( n = 0; n < exec_size; n += 2 ) {
         if ( WrEn.chan[n] ) {
            dst.chan[n] = abs(src0.chan[n] - src1.chan[n])
                        + abs(src0.chan[n+1] - src1.chan[n+1]);
         }
     }

Sum of Absolute Difference Accumulate 2

sada2 - Sum of Absolute Difference Accumulate 2

Source: Eulsa

Length Bias: 4

The sada2 instruction takes source data channels from src0 and src1 in groups of 2-tuples. For each 2-tuple, it computes the sum-of-absolute-difference (SAD) between src0 and src1, adds the intermediate result with the accumulator value corresponding to the first channel, and stores the scalar result in the first channel of the 2-tuple in dst.

The destination operand and the accumulator maintain 16 bits per channel precision. Higher precision (guide bits) stored in the accumulator allows up to 64 rounds of sada2 instructions to be issued back to back without overflowing the accumulator.

The destination register must be aligned to even word (DWord). The even words in the destination region will contain the correct data. The odd words are also written but with undefined values.

Format:

[(pred)] sada2[.cmod] (exec_size) dst src0 src1

Restriction

Restriction : Source operands cannot be accumulators.

Restriction : The execution size cannot be 1 as the computation requires at least two data channels.

Syntax

```
[(pred)] sada2[.cmod] (exec_size) reg reg reg [(pred)] sada2[.cmod] (exec_size) reg reg imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < exec_size; n += 2 ) { uwTmp = abs(src0.chan[n] - src1.chan[n]) + abs(src0.chan[n+1] - src1.chan[n+1]); if ( WrEn.chan[n] ) { dst.chan[n] = uwTmp + acc[n]; } }
```

VEB_DI_IECP

VEB_DI_IECP

Source: VideoEnhancementCS

Length Bias: 2

The VEB_DI_IECP command causes the VEBOX to start processing the frames specified by VEB_SURFACE_STATE using the parameters specified by VEB_DI_STATE and VEB_IECP_STATE. The processing can start and end at any 64 pixel column in the frame. If **Starting X** and **Ending X** are used to split the frame into sections, it should not be split into more than 4 sections.

Each VEB_DI_IECP command should be preceded by a VEB_STATE command and the input/output VEB_SURFACE_STATE commands.

Programming Notes

When DI is enabled, only the Current Frame skin scores are outputted to the Skin Score Output surface.

DWord	Bit	Description

VEBOX_STATE

VEBOX_STATE

Source: VideoEnhancementCS

Length Bias: 2

Description

This command controls the internal functions of the VEBOX. This command has a set of indirect state buffers:

- DN/DI state
- IECP general state
- IECP Gamut Expansion/Compression state
- IECP Gamut Vertex Table state
- Capture Pipe state

: Adds the LACE LUT Table as an indirect state buffer.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Pipeline** Default Value: 2h Media Format: OpCode
	26:24	**Command OpCode** Default Value: 4h VEBOX Format: OpCode
	23:21	**SubOpcode A** Default Value: 0h Format: OpCode
	20:16	**SubOpcode B** Default Value: 2h Format: OpCode
	15:12	**Reserved** Format: MBZ

VEBOX_STATE

	11:0	**DWord Length** Format: =n Total Length - 2 Value / Name / Description Eh / / (Excludes DWords 0, 1)
1	31:25	**State Surface Control Bits** All Indirect state buffers use state surface control bits, only exception being 3D LUT state buffer for which the state surface control bits are tied to 0. See definition under "VEB_DI_IECP_COMMAND_SURFACE_CONTROL_BITS " Bits[6:0] is only used.
	24:23	**Reserved** Format: MBZ
	22	**Reserved** Format: MBZ
	21	**Forward Gamma Correction Enable** Format: Enable **Programming Notes** Single Pipe IECP Enable must also be set if this is enabled.
	20	**Reserved** Format: MBZ
	19	**Single Pipe Enable** **Description** Indicates that the Capture Pipe features that only exist in a single pipe can be enabled. This bit must be set if any of the following features are enabled: Demosaic Denoise with one of the RGBA input formats IECP only mode with Forward Gamma Correction enabled with RGB input formats (All other modes are not supported in single pipe) This bit must be set if any of the following features are enabled: IECP only mode with either Color Correction Matrix, Forward Gamma Correction, Front-End CSC enabled. Value / Name 1 / Enable 0 / Default **[Default]** **Programming Notes** Note that the pixel throughput is 1/2 when this mode is selected. The **Global IECP Enable** must also be set.

VEBOX_STATE

	18	**Disable Temporal Denoise Filter** If set this bit will force the denoise filter to only use the spatial filter. This will eliminate the read of the previous denoise surface and STMM/Denoise History surface and the write of the current denoised surface and STMM/Denoise History surface. **Programming Notes** **The Global IECP Enable** or **Demosaic Enable** must be set along with this bit. This bit must be set if the input to Denoise is RGB. This bit must not be set if the Deinterlacer is enabled. This bit must be clear if both **DN Enable**=0 and **Hot Pixel Filtering Enable**=0 This bit must be set if **Hot Pixel Filtering Enable**=1 and both DN and DI are disabled
	17	**Disable Encoder Statistics** If set this bit will disable writing the per block Encoder statistics. The memory format is not changed, so the area set aside for these statistics will still be there.
	16	**LACE Correction Enable** This bit enables the correction of the image according to the local ACE LUT tables. This is independent from the enable for the collection of LACE histograms. **Programming Notes** LACE correction is only enabled if both this bit and the **Global IECP Enable** are set. The **ACE Enable** bit should also be set if this bit is set, since ACE correction can be used for part of the luma range instead of LACE.
	15:14	**Single Slice VEBOX Enable** For products that have 2 entire VEBOXes that automatically split the frame, this enable emulates a 1 VEBOX product, running at 1/2 speed and only outputting a single set of per command statistics. **Value** / **Name** 00b — Both Slices Enabled 01b — Slice 0 Enabled 10b — Slice 1 Enables 11b — Reserved **Programming Notes** This field must be set if 00b for products that don't have 2 slices.
	13	**Hot Pixel Filtering Enable** Enables hot pixel detection/filtering.
	12	**Alpha Plane Enable** Enables the reading of an independent Alpha plane. Mutually exclusive with Vignette Enable. If **Alpha from State Select** is set it overrides this bit. **Programming Notes** IECP must also be enabled and output format must have alpha if this bit is enabled. Should be 0 if Alpha from State Select is 1.

VEBOX_STATE

11 Vignette Enable

Enables Vignette Correction surface read and correction in IECP. Mutually exclusive with Alpha Plane Enable.

Programming Notes
Demosaic must also be enabled if this bit is enabled.

10 Demosaic Enable

The Demosaic will be used, and White balance statistics will be gathered. The Capture Pipe State Table will be read. This bit is mutually exclusive with **DI Enable.**

Programming Notes
IECP must also be enabled if this bit is enabled.

9:8 DI Output Frames

Indicates which frames to output in DI mode.

Value	Name
00b	Output Both Frames
01b	Output Previous Frame Only
10b	Output Current Frame Only

Programming Notes
Field is ignored if DI Enable = 0. If Previous Frame Only or Current Frame Only are selected, then the **LACE Single Histogram Set** must not try to collect a histogram from the disabled frame.
Field must be programmed to 10 (Output Current Frame Only) for DI First Frame.

7 444 -> 422 Downsample Method

Value	Name
1	Average horizontally aligned chromas
0	Drop right chroma of the pair **[Default]**

Programming Notes

444->422	422->420	Description
0	0	No averaging, only down sampling
0	1	Not Supported
1	0	Only Horizontal averaging
1	1	Horizontal and Vertical averaging

6 422 -> 420 Downsample Method

Value	Name
1	Average vertically aligned chromas
0	Drop lower chroma of the pair **[Default]**

VEBOX_STATE

Programming Notes
To enable averaging in case of 420 (NV12/P016) output formats, 444->422 and 422->420 should be set.

5 **DN/DI First Frame**

Format:	Enable

Indicates that this is the first frame of the stream, so previous clean is not available.

Value	Name
0	Not first field; previous clean surface state is valid
1	First field; previous clean surface state is invalid

Programming Notes
If both DN and DI are disabled, this bit must be 0.

4 **DI Enable**

Format:	Enable

Deinterlacer is bypassed if this is disabled: the output is the same as the input (same as a 2:2 cadence).

FMD and STMM are not calculated and the values in the response message are 0.

Value	Name
0	Do not calculate DI
1	Calculate DI

3 **DN Enable**

Format:	Enable

Denoise is bypassed if this is low - BNE is still calculated and output, but the denoised fields are not. VDI does not read in the denoised previous frame but uses the pointer for the original previous frame.

Value	Name
0	Do not denoise frame
1	Denoise frame

Programming Notes
If DN and/or Hotpixel are the only functions enabled then the only output is the Denoised Output which is the same surface format as the input. To get a format conversion with DN only, enable the Global IECP bit, but disable all the individual functions. The IECP output uses the output surface format.
If DN is used with RGB then the **Global IECP** Enable must also be

2 **Global IECP Enable**

Indicates if any of the IECP features is enabled.

If this is disabled then no state will be read from any of the state pointers. If set then the IECP state will be read.

VEBOX_STATE

	1	**Color Gamut Compression Enable** Indicates if the Gamut Compression feature is enabled. If set then the Gamut State will be read. VEB_VERTEXTABLE_STATE is only needed if this bit is set.
	0	**Color Gamut Expansion Enable** Indicates if the Gamut Expansion feature is enabled. If set then the Gamut State will be read.
2	31:12	**DN/DI State Pointer Low** Format: GraphicAddress[31:12] Bits 31:12 of the starting address of the DN/DI State buffer. This points to a buffer containing the 10 Dwords of the DN/DI state.
	11:0	**Reserved** Format: MBZ
3	31:16	**Reserved** Format: MBZ
	15:0	**DN/DI State Pointer High** Format: GraphicAddress[47:32] Bits 47:32 of the starting address of the DN/DI State Buffer.
4	31:12	**IECP State Pointer Low** Format: GraphicAddress[31:12] Bits 31:12 of the starting address of the IECP State buffer. This points to a buffer containing the 64 Dwords of IECP state.
	11:0	**Reserved** Format: MBZ
5	31:16	**Reserved** Format: MBZ
	15:0	**IECP State Pointer High** Format: GraphicAddress[47:32] Bits 47:32 of the starting address of the IECP State Buffer Table.
6	31:12	**Gamut State Pointer Low** Format: GraphicAddress[31:12] Bits 31:12 of the starting address of the Gamut State buffer. This points to a buffer containing the 42 Dwords of Gamut Compression / Gamut Expansion state.
	11:0	**Reserved** Format: MBZ

VEBOX_STATE

7	31:16	**Reserved** Format: MBZ
	15:0	**Gamut State Pointer High** Format: GraphicAddress[47:32] Bits 47:32 of the starting address of the Gamut State Buffer.
8	31:12	**Vertex Table State Pointer Low** Format: GraphicAddress[31:12] Bits 31:12 of the starting address of the Vertex Table. This points to a buffer containing the 512 Dwords of the Gamut Compression Vertex Table.
	11:0	**Reserved** Format: MBZ
9	31:16	**Reserved** Format: MBZ
	15:0	**Vertex Table State Pointer High** Format: GraphicAddress[47:32] Bits 47:32 of the starting address of the Vertex State Buffer.
10	31:12	**Capture Pipe State Pointer Low** Format: GraphicAddress[31:12] Bits 31:12 of the starting address of the Capture Pipe State Table. This points to a buffer containing the X Dwords of the Capture Pipe State.
	11:0	**Reserved** Format: MBZ
11	31:16	**Reserved** Format: MBZ
	15:0	**Capture Pipe State Pointer High** Format: GraphicAddress[47:32] Bits 47:32 of the starting address of the Capture Pipe State Table.
12	31:12	**LACE LUT Table State Pointer Low** Format: GraphicAddress[31:12] Bits [31:12] of the starting address of the LACE Look-up Tables.
	11:0	**Reserved** Format: MBZ

VEBOX_STATE

13 | 31:30 | Arbitration Priority Control - For LACE LUT

Format:	U2

This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.

Value	Name
0	Highest priority
1	Second highest priority
2	Third highest priority
3	Lowest priority

29:16 | Reserved

Format:	MBZ

15:0 | LACE LUT Table State Pointer High

Format:	GraphicAddress[47:32]

Bits [47:32] of the starting address of the LACE Look-up Tables.

14..15 | 63:12 | Gamma Correction Values Address

Format:	GraphicsAddress63-12

Specifies the 4K byte aligned address reading the Gamma Correction Values in case enabled.

11:0 | Reserved

Format:	MBZ

VEBOX_SURFACE_STATE

VEBOX_SURFACE_STATE	
Source:	VideoEnhancementCS
Length Bias:	2

Description
The input and output data containers accessed are called "surfaces". Surface state is sent to VEBOX via an inline state command rather than using binding tables. SURFACE_STATE contains the parameters defining each surface to be accessed, including its size, format, and offsets to its subsurfaces. The surface's base address is in the execution command. Despite having multiple input and output surfaces, we limit the number of surface states to one for input surfaces and one for output surfaces. The other surfaces are derived from the input/output surface states.
The Current Frame Input surface uses the Input SURFACE_STATE
The Previous Denoised Input surface uses the Input SURFACE_STATE. (For 16-bit Bayer pattern inputs this will be 16-bit.)
The Current Denoised Output surface uses the Input SURFACE_STATE. (For 16-bit Bayer pattern inputs this will be 16-bit.)
The STMM/Noise History Input surface uses the Input SURFACE_STATE with Tile-Y and Width/Height a multiple of 4.
The STMM/Noise History Output surface uses the Input SURFACE_STATE with Tile-Y and Width/Height a multiple of 4.
The Current Deinterlaced/IECP Frame Output surface uses the Output SURFACE_STATE.
The Previous Deinterlaced/IECP Frame Output surface uses the Output SURFACE_STATE.
The FMD per block output / per Frame Output surface uses the Linear SURFACE_STATE (see note below).
The Alpha surface uses the Linear A8 SURFACE_STATE with Width/Height equal to Input Surface. Pitch is width rounded to next 64.
The Skin Score surface uses the Output SURFACE_STATE.
The STMM height is the same as the Input Surface height except when the input **Surface Format** is Bayer Pattern and the **Bayer Pattern Offset** is 10 or 11, in which case the height is the input height + 4. For Bayer pattern inputs when the **Bayer Pattern Offset** is 10 or 11, the Current Denoised Output/Previous Denoised Input will also have a height which is the input height + 4. For Bayer pattern inputs only the Current Denoised Output/Previous Denoised Input are in Tile-Y.
The linear surface for FMD statistics is linear (not tiled). The height of the per block statistics is (Input Height +3)/4 - the Input Surface height in pixels is rounded up to the next even 4 and divided by 4. The width of the per block section in bytes is equal to the width of the Input Surface in pixels rounded up to the next 16 bytes. The pitch of the per block section in bytes is equal to the width of the Input Surface in pixels rounded up to the next 64 bytes.
The STMM surfaces must be identical to the Input surface except for the tiling mode must be Tile-Y and the pitch is specified in DW7. The pitch for the Current Denoised Output/Previous Denoised Input is specified in DW7. The width and height must be a multiple of 4 rounded up from the input height.

VEBOX_SURFACE_STATE

The Vignette Correction surface uses the Linear 16-bit SURFACE_STATE with :
Width=(Ceil(Image Width / 4) +1) * 4
Height= Ceil(Image Height / 4) +1
Pitch in bytes is (vignette width *2) rounded to the next 64

Programming Notes

VEBOX may write to memory between the surface width and the surface pitch for output surfaces.

VEBOX can support a frame level X/Y offset which allows processing of 2 side-by-side frames for certain 3D video formats.

The X/Y Offset for Frame state applies only to the Current Frame Input and the Current Deinterlaced/IECP Frame Output and Previous Deinterlaced/IECP Frame Output. The statistics surfaces, the denoise feedback surfaces and the alpha/vignette surfaces have no X/Y offsets.

For 8bit Alpha input, when converted to 16bit output, the 8 bit alpha value is replicated to both the upper and lower 8 bits to form the 16 bit alpha value.

Skin Score Output Surface uses the same tiling format as the Output surface.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode
	28:27	**Media Command Pipeline** Default Value: 2h Media Format: OpCode
	26:24	**Media Command OpCode** Default Value: 4h VEBOX Format: OpCode
	23:21	**SubOpcode A** Default Value: 0h VEBOX Format: OpCode
	20:16	**SubOpcode B** Default Value: 0h VEBOX Format: OpCode
	15:12	**Reserved** Format: MBZ
	11:0	**DWord Length** Format: =n Total Length - 2 Value: 7h — Name: DWORD_COUNT_n **[Default]** — Description: (Excludes DWords 0, 1)

VEBOX_SURFACE_STATE

1 — 31:1 — Reserved

Format:	MBZ

1 — 0 — Surface Identification

Specifies which set of surfaces this command refers to:

Value	Name
1	Output surface (all except the Denoised Current output surface)
0	Input surface and Denoised Current Output Surface

2 — 31:18 — Height

Format:	U14

This field specifies the height of the surface in units of pixels. For PLANAR surface formats, this field indicates the height of the Y (luma) plane.

Value	Name	Description	Exists If
[15, 16383]		representing heights [16,16384]	
[15, 8191]			//Scalar Enabled - For Input surface only
[63, 2047]			//Scalar + SFC Enabled - For Input surface only

Programming Notes

Height (field value + 1) must be a multiple of 2 for PLANAR_420 surfaces.
Height (field value +1) must be a multiple of 2 when the deinterlace function is enabled (field mode) or when the denoise function is enabled with **Progressive DN** = 0. It must be a multiple of 4 when interleaved deinterlace/denoise and PLANAR_420 are both being used.
VEBOX supports a minimum height of 16.

Height (field value + 1) must be a multiple of 2 for Bayer surfaces.

2 — 17:4 — Width

Format:	U14

This field specifies the width of the surface in units of pixels. For PLANAR surface formats, this field indicates the width of the Y (luma) plane.

Value	Name	Description	Exists If
[63,16383]		representing widths [64,16384]	
[63,8191]			//Scalar Enabled - For Input surface only
[63,2047]			//Scalar and SFC Enabled - For Input Surface only

Programming Notes

The Width specified by this field multiplied by the pixel size in bytes must be less than or equal to the surface pitch (specified in bytes via the **Surface Pitch** field).

VEBOX_SURFACE_STATE

		Width (field value + 1) must be a multiple of 2 for PLANAR_420, PLANAR_422, and all YCRCB_* surfaces, and must be a multiple of 4 for PLANAR_411 surfaces. **VEBOX** supports a minimum width of 64
	3:0	**Reserved** Format: MBZ
3	31:28	**Surface Format** Format: U4 Specifies the format of the surface. All of the Y and G channels will use table 0 and all of the Cr/Cb/R/B channels will use table 1.

Value	Name	Description
0	YCRCB_NORMAL	
1	YCRCB_SWAPUVY	
2	YCRCB_SWAPUV	
3	YCRCB_SWAPY	
4	PLANAR_420_8	NV12 with Interleave Chroma set
5	PACKED_444A_8	IECP input/output only
6	PACKED_422_16	IECP input/output only
7	R10G10B10A2_UNORM / R10G10B10A2_UNORM_SRGB	IECP output only
8	R8G8B8A8_UNORM / R8G8B8A8_UNORM_SRGB	Hot Pixel/Denoise and/or IECP input/output
9	PACKED_444_16	IECP input/output only
10	PLANAR_422_16	IECP input/output only
11	Y8_UNORM	
12	PLANAR_420_16	IECP input/output only
13	R16G16B16A16	Hot Pixel/Denoise and/or IECP input/output
14	Bayer pattern	Demosaic input only
15	Y16_UNORM	Denoise/IECP input/output

	27	**Interleave Chroma** Format: Enable This field indicates that the chroma fields are interleaved in a single plane rather than stored as two separate planes. This field is only used for PLANAR surface formats.
	26:25	**Bayer Pattern Offset** Specifies the starting pixel offset for the Bayer pattern used for Capture Pipe.

Value	Name
00b	Pixel at X=0, Y=0 is Blue

VEBOX_SURFACE_STATE

01b	Pixel at X=0, Y=0 is Red
10b	Pixel at X=0, Y=0 is Green, Pixel at X=1, Y=0 is Red
11b	Pixel at X=0, Y=0 is Green, Pixel at X=1, Y=0 is Blue

24 Bayer Pattern Format

Specifies the format of the Bayer Pattern:

Value	Name
0b	8-bit input at a 8-bit stride
1b	16-bit input at a 16-bit stride

23:21 Reserved

Format:	MBZ

20 Reserved

Format:	MBZ

19:3 Surface Pitch

Format:	U17 pitch in (Bytes - 1)

This field specifies the surface pitch in (#Bytes - 1):

Value	Name	Description
[63, 131071]	For other linear surfaces	[64B, 128KB]
[511, 131071]	For X-tiled surface	[512B, 128KB] = [1tile, 256 tiles]
[127, 131071]	For Y-tiled surfaces	[128B,128KB] = [1 tile, 1024 tiles]

Programming Notes
For tiled surfaces, the pitch must be a multiple of the tile width. For linear surfaces, the pitch must be a multiple of 64. If Half Pitch for Chroma is set, this field must be a multiple of two tile widths for tiled surfaces, or a multiple of 2 bytes for linear surfaces.

2 Half Pitch for Chroma

Format:	Enable

This field indicates that the chroma plane(s) will use a pitch equal to half the value specified in the **Surface Pitch** field. This field is only used for PLANAR surface formats.

Programming Notes
Must be programmed to Zero always as this field is not used

1 Tiled Surface

Format:	Boolean

This field specifies whether the surface is tiled.

Value	Name	Description
1	True	Tiled
0	False	Linear

VEBOX_SURFACE_STATE

		Programming Notes Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled surfaces can only be mapped to Main Memory. The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit.
	0	**Tile Walk** Format: 3D_TileWalk This field specifies the type of memory tiling (XMajor or YMajor) employed to tile this surface. See *Memory Interface Functions* for details on memory tiling and restrictions. This field is ignored when the surface is linear. **Value** / **Name** 0 TILEWALK_XMAJOR 1 TILEWALK_YMAJOR **Programming Notes** The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit.
4	31:29	**Reserved** Format: MBZ
	28:16	**X Offset for U** Format: U13 Pixel Offset This field must be zero for the VEBOX surface formats
	15	**Reserved** Format: MBZ
	14:0	**Y Offset for U** Format: U15 Row Offset This field specifies the veritical offset in rows from the start (origin) or the Luma(Y) plane to the start (origin) of the U(Cb) plane or the interleaved UV plane if **Interleave Chroma** is enabled. This field is only used for PLANAR surface formats. **Programming Notes** This field must indicate an even number (bit 0 = 0). This field must be evenly divisible by 4 for Tile-Y surfaces (so the offset points to the start of a cache line) For Planar formats, if the surface is in YS or YF tile modes, the Y Offset for U should be an integral multiple of the Tile height of the Luma plane
5	31:29	**Reserved** Format: MBZ

VEBOX_SURFACE_STATE

	28:16	**X Offset for V** Format: U13 Pixel Offset This field must be zero for the VEBOX surface formats.
	15	**Reserved** Format: MBZ
	14:0	**Y Offset for V** Format: U15 Row Offset This field specifies the veritical offset in rows from the start (origin) of the Luma(Y) plan**e** to the start (origin) of the V(Cr) plane. This field is only used for PLANAR surface formats with **Interleave Chroma** disabled. **Programming Notes** This field must indicate an even number (bit 0 = 0). This field must be evenly divisible by 4 for Tile-Y surfaces (so the offset points to the start of a cache line). For Planar formats, if the surface is in YS or YF tile modes, the Y Offset for V should be an integral multiple of the Tile height of the Luma plane
6	31	**Reserved** Format: MBZ
	30:16	**X Offset for Frame** Format: U15 Pixel Offset This is an offset in X from the Surface Base Address in pixels for all planes using this surface. For U/V planes this is added to the X Offset for U/V. After converting to bytes this must be an integer multiple of cache lines in the tiling mode. This specifies the edge of the frame, so adjacent pixels needed for Denoise/Deinterlace/Demosaic are replicated or mirrored. **Programming Notes** If**Y Offset for Frame** >0 the X Offset must be 0. If memory compression is enabled then this must be an even number of cache lines.
	15	**Reserved** Format: MBZ
	14:0	**Y Offset for Frame** Format: U15 Pixel Offset This is an offset in Y from the Surface Base Address in pixels for all planes using this surface. For U/V planes this is added to the Y Offset for U/V. After converting to bytes this must be an integer multiple of cache lines in the tiling mode. This specifies the edge of the frame, so adjacent pixels needed for Denoise/Deinterlace/Demosaic are replicated or mirrored. **Programming Notes** If **X Offset for Frame** >0 the Y Offset must be 0. For Planar formats, if the surface is in YS or YF tile modes, the Y Offset for Frame should be an integral multiple of the Tile height.

VEBOX_SURFACE_STATE

7 — 31:17 — Reserved

Format:	MBZ

7 — 16:0 — Derived Surface Pitch

Format:	U17 pitch in (Bytes - 1)

This field specifies the surface pitch in (#Bytes - 1) for the derived surfaces:
STMM/Denoise statistic surface is described when the **Surface Identification** bit is 0 (Input Surface).
The (Current Denoise Output)/(Previous Denoise Input) surfaces are described when the bit is 1 (Output Surface).

Value	Name	Description	Exists If
[63, 131071]		[64B, 128KB]	[Tiled Surface] == 0
[511, 131071]		[512B, 128KB] = [1tile, 256 tiles]	([Tiled Surface] == 1) AND ([Tile Walk] == 0)
[127, 131071]		[128B,128KB] = [1 tile, 1024 tiles]	([Tiled Surface] == 1) AND ([Tile Walk] == 1)

Programming Notes
In DN Only mode, the pitch for the (Current Denoise Output)/(Previous Denoise Input) and the Surface Pitch must be programed the same.
The pitch must be a multiple of the tile width.

8 — 31:17 — Reserved

Format:	MBZ

8 — 16:0 — Surface Pitch for Skin Score Output Surfaces

Format:	U17 pitch in (Bytes - 1)

This field specifies the surface pitch in (#Bytes - 1) for the Skin Score Output surface if enabled;
This is present only in the output surface format and reserved for Input surface format. The height and width are the same as in the Output surface mentioned above.

Value	Name	Description	Exists If
[63, 131071]		[64B, 128KB]	[Tiled Surface] == 0
[511, 131071]		[512B, 128KB] = [1tile, 256 tiles]	([Tiled Surface] == 1) AND ([Tile Walk] == 0)
[127, 131071]		[128B,128KB] = [1 tile, 1024 tiles]	([Tiled Surface] == 1) AND ([Tile Walk] == 1)

Programming Notes
The pitch must be a multiple of the tile width.

VEBOX_TILING_CONVERT

VEBOX_TILING_CONVERT

Source: VideoEnhancementCS

Length Bias: 2

This command takes the input surface and writes directly to the output surface at high speed. The surface format and width/height of the input and output must be the same, only the tiling mode and pitch can change.

DWord	Bit	Description
0	31:29	**Command Type** Default Value: 3h PARALLEL_VIDEO_PIPE Format: OpCode

Wait Notification

wait - Wait Notification

Source: Eulsa

Length Bias: 4

The wait instruction evaluates the value of the notification count register nreg. If nreg is zero, thread execution is suspended and the thread is put in 'wait_for_notification' state. If nreg is not zero (i.e., one or more notifications have been received), nreg is decremented by one and the thread continues executing on the next instruction. If a thread is in the 'wait_for_notification' state, when a notification arrives, the notification count register is incremented by one. As the notification count register becomes nonzero, the thread wakes up to continue execution and at the same time the notification register is decremented by one. If only one notification arrived, the notification register value becomes zero. However, during the above mentioned time period, it is possible that more notifications may arrive, making the notification register nonzero again.

When multiple notifications are received, software must use wait instructions to decrement notification count registers for each notification.

Notification register n0.0:ud is for thread to thread communication (via the Message Gateway shared function) and n0.1:ud for host to thread communication (through MMIO registers). See the Message Gateway chapter for thread-thread communication for host-to-thread communication.

Format:

wait (exec_size) nreg

Restriction
Restriction : src0 and dst must be n0.0, n0.1, or n0.2.
Restriction : Execution size must be 1 as the notification registers are scalar.
Restriction : Predication is not allowed.
Restriction : Two back-to-back wait instructions are not allowed. At minimum, a nop instruction must be inserted between two wait instructions

Syntax
`wait (1) n#`

Pseudocode
`N/A`

Predication	Conditional Modifier	Saturation	Source Modifier
N	N	N	N

	31:0	**Header** Format: **EU_INSTRUCTION_HEADER**

While

while - While

Source: Eulsa

Length Bias: 4

The while instruction marks the end of a do-while block. The instruction first evaluates the loop termination condition for each channel based on the current channel enables and the predication flags specified in the instruction. If any channel has not terminated, a branch is taken to a destination address specified in the instruction, and the loop continues for those channels. Otherwise, execution continues to the next instruction.ld point to the first instruction with the do label of the do-while block of code. It should be a negative number for the backward referencing. In GEN binary, JIP is at location dst and must be of type W (signed word integer).
If SPF is ON, none of the PcIP are updated.

Format:
[(pred)] while (exec_size) JIP

Restriction

Restriction : The execution size must be the same for the while instruction and any break and cont instructions of the same code block.

Syntax

```
[(pred)] while (exec_size) imm32
```

Pseudocode

```
Evaluate(WrEn); for ( n = 0; n < 32; n++ ) { if (WrEn.chan[n] ) { PcIP[n] = IP +
JIP; } else { PcIP[n] = IP + 1; } } if ( | PMask == 1 ) { // any enabled channel
true Jump(IP + JIP); }
```

XY_COLOR_BLT

XY_COLOR_BLT

Source: BlitterCS

Length Bias: 2

COLOR_BLT is the simplest BLT operation. It performs a color fill to the destination (with a possible ROP). The only operand is the destination operand which is written dependent on the raster operation. The solid pattern color is stored in the pattern background register.
This instruction is optimized to run at the maximum memory write bandwidth.
The typical (and fastest) Raster operation code = F0 which performs a copy of the pattern background register to the destination.

DWord	Bit	Description

XY_FAST_COPY_BLT

XY_FAST_COPY_BLT

Source: BlitterCS

Length Bias: 2

This BLT instruction performs a color source copy where the only operands involved are a color source and destination of the same bit width. The source and destination surfaces CANNOT overlap. The hardware assumes this whenever this Fast_Copy command is given to it. For overlapping Blits, use the traditional XY_SRC_COPY_BLT command (for overlap determination, read the description given in the XY_SRC_COPY_BLT command). Note that this command does not support Clipping operations. This new blit command will happen in large numbers, consecutively, possibly an entire batch will comprise only new blit commands Legacy commands and new blit command will not be interspersed. If they are, they will be separated by implied HW flush: Whenever there is a transition between this new Fast Blit command and the Legacy Blit commands, the HW will impose an automatic flush BEFORE the execution (at the beginning) of the next blitter command. New blit command can use any combination of memory surface type - linear, tiledX, tiledY, and the tiling information is conveyed as part of the new Fast Copy command. The Fast Copy Blit supports the new 64KB Tiling defineds.The starting pixel of Fast Copy blit for both source and destination should be on an OWord boundary.

Note that when two sequential fast copy blits have different source surfaces, but their destinations refer to the same destination surfaces and therefore destinations overlap it is imperative that a Flush be inserted between the two blits.

XY_FULL_BLT

XY_FULL_BLT

Source: BlitterCS

Length Bias: 2

The full BLT is the most comprehensive BLT instruction. It provides the ability to specify all 3 operands: destination, source, and pattern. The source and pattern operands are the same bit width as the destination operand.

The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access.

All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.

The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.

XY_FULL_IMMEDIATE_PATTERN_BLT

XY_FULL_IMMEDIATE_PATTERN_BLT

Source: BlitterCS

Length Bias: 2

The full BLT is the most comprehensive BLT instruction. It provides the ability to specify all 3 operands: destination, source, and pattern. The source and immediate pattern operands are the same bit width as the destination operand. The immediate data sizes are 64 bytes (16 DWs), 128 bytes (32 DWs), or 256 (64 DWs) for 8, 16, and 32 bpp color patterns. DWL indicates the total number of Dwords of immediate data.

The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access.

All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.

The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.

XY_FULL_MONO_PATTERN_MONO_SRC_BLT

XY_FULL_MONO_PATTERN_MONO_SRC_BLT

Source: BlitterCS

Length Bias: 2

The full BLT provides the ability to specify all 3 operands: destination, source, and pattern. The pattern and source operands are monochrome.
The monochrome source transparency mode indicates whether to use the source background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the source foreground color is used in the ROP operation.
All non-text monochrome sources are word aligned. At the end of a scan line the monochrome source, the remaining bits until the next word boundary are ignored. The Monochrome source data bit position field [2:0] indicates which bit position within the first byte should be used as the first source pixel which corresponds to the destination X1 coordinate.
The monochrome pattern transparency mode indicates whether to use the pattern background color or de-assert the write enables when the bit in the pattern is 0. When the source bit is 1, then the pattern foreground color is used in the ROP operation. The monochrome source transparency mode works identical to the pattern transparency mode.
All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.
The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.
Setting both Solid Pattern Select =1 and Mono Pattern Transparency = 1 is mutually exclusive. The device implementation results in NO PIXELs DRAWN.
Negative Stride (= Pitch) is NOT ALLOWED.

Source: BlitterCS

Length Bias: 2

The full BLT is the most comprehensive BLT instruction. It provides the ability to specify all 3 operands: destination, source, and pattern. The source operand is monochrome and the pattern operand is the same bit width as the destination.

The monochrome source transparency mode indicates whether to use the source background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the source foreground color is used in the ROP operation.

All non-text and non-immediate monochrome sources are word aligned. At the end of a scan line the monochrome source, the remaining bits until the next word boundary are ignored. The Monochrome source data bit position field [2:0] indicates which bit position within the first byte should be used as the first source pixel which corresponds to the Destination X1 coordinate.

All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.

The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.

Negative Stride (= Pitch) is NOT ALLOWED

XY_MONO_PAT_FIXED_BLT

XY_MONO_PAT_FIXED_BLT

Source: BlitterCS

Length Bias: 2

MONO_PAT_FIXED_BLT is used when we have no source and the monochrome pattern is not trivial (is not a solid color only). The monochrome pattern is one of 10 fixed patterns described below. The pattern seeds can still be used with the fixed patterns, creating even more fixed patterns. This eliminates 2 doublewords compared to the XY_MONO_PAT_BLT command packet.

All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.

The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.

The monochrome pattern transparency mode indicates whether to use the pattern background color or de-assert the write enables when the bit in the pattern is 0. When the pattern bit is 1, then the pattern foreground color is used in the ROP operation.

XY_MONO_SRC_COPY_BLT

XY_MONO_SRC_COPY_BLT

Source: BlitterCS

Length Bias: 2

This BLT instruction performs a monochrome source copy where the only operands involved is a monochrome source and destination. The source and destination operands cannot overlap therefore the X and Y directions are always forward.

All non-text monochrome sources are word aligned. At the end of a scan line of monochrome source, all bits until the next word boundary are ignored. The monochrome source data bit position field [2:0] indicates the bit position within the first byte of the scan line that should be used as the first source pixel which corresponds to the destination X1 coordinate.

The monochrome source transparency mode indicates whether to use the source background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the source foreground color is used in the ROP operation. The ROP value chosen must involve source and no pattern data in the ROP operation. Negative Stride (= Pitch) is NOT ALLOWED.

XY_MONO_SRC_COPY_IMMEDIATE_BLT

XY_MONO_SRC_COPY_IMMEDIATE_BLT

Source: BlitterCS

Length Bias: 2

This instruction allows the Driver to send monochrome data through the instruction stream, eliminating the read latency of the source during command execution.
The IMMEDIATE_BLT data MUST transfer an even number of doublewords and the exact number of quadwords. DWL indicates the total number of Dwords of immediate data.
All non-text monochrome sources are word aligned. At the end of a scan line of monochrome source, all bits until the next word boundary are ignored. The Monochrome source data bit position field [2:0] indicates the bit position within the first byte of the scan line that should be used as the first source pixel which corresponds to the destination X1 coordinate.
The monochrome source transparency mode indicates whether to use the source background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the source foreground color is used in the ROP operation. The ROP value chosen must involve source and no pattern data in the ROP operation.
The monochrome source data supplied corresponds to the Destination X1 and Y1 coordinates.
Negative Stride (= Pitch) is NOT ALLOWED.

XY_PAT_BLT_IMMEDIATE

Source: BlitterCS

Length Bias: 2

PAT_BLT_IMMEDIATE is used when there is no source and the color pattern is not trivial (is not a solid color only) and the pattern is pulled through the command stream. The immediate data sizes are 64 bytes (16 DWs), 128 bytes (32 DWs), or 256 (64DWs) for 8, 16, and 32 bpp color patterns.

DWL indicates the total number of Dwords of immediate data. All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.

The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.

XY_SETUP_BLT

XY_SETUP_BLT

Source: BlitterCS

Length Bias: 2

This setup instruction supplies common setup information including clipping coordinates used by the XY commands: XY_PIXEL_BLT, XY_SCANLINE_BLT, XY_TEXT_BLT, and XY_TEXT_BLT_IMMEDIATE.
These are the only instructions that require that state be saved between instructions other than the Clipping parameters. There are 5 dedicated registers to contain the state for the 3 setup BLT instructions (XY_SETUP_BLT, XY_SETUP_MONO_PATTERN_SL_BLT, and XY_SETUP_CLIP_BLT. All other BLTs use a temporary version of these. The 5 double word registers are: DW1 (Setup Control), DW6 (Setup Foreground color), DW5 (Setup Background color), DW7 (Setup Pattern address), and DW4 (Setup Destination Base Address).

XY_SRC_COPY_BLT

XY_SRC_COPY_BLT

Source: BlitterCS

Length Bias: 2

This BLT instruction performs a color source copy where the only operands involved is a color source and destination of the same bit width.

The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access.

The ROP value chosen must involve source and no pattern data in the ROP operation.

	25:24	**Color Depth** 00b: 8 Bit Color 01b: 16 Bit Color(565) 10b: 16 Bit Color(1555) 11b: 32 Bit Color
	23:16	**Raster Operation**
	15:0	**Destination Pitch in DWords** 2's complement For Tiled surfaces (bit_11 enabled) this pitch is of 512Byte granularity for Tile-X, 128B granularity for Tile-Y and can be upto 128Kbytes (or 32KDwords).
2 BR22	31:16	**Destination Y1 Coordinate (Top)** 16 bit signed number.
	15:0	**Destination X1 Coordinate (Left)** 16 bit signed number.
3 BR23	31:16	**Destination Y2 Coordinate (Bottom)** 16 bit signed number.
	15:0	**Destination X2 Coordinate (Right)** 16 bit signed number.

XY_SRC_COPY_CHROMA_BLT		
4..5 Base address of the destination surface: X=0, Y=0. When Tiling is enabled (Bit_11 enabled), this address is limited to 4Kbytes. When Tiling is not enabled, this address is to be CL (64byte) aligned.	63:0	**Destination Base Address** Format: GraphicsAddress63-0
6 BR26	31:16	**Source Y1 Coordinate (Top)** 16 bit signed number.
	15:0	**Source X1 Coordinate (Left)** 16 bit signed number.
7 BR11	31:16	**Reserved** Format: MBZ
	15:0	**Source Pitch (double word aligned) and in DWords** 2's complement. For Tiled Src (bit 15 enabled) this pitch is of 512Byte granularity for Tile-X, 128B granularity for Tile-Yand can be upto 128Kbytes (or 32KDwords).
8..9 Base address of the source surface: X=0, Y=0. When Src Tiling is enabled (Bit_15 enabled), this address must be 4KB-aligned. When Tiling is not enabled, this address is to be CL (64byte) aligned.	63:0	**Source Base Address** Format: GraphicsAddress63-0
10 BR18	31:0	**Transparency Color Low** (Chroma-key Low = Pixel Greater or Equal)
11 BR19	31:0	**Transparency Color High** (Chroma-key High = Pixel Less or Equal)

XY_TEXT_BLT

XY_TEXT_BLT

Source: BlitterCS

Length Bias: 2

All source scan lines and pixels that fall within the ClipRect Y and X coordinates are written. The source address corresponds to Destination X1 and Y1 coordinate.

Text is either bit or byte packed. Bit packed means that the next scan line starts 1 pixel after the end of the current scan line with no bit padding. Byte packed means that the next scan line starts on the first bit of the next byte boundary after the last bit of the current line.

Source expansion color registers are always in the SETUP_BLT.

Negative Stride (= Pitch) is NOT ALLOWED.

DWord	Bit	Description
0 BR00	31:29	**Client** Default Value: 02h 2D Processor Format: Opcode
	28:22	**Instruction Target(Opcode)** Default Value: 26h Format: Opcode
	21:17	**Reserved** Format: MBZ

2 BR23	31:16	**Destination Y2 Coordinate (Bottom)** 16 bit signed number.
	15:0	**Destination X2 Coordinate (Right)** 16 bit signed number.
3..4 Address of the first byte on a scan line corresponding to source X1, Y1. Note no NPO2 change here. The source address must always be Cache Line (64byte) aligned.	63:0	**Source Address** Format: GraphicsAddress63-0

XY_TEXT_IMMEDIATE_BLT

XY_TEXT_IMMEDIATE_BLT

Source: BlitterCS

Length Bias: 2

This instruction allows the Driver to send data through the instruction stream that eliminates the read latency of reading a source from memory.

If an operand is in system cacheable memory and either small or only accessed once, it can be copied directly to the instruction stream versus to graphics accessible memory. The IMMEDIATE_BLT data MUST transfer an even number of doublewords.

The BLT engine will hang if it does not get an even number of doublewords. All source scan lines and pixels that fall within the ClipRect X and Y coordinates are written. The source data corresponds to Destination X1 and Y1 coordinate.

Source expansion color registers are always in the SETUP_BLT. NEGATIVE STRIDE (= PITCH) IS NOT ALLOWED.

3D_Vertex_Component_Control

3D_Vertex_Component_Control		
Source:	RenderCS	
Size (in bits):	3	
Value	**Name**	**Description**
0	VFCOMP_NOSTORE	Don't store this component. (Not valid for Component 0, but can be used for Component 1-3). Once this setting is used for a component, all higher-numbered components (if any) MUST also use this setting. (I.e., no holes within any particular vertex element). VFCOMP_NOSTORE will not store a component if the SourceElementFormat is R64_PASSTHRU or R64G64_PASSTHRU and it is used on component 2 and 3 else 0 will be stored.
1	VFCOMP_STORE_SRC	Store corresponding component from format-converted source element. Storing a component that is not included in the Source Element Format results in an UNPREDICTABLE value being stored. VF will process Component Control fields within a VERTEX_ELEMENT_STATE structure sequentially, starting with Component 0 Control. For each Component Control field in this sequence, when VF detects (a) the Component Control field is set to STORE_SRC and (b) the component is not overwritten by an SGV, VF will store a component of the source vertex data into the destination component. The first such Component Control field satisfying this criteria will use Component 0 of the source vertex data, the second such Component Control field will use Component 1 of the source vertex data, and so on. Therefore, when a lower-numbered Component Control field (a) is set to something other than STORE_SRC (e.g., STORE_0) or (b) the component is overwritten with an SGV, the source vertex component used when a higher-numbered Component Control fields is set to STORE_SRC will be impacted.
2	VFCOMP_STORE_0	Store 0 (interpreted as 0.0f if accessed as a float value)
3	VFCOMP_STORE_1_FP	Store 1.0f
4	VFCOMP_STORE_1_INT	Store 0x1
5-6	-	Reserved
7	VFCOMP_STORE_PID	Store Primitive ID (as U32) Software can no longer use this encoding as PrimitiveID is passed down the FF pipeline - see explanation above.

AddrMode

AddrMode

Source: Eulsa

Size (in bits): 1

Addressing Mode

This field determines the addressing method of the operand. Normally the destination operand and each source operand each have a distinct addressing mode field.

When it is cleared, the register address of the operand is directly provided by bits in the instruction word. It is called a direct register addressing mode. When it is set, the register address of the operand is computed based on the address register value and an address immediate field in the instruction word. This is referred to as a register-indirect register addressing mode.

This field applies to the destination operand and the first source operand, src0. Support for src1 is device dependent. See Table XX (Indirect source addressing support available in device hardware) in ISA Execution Environment for details.

Programming Notes
Instructions with 3 source operands use Direct Addressing.

Value	Name	Description
0	Direct	'Direct' register addressing
1	Indirect	'Register-Indirect' (or in short 'Indirect'). Register-indirect register addressing

Attribute_Component_Format

Attribute_Component_Format		
Source:	RenderCS	
Size (in bits):	2	
Value	**Name**	**Description**
00b	disabled **[Default]**	All components disabled
01b	.xy	2D attribute, z and w components disabled
10b	.xyz	3D attribute, w components disabled
11b	.xyzw	4D attribute, no disabled components

ChanEn

ChanEn	
Source:	Eulsa
Size (in bits):	1

Description
Channel Enables Dst.ChanEn, used only for the destination operand and only in the Align16 Access Mode. Provides four channel enable bits applied modulo four to all ExecSize channels. For example, 0xF enables all channels, 0 disables all channels, 0xA enables odd-numbered channels, and so on. The assembler mnemonics are x, y, z, and w for channels 0, 1, 2, and 3 respectively. If MaskCtrl is 1 (mnemonic NoMask) then all channels are enabled regardless of the ChanEn value, equivalent to ChanEn of 0xF (xyzw). Predication and execution masking, in addition to ChanEn and MaskCtrl, determine what channels are actually written.

Value	Name
0	Write Disabled
1	Write Enabled **[Default]**

ChanSel

ChanSel

Source: Eulsa

Size (in bits): 2

Channel Select

This field controls the channel swizzle for a source operand. The normally sequential channel assignment can be altered by explicitly identifying neighboring data elements for each channel. Out of the 8-bit field, 2 bits are assigned for each channel within the group of 4. ChanSel[1:0], [3.2], [5.4] and [7,6] are for channel 0 (?x?), 1 (?y?), 2 (?z?), and 3 (?w?) in the group, respectively.

For example with an execution size of 8, r0.0<4>.zywz:f would assign the channels as follows: Chan0 = Data2, Chan1 = Data1, Chan2 = Data3, Chan3 = Data2; Chan4 = Data6, Chan5 = Data5, Chan6 = Data7, Chan7 = Data6.

This field only applies to source operand.

This field is only present in Align16 mode. It is not present for an immediate source operand.

The 2-bit Channel Selection field for each channel within the group of 4 is defined as the following.

Programming Notes
Note: When using channel select for 64-bit operands, the valid selects are .xy and .zw. This is required to pick a pair of DWords.

Value	Name	Description
00b	x	Channel 0 is selected for the corresponding execution channel
01b	y	Channel 1 is selected for the corresponding execution channel
10b	z	Channel 2 is selected for the corresponding execution channel
11b	w	Channel 3 is selected for the corresponding execution channel

COMPONENT_ENABLES

COMPONENT_ENABLES

1110b	YZW
1111b	XYZW

CondModifier

CondModifier	
Source:	Eulsa
Size (in bits):	4

Conditional Modifier - This field sets the flag register based on the internal conditional signals output from the execution pipe such as sign, zero, overflow and NaNs, etc. If this field is set to 0000, no flag registers are updated. Flag registers are not updated for instructions with embedded compares. This field may also be referred to as the flag destination control field. This field applies to all instructions except send, sendc, and math.

Value	Name	Description
0000b	None **[Default]**	Do Not modify Flag Register.
0001b	.z	Zero
0001b	.e	Equal
0010b	.nz	NotZero
0010b	.ne	NotEqual
0011b	.g	Greater-than
0100b	.ge	Greater-than-or-equal
0101b	.l	Less-than

0111b	Reserved	
1000b	.o	Overflow
1001b	.u	Unordered with Computed NaN
1110b-1111b	Reserved	

DepCtrl

DepCtrl

Source: Eulsa

Size (in bits): 2

Destination Dependency Control

This field selectively disables destination dependency check and clear for this instruction. When it is set to 00, normal destination dependency control is performed for the instruction - hardware checks for destination hazards to ensure data integrity. Specifically, destination register dependency check is conducted before the instruction is made ready for execution. After the instruction is executed, the destination register scoreboard will be cleared when the destination operands retire. When bit 10 is set (NoDDClr), the destination register scoreboard will NOT be cleared when the destination operands retire. When bit 11 is set (NoDDChk), hardware does not check for destination register dependency before the instruction is made ready for execution. NoDDClr and NoDDChk are not mutual exclusive. When this field is not all-zero, hardware does not protect against destination hazards for the instruction. This is typically used to assemble data in a fine grained fashion (e.g. matrix-vector compute with dot-product instructions), where the data integrity is guaranteed by software based on the intended usage of instruction sequences.

Value	Name	Description
00b	None **[Default]**	Destination dependency checked and cleared (normal)
01b	NoDDClr	Destination dependency checked but not cleared
10b	NoDDChk	Destination dependency not checked but cleared
11b	NoDDClr, NoDDChk	Destination dependency not checked and not cleared

DstType

DstType	
Source:	Eulsa
Size (in bits):	4

Destination Type
Numeric data type of the destination operand dst. The bits of the destination operand are interpreted as the identified numeric data type, rather than coerced into a type implied by the operator. For a send or sendc instruction, this field applies to CurrDst, the current destination operand. Three source instructions use a 3-bit encoding that allows fewer data types.

Value	Name	Description
0000b	:ud	Unsigned Doubleword (32-bit) Integer
0001b	:d	Signed Doubleword (32-bit) Integer
0010b	:uw	Unsigned Word (16-bit) Integer
0011b	:w	Signed Word (16-bit) Integer

ExecSize

ExecSize	
Source:	Eulsa
Size (in bits):	3

Execution Size
This field determines the number of channels operating in parallel for this instruction.
The size cannot exceed the maximum number of channels allowed for the given data type.

Restriction
Restriction : An operand's Width must be less-than-or-equal to ExecSize

Value	Name	Programming Notes
000b	1 Channel (Scalar operation) **[Default]**	
001b	2 Channels	
010b	4 Channels	
011b	8 Channels	
100b	16 Channels	Restriction : 4-byte or smaller data types. Excludes DF, Q, and UQ types.
101b	32 Channels	Restriction : 2-byte or 1-byte data types. Excludes D, DF, F, Q, UD, and UQ types.
110b-111b	Reserved

Fixed Function ID

FFID - Fixed Function ID

Source: BSpec

Size (in bits): 4

Fixed functions are hardware units that execute complex graphics or media command on behalf of application software. Some fixed functions send work down a pipeline through a series of fixed functions. Multiple fixed functions can be running at the same time. The GPU tracks activity from the fixed function with its FFID.

Programming Notes

Software does not specify the FFID, and does not normally use the FFID value. The FFID value is available to a EU thread in an ARF.

Value	Name	Description
00h	Null	
04h	Hull Shader	
05h	Domain Shader	
07h	General Purpose Thread Spawner	GPGPU command queue thread dispatcher
09h	Vertex Shader	
0Ah	Command Stream	
0Bh	Vertex Fetch	
0Ch	Geometry Shader	

HorzStride

HorzStride	
Source:	Eulsa
Size (in bits):	2

Description
Horizontal Stride This field provides the distance in unit of data elements between two adjacent data elements within a row (horizontal) in the register region for the operand. This field applies to both destination and source operands. This field is not present for an immediate source operand.
A horizontal stride of 0 is used for a row that is one-element wide, useful when an instruction repeats a column value or repeats a scalar value. For example, adding a single column to every column in a 2D array or adding a scalar to every element in a 2D array uses HorzStride of 0. A horizontal stride of 1 indicates that elements are adjacent within a row. References to HorzStride in this volume normally reference the value not the encoding, so there are references to HorzStride of 4, which is encoded as 11b.

Value	Name
00b	0 elements
01b	1 elements
10b	2 elements
11b	4 elements

QtrCtrl

QtrCtrl

Source: EuIsa

Size (in bits): 2

Quarter Control
This field provides explicit control for ARF selection.
This field combined with ExecSize determines which channels are used for the ARF registers.
Along with NibCtrl, 1/8 DMask/VMask and ARF can be selected.

Programming Notes

NibCtrl is only allowed for SIMD4 instructions with a DF (Double Float) source or destination type.

Value	Name	Description	Programming Notes	Exists If
00b	1Q **[Default]**	Use first quarter for DMask/VMask. Use first half for everything else.		([ExecSize]=='8') AND ([NibCtrl]=='0')
01b	2Q	Use second quarter for DMask/VMask. Use second half for everything else.		([ExecSize]=='8') AND ([NibCtrl]=='0')
10b	3Q	Use third quarter for DMask/VMask. Use first half for everything else.		([ExecSize]=='8') AND ([NibCtrl]=='0')
11b	4Q	Use fourth quarter for DMask/VMask. Use second half for everything else.		([ExecSize]=='8') AND ([NibCtrl]=='0')
0	1H	Use first half for DMask/VMask. Use all channels for everything else.		([ExecSize]=='16') AND ([NibCtrl]=='0')
2	2H	Use second half for DMask/VMask. Use all channels for everything else.	Only allowed for SIMD16 instruction in Single Program Flow mode (SPF=1)	([ExecSize]=='16') AND ([NibCtrl]=='0')
0	1N	Use first 1/8th for DMask/VMask and ARF.		([ExecSize]=='4') AND ([NibCtrl]=='0')
0	2N	Use second 1/8th for DMask/VMask and ARF.		([ExecSize]=='4') AND ([NibCtrl]=='1')
1	3N	Use third 1/8th for DMask/VMask and ARF.		([ExecSize]=='4') AND ([NibCtrl]=='0')

2	6N	Use sixth 1/8th for DMask/VMask and ARF.		([ExecSize]=='4') AND ([NibCtrl]=='1')
3	7N	Use seventh 1/8th for DMask/VMask and ARF.		([ExecSize]=='4') AND ([NibCtrl]=='0')
3	8N	Use eighth 1/8th for DMask/VMask and ARF.		([ExecSize]=='4') AND ([NibCtrl]=='1')

RegFile

RegFile

Source: Eulsa

Size (in bits): 2

Value	Name	Description	Programming Notes
00b	ARF	Architecture Register File	Restriction : Only allowed for src0 or destination
01b	GRF	General Register File - allowed for any source or destination	
10b	Reserved		
11b	IMM	Immediate operand	Restriction : Only allowed for the last source operand. Not allowed for the destination operand or for any other source operand. Note that for flow control instructions requiring two offsets, regfile of source0 is required to be immediate since the 64b for immediates occupy the DW2 and DW3

RepCtrl

RepCtrl	
Source:	Eulsa
Size (in bits):	1

Replicate Control. This field is only present in three-source instructions, for each of the three source operands. It controls replication of the starting channel to all channels in the execution size. This is applicable to 32b datatypes. 16b and 64b datatypes cannot use the replicate control.

Value	Name
0	No replication
1	Replicate across all channels

SFID

SFID

Source: Eulsa

Size (in bits): 4

The following table lists the assignments (encodings) of the Shared Function and Fixed Function IDs used within the GPE. A Shared Function is a valid target of a message initiated via a 'send' instruction. A Fixed Function is an identifiable unit of the 3D or Media pipeline. Note that the Thread Spawner is both a Shared Function and Fixed Function.

Note: The initial intention was to combine these two ID namespaces, so that (theoretically) an agent (such as the Thread Spawner) that served both as a Shared Function and Fixed Function would have a single, unique 4-bit ID encoding. However, this combination is not a requirement of the architecture.

Programming Notes
SFID_DP_DC1 is an extension of SFID_DP_DC0 to allow for more message types. They act as a single logical entity.
SFID_DP_DC1, SFID_DP_DC2, SFID_DP_DC3 are extensions of SFID_DP_DC0 to allow for more message types. They act as a single logical entity.

Value	Name	Description	Programming Notes

SrcImmType

SrcImmType

Source: EuIsa

Size (in bits): 4

Specifies the numeric data type of a source operand. In a two-source instruction, each source operand has its own source type field. In a three-source instruction, one source type is used for all three source operands.

The bits of a source operand are interpreted as the identified numeric data type, rather than coerced into a type implied by the operator.

Depending on the RegFile field for the source, this field uses one of two encodings. For a non-immediate source (from a register file), use the Source Register Type Encoding, which is identical to the Destination Type encoding. For an immediate source, use the Source Immediate Type Encoding, which does not support signed or unsigned byte immediate values and does support the three packed vector types, V, UV, and VF.

Note that three-source instructions do not support immediate operands, that only the second source (src1) of a two-source instruction can be immediate, and that 64-bit immediate values (DF, Q, or UQ) can only be used with one-source instructions.

In a two-source instruction with a V (Packed Signed Half-Byte Integer Vector) or UV (Packed Unsigned Half-Byte Integer Vector) immediate operand, the other source operand must have a type compatible with packed word execution mode, one of B, UB, W, or UW.

Note that DF (Double Float) and HF (Half Float) have different encodings in the Source Regster Type Encoding and the Source Immediate Type Encoding.

The Source Register Type Encoding and Source Immediate Type Encoding lists apply to instructions with one or two source operands.

Value	Name	Description
0000b	:ud	Unsigned Doubleword Integer
0001b	:d	Signed Doubleword Integer
0010b	:uw	Unsigned Word Integer
0011b	:w	Signed Word Integer

SrcMod

SrcMod

Source: Eulsa

Size (in bits): 2

Description
Source Modifier This field specifies the numeric modification of a source operand. The value of each data element of a source operand can optionally have its absolute value taken and/or its sign inverted prior to delivery to the execution pipe. The absolute value is prior to negate such that a guaranteed negative value can be produced. This field only applies to source operand. It does not apply to destination. This field is not present for an immediate source operand.
When used with logic instructions (and, not, or, xor), this field indicates whether the source bits are inverted (bitwise NOT) before delivery to the execution pipe, regardless of the source type.

Value	Name	Description
00b	No modification	
01b	abs	Absolute value Logic instructions: No modification (This encoding cannot be selected in the assembler syntax)
10b	negate	Negate Logic instructions: Bitwise NOT, inverting the source bits
11b	negate of abs	Negate of the absolute (forced negative value) Logic instructions: No modification (This encoding cannot be selected in the assembler syntax)

SrcType

SrcType

Source: EuIsa

Size (in bits): 4

Specifies the numeric data type of a source operand. In a two-source instruction, each source operand has its own source type field. In a three-source instruction, one source type is used for all three source operands.

The bits of a source operand are interpreted as the identified numeric data type, rather than coerced into a type implied by the operator.

Depending on the RegFile field for the source, this field uses one of two encodings. For a non-immediate source (from a register file), use the Source Register Type Encoding, which is identical to the Destination Type encoding. For an immediate source, use the Source Immediate Type Encoding, which does not support signed or unsigned byte immediate values and does support the three packed vector types, V, UV, and VF.

Note that three-source instructions do not support immediate operands, that only the second source (src1) of a two-source instruction can be immediate, and that 64-bit immediate values (DF, Q, or UQ) can only be used with one-source instructions.

In a two-source instruction with a V (Packed Signed Half-Byte Integer Vector) or UV (Packed Unsigned Half-Byte Integer Vector) immediate operand, the other source operand must have a type compatible with packed word execution mode, one of B, UB, W, or UW.

Note that DF (Double Float) and HF (Half Float) have different encodings in the Source Regster Type Encoding and the Source Immediate Type Encoding.

The Source Register Type Encoding and Source Immediate Type Encoding lists apply to instructions with one or two source operands.

Texture Coordinate Mode

Texture Coordinate Mode

Source: BSpec

Size (in bits): 3

Value	Name	Description
0h	WRAP	Map is repeated in the U direction
1h	MIRROR	Map is mirrored in the U direction
2h	CLAMP	Map is clamped to the edges of the accessed map
3h	CUBE	For cube-mapping, filtering in edges access adjacent map faces
4h	CLAMP_BORDER	Map is infinitely extended with the border color
5h	MIRROR_ONCE	Map is mirrored once about origin, then clamped
6h	HALF_BORDER	Map is infinitely extended with the average of the nearest edge texel and the border color
7h	Reserved	

ThreadCtrl

ThreadCtrl

Source: Eulsa

Size (in bits): 2

Thread Control
This field provides explicit control for thread switching.

Value	Name	Description
00b	Normal	Up to the GEN execution units to manage thread switching. This is the normal (and unnamed) mode. In this mode, for example, if the current instruction cannot proceed due to operand dependencies, the EU switches to the next available thread to fill the compute pipe. In another example, if the current instruction is ready to go, however, there is another thread with higher priority that also has an instruction ready, the EU switches to that thread. Execution may or may not be preempted by another thread following this instruction.
01b	Atomic	Prevent any thread switch immediately following this instruction. Always execute the next instruction (which may not be next sequentially if the current instruction branches). The next instruction gets highest priority in the thread arbitration for the execution pipelines.
10b	Switch	A forced thread switch occurs after the current instruction is executed and before the next instruction. In addition, a long delay (longer than the execution pipe latency) is introduced for the current thread. Particularly, the instruction queue of the current thread is flushed after the current instruction is dispatched for execution. Switch is designed primarily as a safety feature in case there are race conditions for certain instructions. Force a switch to another thread after this instruction and before the next instruction.
11b	Reserved	

VertStride

VertStride	
Source:	Eulsa
Size (in bits):	4

Vertical Stride
The field provides the vertical stride of the register region in unit of data elements for an operand.
Encoding of this field provides values of 0 or powers of 2, ranging from 1 to 32 elements. Larger values are not supported due to the restriction that a source operand must reside within two adjacent 256-bit registers (64 bytes total).
Special encoding 1111b (0xF) is only valid when the operand is in register-indirect addressing mode (AddrMode = 1). If this field is set to 0xF, one or more sub-registers of the address registers may be used to compute the addresses. Each address sub-register provides the origin for a row of data element. The number of address sub-registers used is determined by the division of ExecSize of the instruction by the Width fields of the operand.
This field only applies to source operand. It does not apply to destination.
This field is not present for an immediate source operand.

Programming Notes
Note 1: Vertical Stride larger than 32 is not allowed due to the restriction that a source operand must reside within two adjacent 256-bit registers (64 bytes total).
Note 2: In Align16 access mode, as encoding 0xF is reserved, only single-index indirect addressing is supported.
Note 3: If indirect address is supported for src1, encoding 0xF is reserved for src1 - only single-index indirect addressing is supported.
Note 4: Encoding 0010 applies for QWord-size operands.

Value	Name	Programming Notes
0000b	0 elements	
0001b	1 element	Restriction : Align1 mode only.
0010b	2 elements	
0011b	4 elements	
0100b	8 elements	Restriction : Align1 mode only.
0101b	16 elements	Restriction : Applies to byte or word operand only. Align1 mode only.
0110b	32 elements	Restriction : Applies to byte operand only. Align1 mode only.
0111b-1110b	Reserved	
1111b	VxH or Vx1 mode	Restriction : Only valid for register-indirect addressing in Align1 mode.

Width

Width

Source: Eulsa

Size (in bits): 3

This field specifies the number of elements in the horizontal dimension of the region for a source operand. This field cannot exceed the ExecSize field of the instruction.
This field only applies to source operand. It does not apply to destination.
This field is not present for an immediate source operand.

Programming Notes
Note that with ExecSize of 32, because the maximum Width is 16, there are at least two rows in a source region.

Value	Name
000b	1 elements
001b	2 elements
010b	4 elements
011b	8 elements
100b	16 elements
101b-111b	Reserved

WRAP_SHORTEST_ENABLE

WRAP_SHORTEST_ENABLE	
Source:	RenderCS
Size (in bits):	4

This state selects which components (if any) of Attribute [n] are to be interpolated in a "wrap shortest" fashion. Operation is UNDEFINED if any of these bits are set and the Constant Interpolation Enable bit associated with this attribute is set. Note that wrap-shortest interpolation is only supported for Attributes 0-15.

Value	Name	Description
0001b	X	Wrap Shortest X Component
0010b	Y	Wrap Shortest Y Component
0011b	XY	Wrap Shortest XY Components
0100b	Z	Wrap Shortest Z Component
0101b	XZ	Wrap Shortest XZ Components
0110b	YZ	Wrap Shortest YZ Components
0111b	XYZ	Wrap Shortest XYZ Components
1000b	W	Wrap Shortest W Component
1001b	XW	Wrap Shortest XW Components
1010b	YW	Wrap Shortest YW Components
1011b	XYW	Wrap Shortest XYW Components
1100b	ZW	Wrap Shortest ZW Components
1101b	XZW	Wrap Shortest XZW Components
1110b	YZW	Wrap Shortest YZW Components
1111b	XYZW	Wrap Shortest XYZW Components

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

Active Head Pointer Register

ACTHD - Active Head Pointer Register

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	RO
Size (in bits):	32
Address:	02074h-02077h
Name:	Active Head Pointer Register
ShortName:	ACTHD_RCSUNIT
Address:	12074h-12077h
Name:	Active Head Pointer Register
ShortName:	ACTHD_VCSUNIT0
Address:	1A074h-1A077h
Name:	Active Head Pointer Register
ShortName:	ACTHD_VECSUNIT
Address:	1C074h-1C077h
Name:	Active Head Pointer Register
ShortName:	ACTHD_VCSUNIT1
Address:	22074h-22077h
Name:	Active Head Pointer Register
ShortName:	ACTHD_BCSUNIT

This register contains the address details of the data dword being parsed by command streamer.

- When the commands are being executed from a batch buffer this register contains the Dword aligned Graphics Memory Address.
- When the commands are being executed from a ring buffer this register contains the Dword aligned offset in to the ring buffer (offset from Ring Buffer start address).

DWord	Bit	Description
0	31:2	**Head Pointer** Format: GraphicsAddress[31:2] • When the commands are being executed from a batch buffer this register contains the Dword aligned Graphics Memory Address. • When the commands are being executed from a ring buffer this register contains the Dword aligned offset in to the ring buffer (offset from Ring Buffer start address).

ACTHD - Active Head Pointer Register			
	1:0	**Reserved**	
		Format:	MBZ

Advanced Scheduler Reset Request Messages

ASSRREQ - Advanced Scheduler Reset Request Messages

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Size (in bits):	32
Address:	0810Ch

Hardware (CS, VCS) initiated Advanced Scheduler reset request messages.

DWord	Bit	Description
0	31:16	**Message Mask** Access: RO Message Mask To write to bits 15:0, the corresponding message mask bits must be written. For example, for bit 14 to be set, bit 30 needs to be 1 : 40004000
	15:6	**Reserved** Access: RO Reserved
	5	**SFC1 gracefull reset request message (2nd Vbox)** Access: R/W Set SFC1 gracefull Reset Request Message for 2nd Vbox: '1' : cmsfc Reset Requested - This bit is cleared by the CP upon completion of the reset request '0' : cmsfc Reset Not Requested
	4	**SFC0 gracefull reset request message (1st Vbox)** Access: R/W Set SFC0 gracefull Reset Request Message for 1st Vbox: '1' : cmsfc Reset Requested - This bit is cleared by the CP upon completion of the reset request '0' : cmsfc Reset Not Requested
	3	**VINunit cmfxrst reset request message (2nd Vbox)** Access: R/W Set CMFX Reset Request Message from the VINunit in 2nd Vbox: '1' : CMFX Reset Requested - This bit is cleared by the CP upon completion of the reset request '0' : CMFX Reset Not Requested

ASSRREQ - Advanced Scheduler Reset Request Messages

	2	**VINunit cmfxrst Reset Request message** Access: R/W Set CMFX Reset Request Message from the VINunit: '1' : CMFX Reset Requested - This bit is cleared by the CP upon completion of the reset request '0' : CMFX Reset Not Requested
	1	**Render AS Reset Request Message** Access: R/W Set Render AS Reset Request Message from the CSunit: '1' : Render AS Reset Requested - This bit is cleared by the CP upon completion of the reset request '0' : Render AS Reset Not Requested
	0	**Media AS Reset Request Message** Access: R/W Set Media AS Reset Request Message from the VCSunit: '1' : Media AS Reset Requested - This bit is cleared by the CP upon completion of the reset request '0' : Media AS Reset Not Requested

Aggregate_Perf_Counter_A31

OAPERF_A31 - Aggregate_Perf_Counter_A31		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Default Value:	0x00000000	
Access:	R/W	
Size (in bits):	32	
Address:	028F8h	
This register reflects the count value of the OA Performance counter A31		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate_Perf_Counter_A32

OAPERF_A32 - Aggregate_Perf_Counter_A32

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02900h

This register reflects the count value of the OA Performance counter A32

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate_Perf_Counter_A33

OAPERF_A33 - Aggregate_Perf_Counter_A33	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02904h

This register reflects the count value of the OA Performance counter A33

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate_Perf_Counter_A34

OAPERF_A34 - Aggregate_Perf_Counter_A34	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02908h

This register reflects the count value of the OA Performance counter A34

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate_Perf_Counter_A35

OAPERF_A35 - Aggregate_Perf_Counter_A35	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0290Ch

This register reflects the count value of the OA Performance counter A35

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A0

OAPERF_A0 - Aggregate Perf Counter A0

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02800h

This register reflects the count value of the OA Performance counter A0.

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Value	Name
0x00000000	**[Default]**
[0x00000001-0xFFFFFFFF]	

Aggregate Perf Counter A0 Upper DWord

OAPERF_A0_UPPER - Aggregate Perf Counter A0 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02804h

This register enables the current live value of performance counter A0 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A1

OAPERF_A1 - Aggregate Perf Counter A1	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02808h

This register reflects the count value of the OA Performance counter A1. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A1 Upper DWord

OAPERF_A1_UPPER - Aggregate Perf Counter A1 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0280Ch

This register enables the current live value of performance counter A1 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A2

OAPERF_A2 - Aggregate Perf Counter A2	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02810h

This register reflects the count value of the OA Performance counter A2. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A2 Upper DWord

OAPERF_A2_UPPER - Aggregate Perf Counter A2 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02814h

This register enables the current live value of performance counter A2 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A3

OAPERF_A3 - Aggregate Perf Counter A3	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02818h

This register reflects the count value of the OA Performance counter A3. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A3 Upper DWord

OAPERF_A3_UPPER - Aggregate Perf Counter A3 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0281Ch

This register enables the current live value of performance counter A3 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A4

OAPERF_A4 - Aggregate Perf Counter A4	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02820h

This register reflects the count value of the OA Performance counter A4. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A4 Lower DWord Free

OAPERF_A4_LOWER_FREE - Aggregate Perf Counter A4 Lower DWord Free	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02960h

This register counts the same event as counter A4 however is not affected by context ID or other conditions that prevent A4 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A4 Upper DWord

OAPERF_A4_UPPER - Aggregate Perf Counter A4 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02824h

This register enables the current live value of performance counter A4 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A4 Upper DWord Free

OAPERF_A4_UPPER_FREE - Aggregate Perf Counter A4 Upper DWord Free

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02964h

This register counts the same event as counter A4 however is not affected by context ID or other conditions that prevent A4 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A5

OAPERF_A5 - Aggregate Perf Counter A5	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02828h

This register reflects the count value of the OA Performance counter A5. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A5 Upper DWord

OAPERF_A5_UPPER - Aggregate Perf Counter A5 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0282Ch

This register enables the current live value of performance counter A5 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A6

OAPERF_A6 - Aggregate Perf Counter A6	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02830h

This register reflects the count value of the OA Performance counter A6. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A6 Lower DWord Free

OAPERF_A6_LOWER_FREE - Aggregate Perf Counter A6 Lower DWord Free	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02968h

This register counts the same event as counter A6 however is not affected by context ID or other conditions that prevent A6 from incrementing. his counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A6 Upper DWord

OAPERF_A6_UPPER - Aggregate Perf Counter A6 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02834h

This register enables the current live value of performance counter A6 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A6 Upper DWord Free

OAPERF_A6_UPPER_FREE - Aggregate Perf Counter A6 Upper DWord Free

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0296Ch

This register counts the same event as counter A6 however is not affected by context ID or other conditions that prevent A6 from incrementing. his counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A7

OAPERF_A7 - Aggregate Perf Counter A7	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02838h

This register reflects the count value of the OA Performance counter A7. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A7 Upper DWord

OAPERF_A7_UPPER - Aggregate Perf Counter A7 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0283Ch

This register enables the current live value of performance counter A7 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A8

OAPERF_A8 - Aggregate Perf Counter A8	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02840h

This register reflects the count value of the OA Performance counter A8. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A8 Upper DWord

OAPERF_A8_UPPER - Aggregate Perf Counter A8 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02844h

This register enables the current live value of performance counter A8 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A9

OAPERF_A9 - Aggregate Perf Counter A9	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02848h

This register reflects the count value of the OA Performance counter A9. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A9 Upper DWord

OAPERF_A9_UPPER - Aggregate Perf Counter A9 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0284Ch

This register enables the current live value of performance counter A9 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A10

OAPERF_A10 - Aggregate Perf Counter A10	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02850h

This register reflects the count value of the OA Performance counter A10. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A10 Upper DWord

OAPERF_A10_UPPER - Aggregate Perf Counter A10 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02854h

This register enables the current live value of performance counter A10 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A11

OAPERF_A11 - Aggregate Perf Counter A11	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02858h

This register reflects the count value of the OA Performance counter A11. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A11 Upper DWord

OAPERF_A11_UPPER - Aggregate Perf Counter A11 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0285Ch

This register enables the current live value of performance counter A11 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A12

OAPERF_A12 - Aggregate Perf Counter A12	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02860h

This register reflects the count value of the OA Performance counter A12. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A12 Upper DWord

OAPERF_A12_UPPER - Aggregate Perf Counter A12 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02864h

This register enables the current live value of performance counter A12 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A13

OAPERF_A13 - Aggregate Perf Counter A13	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02868h

This register reflects the count value of the OA Performance counter A13. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A13 Upper DWord

OAPERF_A13_UPPER - Aggregate Perf Counter A13 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0286Ch

This register enables the current live value of performance counter A13 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A14

OAPERF_A14 - Aggregate Perf Counter A14	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02870h

This register reflects the count value of the OA Performance counter A14. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A14 Upper DWord

OAPERF_A14_UPPER - Aggregate Perf Counter A14 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02874h

This register enables the current live value of performance counter A14 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A15

OAPERF_A15 - Aggregate Perf Counter A15		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Default Value:	0x00000000	
Access:	R/W	
Size (in bits):	32	
Address:	02878h	
This register reflects the count value of the OA Performance counter A15. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A15 Upper DWord

OAPERF_A15_UPPER - Aggregate Perf Counter A15 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0287Ch

This register enables the current live value of performance counter A15 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A16

OAPERF_A16 - Aggregate Perf Counter A16	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02880h

This register reflects the count value of the OA Performance counter A16. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A16 Upper DWord

OAPERF_A16_UPPER - Aggregate Perf Counter A16 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02884h

This register enables the current live value of performance counter A16 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A17

OAPERF_A17 - Aggregate Perf Counter A17	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02888h

This register reflects the count value of the OA Performance counter A17. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A17 Upper DWord

OAPERF_A17_UPPER - Aggregate Perf Counter A17 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0288Ch

This register enables the current live value of performance counter A17 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A18

OAPERF_A18 - Aggregate Perf Counter A18	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02890h

This register reflects the count value of the OA Performance counter A9. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A18 Upper DWord

OAPERF_A18_UPPER - Aggregate Perf Counter A18 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02894h

This register enables the current live value of performance counter A18 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A19

OAPERF_A19 - Aggregate Perf Counter A19	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02898h

This register reflects the count value of the OA Performance counter A19. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A19 Lower DWord Free

OAPERF_A19_LOWER_FREE - Aggregate Perf Counter A19 Lower DWord Free	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02970h

This register counts the same event as counter A19 however is not affected by context ID or other conditions that prevent A19 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A19 Upper DWord

OAPERF_A19_UPPER - Aggregate Perf Counter A19 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0289Ch

This register enables the current live value of performance counter A19 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A19 Upper DWord Free

OAPERF_A19_UPPER_FREE - Aggregate Perf Counter A19 Upper DWord Free

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02974h

This register counts the same event as counter A19 however is not affected by context ID or other conditions that prevent A19 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A20

OAPERF_A20 - Aggregate Perf Counter A20	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028A0h

This register reflects the count value of the OA Performance counter A20. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A20 Lower DWord Free

OAPERF_A20_LOWER_FREE - Aggregate Perf Counter A20 Lower DWord Free	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	02978h

This register counts the same event as counter A20 however is not affected by context ID or other conditions that prevent A20 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A20 Upper DWord

OAPERF_A20_UPPER - Aggregate Perf Counter A20 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028A4h

This register enables the current live value of performance counter A20 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A20 Upper DWord Free

OAPERF_A20_UPPER_FREE - Aggregate Perf Counter A20 Upper DWord Free

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	0297Ch

This register counts the same event as counter A20 however is not affected by context ID or other conditions that prevent A20 from incrementing. his counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A21

OAPERF_A21 - Aggregate Perf Counter A21	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028A8h

This register reflects the count value of the OA Performance counter A21. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A21 Upper DWord

OAPERF_A21_UPPER - Aggregate Perf Counter A21 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028ACh

This register enables the current live value of performance counter A21 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A22

OAPERF_A22 - Aggregate Perf Counter A22	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028B0h

This register reflects the count value of the OA Performance counter A22. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A22 Upper DWord

OAPERF_A22_UPPER - Aggregate Perf Counter A22 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028B4h

This register enables the current live value of performance counter A22 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A23

OAPERF_A23 - Aggregate Perf Counter A23	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028B8h

This register reflects the count value of the OA Performance counter A23. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A23 Upper DWord

OAPERF_A23_UPPER - Aggregate Perf Counter A23 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028BCh

This register enables the current live value of performance counter A23 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A24

OAPERF_A24 - Aggregate Perf Counter A24	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028C0h

This register reflects the count value of the OA Performance counter A24. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A24 Upper DWord

OAPERF_A24_UPPER - Aggregate Perf Counter A24 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028C4h

This register enables the current live value of performance counter A24 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A25

OAPERF_A25 - Aggregate Perf Counter A25	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028C8h

This register reflects the count value of the OA Performance counter A25. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A25 Upper DWord

OAPERF_A25_UPPER - Aggregate Perf Counter A25 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028CCh

This register enables the current live value of performance counter A25 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A26

OAPERF_A26 - Aggregate Perf Counter A26	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028D0h

This register reflects the count value of the OA Performance counter A26. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A26 Upper DWord

OAPERF_A26_UPPER - Aggregate Perf Counter A26 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028D4h

This register enables the current live value of performance counter A26 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A27

OAPERF_A27 - Aggregate Perf Counter A27	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028D8h

This register reflects the count value of the OA Performance counter A27. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A27 Upper DWord

OAPERF_A27_UPPER - Aggregate Perf Counter A27 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028DCh

This register enables the current live value of performance counter A27 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A28

OAPERF_A28 - Aggregate Perf Counter A28	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028E0h

This register reflects the count value of the OA Performance counter A28. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A28 Upper DWord

OAPERF_A28_UPPER - Aggregate Perf Counter A28 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028E4h

This register enables the current live value of performance counter A28 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A29

OAPERF_A29 - Aggregate Perf Counter A29	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028E8h

This register reflects the count value of the OA Performance counter A29. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A29 Upper DWord

OAPERF_A29_UPPER - Aggregate Perf Counter A29 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028ECh

This register enables the current live value of performance counter A29 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A30

OAPERF_A30 - Aggregate Perf Counter A30	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028F0h

This register reflects the count value of the OA Performance counter A30. DefaultValue="00000000h"

DWord	Bit	Description
0	31:0	**Considerations** This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A30 Upper DWord

OAPERF_A30_UPPER - Aggregate Perf Counter A30 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028F4h

This register enables the current live value of performance counter A30 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter A31 Upper DWord

OAPERF_A31_UPPER - Aggregate Perf Counter A31 Upper DWord

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	028FCh

This register enables the current live value of performance counter A31 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC
	7:0	**Upper Value** Format: U8 This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

All Engine Fault Register

FAULT_REG - All Engine Fault Register

Register Space:	MMIO: 0/2/0
Default Value:	0x00000000
Size (in bits):	32
Address:	04094h

DWord	Bit	Description
0	31:1	**All Engine Fault Register** Default Value: 00000000000000000000000000000000b Access: R/W Bit[31:15]: Reserved. Bit[14:12]: Engine ID: 000b - GFX. 001b - MFX0. 010b - MFX1. 011b - VEBX. 100b - BLT. 110b - Reserved Bit[11]: Reserved. Bit[10:3]: SRCID of Fault. This is the Source ID of the unit that requested the cycle that generated the First Page fault for this engine. This value is locked and not updated on subsequent faults, until the valid bit of this register is cleared by SW. Bit[2:1]: Fault Type (GFX_FT): Type of Fault recorded: 00b - Invalid PTE Fault. 01b - Invalid PDE Fault. 10b - Invalid PDPE Fault. 11b - Invalid PML4E Fault. This value is locked and not updated on subsequent faults, until the valid bit of this register is cleared by SW. All bits are only valid with bit[0]=1.
	0	**Valid Bit** Default Value: 0b Access: R/W This bit indicates that the first fault for this engine has been recorded. It can only be cleared by SW, which also clears the other fields.

ARB_CTL

ARB_CTL

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x0E661056 [KBL]
Access:	R/W
Size (in bits):	32
Address:	45000h-45003h
Name:	Display Arbitration Control 1
ShortName:	ARB_CTL
Power:	PG0
Reset:	soft

DWord	Bit	Description
0	31	**FBC Memory Wake** Setting this bit allows FBC compressed write requests to wake memory. Value: 1b — Name: Wake On Value: 0b — Name: Wake Off
	30	**Reserved**
	29	**Reserved**
	28:26	**HP Queue Watermark** Default Value: 011b 4 entries The value in this register indicates the number of entries the high priority queue should have before it can be read. The value is zero based.
	25:24	**LP Write Request Limit** The value in this register indicates the maximum number of back to back LP write requests that will be accepted from a single client before re-arbitrating. Value: 00b — Name: 1 Value: 01b — Name: 2 Value: 10b — Name: 4 **[Default]** Value: 11b — Name: 8
	23:20	**TLB Request Limit** The value in this register indicates the maximum number of TLB requests that can be made in an arbitration loop. Zero is not a valid programming. Value: 0110b — Name: 6 **[Default]**

ARB_CTL

	[1,15]

19:16	**TLB Request InFlight Limit** The value in this register indicates the maximum number of TLB (or VTd) requests that can be in flight at any given time. Zero is not a valid programming. **Value** / **Name** 0110b — 6 **[Default]** [1,15]
15	**FBC Watermark Disable** Setting this bit disables the FBC watermarks. **Value** / **Name** 0b — Enable 1b — Disable
14:13	**Tiled Address Swizzling** DRAM configuration registers show if memory address swizzling is needed. **Value** / **Name** / **Description** 00b — No Display — No display request address swizzling 01b — Reserved — Address bit[6] swizzling for tiled surfaces is not used 10b — Reserved — 11b — Reserved —
12:8	**HP Page Break Limit** The value in this register represents the maximum number of page breaks allowed in a HP request chain. Zero is not a valid programming. **Value** / **Name** 10000b — 16 **[Default]** [1,31]
7	**Reserved**
6:0	**HP Data Request Limit** The value in this register represents the maximum number of cachelines allowed in a HP request chain. **Value** / **Name** 1010110b — 86 **[Default]** [1,127] **Restriction** Restriction: This value must always be programmed greater than 8.

ARB_CTL2

ARB_CTL2

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x20000600
Access:	R/W
Size (in bits):	32
Address:	45004h-45007h
Name:	Display Arbitration Control 2
ShortName:	ARB_CTL2
Power:	PG0
Reset:	soft

DWord	Bit	Description
0	31	**Reserved**
	30	**Reserved** Format: MBZ
	29:28	**LP WD Write Request Limit** The value in this register indicates the maximum number of back to back LP write requests that will be accepted from WD before re-arbitrating. 00b: 1 01b: 2 10b: 4 **[Default]** 11b: 8
	27:25	**Reserved** Format: MBZ
	24:20	**Reserved** Format: MBZ
	19:16	**Reserved** Format: MBZ
	15	**Reserved** Format: MBZ
	14	**Reserved** Format: MBZ
	13	**Reserved**

ARB_CTL2

12 — Arbiter Trickle Feed Allow On HP Request

Description	Project
If enabled, Arbiter will allow trickle feed request from all clients if any of the client sends a high priority request	
This field must be kept at default value.	KBL:*:A, KBL:*:B

Value	Name
0b	Disable **[Default]**
1b	Enable

11 — Reserved

10:9 — Inflight LP Read Request Limit

The value in this register represents the maximum number of LP read request transactions that can be inflight at any given time.

Value	Name
00b	1 LP
01b	2 LP
10b	3 LP
11b	4 LP **[Default]**

8 — Reserved

Format:	MBZ

7 — Reserved

6 — Reserved

Format:	MBZ

5:4 — Inflight HP Read Request Limit

The value in this register represents the maximum number of HP read request transactions that can be inflight at any given time.

Value	Name
00b	128 HP
01b	64 HP
10b	32 HP
11b	16 HP

ARB_CTL2

	3	**Enable IPC** Enables the Isochronous Priority Control. If enabled, Display sends demoted requests once the transition watermark is reached. If transition watermark is not enabled, Display sends demoted requests when the display buffer is full. **Value** / **Name** 0b – Disable 1b – Enable
	2	**Reserved** Format: MBZ
	1:0	**RTID FIFO Watermark** The value in this register represents the watermark value for the RTID FIFO. HP transactions will start only when the FIFO level is above or equal the watermark. **Value** / **Name** 00b – 8 RTIDs 01b – 16 RTIDs 10b – 32 RTIDs 11b – Reserved

Arbiter Control Register

GARBCNTLREG - Arbiter Control Register

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x29124100 [KBL]
Size (in bits):	32
Address:	0B004h

DWord	Bit	Description
0	31	**Reserved**
	30	**Disables hashing function** Access: R/W Disables hashing function to generate bank_id[1:0] for L3$ bank accessing, and forces the use of address[7:6] for bank_id[1:0]. 0: (default) Hash function enabled to generate L3$ bank IDs. 1: L3$ address[7:6] used as L3$ bank IDs. Incf_csr_l3bankidhashdis. (This bit needs to set corresponding bit lpfcon_csr_l3bankidhashdis in LPFC.)
	29:28	**Arbitration priority order between RCC and MSC** Default Value: 10b Access: R/W Arbitration priority order between RCC and MSC. 00b/11b: Invalid; default setting used. 10b: Default setting; RCC MSC (i.e., MSC has higher priority). 01b: RCC MSC (i.e., RCC has higher priority). Incf_csr_rcc_msc_pri[1:0].
	27:22	**Arbitration priority order between RCZ, STC, and HIZ** Default Value: 100100b Access: R/W Arbitration priority order between RCZ, STC, and HIZ. 100100b: Default setting; RCZ STC HIZ. (i.e., RCZ has lowest priority; HIZ has highest priority). 100001b: RCZ ; HIZ ; STC. 011000b: STC ; RCZ ; HIZ. 010010b: STC ; HIZ ; RCZ. 001001b: HIZ ; RCZ ; STC. 000110b: HIZ ; STC ; RCZ. Note: Others settings are invalid, and result in use of default. Incf_csr_rcz_stc_hiz_pri[5:0].

GARBCNTLREG - Arbiter Control Register

	21:19	**Write data port arbitration priority between Z client writes and L3$ evictions** Default Value: 010b Access: R/W Z Max Write Request Limit Count (GFXC_MRLC). This is the MAX number of Allowed Requests Count - These counters keep track of the accepted requests from each engine. Requests are counted, regardless of kind of cycle (both Slice 0 and 1). Minimum count value must be = 1. Incf_csr_wdpagapz[2:0].
	18:16	**Write data port arbitration priority between C client writes and Z/L3$ writes/evictions** Default Value: 010b Access: R/W C Max Request Limit Count (GFXZ_MRLC). This is the MAX number of Allowed Requests Count - These counters keep track of the accepted requests from each engine. Requests are counted, regardless of kind of cycle (both Slice 0 and 1). Minimum count value must be = 1. Incf_csr_wdpagapc[2:0].
	15	**Reserved** Access: RO
	14:12	**L3 Max Write Request Limit Count** Default Value: 100b Access: R/W L3 Max Write Request Limit Count (GFXL3_MRLC). This is the MAX number of Allowed Requests Count - These counters keep track of the accepted requests from each engine. Requests are counted, regardless of kind of cycle (Miss/Hit/Present). Minimum count value must be = 1. Incf_csr_wdpagapl3[2:0].
	11:9	**Reserved** Access: RO
	8	**GAPs_fixarb_en** Default Value: 1b Access: R/W Incf_csr_gaps_fixarb_en.
	7	**GAPS TSV Credit fix Enable** Access: R/W Disables GAPS TSV fix for credit signal 0 (default): GAPS TSV fix for credit signal is disabled 1: GAPS TSV fix for credit signal is enabled This bit always needs to be programmed to 1 as part of the BIOS sequence Incf_csr_gaps_tsvfix_en.

GARBCNTLREG - Arbiter Control Register			
	6:0	**Reserved**	
		Access:	RO

Arbiter Mode Control Register

ARB_MODE - Arbiter Mode Control Register

Register Space:	MMIO: 0/2/0
Default Value:	0x00000000
Size (in bits):	32
Address:	04030h

DWord	Bit	Description
0	31:16	**Mask Bits** Default Value: 0000000000000000b Access: RO Mask Bits act as Write Enables for the bits[15:0] of this register.
	15	**Extra Register Bit 15** Default Value: 0b Access: R/W Bit 15 toggles (XOR) the meaning of Per Client Write Drop Enables (Register 40b4); If 0, drop per client happens as stated in register 40b4 definition; If 1, the meaning changes, and a 1 on a bit in register 40b4 means dont drop while 0 means drop. In this case, the default (for clients not included in 40b4) will be drop enabled.
	14	**Extra Register Bit 14** Default Value: 0b Access: R/W Reserved.
	13	**DC GDR** Default Value: 0b Access: R/W
	12	**HIZ GDR** Default Value: 0b Access: R/W
	11	**STC GDR** Default Value: 0b Access: R/W
	10	**BLB GDR** Default Value: 0b Access: R/W

ARB_MODE - Arbiter Mode Control Register

	9	**GAM PD GDR** Default Value: 0b Access: R/W
	8	**Extra Register Bit 8** Default Value: 0b Access: R/W **Description** Reserved.
	7:6	**Cacheability Attribute Override** Default Value: 00b Access: R/W 00b No override. 01b UC (LLC/eLLC) - Allocation age is don't care. 10b WT in LLC/eLLC - Aged is 3. 11b WB in LLC/eLLC - Aged is 3. The above conditions apply for the following conditions only: 1. Register overwrite except for GTT, CFG and L3 coherent wcil cycles 2. Read- GTTRD, CFGRD 3. Write- GTTWR, CFGWR, DMWR (with gam_ci_wcoherenttype[2:0]="001" WCIL* w/self snoop)
	5	**Extra Register Bit 5** Default Value: 0b Access: R/W Reserved.
	4	**VMC GDR Enable** Default Value: 0b Access: R/W When this bit is set, data requested from the VMC client is generated by the GDR Algorithm.
	3	**Texture Cache (MT) GDR Enable Bit** Default Value: 0b Access: R/W When this bit is set, data requested from the Texture Cache (MT) client is generated by the GDR algorithm.
	2	**Depth (RCZ) Cache GDR Enable bit** Default Value: 0b Access: R/W Depth Cache GDR enable bit. Project: All. Format: U1. When this bit is set, data requested from the Depth Cache client is generated by the GDR algorithm (See GDR algorithm in xxx section).

ARB_MODE - Arbiter Mode Control Register

	1	**Color Cache (RCC) GDR Enable Bit** Default Value: 0b Access: R/W When this bit is set, data requested from the Color Cache (RCC) client is generated by the GDR algorithm.
	0	**GTT Accesses GDR** Default Value: 0b Access: R/W When this bit is enabled along with the Client's GDR bit, PPGTT and GGTT requests for this memory access are also tagged as GDR to SQ.

ASL Storage

ASLS_0_2_0_PCI - ASL Storage

Register Space:	PCI: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Size (in bits):	32
Address:	000FCh

This is a software scratch register. The exact bit register usage must be worked out in common between System BIOS and driver software.
For each device, the ASL control method requires two bits for DOD (BIOS detectable yes or no, VGA/NonVGA), one bit for DGS (enable/disable requested), and two bits for DCS (enabled now/disabled now, connected or not).

DWord	Bit	Description
0	31:0	**Device Switching Storage** Default Value: 00000000000000000000000000000000b Access: R/W Software controlled usage to support device switching.

ATS Capability

ATS_CAP_0_2_0_PCI - ATS Capability

Register Space:	PCI: 0/2/0
Source:	BSpec
Default Value:	0x00000020
Size (in bits):	16
Address:	00204h

ATS Capability reports support for Device-TLBs on Device-2, compliant to PCI Express ATS specification.

DWord	Bit	Description
0	5	**Page Aligned Request** Default Value: 1b Access: RO Hardwired to 1, the Untranslated Address is always aligned to a 4096 byte boundary. Processor Graphics reports value of 1b indicating all VT-d and SVM translations are page-aligned.
	4:0	**Invalidate Queue Depth** Default Value: 00000b Access: RO The number of Invalidate Requests that the endpoint can accept before putting back pressure on the upstream connection. Hardwired to 0h, the function can accept 32 Invalidate Requests.

ATS Control

ATS_CTRL_0_2_0_PCI - ATS Control

Register Space:	PCI: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Size (in bits):	16
Address:	00206h

DWord	Bit	Description
0	15	**ATS Enable** Default Value: 0b Access: R/W When Set, the function is enabled to cache translations. Processor graphics ignores this field, as GT uses GTLB as IOTLB and only pretends to software that it has a Device-TLB. Software is expected to Set this field before configuring extended context-entry for Device2 with Page Request Enable field Set. For compatibility, this field is implemeted as RW as software can read it to determine ATS enable status.
	14:5	**Reserved** Format: MBZ
	4:0	**Smallest Translation Unit** Default Value: 00000b Access: R/W This value indicates to the Endpoint the minimum number of 4096-byte blocks that is indicated in a Translation Completion or Invalidate Request. This is a power of 2 multiple and the number of blocks is 2^STU. A value of 0 indicates one block and value 1F indicates 2^31 blocks. For IGD this must be programmed to 0h for 4KB as smallest translation unit.

ATS Extended Capability Header

ATS_EXTCAP_0_2_0_PCI - ATS Extended Capability Header

Register Space:	PCI: 0/2/0
Source:	BSpec
Default Value:	0x3001000F
Size (in bits):	32
Address:	00200h

ATS Capability reports support for Device-TLBs on Device-2, compliant to PCI Express ATS specification.

DWord	Bit	Description
0	31:20	**Next Capability Offset** Default Value: 001100000000b Access: RO This is a hardwired pointer to the next item in the capabilities list. Value 300h in this field provides the offset for Page-Request Capability.
	19:16	**Version** Default Value: 0001b Access: RO Hardwired to capability version 1.
	15:0	**Capability ID** Default Value: 0000000000001111b Access: RO Hardwired to the ATS Extended Capability ID

AUD_CONFIG

AUD_CONFIG	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x0070FA60
Access:	R/W
Size (in bits):	32
Address:	65000h-65003h
Name:	Audio Configuration Transcoder A
ShortName:	AUD_TCA_CONFIG
Power:	off/on
Reset:	soft
Address:	65100h-65103h
Name:	Audio Configuration Transcoder B
ShortName:	AUD_TCB_CONFIG
Power:	off/on
Reset:	soft
Address:	65200h-65203h
Name:	Audio Configuration Transcoder C
ShortName:	AUD_TCC_CONFIG
Power:	off/on
Reset:	soft

This register configures the audio output. There is one instance of this register per transcoder A/B/C. Each Transcoder is independent of the other.

DWord	Bit	Description
0	31:30	**Reserved**
	29	**N value Index** Value / Name / Description 0b / HDMI **[Default]** / N value read on bits 27:20 and 15:4 reflects HDMI N value. Bits 27:20 and 15:4 are programmable to any N value. Default h7FA6 when bit 28 is not set. 1b / DisplayPort / N value read on bits 27:20 and 15:4 reflects DisplayPort N value. Set this bit to 1 before programming N value register. When this bit is set to 1, 27:20 and 15:4 will reflect the current N value. Default is h8000 when bit 28 is not set.
	28	**N programming enable** This bit enables programming of N values for non-CEA modes. Please note that the transcoder to which audio is attached must be disabled when changing this field.

AUD_CONFIG

	27:20	**Upper N value** Default Value: 00000111b These are bits [19:12] of programmable N values for non-CEA modes. Bit 29 of this register must also be written in order to enable programming. Please note that the transcoder to which audio is attached must be disabled when changing this field. See bit 29 description for default values.
	19:16	**Pixel Clock HDMI** This is the target frequency of the CEA/HDMI video mode to which the audio stream is added. This value is used for generating N_CTS packets. This refers to only HDMI Pixel clock and does not refer to DisplayPort Link clock. DisplayPort Link clock does not require this programming. Note: The transcoder on which audio is attached must be disabled when changing this field.

Value	Name	Description
0b	**[Default]**	
0000b	25.2 / 1.001 MHz	25.2 / 1.001 MHz
0001b	25.2 MHz	25.2 MHz (Program this value for pixel clocks not listed in this field)
0010b	27 MHz	27 MHz
0011b	27 * 1.001 MHz	27 * 1.001 MHz
0100b	54 MHz	54 MHz
0101b	54 * 1.001 MHz	54 * 1.001 MHz

AUD_DIP_ELD_CTRL_ST

AUD_DIP_ELD_CTRL_ST	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00005400
Access:	R/W
Size (in bits):	32
Address:	650B4h-650B7h
Name:	Audio Control State for DIP and ELD Transcoder A
ShortName:	AUD_TCA_DIP_ELD_CTRL_ST
Power:	off/on
Reset:	soft
Address:	651B4h-651B7h
Name:	Audio Control State for DIP and ELD Transcoder B
ShortName:	AUD_TCB_DIP_ELD_CTRL_ST
Power:	off/on
Reset:	soft
Address:	652B4h-652B7h
Name:	Audio Control State for DIP and ELD Transcoder C
ShortName:	AUD_TCC_DIP_ELD_CTRL_ST
Power:	off/on
Reset:	soft

There is one instance of this register per transcoder A/B/C.

DWord	Bit	Description
0	31	**Reserved** Format: MBZ
	30:29	**DIP Port Select** Access: RO This read-only bit reflects which port is used to transmit the DIP data. This can only change when DIP is disabled. If one or more audio-related DIP packets is enabled and audio is enabled on a digital port, these bits will reflect the digital port to which audio is directed. For DP MST, this is the device select/pipe select.

Value	Name	Description
00b	Reserved **[Default]**	Reserved
01b	Digital Port B	Digital Port B
10b	Digital Port C	Digital Port C
11b	Digital Port D	Digital Port D

AUD_DIP_ELD_CTRL_ST

28:25 **Reserved**

Format:	MBZ

24:21 **DIP type enable status**

Access:	RO

These bits reflect the DIP types enabled. It can be updated while the port is enabled. Within 2 vblank periods, the DIP is guaranteed to have been transmitted. Disabling a DIP type results in setting the contents of that DIP buffer to zero. A reserved setting reflects a disabled DIP.

Value	Name	Description
0000b	**[Default]**	
XXX0b	DIP Disable	Audio DIP disabled
XXX1b	DIP Enable	Audio DIP enabled
XX0Xb	ACP Disable	Generic 1 (ACP) DIP disabled
XX1Xb	ACP Enable	Generic 1 (ACP) DIP enabled
X0XXb	Generic 2 Disable	Generic 2 DIP disabled
X1XXb	Generic 2 Enable	Generic 2 DIP enabled, can be used by ISRC1 or ISRC2
1XXXb	Reserved	Reserved

20:18 **DIP buffer index**

This field is used during read of different DIPs, and during read or write of ELD data. These bits are used as an index to their respective DIP or ELD buffers. When the index is not valid, the contents of the DIP will return all 0s.

Value	Name	Description
000b	Audio **[Default]**	Audio DIP (31 bytes of address space, 31 bytes of data)
001b	Gen 1	Generic 1 (ACP) Data Island Packet (31 bytes of address space, 31 bytes of data)
010b	Gen 2	Generic 2 (ISRC1) Data Island Packet (31 bytes of address space, 31 bytes of data)
011b	Gen 3	Generic 3 (ISRC2) Data Island Packet (31 bytes of address space, 31 bytes of data)
Others	Reserved	Reserved

17:16 **DIP transmission frequency**

Access:	RO

These bits reflect the frequency of DIP transmission for the DIP buffer type designated in bits 20:18. When writing DIP data, this value is also latched when the first DW of the DIP is written. When read, this value reflects the DIP transmission frequency for the DIP buffer designated in bits 20:18.

Value	Name	Description
00b	Disable **[Default]**	Disabled

AUD_DIP_ELD_CTRL_ST

		01b: Reserved: Reserved 10b: Send Once: Send Once 11b: Best Effort: Best effort (Send at least every other vsync)
	15	**Reserved** Format: MBZ
	14:10	**ELD buffer size** Default Value: 10101b Access: RO This field reflects the size of the ELD buffer in DWORDs (84 Bytes of ELD)
	9:5	**ELD access address** Selects the DWORD address for access to the ELD buffer (84 bytes). The value wraps back to zero when incremented past the max addressing value 0x1F. This field change takes effect immediately after being written. The read value indicates the current access address.
	4	**ELD ACK** Acknowledgement from the audio driver that ELD read has been completed
	3:0	**DIP access address** Selects the DWORD address for access to the DIP buffers. The value wraps back to zero when it incremented past the max addressing value of 0xF. This field change takes effect immediately after being written. The read value indicates the current access address.

AUD_EDID_DATA

AUD_EDID_DATA	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	65050h-65053h
Name:	Audio EDID Data Block Transcoder A
ShortName:	AUD_TCA_EDID_DATA
Power:	off/on
Reset:	soft
Address:	65150h-65153h
Name:	Audio EDID Data Block Transcoder B
ShortName:	AUD_TCB_EDID_DATA
Power:	off/on

Address:	65250h-65253h
Name:	Audio EDID Data Block Transcoder C
ShortName:	AUD_TCC_EDID_DATA
Power:	off/on
Reset:	soft

These registers contain the HDMI/DP data block from the EDID. The graphics driver reads the EDID and writes the structure to these registers. The vendor specific data block may be longer than 8 bytes, but the driver must not write more than 48 bytes to the buffer. The EDID format is Version 3 within the CEA-861B specification. The HDMI/DP Vendor Specific Data Block is described in version 1.1 of the HDMI specification.

These values are returned from the device as the HDMI/DP Vendor Specific Data Block response to a Get HDMI/DP Widget command.

Writing sequence:

- Video software sets ELD invalid, and sets the ELD access address to 0, or to the desired DWORD to be written.
- Video software writes ELD data 1 DWORD at a time. The ELD access address autoincrements with each DWORD write, wrapping around to address 0 when the max buffer address size of 0xF has been reached.
- Please note that software must write an entire DWORD at a time.
- Please note that the audio driver checks the valid bit with each byte read of the ELD. This means that the video driver can unilaterally write ELD irrespective of audio driver ELD read status.

Reading sequence:

AUD_EDID_DATA

- Video software sets the ELD access address to 0, or to the desired DWORD to be read.
- Video software reads ELD data 1 DWORD at a time. The ELD access address autoincrements with each DWORD read, wrapping around to address 0 when the max buffer address size of 0xF has been reached.

There is one instance of this register per transcoder A/B/C.

DWord	Bit	Description
0	31:0	**EDID Data Block** Please note that the contents of this buffer are not cleared when ELD is disabled. The contents of this buffer are cleared during FLR.

AUD_FREQ_CNTRL

AUD_FREQ_CNTRL

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000010
Access:	R/W
Size (in bits):	32
Address:	65900h-65903h
Name:	Audio BCLK Frequency Control
ShortName:	AUD_FREQ_CNTRL
Power:	off/on
Reset:	soft

DWord	Bit	Description
0	31:16	**Reserved** Format: MBZ
	15	**T-Mode** Indicates whether SDI is operating in 1T mode or 2T mode. BIOS or System Software must pre-program the T-mode register. a. before the iDISPLAY Audio Link is brought out from Link Reset, b. to a value which is consistent with the value of the its counterpart T-mode bit in the Audio Controller (inside the Skylake PCH). c. to a value which is within the electrical capabilities of the platform. Note that 2T mode is prohibited from being used with any BCLK frequency which has an odd number of bit cells. Example, 2T mode is incompatible with BCLK=6MHz (125 bit cells). Value / Name / Description: 0b / Enable **[Default]** / 2T mode with sdi data held for 2 bit clks. 1b / Disable / 1T Mode with sdi data held for 1 bit clock only.
	14:5	**Reserved** Format: MBZ
	4	**96MHz BCLK** Default Value: 1b Indicates that iDISPLAY Audio Link will run at 96MHz. This bit is defaulted to 1. BIOS or System Software must pre-program B96 before the iDISPLAY Audio Link is brought out from reset.
	3	**48MHz BCLK** Default Value: 0b Indicates that iDISPLAY Audio Link will run at 48MHz. This bit is defaulted to 0. BIOS or System Software must pre-program B96 before the iDISPLAY Audio Link is brought out from reset.

AUD_FREQ_CNTRL		
	2:0	**Reserved** Format: MBZ

AUD_INFOFR

AUD_INFOFR	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	RO
Size (in bits):	32
Address:	65054h-65057h
Name:	Audio Widget Data Island Packet Transcoder A
ShortName:	AUD_TCA_INFOFR
Power:	off/on
Reset:	soft
Address:	65154h-65157h
Name:	Audio Widget Data Island Packet Transcoder B
ShortName:	AUD_TCB_INFOFR

Name:	Audio Widget Data Island Packet Transcoder C
ShortName:	AUD_TCC_INFOFR
Power:	off/on
Reset:	soft

When the IF type or dword index is not valid, the contents of the DIP will return all 0s.
These values are programmed by the audio driver in an HDMI/DP Widget Set command. They are returned one byte at a time from the device on the HD audio bus as the HDMI/DP DIP response to a Get HDMI/DP Widget command. To fetch a specific byte, the audio driver should send an HDMI/DP Widget HDMI/DP DIP Index Pointer Set command to set the index, then fetch the indexed byte using the HDMI/DP DIP get.

DWord	Bit	Description
0	31:0	**Data Island Packet Data** This reflects the contents of the DIP indexed by the DIP access address. The contents of this buffer are cleared during function reset or HD audio link reset.

AUD_M_CTS_ENABLE

AUD_M_CTS_ENABLE	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	65028h-6502Bh
Name:	Audio M and CTS Programming Enable Transcoder A
ShortName:	AUD_TCA_M_CTS_ENABLE
Power:	off/on

Reset:	soft
There is one instance of this register per audio converter 1/2/3.	

DWord	Bit	Description
0	31:9	**Reserved** Format: MBZ
	8	**Reserved**
	7:4	**Output Delay** Default Value: 0100b The number of samples between when the sample is received from the HD Audio link and when it appears as an analog signal at the pin.
	3	**Reserved** Format: MBZ
	2	**Sample Fabrication EN bit** Access: R/W

AUD_MISC_CTRL

This bit indicates whether internal fabrication of audio samples is enabled during a link underrun.

Value	Name	Description
0b	Disable	Audio fabrication disabled
1b	Enable **[Default]**	Audio fabrication enabled

1 **Pro Allowed**

Access:	R/W

By default, the audio device is configured to consumer mode and does not allow the mode to be changed to professional mode by an HD Audio verb. When Pro is allowed by setting this configuration bit, the HD Audio codec allows a verb to set the device into professional mode.
Note: Setting this configuration bit does not change the default Pro bit value to be 1. Pro must be set to 1 through the normal process, using a verb.

Value	Name	Description
0b	Consumer **[Default]**	Consumer use only
1b	Professional	Professional use allowed

0 **Reserved**

Format:	MBZ

AUD_PIN_ELD_CP_VLD

AUD_PIN_ELD_CP_VLD

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	650C0h-650C3h
Name:	Audio Pin ELD and CP Ready Status
ShortName:	AUD_PIN_ELD_CP_VLD
Power:	off/on
Reset:	soft

DWord	Bit	Description
0	31:12	**Reserved**
	11	**Audio InactiveC** Inactive: When this bit is set, a digital display sink device has been attached but not active for streaming audio. Value / Name / Description: 0b / Disable / Device is active for streaming audio data 1b / Enable / Device is connected but not active
	10	**Audio Output EnableC** This bit directs audio to the device connected to this transcoder. When enabled along with Inactive set to 0 and audio data is available, the audio data will be combined with the video data and sent over this transcoder. The audio unit uses the status of this bit to indicate presence of the HDMI/DP output to the audio driver. Value / Name / Description: 0b / Disable / No Audio output 1b / Valid / Audio is enabled
	9	**CP ReadyC** This R/W bit reflects the state of CP request from the audio unit. When an audio CP request has been serviced, it must be reset to 1 by the video software to indicate that the CP request has been serviced. This is transcoder based. Software should add a delay of 1ms before updating the CP ready bit. This is needed to make sure that all the pending unsolicited responses are cleared (transmitted to HD audio) before CP ready unsolicited responses is generated. This is needed in case of DP MST is enabled and when many changes to PD, ELDV and CP ready bits are done during mode set. Value / Name / Description: 0b / Pending or Not Ready / CP request pending or not ready to receive requests 1b / Ready / CP request ready

AUD_PIN_ELD_CP_VLD

8	**ELD validC** This R/W bit reflects the state of the ELD data written to the ELD RAM. After writing the ELD data, the video software must set this bit to 1 to indicate that the ELD data is valid. At audio codec initialization, or on a hotplug event, this bit is set to 0 by the video software. This bit is reflected in the audio pin complex widget as the ELD valid status bit. This is transcoder based.

Value	Name	Description
0b	Invalid	ELD data invalid (default, when writing ELD data, set 0 by software)
1b	Valid	ELD data valid (Set by video software only)

7	**Audio InactiveB** Inactive: When this bit is set, a digital display sink device has been attached but not active for streaming audio.

Value	Name	Description
0b	Disable	Device is active for streaming audio data
1b	Enable	Device is connected but not active

6	**Audio Output EnableB** This bit directs audio to the device connected to this transcoder. When enabled along with Inactive set to 0 and audio data is available, the audio data will be combined with the video data and sent over this transcoder. The audio unit uses the status of this bit to indicate presence of the HDMI/DP output to the audio driver. This is transcoder based.

Value	Name	Description
0b	Disable	No audio output
1b	Enable	Audio is enabled

5	**CP ReadyB** See CP_ReadyC description.

Value	Name	Description
0b	Not Ready	CP request pending or not ready to receive requests
1b	Ready	CP request ready

4	**ELD validB** See ELD_validC descripion.

Value	Name	Description
0b	Invalid	ELD data invalid (default, when writing ELD data, set 0 by software)
1b	Valid	ELD data valid (Set by video software only)

3	**Audio InactiveA** Inactive: When this bit is set, a digital display sink device has been attached but not active for streaming audio.

Value	Name	Description
0b	Disable	Device is active for streaming audio data
1b	Enable	Device is connected but not active

AUD_PIN_ELD_CP_VLD

	2	**Audio Output EnableA** This bit directs audio to the device connected to this transcoder. When enabled along with Inactive set to 0 and audio data is available, the audio data will be combined with the video data and sent over this transcoder. The audio unit uses the status of this bit to indicate presence of the HDMI/DP output to the audio driver. This is transcoder based.

Value	Name	Description
0b	Disable	No audio output
1b	Enable	Audio is enabled

	1	**CP ReadyA** See CP_ReadyC description.

Value	Name	Description
0b	Not Ready	CP request pending or not ready to receive requests
1b	Ready	CP request ready

	0	**ELD validA** See ELD_validC descripion.

Value	Name	Description
0b	Invalid	ELD data invalid (default, when writing ELD data, set 0 by software)
1b	Valid	ELD data valid (Set by video software only)

AUD_PIN_PIPE_CONN_ENTRY_LNGTH

AUD_PIN_PIPE_CONN_ENTRY_LNGTH

Register Space:	MMIO: 0/2/0
Source:	BSpec

Base Data of Stolen Memory

BDSM_0_0_0_PCI - Base Data of Stolen Memory

Register Space:	PCI: 0/0/0
Source:	BSpec
Default Value:	0x00000000
Size (in bits):	32
Address:	000B0h

This register contains the base address of graphics data stolen DRAM memory.

DWord	Bit	Description
0	31:20	**Graphics Base of Stolen Memory** Default Value: 000000000000b Access: R/W Lock This register contains bits 31 to 20 of the base address of stolen DRAM memory. BIOS determines the base of graphics stolen memory by subtracting the graphics stolen memory size (PCI Device 0 offset 52 bits 6:4) from TOLUD (PCI Device 0 offset BC bits 31:20).
	19:1	**Reserved** Format: MBZ
	0	**Lock** Default Value: 0b Access: R/W Key Lock This bit will lock all writeable settings in this register, including itself.

Base of GTT Stolen Memory

BGSM_0_0_0_PCI - Base of GTT Stolen Memory

Register Space:	PCI: 0/0/0
Source:	BSpec
Default Value:	0x00100000
Size (in bits):	32
Address:	000B4h

This register contains the base address of stolen DRAM memory for the GTT.

DWord	Bit	Description
0	31:20	**Graphics Base of GTT Stolen Memory** Default Value: 000000000001b Access: R/W Lock This register contains the base address of stolen DRAM memory for the GTT. BIOS determines the base of GTT stolen memory by subtracting the GTT graphics stolen memory size (PCI Device 0 offset 52 bits 11:8) from the Graphics Base of Data Stolen Memory (PCI Device 0 offset B0 bits 31:20).
	19:1	**Reserved** Format: MBZ
	0	**Lock** Default Value: 0b Access: R/W Key Lock This bit will lock all writeable settings in this register, including itself.

Batch Address Difference Register

BB_ADDR_DIFF - Batch Address Difference Register

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32

Address:	02154h-02157h
Name:	Batch Address Difference Register
ShortName:	BB_ADDR_DIFF_RCSUNIT

Address:	12154h-12157h
Name:	Batch Address Difference Register
ShortName:	BB_ADDR_DIFF_VCSUNIT0

Address:	1A154h-1A157h
Name:	Batch Address Difference Register
ShortName:	BB_ADDR_DIFF_VECSUNIT

Address:	1C154h-1C157h
Name:	Batch Address Difference Register
ShortName:	BB_ADDR_DIFF_VCSUNIT1

Address:	22154h-22157h
Name:	Batch Address Difference Register
ShortName:	BB_ADDR_DIFF_BCSUNIT

This register contains the difference between the start of the last batch and where the last initiated Batch Buffer is currently fetching commands.

Programming Notes

Programming Restriction:
This register should NEVER be programmed by driver, this is for HW internal use only.

DWord	Bit	Description
0	31:2	**Batch Buffer Address Difference** Format: GraphicsAddress[31:2] This field specifies the DWord-aligned difference between the starting address of the batch buffer and where the last initiated Batch Buffer is currently fetching commands.
	1:0	**Reserved** Format: MBZ

Batch Buffer Head Pointer Preemption Register

BB_PREEMPT_ADDR - Batch Buffer Head Pointer Preemption Register

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32

Address:	02148h-0214Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_RCSUNIT

Address:	12148h-1214Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_VCSUNIT0

Address:	1A148h-1A14Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_VECSUNIT

Address:	1C148h-1C14Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_VCSUNIT1

Address:	22148h-2214Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_BCSUNIT

Description

This register gets updated with the DWord-aligned graphics memory address of the PREEMPTABLE command in the batch buffer on which preemption has occurred.
This register gets updated with the DWord-aligned graphics memory address of the command following the MI_BATCH_START corresponding to the second level batch buffer, when the preemption has occurred in the second level batch buffer.
This register value should be looked at only when the preemption has occurred in the batch buffer. This is indicated by "Ring/Batch Indicator" in "RING_BUFFER_HEAD_PREEMPT_REG". This register value retains its previous value and doesn't change when the preemption occurs on a preemptable command in ring buffer.
Preemption is triggered by valid UHPTR in ring buffer mode of scheduling and by a pending execlist in Exec-List mode of scheduling.
This is a global register and context save/restored as part of power context image.

Preemptable Commands	Source

BB_PREEMPT_ADDR - Batch Buffer Head Pointer Preemption Register

MI_ARB_CHECK 3D_PRIMITIVE GPGPU_WALKER MEDIA_STATE_FLUSH PIPE_CONTROL (Only in GPGPU mode of pipeline selection) MI_ATOMIC (Post Sync Operation set in GPGPU mode of pipeline selection) MI_SEMAPHORE_SIGNAL (Post Sync Operation set in GPGPU mode of pipeline selection)	RenderCS

Preemptable Commands	Source
MI_ARB_CHECK	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS

Programming Notes

Programming Restriction:
This register should NEVER be programmed by driver, this is for HW internal use only.

DWord	Bit	Description
0	31:2	**Batch Buffer Head Pointer** Format: GraphicsAddress[31:2] This field specifies the DWord-aligned Graphics Memory Address of the PREEMPTABLE command in a batch buffer where the Preemption has occurred.

Address:	22140h-22143h
Name:	Batch Buffer Head Pointer Register
ShortName:	BB_ADDR_BCSUNIT

Description

This field specifies the DWord-aligned Graphics Memory Address of commands being fetched from the first level batch buffer. This register have valid values only when the “Valid” bit is set to‘0’.

Programming Notes

Programming Restriction: This register should NEVER be programmed by driver. This is for HW internal use only.

DWord	Bit	Description
0	31:2	**Batch Buffer Head Pointer** Format: GraphicsAddress[31:2] **Description** This field specifies the DWord-aligned Graphics Memory Address of commands being fetched from the first level batch buffer. “Valid” bit will be ‘0’ when there is no active batch buffer and this field has no significance.

BB_ADDR - Batch Buffer Head Pointer Register

		This field specifies the DWord-aligned Graphics Memory Address of commands being fetched for the most recently initiated batch buffer. This register have valid values only when the "Valid" bit is set to'0'. Level of the batch buffer is indicated based on the Batch Buffer Stack Pointer value in BB_STATE register. • Stack Pointer holding a value '0' indicates First Level batch buffer. • Stack Pointer holding a value '1' indicates Second Level batch buffer. • Stack Pointer holding a value '2' indicates Third Level batch buffer.
	1	**Reserved** Format: MBZ
	0	**Valid** Format: U1

Value	Name	Description
0h	Invalid **[Default]**	Batch buffer Invalid
1h	Valid	Batch buffer Valid

Batch Buffer Per Context Pointer

BB_PER_CTX_PTR - Batch Buffer Per Context Pointer	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Trusted Type:	1
Address:	021C0h-021C3h
Name:	Batch Buffer Per Context Pointer
ShortName:	BB_PER_CTX_PTR_RCSUNIT
Address:	121C0h-121C3h
Name:	Batch Buffer Per Context Pointer
ShortName:	BB_PER_CTX_PTR_VCSUNIT0
Address:	1A1C0h-1A1C3h
Name:	Batch Buffer Per Context Pointer
ShortName:	BB_PER_CTX_PTR_VECSUNIT
Address:	1C1C0h-1C1C3h
Name:	Batch Buffer Per Context Pointer
ShortName:	BB_PER_CTX_PTR_VCSUNIT1
Address:	221C0h-221C3h
Name:	Batch Buffer Per Context Pointer
ShortName:	BB_PER_CTX_PTR_BCSUNIT

This register is used to program the batch buffer address to be executed between context restore and execution of ring/execution list if enabled. This will only get executed due to regular context save/restore and not during power restore. This register is part of the execution list context and will be executed per context. Only supported if execution list is enabled. There is no preempting workloads within the Per Context Batch Buffer.

Programming Notes	Source
BlitterCS/VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be programmed for these command streamers.	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS
Render CS: Per Context Batch Buffer execution must not look at the MI_RS_CONTROL or Wait For Event status that are restored for the corresponding context. Ex: A context with MI_RS_CONTROL status with RS disabled doesn't stop Render CS from triggering Resource Streamer to execute Per Context Batch Buffer when "**RS Enabled Batch Buffer Per Context**" is set.	RenderCS

BB_PER_CTX_PTR - Batch Buffer Per Context Pointer

RenderCS: The following commands are not supported within a Per Context Batch Buffer: **Command Name** MI_WAIT_FOR_EVENT MI_ARB_CHECK MI_RS_CONTROL MI_REPORT_HEAD MI_URB_ATOMIC_ALLOC MI_SUSPEND_FLUSH MI_TOPOLOGY_FILTER MI_RS_CONTEXT MI_SET_CONTEXT MI_URB_CLEAR MI_SEMAPHORE_WAIT (Memory Poll Mode).Note: MI_SEMAPHORE_WAIT in register poll mode is supported. ShortName:	BB_STATE_BCSUNIT

Description

This register contains the attributes of the current batch buffer initiated from the Ring Buffer.

This register should not be written by software. These fields should only get written by a context restore. Software should always set these fields via the MI_BATCH_BUFFER_START command when initiating a batch buffer.
This register is saved and restored with context.

Programming Notes

Contents of this register are valid only when "Valid" bit in BB_ADDR register is set.

Address:	1A168h-1A16Bh
Name:	Batch Buffer Upper Head Pointer Register
ShortName:	BB_ADDR_UDW_VECSUNIT
Address:	1C168h-1C16Bh
Name:	Batch Buffer Upper Head Pointer Register
ShortName:	BB_ADDR_UDW_VCSUNIT1
Address:	22168h-2216Bh
Name:	Batch Buffer Upper Head Pointer Register
ShortName:	BB_ADDR_UDW_BCSUNIT

Description

This register specifies the upper 32 bits of the 4GB aligned base address, within the 64-bit host virtual address space of the commands being fetched from the first level batch buffer. This register has valid values only when the "Valid" bit in BB_ADDR is set to "1'.
GraphicsAddress is 64-bit value [63:0], but only a portion of it is used by hardware. The uppermost reserved bits are ignored and MBZ.

Programming Notes

This register should NEVER be programmed by driver. This is for HW internal use only.

DWord	Bit	Description
0	31:16	**Reserved** Format: MBZ
	15:0	**Batch Buffer Head Pointer Upper DWORD** Format: GraphicsAddress[47:32]

Batch Offset Register

BB_OFFSET - Batch Offset Register

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000001
Access:	R/W
Size (in bits):	32

Address:	02158h-0215Bh
Name:	Batch Offset Register
ShortName:	BB_OFFSET_RCSUNIT

Address:	12158h-1215Bh
Name:	Batch Offset Register
ShortName:	BB_OFFSET_VCSUNIT0

Address:	1A158h-1A15Bh
Name:	Batch Offset Register
ShortName:	BB_OFFSET_VECSUNIT

Address:	1C158h-1C15Bh
Name:	Batch Offset Register
ShortName:	BB_OFFSET_VCSUNIT1

Address:	22158h-2215Bh
Name:	Batch Offset Register
ShortName:	BB_OFFSET_BCSUNIT

Description	Source
This register contains the offset value to be added to the Batch Buffer Start Address in the MI_BATCH_BUFFER_START command when the Enable Offset bit in MI_BATCH_BUFFER_START command is set.	

Preemptable Commands	Source
• MI_ARB_CHECK • 3D_PRIMITIVE • GPGPU_WALKER • MEDIA_STATE_FLUSH • PIPE_CONTROL (Only in GPGPU mode of pipeline selection) • MI_ATOMIC (Post Sync Operation set in GPGPU mode of pipeline selection) • MI_SEMAPHORE_SIGNAL (Post Sync Operation set in GPGPU	RenderCS

RenderCS

BB_OFFSET - Batch Offset Register

mode of pipeline selection)		
Preemptable Commands	**Source**	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS
MI_ARB_CHECK	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS	

Programming Notes

On preemption occurring whith in a primary/chain batch buffer this register is loaded with the offset value of the preempted command header from the batch start address when the Enable Load is set. Preemption of 3D or GP_GPU workloads can only occur on preemptable commands. Batch buffer offset always points to the preemptable command if preempted on preemption or the immediate command following it if not preempted on preemption.

EX: Preemption occurs on 3D_PRIMITVE command

- If the 3D_PRIMTIVE command is completely processed by render pipe then the BB_OFFSET points to the command following 3D_PRIMITIVE
- If the 3D_PRIMTIVE command is not completely processed by render pipe then the BB_OFFSET points to the 3D_PRIMITIVE command.

DWord	Bit	Description
0	31:2	**Batch Buffer Offset** Format: GraphicsAddress[31:2] This field specifies the DWord-aligned offset between the starting address of the batch buffer and where the last initiated Batch Buffer is currently fetching commands.
	1	**Reserved** Format: MBZ
	0	**Enable Load** Default Value: 1 Format: Enable **Description** If this bit is set then the Batch Buffer Offset is loaded with the preempted command offset or the following command whenever a batch buffer is ended due to a Preemptable command.

BCS Context Sizes

BCS_CXT_SIZE - BCS Context Sizes	
Register Space:	MMIO: 0/2/0
Source:	BlitterCS
Default Value:	0x00000000
Access:	Read/32 bit Write Only
Size (in bits):	32
Address:	221A8h

DWord	Bit	Description
0	31:13	**Reserved** Format: MBZ
	12:8	**BCS Context Size** Format: U5
	7:5	**Reserved** Format: MBZ
	4:0	**Execlist Context Size** Format: U5

BCS Ring Buffer Next Context ID Register

BCS_RNCID - BCS Ring Buffer Next Context ID Register

Register Space:	MMIO: 0/2/0
Source:	BlitterCS
Default Value:	0x00000000, 0x00000000
Access:	R/W
Size (in bits):	64
Address:	22198h-2219Fh

This register contains the *next* ring context ID associated with the ring buffer.

Programming Notes

The current context (RCCID) register can be updated indirectly from this register on a context switch event. Note that the only time a context switch can occur is when MI_ARB_CHECK enables preemption or the current context runs dry (head pointer becomes equal to tail pointer).

DWord	Bit	Description
0	63:0	**Unnamed** See Context Descriptor for BCS

BCS SW Control

BCS_SWCTRL - BCS SW Control

Register Space:	MMIO: 0/2/0
Source:	BlitterCS
Default Value:	0x00000000
Access:	r/w
Size (in bits):	32
Trusted Type:	1
Address:	22200h

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask
	15:4	**Reserved** Format: MBZ
	3	**Shrink Blitter Cache** Format: U1 This bit is primarily used for validation purposes to speed up the test time. The full cache depth of 128 CLs should be used for production. This bit is part of the context save/restore. This bit only applies to the XY_FAST_COPY_BLT command. **Value** / **Name** / **Description** 0 / **[Default]** / Blitter/BCS flush will flush and invalidate all cachelines in the Blitter/BLB cache (default). 1 / / Blitter Cache depth will be shortened from 128 CLs to 16 CLs.
	2	**Not Invalidate Blitter Cache on BCS Flush** Format: U1 Programming this bit allows optimal/maximal cache hit usage, when the destination surface of a Fast Copy Blit, is to be used as the Source for a follow on Fast Copy blit, even if the destination surface is flushed out for Display coherency reasons (where the destination surface is also needed to be Displayed). Such a flush with clean cacheline state is suggested when the intermediate blit operation results are being required to maintain memory coherency. The legacy method of cache invalidation on flush can be still pursued at the end of all blit operations or when switching happens due to other prescribed legacy reasons, or when switching from the new Fast Copy Engine blit, to legacy Engine blits. This bit should be programmed set only when used with Fast Copy Blit commands. This bit is part of the context save/restore. This bit only applies to the XY_FAST_COPY_BLT command. **Value** / **Name** / **Description** 0 / **[Default]** / Blitter/BLB Cache will be 128 cache lines in depth (default).

BCS_SWCTRL - BCS SW Control

		1 | | BCS flush will put all dirty CL in the Blitter cache in the clean state. Any CL already in the clean state will remain clean.
	1	**Tile Y Destination** Format: U1 Programming this bit makes the HW treat all destination surfaces as Tile Y. This bit over-rides the setting of the destination format in the packet provided to the blitter command streamer. SW is required to flush the HW before changing the polarity of this bit. This bit is part of the context save/restore. This bit does not impact the operations of the XY_FAST_COPY_BLT command
	0	**Tile Y Source** Format: U1 Programming this bit makes the HW treat all source surfaces as Tile Y. This bit over-rides the setting of the source format in the packet provided to the blitter command streamer. SW is required to flush the HW before changing the polarity of this bit. This bit is part of the context save/restore. This bit does not impact the operations of the XY_FAST_COPY_BLT command

BITPLANE CYCLE CONTROL REGISTER

BITPLANE_CTRL - BITPLANE CYCLE CONTROL REGISTER

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Size (in bits):	32

Bitplane Cycle Control Register

DWord	Bit	Description
0	30:19	**Reserved** Default Value: 000000000000b Access: RO

Bitstream Output Bit Count for the last Syntax Element Report Register

MFC_BITSTREAM_SE_BITCOUNT_SLICE - Bitstream Output Bit Count for the last Syntax Element Report Register	
Register Space:	MMIO: 0/2/0
Source:	VideoCS
Default Value:	0x00000000
Access:	RO
Size (in bits):	32
Trusted Type:	1
Address:	128D4h
Name:	SE Output Bit Count

This register stores the count of number of bits in the bitstream for the last syntax element before padding. The bit count is before the byte-aligned alignment padding insertion, but includes the stop-one-bit. This register is part of the context save and restore.

DWord	Bit	Description
0	31:0	**MFC Bitstream Syntax Element Bit Count** Total number of bits in the bitstream output before padding. This count is updated each time the internal counter is incremented.

Bitstream Output Byte Count Per Slice Report Register

MFC_BITSTREAM_BYTECOUNT_SLICE - Bitstream Output Byte Count Per Slice Report Register

Register Space:	MMIO: 0/2/0
Source:	VideoCS
Default Value:	0x00000000
Access:	RO
Size (in bits):	32
Trusted Type:	1
Address:	128D0h

This register stores the count of bytes of the bitstream output. This register is part of the context save and restore.

DWord	Bit	Description
0	31:0	**MFC Bitstream Byte Count** Total number of bytes in the bitstream output from the encoder. This count is updated for every time the internal bitstream counter is incremented.

Bitstream Output Minimal Size Padding Count Report Register

MFC_AVC_MINSIZE_PADDING_COUNT - Bitstream Output Minimal Size Padding Count Report Register

Register Space:	MMIO: 0/2/0
Source:	VideoCS
Default Value:	0x00000000
Access:	RO
Size (in bits):	32
Trusted Type:	1
Address:	12814h
Name:	Minimal Size Padding

This register stores the count in bytes of **minimal size padding insertion. It is primarily provided for statistical data gathering.** This register is part of the context save and restore.

DWord	Bit	Description
0	31:0	**MFC AVC MinSize Padding Count** Total number of bytes in the bitstream output contributing to minimal size padding operation. This count is updated each time when the padding count is incremented.

BLC_PWM_CTL

BLC_PWM_CTL

Register Space:	MMIO: 0/2/0
Source:	BSpec
Default Value:	0x00000000
Access:	R/W
Size (in bits):	32
Address:	48250h-48253h
Name:	Backlight PWM Control
ShortName:	BLC_PWM_CTL
Power:	PG0
Reset:	soft

This register controls the backlight PWM logic going to the display utility pin on the CPU.

DWord	Bit	Description
0	31	**PWM Enable** This bit enables the PWM logic. Value / Name / Description: 0b / Disable / PWM disabled 1b / Enable / PWM enabled Restriction: Restriction : The display utility pin must be configured correctly to output the PWM. Program the frequency and duty cycle before enabling PWM.
	30:29	**Pipe Select** This field selects which vertical blank will be used for backlight blinking. Value / Name / Description: 00b / Pipe A / Use Pipe A 01b / Pipe B / Use Pipe B 10b / Pipe C / Use Pipe C
	28	**Blinking Enable** This bit enables backlight blinking. When enabled, the backlight will be driven on at the programmed brightness during vertical blank and driven off during vertical active. Value / Name: 0b / Disable 1b / Enable

BLC_PWM_CTL

	27	**PWM Granularity** This field controls the granularity (minimum increment) of the PWM backlight control counter.

Value	Name	Description
0b	128	PWM frequency adjustment on 128 clock increments
1b	8	PWM frequency adjustment on 8 clock increments

	26:0	**Reserved**

BLC_PWM_DATA

BLC_PWM_DATA		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Default Value:	0x00000000	
Access:	R/W	
Size (in bits):	32	
Address:	48254h-48257h	
Name:	Backlight PWM Data	
ShortName:	BLC_PWM_DATA	
Power:	PG0	
Reset:	soft	
DWord	**Bit**	**Description**
0	31:16	**Backlight Frequency** This field determines the number of time base events in total for a complete cycle of modulated backlight control. This field is programmed based on the frequency of the clock that is being used and the desired PWM frequency. This value represents the period of the PWM stream in CD clocks multiplied by 128 (default increment) or 8 (alternate increment selected by BLC_PWM_CTL PWM_Granularity).
	15:0	**Backlight Duty Cycle** This field determines the number of time base events for the active portion of the PWM backlight control. A value of zero will turn the backlight off. A value equal to the backlight modulation frequency field will be full on. Updates will take affect at the end of the current PWM cycle. This value represents the active time of the PWM stream in CD clock periods multiplied by 128 (default increment) or 8 (alternate increment selected by BLC_PWM_CTL PWM_Granularity). **Restriction** Restriction : This should never be larger than the frequency field.

	14	**Reserved1** Default Value: 0b Access: RO
	13:11	**Page Faulting Mode** Default Value: 000b Access: R/W This fields controls the page faulting mode that will be used in the memory interface block for the given request coming from this surface: 000: Use the global page faulting mode from context descriptor (default) 001-111: Reserved
	10:8	**Skip Caching control** Default Value: 000b Access: R/W Defines the bit values to enable caching. Outcome overrides the LLC caching for the surface. If "0" - than corresponding address bit value is don't care Bit[8]=1: address bit[9] needs to be "0" to cache in target Bit[9]=1: address bit[10] needs to be "0" to cache in target Bit[10]=1: address bit[11] needs to be "0" to cache in target
	7	**Enable Skip Caching** Default Value: 0b Access: R/W Enable for the Skip cache mechanism 0: Not enabled 1: Enabled for LLC

BLT_MOCS_35 - Blitter MOCS Register35

	6	**Dont allocate on miss** Default Value: 0b Access: R/W Controls defined for RO surfaces in mind, where if the target cache is missed - don't bring the line (applicable to LLC/eDRAM). 0: Allocate on MISS (normal cache behavior) 1: Do NOT allocate on MISS
	5:4	**LRU management** Default Value: 11b Access: R/W This field allows the selection of AGE parameter for a given surface in LLC or eLLC. . If a particular allocation is done at youngest age 3 it tends to stay longer in the cache as compared to older age allocations - 2, 1 or 0. This option is given to driver to be able to decide which surfaces are more likely to generate HITs, hence need to be replaced least often in caches. 11: Good chance of generating hits. 10: Poor chance of generating hits 01: Don't change the LRU if it is a HIT 00: Reserved
	3:2	**Target Cache** Default Value: 00b Access: R/W This field allows the choice of LLC vs eLLC for caching 00: eLLC Only 01: LLC Only 10: LLC/eLLC Allowed 11: LLC/eLLC Allowed
	1:0	**LLC/eDRAM cacheability control** Default Value: 01b Access: R/W Memory type information used in LLC/eDRAM. 00: Use Cacheability Controls from page table / UC with Fence (if coherent cycle) 01: Uncacheable (UC) - non-cacheable 10: Writethrough (WT) 11: Writeback (WB)
