Intel® Iris® Xe and UHD Graphics Open Source

Programmer's Reference Manual

For the 2020-2021 11th Generation Intel Xeon®, Core™, Celeron®, Pentium® Gold Processors based on the "Tiger Lake" Platform

Volume 1: Preface

December 2021, Revision 1.0

Notices and Disclaimers

Intel technologies may require enabled hardware, software or service activation.

No product or component can be absolutely secure.

Code names are used by Intel to identify products, technologies, or services that are in development and not publicly available. These are not "commercial" names and not intended to function as trademarks

Customer is responsible for safety of the overall system, including compliance with applicable safety-related requirements or standards.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document, with the sole exceptions that a) you may publish an unmodified copy and b) code included in this document is licensed subject to Zero-Clause BSD open source license (0BSD). You may create software implementations based on this document and in compliance with the foregoing that are intended to execute on the Intel product(s) referenced in this document. No rights are granted to create modifications or derivatives of this document.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

Terminology 11

About This Programmer's Reference Manual

This Preface serves as an Introduction to the Programmer's Reference Manual (PRM) for the Graphics Processing Unit (GPU) included on the Tiger Lake series of chips. The PRM includes both narrative content that explains conceptually how the different modules of the GPU work, and a comprehensive Command Reference that describes named memory addresses/registers, commands, structures and enumerations, at the bit-level.

A Public View of the PRM

For each major chip series, Intel publicly releases a version of the PRM for the Open Source development community and developers at large. For those releases, we release the PRM in Portable Document Format (PDF).

In Multiple PDF Files

Due to file size constraints in generating PDF output (the Tiger Lake "Open Source" version of the PRM is roughly 5,000 pages long), the PRM is generated in multiple PDF files. The organization of those files reflects the major components of the Tiger Lake GPU. Both the narrative content and the Command Reference had to be partitioned into multiple PDF files.

Without Cross-book Links

Cross-book hyperlinks could not reasonably be included for the PDF. Instead, those links have been disabled and colored dark red and display in a serif font for easy recognition. This is an example:

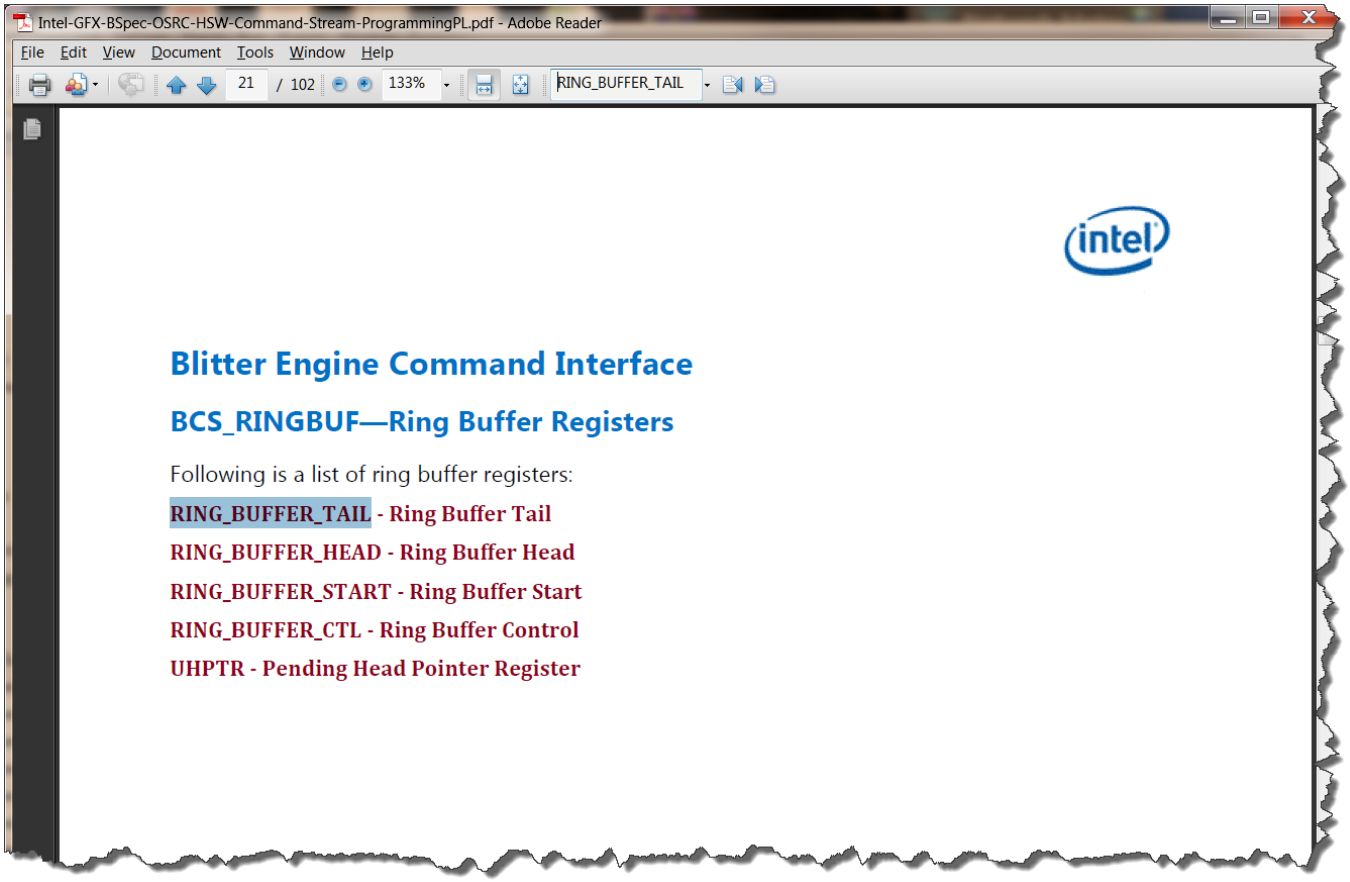
RING_BUFFER_TAIL – Ring Buffer Tail
RING_BUFFER_HEAD – Ring Buffer Head

Searching Across Multiple PDF Files

You can quickly access the detailed explanation for each named memory address, command, structure or enumerator utilizing the Advanced Search capabilities in Acrobat Reader.

To maximize the efficiency of the search, make sure to place all PRM PDFs in a single folder, or at least the four Command Reference PDFs in a single folder.

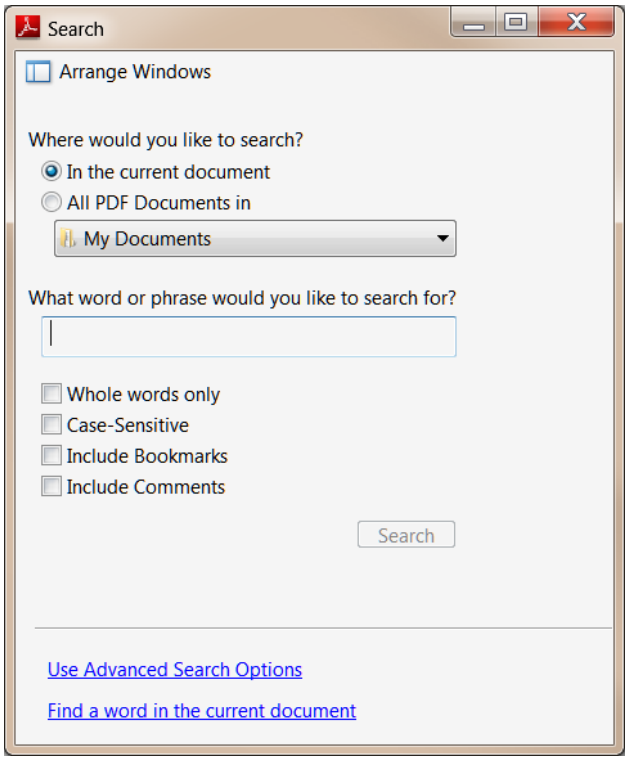
Let's walk through an example PDF search, you might be reading the Command Stream Programming module PDF file and encounter the page illustrated below.



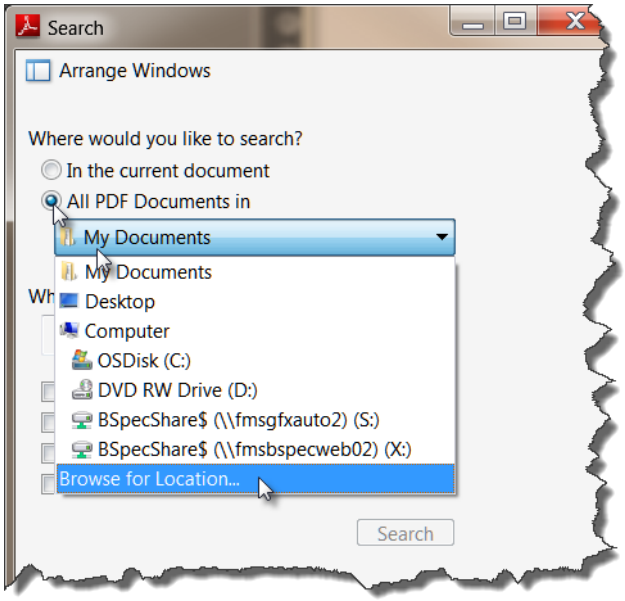
To view the detailed explanation of one of the listed registers, for this example, we will use **RING_BUFFER_TAIL ...**

1. Simply select **Search** or **Advanced Search** from the **Edit** menu, depending on the version of Acrobat you might be using. (If you are using some other PDF Reader, it probably will also have advanced search capabilities.)

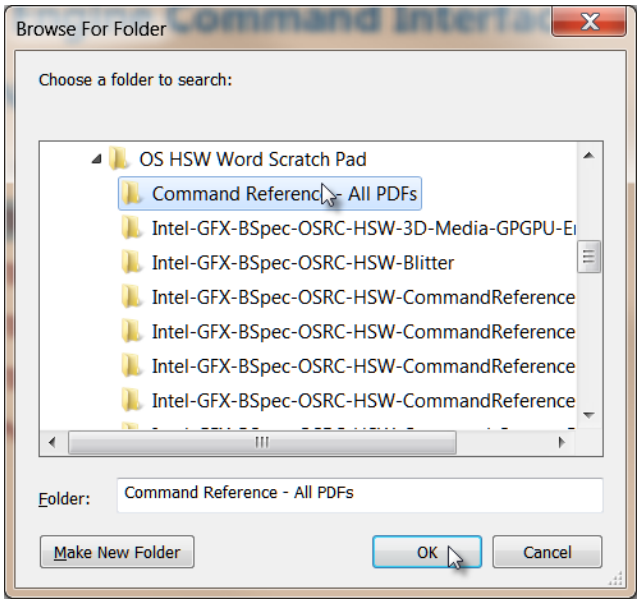
A search dialog box then displays.



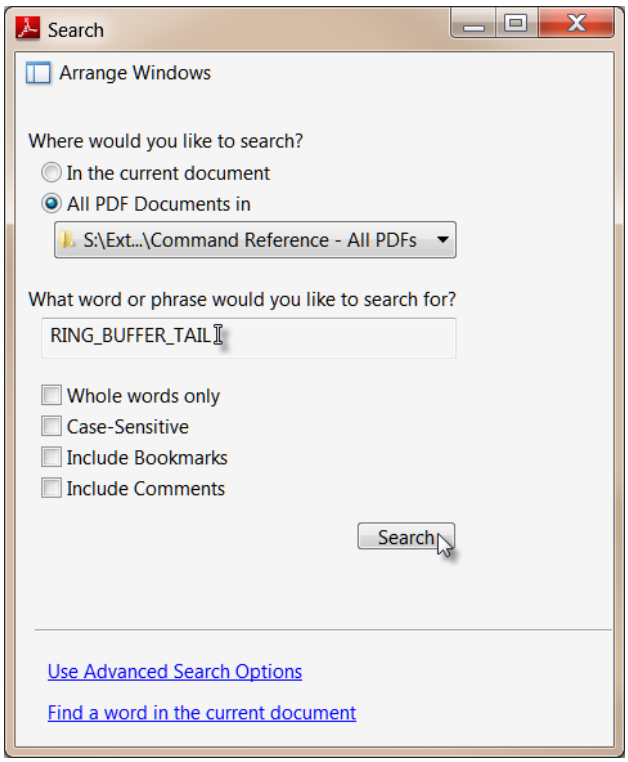
2. Select the **All PDF Documents in** radio button, click the pull-down list box, then select **Browse for Location...**



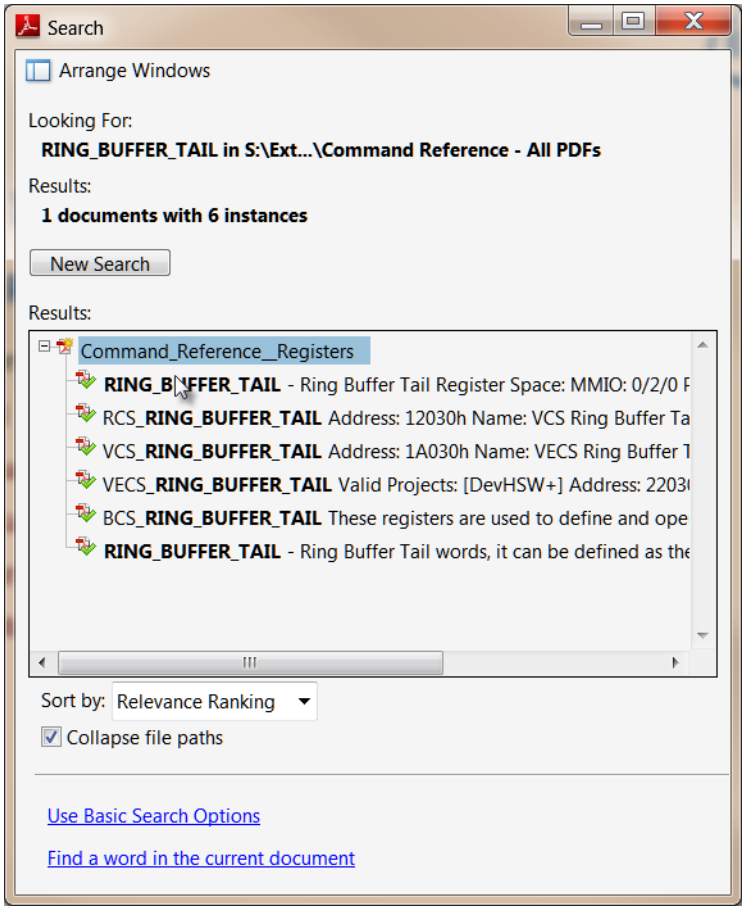
3. Browse to and select the folder containing the pertinent PDF files and click **OK**.



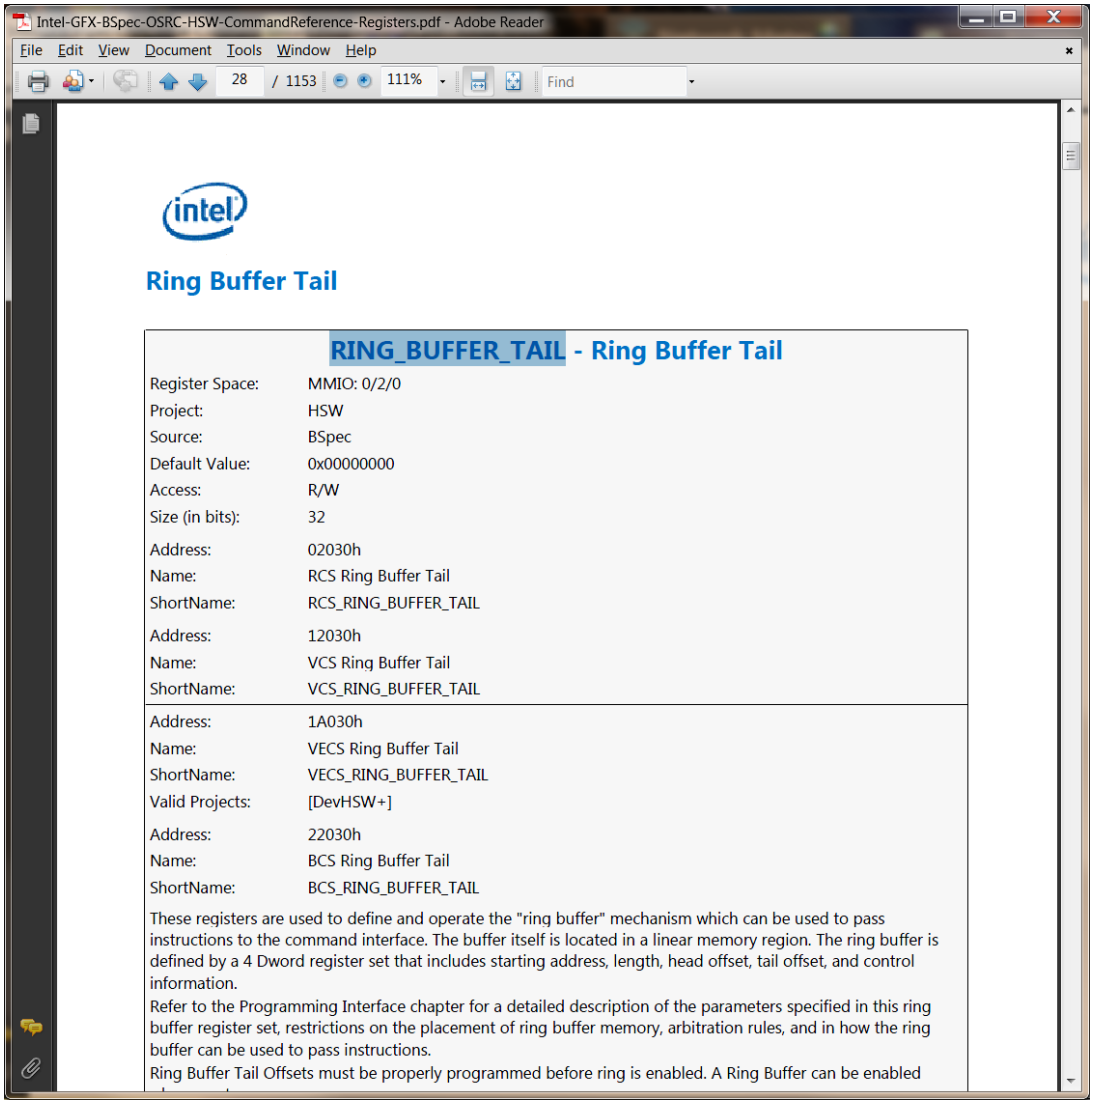
4. The Browse for Folder dialog closes and the focus shifts back to the original Search dialog. Enter the word or phrase from the red, serif text in the **What word or phrase would you like to search for?** text box and click **Search**.



As matches are found, they will be listed. When the search is complete, the dialog will appear similar to the following:



Click the most relevant result and the PDF file containing that result will open at the correct page.



Organization of the Programmer's Reference Manual

The Intel® Graphics PRM is organized into the following content areas:

Command Reference provides a tabular graphical interface tool for searching for and displaying command opcodes, registers, structures, and instructions.

GPU Overview introduces the GPU and its subsystems. This includes high level descriptions of its hardware pipelines, command formats, register maps, and supported memory/surface formats.

Configurations tracks the evolution of the graphics architecture and provides generational information for many basic architectural attributes.

Memory Views covers the Graphics Memory Interface, including memory interface functions, tiling, the physical graphics memory, page faults and error handling, memory types, common video and non-video surface formats, and other information related to the memory interface.

The **GuC** micro-controller is a scheduler for the graphics engines. This section describes the following GuC register functions:

Functions
Interrupt register functions
DMA register functions
Shim register functions

Command Stream Programming describes the programming interfaces for Command Streamer, which manages the use of the 3D and Media pipelines. It performs switching between pipelines and forwarding command streams to the currently active pipeline. It also manages the allocation of the Unified Return Buffer (URB) and helps support the Constant URB Entry (CURBE) function. It includes the following topics:

Topic
Command Formats
Blitter Engine Command Interface
Render Engine Command Interface
Video Codec Engine Command Interface
Video Enhancement Engine Command Interface
Preemption
Command Streamer (CS) ALU Programming
Resource Streamer

Media describes the VDBOX, VEBOX, VDENC engines and registers. Also covered are HEVC, HCP and SFC.

Topic
Media VDBOX covers the **Multi-Format Codec (MFX) Engine**, the hardware fixed-function pipeline that includes both multi-format decoding (MFD) and multi-format encoding (MFC).
Media VEBOX discusses the Video Enhancement pipeline, an independent pipe that manages image enhancement functions.

Topic
Topics include denoise filtering, deinterlacing, color processing, auto contrast enhancement, the capture pipe, output statistics, and video enhancement engine functions.
Media VDENC is the VDBOX Fixed Function Encode Engine. It is a dedicated encoder that does not depend on Execution Units and the Video Motion Estimation engine for motion estimation and mode decisions. This saves bandwidth and power and provides an independent encode pipeline that can be better managed for Quality of Service features. The primary usage will be low power video conferencing and video capture. This engine supports the AVC codec for encoding video with resolutions up to 3840x2160 in real-time.
HEVC covers the High Efficiency Video Coding (HEVC) Codec Pipeline (HCP), which is a fixed function hardware video codec pipeline responsible for encoding and decoding HEVC streams, with a target resolution of 4kx2k at 60 frames per second.

3D/GPGPU Engine includes the following topics:

- Command stream backend processing
- L3 cache
- Shared Local Memory (SLM)
- Messaging
- Shared functions for the 3D pipeline
- 3D fixed functions
- GPGPU Pipeline processing via both fixed functions and programmable GPU cores
- Execution units

Blitter discusses the **BL**ock **I**mage **T**ransfer**er** Engine for 2D graphics processing.

Display describes display engine registers, including display HD audio configuration and programming. It includes VGA and extended VGA registers, CPU display registers, North display engine registers, and South display engine registers. The Display section explains audio codec verbs, display audio configuration registers, and the display audio controller registers.

Topic
Wireless Display (WIDI) covers the **Wireless Display engine (WDBOX)**, a dedicated AVC video encoder. This section discusses the use of state parameters and lists the MMIO registers used for wireless display.
PCIE Config Registers lists the registers used for **Peripheral Component Interconnect Express (PCIE)** functions, including device identification and enabling, power management capabilities, per-thread and per-core status.
The PCIE Config Registers also include the UNCORE registers.
Memory Mapped I/O (**MMIO**) includes information on:
• Slice Registers and Die Recovery
SFC discusses the commands sent to the **Scalar and Format Converter (SFC)** pipeline from the Media VEBOX and Media VDBOX.

Topic
Workarounds provides software workarounds for known issues with the GPU.

Reserved Bits and Software Compatibility

In many register, instruction, and memory layout descriptions, certain bits are marked as "Reserved." When bits are marked as reserved, it is essential for compatibility with future devices that the software treat these bits as having a future, though unknown, effect. The behavior of reserved bits should be regarded as undefined *and unpredictable*. Software should follow the guidelines listed below in dealing with reserved bits:

1. Do not depend on the states of any reserved bits when testing values of registers that contain such bits.
2. Mask out the reserved bits before testing.
3. Do not depend on the states of any reserved bits when storing to an instruction or to a register.
4. When loading a register or formatting an instruction, always load the reserved bits with the values indicated in the documentation (if any), or reload them with the values previously read from the register.

Terminology

Term	Abbr.	Definition
Adjacency	--	One can consider a single line object as existing in a strip of connected lines. The neighboring line objects are called "adjacent objects", with the non-shared endpoints called the "adjacent vertices." The same concept can be applied to a single triangle object, considering it as existing in a mesh of connected triangles. Each triangle shares edges with three other adjacent triangles, each defined by a non-shared adjacent vertex. Knowledge of these adjacent objects/vertices is required by some object processing algorithms (e.g., silhouette edge detection). See *3D Pipeline*.
Application IP	AIP	Application Instruction Pointer. This is part of the control registers for exception handling for a thread. Upon an exception, hardware moves the current IP into this register and then jumps to System Instruction Pointer (SIP).
Architectural Register File	ARF	A collection of architecturally visible registers for a thread such as address registers, accumulator, flags, notification registers, IP, null, etc.
Binding Table	--	Memory-resident list of pointers to surface state blocks (also in memory).
Binding Table Pointer	BTP	Pointer to a binding table, specified as an offset from the Surface State Base Address register.
Blitter	BLT	Block Image Transferrer
Bypass Mode	--	Mode where a given fixed function (FF) unit is disabled and forwards data down the pipeline unchanged. Not supported by all FF units.
Byte	B	A numerical data type of 8 bits, B represents a signed byte integer.
Child Thread	--	A branch-node or a leaf-node thread that is created by another thread. It is a kind of thread associated with the media fixed function pipeline. A child thread is originated from a thread (the parent) executing on an EU and forwarded to the Thread Dispatcher by the TS unit. A child thread may or may not have child threads depending on whether it is a branch-node or a leaf-node thread. All pre-allocated resources such as URB and scratch memory for a child thread are managed by its parent thread. See also *Parent Thread*.
Clip Space	--	A 4-dimensional coordinate system within which a clipping frustum is defined. Object positions are projected from Clip Space to NDC space via "perspective divide" by the W coordinate, and then viewport mapped into Screen Space.
Clipper	--	3D fixed function unit that removes invisible portions of the drawing sequence by discarding (culling) primitives or by "replacing" primitives with one or more primitives that replicate only the visible portion of the original primitive.
Color Calculator	CC	Part of the Data Port shared function, the color calculator performs fixed-function pixel operations (e.g., blending) before writing a result pixel into the render cache.
Command	--	Directive fetched from a ring buffer in memory by the Command Streamer

Term	Abbr.	Definition
		and routed down a pipeline. Should not be confused with instructions which are fetched by the instruction cache subsystem and executed on an EU.
Command Streamer	CS or CSI	Functional unit of the Graphics Processing Engine that fetches commands, parses them, and routes them to the appropriate pipeline.
Constant URB Entry	CURBE	A UE that contains "constant" data for use by various stages of the pipeline.
Control Register	CR	The read-write registers are used for thread mode control and exception handling for a thread.
Data Port	DP	Shared function unit that performs a majority of the memory access types. The Data Port contains the render cache and the constant cache and performs all memory accesses requested by programs except those performed by the Sampler. See the DataPort section.
Degenerate Object	--	Object that is invisible due to coincident vertices or because it does not intersect any sample points (usually due to being tiny or a very thin sliver).
Destination	--	Describes an output or write operand.
Destination Size	--	The number of data elements in the destination of a SIMD instruction.
Destination Width	--	The size of each of (possibly) many elements of the destination of a SIMD instruction.
Domain Shader	DS	An API-supplied program that shades vertices using domain points. Also refers to the FF unit that dispatches threads to "shade" (calculate attributes for) vertices based on domain points.
Double Quad word (DQword)	DQ	A fundamental data type, DQ represents 16 bytes.
Double word (DWord)	D or DW	A fundamental data type, D or DW represents 4 bytes.
Drawing Rectangle	--	A screen-space rectangle within which 3D primitives are rendered. An object's screen-space positions are relative to the Drawing Rectangle origin. See *Strips and Fans*.
Dual Sub-slice	DSS	The collection of Execution Units (EU) that have a common set of shared function units, such as sampler, dataport, and pixel port.
End of Block	EOB	A 1-bit flag in the non-zero DCT coefficient data structure indicating the end of an 8x8 block in a DCT coefficient data buffer.
End Of Thread	EOT	A message sideband signal on the Output message bus signifying that the message requester thread is terminated. A thread must have at least one SEND instruction with the EOT bit in the message descriptor field set to properly terminate.
Exception	--	Type of (normally rare) interruption to EU execution of a thread's instructions. An exception occurrence causes the EU thread to begin executing the System Routine, which is designed to handle exceptions.
Execution Channel	--	Single lane of a SIMD operand.
Execution Size	ExecSize	Execution Size indicates the number of data elements processed by an SIMD instruction. It is one of the instruction fields and can be changed per instruction.

Term	Abbr.	Definition
Execution Unit	EU	An EU is a multi-threaded processor within the multi-processor system. Each EU is a fully-capable processor containing instruction fetch and decode, register files, source operand swizzle and SIMD ALU, etc.
Execution Unit Identifier	EUID	The 4-bit field within a thread state register (SR0) that identifies the row and column location of the EU where a thread is located. A thread can be uniquely identified by the EUID and TID.
Execution Width	ExecWidth	The width of each of several data elements that may be processed by a single SIMD instruction.
Fixed Function	FF	Function of the pipeline that is performed by dedicated (vs. programmable) hardware.
Fixed Function ID	FFID	Unique identifier for a fixed function unit.
Gateway	GW	See *Message Gateway*.
General Register File	GRF	Large read/write register file shared by all the EUs for operand sources and destinations. This is the most commonly used read-write register space organized as an array of 256-bit registers for a thread.
General State Base Address	--	The Graphics Address of a block of memory-resident "state data", which includes state blocks, scratch space, constant buffers, and kernel programs. The contents of this memory block are referenced via offsets from the contents of the General State Base Address register. See *Graphics Processing Engine*.
Geometry Shader	GS	Fixed-function unit between the vertex shader and the clipper that (if enabled) dispatches "geometry shader" threads on its input primitives. Application-supplied geometry shaders normally expand each input primitive into several output primitives to perform 3D modeling algorithms such as fur/fins.
Graphics Address	--	The GPE virtual address of some memory-resident object. This virtual address gets mapped by a GTT or PGTT to a physical memory address. Note that many memory-resident objects are referenced not with Graphics Addresses, but instead with offsets from a "base address register".
Graphics Processing Engine	GPE	Collective name for the Subsystem, the 3D and Media pipelines, and the Command Streamer.
Guardband	GB	Region that may be clipped against to make sure objects do not exceed the limitations of the renderer's coordinate space.
Horizontal Stride	HorzStride	The distance in element-sized units between adjacent elements of a region-based GRF access.
Immediate floating point vector	VF	A numerical data type of 32 bits, an immediate floating point vector of type VF contains 4 floating point elements with 8 bits each. The 8-bit floating point element contains a sign field, a 3-bit exponent field and a 4-bit mantissa field. It may be used to specify the type of an immediate operand in an instruction.
Immediate integer vector	V	A numerical data type of 32 bits, an immediate integer vector of type V contains 8 signed integer elements with 4 bits each. The 4-bit integer element is in 2's complement form. It may be used to specify the type of an

Term	Abbr.	Definition
		immediate operand in an instruction.
Index Buffer	IB	Buffer in memory containing vertex indices.
Intel Architecture	IA	
Instance	--	In the context of the VF unit, an instance is one of a sequence of sets of similar primitive data. Each set has identical vertex data but may have unique instance data that differentiates it from other sets in the sequence.
Instruction	--	Data in memory directing an EU operation. Instructions are fetched from memory, stored in a cache, and executed on one or more cores. Not to be confused with commands which are fetched and parsed by the command streamer and dispatched down the 3D or Media pipeline.
Instruction Pointer	IP	The address (really an offset) of the instruction currently being fetched by an EU. Each EU has its own IP.
Instruction Set Architecture	ISA	The ISA describes the instructions supported by an EU.
Instruction State Cache	ISC	On-chip memory that holds recently-used instructions and state variable values.
Interface Descriptor	--	Media analog of a State Descriptor.
Intermediate Z	IZ	Completion of the Z (depth) test at the front end of the Windower/Masker unit when certain conditions are met (no alpha, no pixel-shader computed Z values, etc.).
Inverse Discrete Cosine Transform	IDCT	The stage in the video decoding pipe between IQ and MC.
Inverse Quantization	IQ	A stage in the video decoding pipe between IS and IDCT.
JIT	--	Just-in-time compiler, aka "jitter".
Kernel	--	A sequence of instructions that is logically part of the driver or generated by the jitter. Differentiated from a Shader which is an application supplied program that is translated by the jitter to instructions.
Logical Ring Context Area	LRCA	Memory area used to store contents of registers and state information required for initiating and resuming communication between software application and hardware graphics pipeline via Ring Buffers.
Least Significant Bit	LSB	The bit with the lowest bit position within a group of bits, which could be a bit group, DWord, field, instruction, memory range, register, or structure. For example, bit 0 of a DWord.
MathBox	--	See *Extended Math Unit*
Media	--	Term for operations such as video decode and encode that are normally performed by the Media pipeline.
Media Pipeline	--	Fixed function stages dedicated to media and "generic" processing, sometimes referred to as the generic pipeline.
Memory-mapped Input/Output	MMIO	A methord for performing input/output between the CPU/GPU and peripheral devices.
Message	--	Messages are data packages transmitted from a thread to another thread,

Term	Abbr.	Definition
		another shared function, or another fixed function. Message passing is the primary communication mechanism of the architecture.
Message Gateway	--	Shared function that enables thread-to-thread message communication/synchronization, used solely by the Media pipeline.
Most Significant Bit	MSB	The bit with the highest bit position within a group of bits, which could be a bit group, DWord, field, instruction, memory range, register, or structure. For example, bit 31 of a DWord.
Motion Compensation	MC	Part of the video decoding pipe.
Motion Picture Expert Group	MPEG	MPEG is the international standard body JTC1/SC29/WG11 under ISO/IEC that has defined audio and video compression standards such as MPEG-1, MPEG-2, and MPEG-4.
Motion Vector Field Selection	MVFS	A four-bit field selecting reference fields for the motion vectors of the current macroblock.
Multiple Render Targets	MRT	Multiple independent surfaces that may be the target of a sequence of 3D or Media commands that use the same surface state.
Normalized Device Coordinates	NDC	Clip Space Coordinates that have been divided by the Clip Space "W" component.
Object	--	A single triangle, line, or point.
OpenGL	OGL	**O**pen **G**raphics **L**ibrary. A graphics API specification associated with Linux.
Parent Thread	--	A thread corresponding to a root-node or a branch-node in thread generation hierarchy. A parent thread may be a root thread or a child thread depending on its position in the thread generation hierarchy.
Pipeline Stage	--	An abstracted element of the 3D Pipeline, providing functions performed by a combination of the corresponding hardware FF unit and the threads spawned by that FF unit.
Pipelined State Pointers	PSP	Pointers to state blocks in memory that are passed down the pipeline.
Pixel Shader	PS	Shader that is supplied by the application, translated by the jitter and is dispatched to the EU by the Windower (conceptually) once per pixel.
Point	--	A drawing object characterized only by position coordinates and width.
Primitive	--	Synonym for object: triangle, rectangle, line, or point.
Primitive Topology	--	A composite primitive such as a triangle strip or a line list. Also includes the objects triangle, line, and point as degenerate cases.
Provoking Vertex	--	The vertex of a primitive topology from which vertex attributes that are constant across the primitive are taken.
Quad Quad word (QQword)	QQ	A fundamental data type, QQ represents 32 bytes.
Quad Word (QWord)	QW	A fundamental data type, QW represents 8 bytes.
Rasterization	--	Conversion of an object represented by vertices into the set of pixels that make up the object.
Region-based addressing	--	Collective term for the register addressing modes available in the EU instruction set that permit discontiguous register data to be fetched and

Term	Abbr.	Definition
		used as a single operand.
Render Cache	RC	Cache in which pixel color and depth information is written before being written to memory, and where prior pixel destination attributes are read in preparation for blending and Z test.
Render Target	RT	A destination surface in memory where render results are written.
Render Target Array Index	--	Selector of which of several render targets the current operation is targeting.
Resource Streamer	RS	Functional unit of the Graphics Processing Engine that examines the commands in the ring buffer in an attempt to pre-process certain long latency items for the remainder of the graphics processing.
Root Thread	--	A root-node thread. A thread corresponds to a root-node in a thread generation hierarchy. It is a kind of thread associated with the media fixed function pipeline. A root thread is originated from the VFE unit and forwarded to the Thread Dispatcher by the TS unit. A root thread may or may not have child threads. A root thread may have scratch memory managed by TS. A root thread with children has its URB resource managed by the VFE.
Sampler	--	Shared function that samples textures and reads data from buffers on behalf of EU programs.
Scratch Space	--	Memory allocated to the subsystem that is used by EU threads for data storage that exceeds their register allocation, persistent storage, storage of mask stack entries beyond the first 16, etc.
Shader	--	A program supplied by the application in a high level shader language, and translated to instructions by the jitter.
Shared Function	SF	Function unit that is shared by EUs. EUs send messages to shared functions, that consume the data and may return results. Example Sampler and Data Port.
Shared Function ID	SFID	Unique identifier used by kernels and shaders to target shared functions and to identify their returned messages.
Single Instruction Multiple Data	SIMD	A parallel processing architecture that exploits data parallelism at the instruction level. It can also be used to describe the instructions in such an architecture or to describe the amount of data parallelism in a particular instruction (SIMD8 for example).
Source	--	Describes an input or read operand.
Spawn	--	To initiate a thread for execution on an EU. Done by the thread spawner as well as most FF units in the 3D Pipeline.
Sprite Point	--	Point object using full range texture coordinates. Points that are not sprite points use the texture coordinates of the point's center across the entire point object.
State Descriptor	--	Blocks in memory that describe the state associated with a particular FF, including its associated kernel pointer, kernel resource allowances, and a pointer to its surface state.

Term	Abbr.	Definition
State Register	SR	The read-only registers containing the state information of the current thread, including the EUID/TID, Dispatcher Mask, and System IP.
State Variable	SV	An individual state element that can be varied to change the way given primitives are rendered or media objects processed. On state variables persist only in memory and are cached as needed by rendering/processing operations except for a small amount of non-pipelined state.
Stream Output	--	A term for writing the output of a FF unit directly to a memory buffer instead of, or in addition to, the output passing to the next FF unit in the pipeline. Currently only supported for the Geometry Shader (GS) FF unit.
Strips and Fans	SF	Fixed function unit whose main function is to decompose primitive topologies such as strips and fans into primitives or objects.
Sub-Register	--	Subfield of a SIMD register. A SIMD register is an aligned fixed size register for a register file or a register type. For example, a GRF register, *r2*, is a 256-bits wide, 256-bit aligned register. A sub-register, *r2.3:d*, is the fourth dword of GRF register *r2*.
Subsystem	--	The name given to the resources shared by the FF units, including shared functions and EUs.
Surface	--	A rendering operand or destination, including textures, buffers, and render targets.
Surface State Base Pointer	--	Base address used when referencing binding table and surface state data.
Synchronized Root Thread	--	A root thread that is dispatched by TS upon a 'dispatch root thread' message.
System IP	SIP	There is one global System IP register for all the threads. From a thread's point of view, this is a virtual read only register. Upon an exception, hardware performs some bookkeeping and then jumps to SIP.
System Routine	--	Sequence of instructions that handles exceptions. SIP is programmed to point to this routine, and all threads encountering an exception will call it.
Thread	--	An instance of a kernel program executed on an EU. The life cycle for a thread starts from the executing the first instruction after being dispatched from Thread Dispatcher to an EU to the execution of the last instruction - a *send* instruction with EOT that signals the thread termination. Threads in the system may be independent from each other or communicate with each other through Message Gateway share function.
Thread Dispatcher	TD, TDL	Functional unit that arbitrates thread initiation requests from Fixed Functions units and instantiates the threads on EUs.
Thread Identifier	TID	The field within a thread state register (SR0) that identifies which thread slots on an EU a thread occupies. A thread can be uniquely identified by the EUID and TID.
Thread Payload	--	Before a thread starting execution, some amount of data is pre-loaded into the thread's GRF (starting at r0). This data is typically a combination of control information provided by the spawning entity (FF Unit) and data read from the URB.
Thread Spawner	TS	The second and the last fixed function stage of the media pipeline that

Term	Abbr.	Definition
		initiates new threads on behalf of generic/media processing.
Topology	--	See *Primitive Topology*.
Unified Return Buffer	URB	The on-chip memory managed/shared by Fixed Functions in order for a thread to return data that will be consumed either by a Fixed Function or other threads.
Unsigned Byte integer	UB	A numerical data type of 8 bits.
Unsigned Double Word integer	UD	A numerical data type of 32 bits. It may be used to specify the type of an operand in an instruction.
Unsigned Word integer	UW	A numerical data type of 16 bits. It may be used to specify the type of an operand in an instruction.
Unsynchronized Root Thread	--	A root thread that is automatically dispatched by TS.
URB Dereference	--	
URB Entry	UE	URB Entry: A logical entity stored in the URB (such as a vertex), referenced via a URB Handle.
URB Entry Allocation Size	--	Number of URB entries allocated to a Fixed Function unit.
URB Fence	Fence	Virtual, movable boundaries between the URB regions owned by each FF unit.
URB Handle	--	A unique identifier for an URB entry that is passed down a pipeline.
URB Reference	--	
Variable Length Decode	VLD	The first stage of the video decoding pipe that consists mainly of bit-wide operations.
Vertex Buffer	VB	Buffer in memory containing vertex attributes.
Vertex Cache	VC	Cache of Vertex URB Entry (VUE) handles tagged with vertex indices. See the VS chapter for details on this cache.
Vertex Fetcher	VF	The first FF unit in the 3D Pipeline responsible for fetching vertex data from memory. Sometimes referred to as the Vertex Formatter.
Vertex Header	--	Vertex data required for every vertex appearing at the beginning of a Vertex URB Entry.
Vertex ID	--	Unique ID for each vertex that can optionally be included in vertex attribute data sent down the pipeline and used by kernel/shader threads.
Vertex Shader	VS	An API-supplied program that calculates vertex attributes. Also refers to the FF unit that dispatches threads to "shade" (calculate attributes for) vertices.
Vertex URB Entry	VUE	An URB entry that contains data for a specific vertex.
Vertical Stride	VertStride	The distance in element-sized units between 2 vertically-adjacent elements of a region-based GRF access.
Video Front End	VFE	The first fixed function in the generic pipeline; performs fixed-function media operations.
Viewport	VP	

Term	Abbr.	Definition
Windower IZ	WIZ	Term for Windower/Masker that encapsulates its early ("intermediate") depth test function.
Windower/Masker	WM	Fixed function triangle/line rasterizer.
Word	W	A numerical data type of 16 bits, W represents a signed word integer.

3D_Vertex_Component_Control

3D_Vertex_Component_Control	
Source:	RenderCS
Size (in bits):	3

Value	Name	Description
0	VFCOMP_NOSTORE	Don't store this component. (Not valid for Component 0, but can be used for Component 1-3). Once this setting is used for a component, all higher-numbered components (if any) MUST also use this setting. (I.e., no holes within any particular vertex element). VFCOMP_NOSTORE will not store a component if the SourceElementFormat is R64_PASSTHRU or R64G64_PASSTHRU and it is used on component 2 and 3 else 0 will be stored.
1	VFCOMP_STORE_SRC	Store corresponding component from format-converted source element. Storing a component that is not included in the Source Element Format results in an UNPREDICTABLE value being stored. VF will process Component Control fields within a VERTEX_ELEMENT_STATE structure sequentially, starting with Component 0 Control. For each Component Control field in this sequence, when VF detects (a) the Component Control field is set to STORE_SRC and (b) the component is not overwritten by an SGV, VF will store a component of the source vertex data into the destination component. The first such Component Control field satisfying this criteria will use Component 0 of the source vertex data, the second such Component Control field will use Component 1 of the source vertex data, and so on. Therefore, when a lower-numbered Component Control field (a) is set to something other than STORE_SRC (e.g., STORE_0) or (b) the component is overwritten with an SGV, the source vertex component used when a higher-numbered Component Control fields is set to STORE_SRC will be impacted.
2	VFCOMP_STORE_0	Store 0 (interpreted as 0.0f if accessed as a float value)
3	VFCOMP_STORE_1_FP	Store 1.0f
4	VFCOMP_STORE_1_INT	Store 0x1
5-6	-	Reserved
7	VFCOMP_STORE_PID	Store Primitive ID (as U32) Software can no longer use this encoding as PrimitiveID is passed down the FF pipeline - see explanation above.

AccWrCtrl

AccWrCtrl	
Size (in bits):	1
This field allows per instruction accumulator write control. When set, the result is written to both destination and accumulator.	

Value	Name
0	Don't write to ACC **[Default]**
1	Update ACC

AddrMode

AddrMode	
Source:	EuIsa
Size (in bits):	1

Addressing Mode This field determines the addressing method of the operand. Normally the destination operand and each source operand each have a distinct addressing mode field. When it is cleared, the register address of the operand is directly provided by bits in the instruction word. It is called a direct register addressing mode. When it is set, the register address of the operand is computed based on the address register value and an address immediate field in the instruction word. This is referred to as a register-indirect register addressing mode. This field applies to the destination operand and the first source operand, src0. Support for src1 is device dependent. See Table XX (Indirect source addressing support available in device hardware) in ISA Execution Environment for details.

Programming Notes
Instructions with 3 source operands use Direct Addressing.

Value	Name	Description
0	Direct	'Direct' register addressing
1	Indirect	'Register-Indirect' (or in short 'Indirect'). Register-indirect register addressing

AtomicCtrl

AtomicCtrl	
Source:	EuIsa
Size (in bits):	1
Enables the atomic instruction control option	

Value	Name	Description
0b	No Operation **[Default]**	This value leaves thread switching up to the EU's scheduler.
1b	Atomic	Prevent any thread switch immediately following this instruction. Always execute the next instruction (which may not be next sequentially if the current instruction branches). The next instruction gets highest priority in the thread arbitration for the execution pipelines.

Attribute_Component_Format

Attribute_Component_Format

Source: RenderCS

Size (in bits): 2

Value	Name	Description
00b	disabled **[Default]**	All components disabled
01b	.xy	2D attribute, z and w components disabled
10b	.xyz	3D attribute, w components disabled
11b	.xyzw	4D attribute, no disabled components

ChanOff

ChanOff	
Source:	EuIsa
Size (in bits):	3

Channel Offset
This enumeration (instruction field) provides offset information for ARF selection. The can be thought of as a starting channel offset for the execution mask and other ARF registers implicitly accessed. Some of the ARFs affected by this offset are:

- ce access (channel enable / the execution mask): bitwise offset
- f# access: bitwise offset (e.g. in predication or conditional modifier access)
- acc# access via AccWrEn (implicit only): in subregister units of the data type

Note: ChanOff is functionally the same as a concatenation of the previous QtrCtrl and NibCtrl and supersedes these fields.

Restriction
The execution size (ExecSize) must be a factor of the chosen offset. For instance, M28 (offset 28) can only be used with SIMD1, SIMD2, and SIMD4.

Value	Name	Description
000b	M0 **[Default]**	ARF access begins at channel 0
001b	M4	ARF access begins at channel 4 (e.g. 4 bits in on ce and f#
010b	M8	
011b	M12	
100b	M16	
101b	M20	
110b	M24	
111b	M28	

COMPONENT_ENABLES

COMPONENT_ENABLES	
Source:	RenderCS
Size (in bits):	4
If enabled, the component will be stored in the URB.	

Value	Name
0000b	NONE
0001b	X
0010b	Y
0011b	XY
0100b	Z
0101b	XZ
0110b	YZ

EU_OPCODE		
4Fh	subb	Instruction: subb
1h	sync	Instruction: sync
27h	while	Instruction: while
67h	xor	Instruction: xor

ExecSize

ExecSize	
Source:	EuIsa
Size (in bits):	3

Execution Size This field determines the number of channels operating in parallel for this instruction. The size cannot exceed the maximum number of channels allowed for the given data type.

Restriction
An operand's Width must be less-than-or-equal to ExecSize

Value	Name	Programming Notes
000b	1 Channel (Scalar operation) **[Default]**	
001b	2 Channels	
010b	4 Channels	
011b	8 Channels	
100b	16 Channels	[] 4-byte or smaller data types. Excludes DF, Q, and UQ types.
101b	32 Channels	[] 2-byte or 1-byte data types. Excludes D, DF, F, Q, UD, and UQ types.
110b-111b	Reserved	

Fixed Function ID

FFID - Fixed Function ID

Size (in bits): 4

Fixed functions are hardware units that execute complex graphics or media command on behalf of application software. Some fixed functions send work down a pipeline through a series of fixed functions. Multiple fixed functions can be running at the same time. The GPU tracks activity from the fixed function with its FFID.

Programming Notes

Software does not specify the FFID, and does not normally use the FFID value. The FFID value is available to a EU thread in an ARF.

Value	Name	Description
00h	Null	
03h	POSH Vertex Shader	
04h	Hull Shader	
05h	Domain Shader	
06h	Texel Shader	Adaptive Multi-Frequency Shader
07h	General Purpose Thread Spawner	GPGPU command queue thread dispatcher
08h	General Purpose Asynchronous Thread Spawner	GPGPU command queue's thread dispatcher for secondary queue
09h	Vertex Shader	
0Ch	Geometry Shader	

FlagModifier

FlagModifier	
Source:	EuIsa
Size (in bits):	4

Flag (Conditional) Modifier - This field sets the flag register based on the internal conditional signals output from the execution pipe such as sign, zero, overflow and NaNs, etc. If this field is set to 0000, no flag registers are updated. Flag registers are not updated for instructions with embedded compares. This field may also be referred to as the flag destination control field.

Value	Name	Description
0000b	None **[Default]**	None
0001b	(ze)	Zero
0010b	(nz)	NotZero
0011b	(gt)	Greater-than
0100b	(ge)	Greater-than-or-equal
0101b	(lt)	Less-than
0110b	(le)	Less-than-or-equal
0111b	Reserved	
1000b	(ov)	Overflow
1001b	(un)	Unordered (NaN)
1110b-1111b	Reserved	

GW_FENCE_PORTS

GW_FENCE_PORTS	
Source:	BSpec
Size (in bits):	0

Bit mask specifies the list of data ports to be fenced.

Value	Name	Description
0	None **[Default]**	No fence is performed when no bits are set.

HorzStride

HorzStride	
Source:	EuIsa
Size (in bits):	2

Horizontal Stride This field provides the distance in unit of data elements between two adjacent data elements within a row (horizontal) in the register region for the operand. This field applies to both destination and source operands. This field is not present for an immediate source operand.

A horizontal stride of 0 is used for a row that is one-element wide, useful when an instruction repeats a column value or repeats a scalar value. For example, adding a single column to every column in a 2D array or adding a scalar to every element in a 2D array uses HorzStride of 0. A horizontal stride of 1 indicates that elements are adjacent within a row. References to HorzStride in this volume normally reference the value not the encoding, so there are references to HorzStride of 4, which is encoded as 11b.

Value	Name
00b	0 elements
01b	1 elements
10b	2 elements
11b	4 elements

ImmDataType

ImmDataType

Source: EuIsa

Size (in bits): 4

Numeric data type of source and destination operand. Three source instructions use a 3-bit encoding that allows fewer data types.

Value	Name	Description
0000b	:uv	Packed Unsigned Half-Byte Integer Vector, 8 x 4-Bit Unsigned Integer
0001b	:uw	Unsigned Word (16-bit) Integer
0010b	:ud	Unsigned DoubleWord (32-bit) Integer
0011b	:uq	Unsigned Quadword (64-bit) Integer
0100b	:v	Packed Signed Half-Byte Integer Vector, 8 x 4-Bit Signed Integer
0101b	:w	Signed Word (16-bit) Integer
0110b	:d	Signed DoubleWord (32-bit) Integer
0111b	:q	Signed QuadWord (64-bit) Integer
1000b	:vf	Packed Restricted Float Vector, 4 x 8-Bit Restricted Precision Floating-Point Number.
1001b	:hf	Half (16-bit) Float
1010b	:f	Single-Precision (32-bit) Float
1011b	:df	Double-Precision (64-bit) Float
1100b	Reserved	
1101b	Reserved

PREFERRED_SLM_SIZE

PREFERRED_SLM_SIZE - PREFERRED_SLM_SIZE		
Size (in bits):	0	
Specifies the preferred SLM size per subslice for this kernel.		

Restriction
Selected PREFERRED_SLM_SIZE must specify a size >= the selected SLM_SIZE

Value	Name	Description
0x0	Max **[Default]**	Preferred SLM size is the largest SLM size supported in the subslice.

RegDataType

RegDataType	
Source:	EuIsa
Size (in bits):	4

Destination Type Numeric data type of the destination operand dst. The bits of the destination operand are interpreted as the identified numeric data type, rather than coerced into a type implied by the operator. For a send or sendc instruction, this field applies to CurrDst, the current destination operand. Three source instructions use a 3-bit encoding that allows fewer data types.

Value	Name	Description
0000b	:ub	Unsigned Byte (8-bit) Integer
0001b	:uw	Unsigned Word (16-bit) Integer
0010b	:ud	Unsigned DoubleWord (32-bit) Integer

Saturate

Saturate	
Size (in bits):	1
This field controls the destination saturation. When it is set, output data to the destination register are saturated. The saturation operation depends on the destination data type. Saturation is the operation that converts any data that is outside the saturation target range for the data type to the closest representable value with the target range. If destination type is float, saturation target range is [0, 1]. For example, any positive number greater than 1 (including +INF) is saturated to 1 and any negative number (including -INF) is saturated to 0. A NaN is saturated to 0, For integer data types, the maximum range for the given numerical data type is the saturation target range. When it is not set, output data to the destination register are not saturated. For example, a wrapped result (modular) is output to the destination for an overflowed integer data. More details can be found in the Data Types chapter.	

Value	Name
0	No Destination modification **[Default]**
1	Saturate Destination

SFID

SFID

Source: EuIsa

Size (in bits): 4

The following table lists the assignments (encodings) of the Shared Function and Fixed Function IDs used within the GPE. A Shared Function is a valid target of a message initiated via a 'send' instruction. A Fixed Function is an identifiable unit of the 3D or Media pipeline. Note that the Thread Spawner is both a Shared Function and Fixed Function. Note: The initial intention was to combine these two ID namespaces, so that (theoretically) an agent (such as the Thread Spawner) that served both as a Shared Function and Fixed Function would have a single, unique 4-bit ID encoding. However, this combination is not a requirement of the architecture.

Programming Notes

SFID_DP_DC1 is an extension of SFID_DP_DC0 to allow for more message types. They act as a single logical entity.

SFID_DP_DC1 and SFID_DP_DC2 are extensions of SFID_DP_DC0 to allow for more message types. They act as a single logical entity.

Value	Name	Description

Slice Hash Control

Slice Hash Control

Source: RenderCS

Size (in bits): 2

This is a sample showing the basic structure of an explicit enumeration.

Value	Name	Description
00b	Computed	Use Computed pixelhash_id
01b	Unbalanced table[0]	Use Computed pixelhash_id when balanced, Table[0] when unbalanced
10b	Table[0]	Use Table[0]
11b	Table[1]	Use Table[1]

SrcMod

SrcMod

Source: EuIsa

Size (in bits): 2

Source Modifier This field specifies the numeric modification of a source operand. The value of each data element of a source operand can optionally have its absolute value taken and/or its sign inverted prior to delivery to the execution pipe. The absolute value is prior to negate such that a guaranteed negative value can be produced. This field only applies to source operand. It does not apply to destination. This field is not present for an immediate source operand.

When used with logic instructions (and, not, or, xor), this field indicates whether the source bits are inverted (bitwise NOT) before delivery to the execution pipe, regardless of the source type.

Value	Name	Description
00b	No modification	
01b	abs	Absolute value Logic instructions: No modification (This encoding cannot be selected in the assembler syntax)
10b	negate	Negate Logic instructions: Bitwise NOT, inverting the source bits
11b	negate of abs	Negate of the absolute (forced negative value) Logic instructions: No modification (This encoding cannot be selected in the assembler syntax)

SURFACE_FORMAT

SURFACE_FORMAT

Size (in bits): 9

The following table indicates the supported surface formats and the 9-bit encoding for each. Note that some of these formats are used not only by the Sampling Engine, but also by the Data Port and the Vertex Fetch unit.

SyncFC

SyncFC		
Source:	EuIsa	
Size (in bits):	4	
Subfunctions that the sync instruction supports.		

Value	Name	Description	
0000b	No Operation	Performs no operation. Regular SWSB constraints are checked.	Syntax: SYNC_UNARY
0010b	SBID Read Wait	Blocks until pending out-of-order source accesses are complete. If a mask is provided as immediate value in src0 then specific SBID resources can be checked, else all SBID resources are checked for source access complete status.	Syntax: SYNC_UNARY
0011b	SBID Write Wait	Blocks until pending out-of-order writebacks are complete. If a mask is provided as immediate value in src0 then specific SBID resources can be checked, else all SBID resources are checked for writeback complete status.	Syntax: SYNC_UNARY
1110b	Wait on Barrier	[] Blocks until the notification count reaches 0. The wait instruction evaluates the value of the notification count register nreg. If nreg is zero, thread execution is suspended and the thread is put in 'wait_for_notification' state. If nreg is not zero (i.e., one or more notifications have been received), nreg is decremented by one and the thread continues executing on the next instruction. If a thread is in the 'wait_for_notification' state, when a notification arrives, the notification count register is incremented by one. As the notification count register becomes nonzero, the thread wakes up to continue execution and at the same time the notification register is decremented by one. If only one notification arrived, the notification register value becomes zero. However, during the above mentioned time period, it is possible that more notifications may arrive, making the notification register nonzero again. This operation implicitly accesses n0 (typically n0.0 for barriers).	Syntax: SYNC_UNARY
1111b	Wait on Host Notification	Similar to .bar, but waits the host's notification register (typically n0.1). See that element for more information.	Syntax: SYNC_UNARY

TernaryDataType

TernaryDataType	
Source:	EuIsa
Size (in bits):	3
This field provide the datatype of the source and destination operands for ternary instruction.	

Value	Name	Description	Exists If
000b	:ub	Unsigned Byte (8-bit) Integer	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Integer)
001b	:uw	Unsigned Word (16-bit) Integer	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Integer)
010b	:ud	Unsigned DoubleWord (32-bit) Integer	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Integer)
011b	:uq	Unsigned Quadword (64-bit) Integer	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Integer)
100b	:b	Signed Byte (8-bit) Integer	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Integer)
101b	:w	Signed Word (16-bit) Integer	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Integer)
110b	:d	Signed DoubleWord (32-bit) Integer	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Integer)
111b	:q	Signed QuadWord (64-bit) Integer	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Integer)
000b	Reserved		(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Float)
001b	:hf	Half (16-bit) Float	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Float)
010b	:f	Single-Precision (32-bit) Float	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Float)
011b	:df	Double-Precision (64-bit) Float	(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Float)
100b	Reserved		(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Float)
101b	Reserved		(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Float)
110b	Reserved		(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Float)
111b	Reserved		(Structure[EU_INSTRUCTION_BASIC_THREE_SRC][ExecDataType]==Float)

TernaryVertStride

TernaryVertStride	
Source:	EuIsa
Size (in bits):	2
Source Vertical Stride is required for regioning/accessing datatypes of varied size. It is one way to obtain a vector of scalars.	

Value	Name
00b	0 - elements
01b	1 - elements
10b	4 - elements
11b	8 - elements

Texture Coordinate Mode

Texture Coordinate Mode		
Size (in bits): 3		
Value	**Name**	**Description**
0h	WRAP	Map is repeated in the U direction
1h	MIRROR	Map is mirrored in the U direction
2h	CLAMP	Map is clamped to the edges of the accessed map
3h	CUBE	For cube-mapping, filtering in edges access adjacent map faces
4h	CLAMP_BORDER	Map is infinitely extended with the border color
5h	MIRROR_ONCE	Map is mirrored once about origin, then clamped
6h	HALF_BORDER	Map is infinitely extended with the average of the nearest edge texel and the border color
7h	MIRROR_101	Map is mirrored one time in each direction, but the first pixel of the reflected image is skipped, and the reflected image is effectively 1 pixel less in that direction. May only be used on 2D surfaces.

VertStride

VertStride	
Source:	EuIsa
Size (in bits):	4

Description
Vertical Stride. The field provides the vertical stride of the register region in unit of data elements for an operand. Encoding of this field provides values of 0 or powers of 2, ranging from 1 to 32 elements. Larger values are not supported due to the restriction that a source operand must reside within two adjacent 256-bit registers (64 bytes total). Special encoding 1111b (0xF) is only valid when the operand is in register-indirect addressing mode (AddrMode = 1). If this field is set to 0xF, one or more sub-registers of the address registers may be used to compute the addresses. Each address sub-register provides the origin for a row of data element. The number of address sub-registers used is determined by the division of ExecSize of the instruction by the Width fields of the operand. This field only applies to source operand. It does not apply to destination. This field is not present for an immediate source operand.

Programming Notes
Note 1: If indirect address is supported for src1, encoding 0xF is reserved for src1 - only single-index indirect addressing is supported.
Note 2: Encoding 0010 applies for QWord-size operands.

Value	Name	Programming Notes
0000b	0 elements	
0001b	1 element	Align1 mode only.
0010b	2 elements	
0011b	4 elements	
0100b	8 elements	Align1 mode only.
0101b	16 elements	Applies to byte or word operand only. Align1 mode only.
0110b	32 elements	Applies to byte operand only. Align1 mode only.
0111b-1110b	Reserved	
1111b	VxH or Vx1 mode	Only valid for register-indirect addressing in Align1 mode.

Width

Width	
Source:	EuIsa
Size (in bits):	3

This field specifies the number of elements in the horizontal dimension of the region for a source operand. This field cannot exceed the ExecSize field of the instruction. This field only applies to source operand. It does not apply to destination. This field is not present for an immediate source operand.

Programming Notes
Note that with ExecSize of 32, because the maximum Width is 16, there are at least two rows in a source region.

Value	Name
000b	1 elements
001b	2 elements
010b	4 elements
011b	8 elements
100b	16 elements
101b-111b	Reserved

WRAP_SHORTEST_ENABLE

WRAP_SHORTEST_ENABLE	
Source:	RenderCS
Size (in bits):	4

This state selects which components (if any) of Attribute [n] are to be interpolated in a "wrap shortest" fashion. Operation is UNDEFINED if any of these bits are set and the Constant Interpolation Enable bit associated with this attribute is set. Note that wrap-shortest interpolation is only supported for Attributes 0-15.

Value	Name	Description
0001b	X	Wrap Shortest X Component
0010b	Y	Wrap Shortest Y Component
0011b	XY	Wrap Shortest XY Components
0100b	Z	Wrap Shortest Z Component
0101b	XZ	Wrap Shortest XZ Components
0110b	YZ	Wrap Shortest YZ Components
0111b	XYZ	Wrap Shortest XYZ Components
1000b	W	Wrap Shortest W Component
1001b	XW	Wrap Shortest XW Components
1010b	YW	Wrap Shortest YW Components
1011b	XYW	Wrap Shortest XYW Components
1100b	ZW	Wrap Shortest ZW Components
1101b	XZW	Wrap Shortest XZW Components
1110b	YZW	Wrap Shortest YZW Components
1111b	XYZW	Wrap Shortest XYZW Components

This register contains the address details of the data dword being parsed by command streamer.

- When the commands are being executed from a batch buffer this register contains the Dword aligned Graphics Memory Address.
- When the commands are being executed from a ring buffer this register contains the Dword aligned offset into the ring buffer (offset from Ring Buffer start address).

DWord	Bit	Description
0	31:2	**Head Pointer** Format: GraphicsAddress[31:2] • When the commands are being executed from a batch buffer this register contains the Dword aligned Graphics Memory Address. • When the commands are being executed from a ring buffer this register contains the Dword aligned offset into the ring buffer (offset from Ring Buffer start address).
	1:0	**Reserved** Access: RO Format: MBZ

Advanced Scheduler Reset Request Messages

SSRREQ - Advanced Scheduler Reset Request Messages

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 0810Ch

Hardware (CS, VCS) initiated Advanced Scheduler reset request messages.

DWord	Bit	Description
0	31:16	**Message Mask** Access: RO _Custom_GTIReset: BUS Message Mask In order to write to bits 15:0, the corresponding message mask bits must be written. For example, for bit 14 to be set, bit 30 needs to be 1 : 40004000
	15:14	**Reserved** Access: RO Format: MBZ

Aggregate Perf Counter SPM0 Lower DWord Free

OAPERF_SPM0_LOWER_FREE - Aggregate Perf Counter SPM0 Lower DWord Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02980h

This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO,so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter SPM0 Upper DWord Free

OAPERF_SPM0_UPPER_FREE - Aggregate Perf Counter SPM0 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02984h

This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter SPM1 Lower DWord Free

OAPERF_SPM1_LOWER_FREE - Aggregate Perf Counter SPM1 Lower DWord Free		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02988h	
This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

Aggregate Perf Counter SPM1 Upper DWord Free

OAPERF_SPM1_UPPER_FREE - Aggregate Perf Counter SPM1 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0298Ch

This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

ARAT C6 Disallow Threshold

ARAT_C6DIS - ARAT C6 Disallow Threshold		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 0A178h		
DWord	**Bit**	**Description**
0	31:0	**C6 Disallow Threshold for ARAT** Access: R/W _Custom_GTIReset: DEV Threshold, in 10ns increments to prevent short C6.

ARAT Delta (LSB)

ARAT_TDELTA_LOW - ARAT Delta (LSB)		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	0A174h	
DWord	**Bit**	**Description**
0	31:2	**Lower Bits of Delta Time for ARAT** Access: R/W _Custom_GTIReset: DEV Bits [31:2] of Delta Time, in 10ns increments. Bits 1:0 dropped. This means the granularity is 40ns increments. For example, [31:2]=b1 means the delta time is 40ns.
	1	**ARAT Mode** Access: R/W _Custom_GTIReset: DEV 0b: One-Shot Mode (default). 1b: Periodic Mode.
	0	**ARAT Enable** Access: R/W _Custom_GTIReset: DEV 0b: ARAT Disabled (default). 1b: ARAT Enabled.

ARB_CTL

DWord	Bit	Description
0	31	**FBC Memory Wake** Setting this bit allows FBC compressed write requests to wake memory. Value: 1b — Name: Wake On **[Default]** Value: 0b — Name: Wake Off
	30	**Reserved**
	29	**Reserved** Access: RO Format: MBZ
	28:26	**HP Queue Watermark** The value in this register indicates the number of entries the high priority queue should have before it can be read. The value is zero based. Program the values as N-1, where 3'b011 indicates 4 entries. Value: 011b — Name: 4 entries **[Default]** Value: [0,7] — Name:
	25:24	**LP Write Request Limit** The value in this register indicates the maximum number of back-to-back LP write requests that will be accepted from a single client before re-arbitrating.

ARB_CTL

Value	Name
00b	1
01b	2
10b	4 **[Default]**
11b	8

23:20 **TLB Request Limit**

The value in this register indicates the maximum number of TLB requests that can be made in an arbitration loop. Zero is not a valid programming.

Value	Name
0110b	6 **[Default]**
[1,15]	

19:16 **TLB Request InFlight Limit**

The value in this register indicates the maximum number of TLB (or VTd) requests that can be in flight at any given time. Zero is not a valid programming.

Value	Name
0110b	6 **[Default]**
[1,15]	

15 **FBC Watermark Disable**

Setting this bit disables the FBC watermarks.

Value	Name
0b	Enable
1b	Disable

14:13 **Tiled Address Swizzling**

DRAM configuration registers show if memory address swizzling is needed.

Value	Name	Description
00b	No Display	No display request address swizzling
01b	Reserved	Address bit[6] swizzling for tiled surfaces is not used
10b	Reserved	
11b	Reserved	

12:8 **HP Page Break Limit**

The value in this register represents the maximum number of page breaks allowed in a HP request chain. Zero is not a valid programming.

Value	Name
10000b	16 **[Default]**
[1,31]	

7 **Reserved**

Access:	RO
Format:	MBZ

ARB_CTL

	6:0	**HP Data Request Limit** The value in this register represents the maximum number of cachelines allowed in a HP request chain. **Value** / **Name** 1010110b / 86 **[Default]** [1,127] / **Restriction** This value must always be programmed greater than 8.

ASL Storage

ASLS_0_2_0_PCI - ASL Storage

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	000FCh

This is a software scratch register. The exact bit register usage must be worked out in common between System BIOS and driver software. For each device, the ASL control method requires two bits for DOD (BIOS detectable yes or no, VGA/NonVGA), one bit for DGS (enable/disable requested), and two bits for DCS (enabled now/disabled now, connected or not).

DWord	Bit	Description
0	31:0	**Device Switching Storage** Default Value: 00000000000000000000000000000000b Access: R/W _Custom_GTIReset: BUS Software controlled usage to support device switching.

ATS Capability

ATS_CAP_0_2_0_PCI - ATS Capability

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	00204h

ATS Capability reports support for Device-TLBs on Device-2, compliant to PCI Express ATS specification.

DWord	Bit	Description
0	15:7	**Reserved** Access: RO Format: MBZ
	6	**Global Invalidate Supported** Default Value: 1b Access: RO _Custom_GTIReset: BUS If Set, the Function supports Invalidation Requests that have the Global Invalidate bit Set. If Clear, the Function ignores the Global Invalidate bit in all Invalidate requests. Reserved
	5	**Page Aligned Request** Default Value: 1b Access: RO _Custom_GTIReset: BUS Hardwired to 1, the Untranslated Address is always aligned to a 4096 byte boundary. Processor Graphics reports value of 1b indicating all VT-d and SVM translations are page-aligned.
	4:0	**Invalidate Queue Depth** Default Value: 00000b Access: RO _Custom_GTIReset: BUS The number of Invalidate Requests that the endpoint can accept before putting back pressure on the upstream connection. Hardwired to 0h, the function can accept 32 Invalidate Requests.

ATS Control

ATS_CTRL_0_2_0_PCI - ATS Control

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 00206h

DWord	Bit	Description
0	15	**ATS Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS When Set, the function is enabled to cache translations. Processor graphics ignores this field, as GT uses GTLB as IOTLB and only pretends to software that it has a Device-TLB. Software is expected to Set this field before configuring extended context-entry for Device2 with Page Request Enable field Set. For compatibility, this field is implemented as RW as software can read it to determine ATS enable status.
	14:5	**Reserved** Access: RO Format: MBZ
	4:0	**Smallest Translation Unit** Default Value: 00000b Access: R/W _Custom_GTIReset: BUS This value indicates to the Endpoint the minimum number of 4096-byte blocks that is indicated in a Translation Completion or Invalidate Request. This is a power of 2 multiple and the number of blocks is 2^STU. A value of 0 indicates one block and value 1F indicates 2^31 blocks. For IGD this must be programmed to 0h for 4KB as smallest translation unit.

ATS Extended Capability Header

ATS_EXTCAP_0_2_0_PCI - ATS Extended Capability Header

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00200h

ATS Capability reports support for Device-TLBs on Device-2, compliant to PCI Express ats specification.

DWord	Bit	Description
0	31:20	**Next Capability Offset** Default Value: 001100000000b Access: RO _Custom_GTIReset: BUS This is a hardwired pointer to the next item in the capabilities list. Value 300h in this field provides the offset for Page-Request Capability.
	19:16	**Version** Default Value: 0001b Access: RO _Custom_GTIReset: BUS Hardwired to capability version 1.
	15:0	**Capability ID** Default Value: 0000000000001111b Access: RO _Custom_GTIReset: BUS Hardwired to the ATS Extended Capability ID

AUD_CONFIG

AUD_CONFIG	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	65000h-65003h
Name:	Audio Configuration Transcoder A
ShortName:	AUD_TCA_CONFIG
Reset:	soft
Address:	65100h-65103h
Name:	Audio Configuration Transcoder B
ShortName:	AUD_TCB_CONFIG
Reset:	soft
Address:	65200h-65203h
Name:	Audio Configuration Transcoder C
ShortName:	AUD_TCC_CONFIG
Reset:	soft
Address:	65300h-65303h
Name:	Audio Configuration Transcoder D
ShortName:	AUD_TCD_CONFIG
Reset:	soft

This register configures the audio output. There is one instance of this register per transcoder A/B/C. Each Transcoder is independent of the other.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29	**N value Index** 0b – HDMI **[Default]** – N value read on bits 27:20 and 15:4 reflects HDMI N value. Bits 27:20 and 15:4 are programmable to any N value. Default h7FA6 when bit 28 is not set. 1b – DisplayPort – N value read on bits 27:20 and 15:4 reflects DisplayPort N value. Set this bit to 1 before programming N value register. When this bit is set to 1, 27:20 and 15:4 will reflect the current N value. Default is h8000 when bit 28 is not set.

AUD_CONFIG

28	**N programming enable** This bit enables programming of N values for non-CEA modes. Please note that the transcoder to which audio is attached must be disabled when changing this field.
27:20	**Upper N value** Default Value: 00000111b These are bits [19:12] of programmable N values for non-CEA modes. Bit 29 of this register must also be written in order to enable programming. Please note that the transcoder to which audio is attached must be disabled when changing this field. See bit 29 description for default values.
19:16	**Pixel Clock HDMI** This is the target frequency of the CEA/HDMI video mode to which the audio stream is added. This value is used for generating N_CTS packets. This refers to only HDMI Pixel clock and does not refer to DisplayPort Link clock. DisplayPort Link clock does not require this programming. Note: The transcoder on which audio is attached must be disabled when changing this field.

Value	Name	Description
0b	**[Default]**	
0000b	25.2 / 1.001 MHz	25.2 / 1.001 MHz

Reset:	soft
Address:	65304h-65307h
Name:	Audio Configuration Register 2 Transcoder D
ShortName:	AUD_TCD_CONFIG_2
Reset:	soft

This is a new register to add 297 and 584MHz frequencies support for HDMI TMDS clocks. These are programmed along with the other lower bits of the N and CTS values in the Audio Config register. There is one instance of this register per transcoder A/B/C. Each Transcoder is independent of the other.

DWord	Bit	Description
0	31	**Reserved**
	30:21	**Reserved** Access: RO Format: MBZ
	20:16	**DPSpecVersion** Default Value: 00010010b DP spec version number that goes in the header of the samples. Default 12h for DP MST. Currently DP Compliance is expecting this field to be 00010001 (DP1.1) as the Compliance spec has not been updated. SW must program this register to "00010001" to overcome this compliance failure. This programming can be updated after the Compliance Specification is updated.

AUD_CONFIG_2		
	15:12	**Reserved** Access: RO Format: MBZ
	11:8	**Upper bits for N value** These are bits are concatenated as the upper 4 bits to the N value in the AUD_CONFIG register. Please note that the transcoder to which audio is attached must be disabled when changing this field. See bit 29 description for default values
	7:4	**Reserved** Access: RO Format: MBZ
	3:0	**Upper bits for MCTS value** These are the upper 4bits concatenated to CTS or M generation for CTM modes.

AUD_CONFIG_BE

AUD_CONFIG_BE

Register Space: MMIO: 0/2/0
Access: R/W
Size (in bits): 32

Address: 65EF0h-65EF3h
Name: Audio Config Register for Dacbeunit
ShortName: AUD_CONFIG_BE
Reset: soft

DWord	Bit	Description
0	31	**Delay sample count latch Pipe D** Access: R/W Pipe D Hblank SM arc delay for samplecount. Value / Name / Description: 0b / Delay by 16 clocks **[Default]** / When set to 0, sample count latch is delayed by 16 clocks after Hblank starts. 1b / Delay by 32 clocks / When set to 1, sample count latch is delayed by 32 clocks after Hblank starts.
	30	**Delay sample count latch Pipe C** Access: R/W Pipe C Hblank SM arc delay for samplecount. Value / Name / Description: 0b / Delay by 16 clocks **[Default]** / When set to 0, sample count latch is delayed by 16 clocks after Hblank starts. 1b / Delay by 32 clocks / When set to 1, sample count latch is delayed by 32 clocks after Hblank starts.
	29	**Delay sample count latch Pipe B** Access: R/W Pipe B Hblank SM arc delay for samplecount. Value / Name / Description: 0b / Delay by 16 clocks **[Default]** / When set to 0, sample count latch is delayed by 16 clocks after Hblank starts. 1b / Delay by 32 clocks / When set to 1, sample count latch is delayed by 32 clocks after Hblank starts.
	28	**Delay sample count latch Pipe A** Access: R/W Pipe A Hblank SM arc delay for samplecount.

Value	Name	Description
0b	Delay by 16 clocks **[Default]**	When set to 0, sample count latch is delayed by 16 clocks after Hblank starts.
1b	Delay by 32 clocks	When set to 1, sample count latch is delayed by 32 clocks after Hblank starts.

27 **HBlank Early Enable for PipeD**

Access:	R/W

Enables using the HBlank_start count bit-field value for triggering the samplecount calculation.

Value	Name	Description
0b	Hblank Early Disable **[Default]**	The default Hblank is used and a delay of 16 tcclks is added before the SM arcs during each hblank for Pipe D
1b	Hblank Early Enable	The early hblank programmed by fields hblank_start count for Pipe D will be used to trigger samplecount calculation for Pipe D.

26 **HBlank Early Enable for PipeC**

Access:	R/W

Enables using the HBlank_start count bit-field value for triggering the samplecount calculation.

Value	Name	Description
0b	Hblank Early Disable **[Default]**	The default Hblank is used and a delay of 16 tcclks is added before the SM arcs during each hblank for Pipe C
1b	Hblank Early Enable	The early hblank programmed by fields hblank_start count for Pipe C will be used to trigger samplecount calculation for Pipe C.

25 **HBlank Early Enable for PipeB**

Access:	R/W

Enables using the HBlank_start count bit-field value for triggering the samplecount calculation.

Value	Name	Description
0b	Hblank Early Disable **[Default]**	The default Hblank is used and a delay of 16 tcclks is added before the SM arcs during each hblank for Pipe B
1b	Hblank Early Enable	The early hblank programmed by fields hblank_start count for Pipe B will be used to trigger samplecount calculation for Pipe B.

24 **HBlank Early Enable for PipeA**

Access:	R/W

Enables using the HBlank_start count bit-field value for triggering the samplecount calculation.

Value	Name	Description
0b	Hblank Early Disable **[Default]**	The default Hblank is used and a delay of 16 tcclks is added before the SM arcs during each hblank for Pipe A.
1b	Hblank Early Enable	The early hblank programmed by fields hblank_start count for Pipe A will be used to trigger samplecount calculation for Pipe A.

AUD_CONFIG_BE

23:21 HBlank_start count for Pipe D

Access:	R/W

The number of tcclk cycles that Hblank early is generated.

Value	Name	Description
000b	Delay of 8 tcaclks	Hblank is generated 8 tcclks early.
001b	Delay of 16 tcaclks	Hblank is generated 16 tcclks early.
010b	Delay of 32 tcaclks **[Default]**	Hblank is generated 32 tcclks early.
011b	Delay of 64 tcaclks	Hblank is generated 64 tcclks early.
100b	Delay of 96 tcaclks	Hblank is generated 96 tcclks early.
101b	Delay of 128 tcaclks	Hblank is generated 128 tcclks early.

20 DP Mixer Mainstream priority enable for Pipe D

Access:	R/W

When set, this will prioritize sending of mainstream data. No Timestamps/DIPs can be sent when there is mainstream data to send except in lines 2-7 of the vblank..

19:18 Number of samples per line for Pipe D

Access:	R/W

When prorgammed to non zero value, this field determines how many samples are sent per line. This is to avoid the audio overflow for high resolutions with small hblanks regions.

Value	Name	Description
00b	All Samples available in buffer **[Default]**	When set to this value, all the collected samples in the buffer are unloaded on the line in the hblank region.
01b	1 sample per line	When set to this value, maximum of one sample(each sample has 2 channels data for layout0 and 8 channels data in layout 1 mode) in the buffer is unloaded on the line in the hblank region.
10b	2 sample per line	When set to this value, maximum of two samples(each sample has 2 channels data for layout0 and 8 channels data in layout 1 mode) in the buffer are unloaded on the line in the hblank region.

17:15 HBlank_start count for Pipe C

Access:	R/W

The number of tcclk cycles that Hblank early is generated.

Value	Name	Description
000b	Delay of 8 tccclks	Hblank is generated 8 tcclks early.
001b	Delay of 16 tccclks	Hblank is generated 16 tcclks early.
010b	Delay of 32 tccclks **[Default]**	Hblank is generated 32 tcclks early.
011b	Delay of 64 tccclks	Hblank is generated 64 tcclks early.
100b	Delay of 96 tccclks	Hblank is generated 96 tcclks early.
101b	Delay of 128 tccclks	Hblank is generated 128 tcclks early.

AUD_CONFIG_BE

	14	**DP Mixer Mainstream priority enable for Pipe C** Access: R/W When set, this will prioritize sending of mainstream data. No Timestamps/DIPs can be sent when there is mainstream data to send except in lines 2-7 of the vblank..
	13:12	**Number of samples per line for Pipe C** Access: R/W When prorgammed to non zero value, this field determines how many samples are sent per line. This is to avoid the audio overflow for high resolutions with small hblanks regions.

Value	Name	Description
00b	All Samples available in buffer **[Default]**	When set to this value, all the collected samples in the buffer are unloaded on the line in the hblank region.

	11:9	**HBlank_start count for Pipe B** Access: R/W The number of tcclk cycles that Hblank early is generated.

Value	Name	Description
000b	Delay of 8 tcbclks	Hblank is generated 8 tcclks early.
001b	Delay of 16 tcbclks	Hblank is generated 16 tcclks early.
010b	Delay of 32 tcbclks **[Default]**	Hblank is generated 32 tcclks early.
011b	Delay of 64 tcbclks	Hblank is generated 64 tcclks early.
100b	Delay of 96 tcbclks	Hblank is generated 96 tcclks early.
101b	Delay of 128 tcbclks	Hblank is generated 128 tcclks early.

	8	**DP Mixer Mainstream priority enable for Pipe B** Access: R/W When set, this will prioritize sending of mainstream data. No Timestamps/DIPs can be sent when there is mainstream data to send except in lines 2-7 of the vblank..
	7:6	**Number of samples per line for Pipe B** Access: R/W When programmed to non zero value, this field determines how many samples are sent per line. This is to avoid the audio overflow for high resolutions with small hblanks regions.

Value	Name	Description
00b	All Samples available in buffer **[Default]**	When set to this value, all the collected samples in the buffer are unloaded on the line in the hblank region.

		01b	1 sample per line	When set to this value, maximum of one sample(each sample has 2 channels data for layout0 and 8 channels data in layout 1 mode) in the buffer is unloaded on the line in the hblank region.
		10b	2 sample per line	When set to this value, maximum of two samples(each sample has 2 channels data for layout0 and 8 channels data in layout 1 mode) in the buffer are unloaded on the line in the hblank region.

5:3 HBlank_start count for Pipe A

Access:	R/W

The number of tcclk cycles that Hblank early is generated.

Value	Name	Description
000b	Delay of 8 tcaclks	Hblank is generated 8 tcclks early.
001b	Delay of 16 tcaclks	Hblank is generated 16 tcclks early.
010b	Delay of 32 tcaclks **[Default]**	Hblank is generated 32 tcclks early.
011b	Delay of 64 tcaclks	Hblank is generated 64 tcclks early.
100b	Delay of 96 tcaclks	Hblank is generated 96 tcclks early.
101b	Delay of 128 tcaclks	Hblank is generated 128 tcclks early.

2 DP Mixer Mainstream priority enable for Pipe A

Access:	R/W

When set, this will prioritize sending of mainstream data. No Timestamps/DIPs can be sent when there is mainstream data to send except in lines 2-7 of the vblank.

1:0 Number of samples per line for Pipe A

Access:	R/W

When programmed to non zero value, this field determines how many samples are sent per line. This is to avoid the audio overflow for high resolutions with small hblanks regions.

Value	Name	Description
00b	All Samples available in buffer **[Default]**	When set to this value, all the collected samples in the buffer are unloaded on the line in the hblank region.
01b	1 sample per line	When set to this value, maximum of one sample(each sample has 2 channels data for layout0 and 8 channels data in layout 1 mode) in the buffer is unloaded on the line in the hblank region.
10b	2 sample per line	When set to this value, maximum of two samples(each sample has 2 channels data for layout0 and 8 channels data in layout 1 mode) in the buffer are unloaded on the line in the hblank region.

AUD_DIP_ELD_CTRL_ST

AUD_DIP_ELD_CTRL_ST

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	650B4h-650B7h
Name:	Audio Control State for DIP and ELD Transcoder A
ShortName:	AUD_TCA_DIP_ELD_CTRL_ST
Reset:	soft
Address:	651B4h-651B7h
Name:	Audio Control State for DIP and ELD Transcoder B
ShortName:	AUD_TCB_DIP_ELD_CTRL_ST
Reset:	soft
Address:	652B4h-652B7h
Name:	Audio Control State for DIP and ELD Transcoder C
ShortName:	AUD_TCC_DIP_ELD_CTRL_ST
Reset:	soft
Address:	653B4h-653B7h
Name:	Audio Control State for DIP and ELD Transcoder D
ShortName:	AUD_TCD_DIP_ELD_CTRL_ST
Reset:	soft

There is one instance of this register per transcoder A/B/C.

DWord	Bit	Description
0	31:28	**DIP Port Select** Access: RO This read-only bit reflects which port is used to transmit the DIP data. This can only change when DIP is disabled. If one or more audio-related DIP packets is enabled and audio is enabled on a digital port, these bits will reflect the digital port to which audio is directed. For DP MST, this is the device select/pipe select.

Value	Name	Description
0000b	Reserved **[Default]**	Reserved
0001b	Digital Port B	Digital Port B
0010b	Digital Port C	Digital Port C
0011b	USBC1	USBC1
0100b	USBC2	USBC2
0101b	USBC3	USBC3
0110b	USBC4	USBC4

0111b	USBC5	USBC5
1000b	USBC6	USBC6

27:25 **Reserved**

Access:	RO
Format:	MBZ

24:21 **DIP type enable status**

Access:	RO

These bits reflect the DIP types enabled. It can be updated while the port is enabled. Within 2 vblank periods, the DIP is guaranteed to have been transmitted. Disabling a DIP type results in setting the contents of that DIP buffer to zero. A reserved setting reflects a disabled DIP.

Value	Name	Description
0000b	**[Default]**	
XXX0b	DIP Disable	Audio DIP disabled
XXX1b	DIP Enable	Audio DIP enabled
XX0Xb	ACP Disable	Generic 1 (ACP) DIP disabled
XX1Xb	ACP Enable	Generic 1 (ACP) DIP enabled
X0XXb	Generic 2 Disable	Generic 2 DIP disabled
X1XXb	Generic 2 Enable	Generic 2 DIP enabled, can be used by ISRC1 or ISRC2
1XXXb	Reserved	Reserved

20:18 **DIP buffer index**

This field is used during read of different DIPs, and during read or write of ELD data. These bits are used as an index to their respective DIP or ELD buffers. When the index is not valid, the contents of the DIP will return all 0s.

Value	Name	Description
000b	Audio **[Default]**	Audio DIP (31 bytes of address space, 31 bytes of data)
001b	Gen 1	Generic 1 (ACP) Data Island Packet (31 bytes of address space, 31 bytes of data)
010b	Gen 2	Generic 2 (ISRC1) Data Island Packet (31 bytes of address space, 31 bytes of data)
011b	Gen 3	Generic 3 (ISRC2) Data Island Packet (31 bytes of address space, 31 bytes of data)
Others	Reserved	Reserved

17:16 **DIP transmission frequency**

Access:	RO

These bits reflect the frequency of DIP transmission for the DIP buffer type designated in bits 20:18. When writing DIP data, this value is also latched when the first DW of the DIP is written. When read, this value reflects the DIP transmission frequency for the DIP buffer designated in bits 20:18.

AUD_DIP_ELD_CTRL_ST

		Value / **Name** / **Description** 00b / Disable **[Default]** / Disabled 01b / Reserved / Reserved 10b / Send Once / Send Once 11b / Best Effort / Best effort (Send at least every other vsync)
	15	**Reserved** Access: RO Format: MBZ
	14:10	**ELD buffer size** Default Value: 10101b Access: RO This field reflects the size of the ELD buffer in DWORDs (84 Bytes of ELD)
	9:5	**ELD access address** Selects the DWORD address for access to the ELD buffer (84 bytes). The value wraps back to zero when incremented past the max addressing value 0x1F. This field change takes effect immediately after being written. The read value indicates the current access address.
	4	**ELD ACK** Acknowledgement from the audio driver that ELD read has been completed
	3:0	**DIP access address** Selects the DWORD address for access to the DIP buffers. The value wraps back to zero when it incremented past the max addressing value of 0xF. This field change takes effect immediately after being written. The read value indicates the current access address.

AUD_EDID_DATA

AUD_EDID_DATA	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	65050h-65053h
Name:	Audio EDID Data Block Transcoder A
ShortName:	AUD_TCA_EDID_DATA
Reset:	soft
Address:	65150h-65153h
Name:	Audio EDID Data Block Transcoder B
ShortName:	AUD_TCB_EDID_DATA
Reset:	soft
Address:	65250h-65253h
Name:	Audio EDID Data Block Transcoder C
ShortName:	AUD_TCC_EDID_DATA
Reset:	soft
Address:	65350h-65353h
Name:	Audio EDID Data Block Transcoder D
ShortName:	AUD_TCD_EDID_DATA
Reset:	soft

These registers contain the HDMI/DP data block from the EDID. The graphics driver reads the EDID and writes the structure to these registers. The vendor specific data block may be longer than 8 bytes, but the driver must not write more than 48 bytes to the buffer. The EDID format is Version 3 within the CEA-861B specification. The HDMI/DP Vendor Specific Data Block is described in version 1.1 of the HDMI specification. These values are returned from the device as the HDMI/DP Vendor Specific Data Block response to a Get HDMI/DP Widget command. Writing sequence:

- Video software sets ELD invalid, and sets the ELD access address to 0, or to the desired DWORD to be written.
- Video software writes ELD data 1 DWORD at a time. The ELD access address autoincrements with each DWORD write, wrapping around to address 0 when the max buffer address size of 0xF has been reached.
- Please note that software must write an entire DWORD at a time.
- Please note that the audio driver checks the valid bit with each byte read of the ELD. This means that the video driver can unilaterally write ELD irrespective of audio driver ELD read status.

Reading sequence:

- Video software sets the ELD access address to 0, or to the desired DWORD to be read.
- Video software reads ELD data 1 DWORD at a time. The ELD access address autoincrements with each DWORD read, wrapping around to address 0 when the max buffer address size of 0xF has been reached.

AUD_EDID_DATA

There is one instance of this register per transcoder A/B/C.

DWord	Bit	Description
0	31:0	**EDID Data Block** Please note that the contents of this buffer are not cleared when ELD is disabled. The contents of this buffer are cleared during FLR.

AUD_FREQ_CNTRL

AUD_FREQ_CNTRL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	65900h-65903h
Name:	Audio BCLK Frequency Control
ShortName:	AUD_FREQ_CNTRL
Reset:	soft

Please refer "Audio Link Settings" of the **"Audio Bios Programming Sequence"** section for details about per-project programming requirements for this register.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:14	**T-Mode** Indicates the T mode SDI is operating in. BIOS or System Software must pre-program the T-mode register.a. before the iDISPLAY Audio Link is brought out from Link Reset,b. to a value which is consistent with the value of the its counterpart T-mode bit in the Audio Controller.c. to a value which is within the electrical capabilities of the platform. Note that even T modes are prohibited from being used with any BCLK frequency which has an odd number of bit cells. Example, 2T mode is incompatible with BCLK=6MHz (125 bit cells). **Value** / **Name** / **Description** 00b / 4T / 4T mode with sdi data held for 4 bit clks. 01b / 2T / 2T Mode with sdi data held for 2 bit clocks. To use 2T mode, the bclk has to be 48MHz and flop in the IO needs to bypass by setting bit 13 of this register. BIOS has to program 48MHz in the controller also to use this mode. 10b / 8T **[Default]** / 8T Mode with sdi data held for 8 bit clocks. 11b / 16T / 16T Mode with sdi data held for 16 bit clocks.
	13	**Bypass Flop** Setting this bit will bypass the flop in the IO in the Audout path. **Value** / **Name** / **Description** 0b / No bypass **[Default]** / Flop in the AUDIO OUT IO is not bypassed. 1b / Bypass / Flop in the AUDIO OUT IO is bypassed.
	12:11	**Detect Frame sync early** These bits are used to pullin the frame sync detection logic earlier to compensate for PV issues if any. Audio codec starts driving the SDI pin earlier by the number of clocks programmed by this register.

AUD_FREQ_CNTRL

Value	Name	Description
00b	Pull in by 0 bclks	Frame sync is detected at bclk = 1998.
01b	Pull in by 1 bclks	Frame sync is detected at bclk = 1997.
10b	Pull in by 2 bclks **[Default]**	Frame sync is detected at bclk = 1996.
11b	Pull in by 3 bclks	Frame sync is detected at bclk = 1995.

10:5 Reserved

Access:	RO
Format:	MBZ

4 96MHz BCLK

Default Value:	1b

Indicates that iDISPLAY Audio Link will run at 96MHz. This bit is defaulted to 1. BIOS or System Software must pre-program B96 before the iDISPLAY Audio Link is brought out from reset.

3 48MHz BCLK

Default Value:	0b

Indicates that iDISPLAY Audio Link will run at 48MHz. This bit is defaulted to 0. BIOS or System Software must pre-program B96 before the iDISPLAY Audio Link is brought out from reset.

2:0 Reserved

Access:	RO
Format:	MBZ

AUD_INFOFR

AUD_INFOFR

ShortName:	AUD_TCD_INFOFR
Reset:	soft

When the IF type or dword index is not valid, the contents of the DIP will return all 0s.
These values are programmed by the audio driver in an HDMI/DP Widget Set command. They are returned one byte at a time from the device on the HD audio bus as the HDMI/DP DIP response to a Get HDMI/DP Widget command. To fetch a specific byte, the audio driver should send an HDMI/DP Widget HDMI/DP DIP Index Pointer Set command to set the index, then fetch the indexed byte using the HDMI/DP DIP get.

DWord	Bit	Description
0	31:0	**Data Island Packet Data** This reflects the contents of the DIP indexed by the DIP access address. The contents of this buffer are cleared during function reset or HD audio link reset.

AUD_M_CTS_ENABLE

AUD_M_CTS_ENABLE

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	65028h-6502Bh

There is one instance of this register per audio converter 1/2/3.

DWord	Bit	Description
0	31:9	**Reserved** Access: RO Format: MBZ
	8	**Reserved**
	7:4	**Output Delay** Default Value: 0100b The number of samples between when the sample is received from the HD Audio link and when it appears as an analog signal at the pin.
	3	**Reserved** Access: RO Format: MBZ
	2	**Sample Fabrication EN bit** Access: R/W This bit indicates whether internal fabrication of audio samples is enabled during a link underrun.

AUD_MISC_CTRL

Value	Name	Description
0b	Disable	Audio fabrication disabled
1b	Enable **[Default]**	Audio fabrication enabled

1 **Pro Allowed**

Access:	R/W

By default, the audio device is configured to consumer mode and does not allow the mode to be changed to professional mode by an HD Audio verb. When Pro is allowed by setting this configuration bit, the HD Audio codec allows a verb to set the device into professional mode. Note: Setting this configuration bit does not change the default Pro bit value to be 1. Pro must be set to 1 through the normal process, using a verb.

Value	Name	Description
0b	Consumer **[Default]**	Consumer use only
1b	Professional	Professional use allowed

0 **Reserved**

Access:	RO
Format:	MBZ

AUD_PIN_ELD_CP_VLD

AUD_PIN_ELD_CP_VLD

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	650C0h-650C3h
Name:	Audio Pin ELD and CP Ready Status
ShortName:	AUD_PIN_ELD_CP_VLD
Reset:	soft

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**Audio InactiveD** Inactive: When this bit is set, a digital display sink device has been attached but not active for streaming audio. 0b – Disable – Device is active for streaming audio data 1b – Enable – Device is connected but not active
	14	**Audio Output EnableD** This bit directs audio to the device connected to this transcoder. When enabled along with Inactive set to 0 and audio data is available, the audio data will be combined with the video data and sent over this transcoder. The audio unit uses the status of this bit to indicate presence of the HDMI/DP output to the audio driver. 0b – Disable – No Audio output 1b – Valid – Audio is enabled
	13	**CP ReadyD** This R/W bit reflects the state of CP request from the audio unit. When an audio CP request has been serviced, it must be reset to 1 by the video software to indicate that the CP request has been serviced. This is transcoder based. Software should add a delay of 1ms before updating the CP ready bit. This is needed to make sure that all the pending unsolicited responses are cleared (transmitted to HD audio) before CP ready unsolicited responses is generated. This is needed in case of DP MST is enabled and when many changes to PD, ELDV and CP ready bits are done during mode set. 0b – Pending or Not Ready – CP request pending or not ready to receive requests. 1b – Ready – CP request ready

AUD_PIN_ELD_CP_VLD

12 **ELD validD**

This R/W bit reflects the state of the ELD data written to the ELD RAM. After writing the ELD data, the video software must set this bit to 1 to indicate that the ELD data is valid. At audio codec initialization, or on a hotplug event, this bit is set to 0 by the video software. This bit is reflected in the audio pin complex widget as the ELD valid status bit. This is transcoder based.

Value	Name	Description
0b	Invalid	ELD data invalid (default, when writing ELD data, set 0 by software)
1b	Valid	ELD data valid (Set by video software only)

11 **Audio InactiveC**

Inactive: When this bit is set, a digital display sink device has been attached but not active for streaming audio.

Value	Name	Description
0b	Disable	Device is active for streaming audio data
1b	Enable	Device is connected but not active

10 **Audio Output EnableC**

This bit directs audio to the device connected to this transcoder. When enabled along with Inactive set to 0 and audio data is available, the audio data will be combined with the video data and sent over this transcoder. The audio unit uses the status of this bit to indicate presence of the HDMI/DP output to the audio driver.

Value	Name	Description
0b	Disable	No Audio output
1b	Valid	Audio is enabled

9 **CP ReadyC**

This R/W bit reflects the state of CP request from the audio unit. When an audio CP request has been serviced, it must be reset to 1 by the video software to indicate that the CP request has been serviced. This is transcoder based. Software should add a delay of 1ms before updating the CP ready bit. This is needed to make sure that all the pending unsolicited responses are cleared (transmitted to HD audio) before CP ready unsolicited responses is generated. This is needed in case of DP MST is enabled and when many changes to PD, ELDV and CP ready bits are done during mode set.

Value	Name	Description
0b	Pending or Not Ready	CP request pending or not ready to receive requests
1b	Ready	CP request ready

8 **ELD validC**

This R/W bit reflects the state of the ELD data written to the ELD RAM. After writing the ELD data, the video software must set this bit to 1 to indicate that the ELD data is valid. At audio codec initialization, or on a hotplug event, this bit is set to 0 by the video software. This bit is reflected in the audio pin complex widget as the ELD valid status bit. This is transcoder based.

Value	Name	Description
0b	Invalid	ELD data invalid (default, when writing ELD data, set 0 by software)
1b	Valid	ELD data valid (Set by video software only)

AUD_PIN_ELD_CP_VLD

7	**Audio InactiveB** Inactive: When this bit is set, a digital display sink device has been attached but not active for streaming audio.

Value	Name	Description
0b	Disable	Device is active for streaming audio data
1b	Enable	Device is connected but not active

6	**Audio Output EnableB** This bit directs audio to the device connected to this transcoder. When enabled along with Inactive set to 0 and audio data is available, the audio data will be combined with the video data and sent over this transcoder. The audio unit uses the status of this bit to indicate presence of the HDMI/DP output to the audio driver. This is transcoder based.

Value	Name	Description
0b	Disable	No audio output
1b	Enable	Audio is enabled

5	**CP ReadyB** See CP_ReadyC description.

Value	Name	Description
0b	Not Ready	CP request pending or not ready to receive requests
1b	Ready	CP request ready

4	**ELD validB** See ELD_validC descripion.

Value	Name	Description
0b	Invalid	ELD data invalid (default, when writing ELD data, set 0 by software)
1b	Valid	ELD data valid (Set by video software only)

3	**Audio InactiveA** Inactive: When this bit is set, a digital display sink device has been attached but not active for streaming audio.

Value	Name	Description
0b	Disable	Device is active for streaming audio data
1b	Enable	Device is connected but not active

2	**Audio Output EnableA** This bit directs audio to the device connected to this transcoder. When enabled along with Inactive set to 0 and audio data is available, the audio data will be combined with the video data and sent over this transcoder. The audio unit uses the status of this bit to indicate presence of the HDMI/DP output to the audio driver. This is transcoder based.

Value	Name	Description
0b	Disable	No audio output
1b	Enable	Audio is enabled

AUD_PIN_ELD_CP_VLD

	1	**CP ReadyA** See CP_ReadyC description. **Value** / **Name** / **Description** 0b / Not Ready / CP request pending or not ready to receive requests 1b / Ready / CP request ready
	0	**ELD validA** See ELD_validC descripion. **Value** / **Name** / **Description** 0b / Invalid / ELD data invalid (default, when writing ELD data, set 0 by software) 1b / Valid / ELD data valid (Set by video software only)

AUD_PIN_PIPE_CONN_ENTRY_LNGTH

AUD_PIN_PIPE_CONN_ENTRY_LNGTH

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	650A8h-650ABh
Name:	Audio Connection List Entry and Length Transcoder A
ShortName:	AUD_TCA_PIN_PIPE_CONN_ENTRY_LNGTH_RO

Size (in bits):	32
Address:	65020h-65023h
Name:	Audio Vendor ID / Device ID Read Only
ShortName:	AUD_VID_DID_RO
Reset:	soft

These values are returned from the device as the Vendor ID/ Device ID response to a Get Root Node command.

DWord	Bit	Description
0	31:16	**Vendor ID** Default Value: 8086h Used to identify the codec within the PnP system. This field is hardwired within the device.
	15:8	**Device ID Upper byte** Default Value: 28h Constant used to identify the codec within the PnP system. This field is set by the device hardware.
	7:0	**Device ID Lower byte** Constant used to identify the codec within the PnP system. This field is set by fuse download. For correct values refer to the Codec root node parameter 00h.

AUD_WD_CNTRL

AUD_WD_CNTRL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6580Ch-6580Fh
Name:	Audio WD Control for slice 1
ShortName:	AUD_WD_CNTRL_1
Reset:	soft
Address:	6590Ch-6590Fh
Name:	Audio WD Control for slice 2
ShortName:	AUD_WD_CNTRL_2
Reset:	soft

There are two sets of these registers. One for each Wireless Audio Slice

DWord	Bit	Description
0	31	**Audio Inactive WD** Inactive: When this bit is set, wireless display device has been attached but not active for streaming audio. Value / Name / Description: 0b / Disable / Device is active for streaming audio data 1b / Enable / Device is connected but not active
	30	**Audio Output Enable WD** This bit directs audio to the Wireless Device. When enabled along with Inactive set to 0 and audio data is available, the audio data will be sent to the Wireless memory where WDBOX can read and send it to the Wireless NIC. Value / Name / Description: 0b / Disable / No Audio output 1b / Valid / Audio is enabled
	29	**CP Ready WD** This R/W bit reflects the state of CP request from the audio unit. When an audio CP request has been serviced, it must be reset to 1 by the display software to indicate that the CP request has been serviced. Value / Name / Description: 0b / Pending or Not Ready / CP request pending or not ready to receive requests 1b / Ready / CP request ready
	28	**ELD valid WD** This R/W bit reflects the state of the ELD data written to the ELD RAM. After writing the ELD data, the video software must set this bit to 1 to indicate that the ELD data is valid. At audio codec initialization, or on a hotplug event, this bit is set to 0 by the video software. This bit is

AUD_WD_CNTRL

reflected in the audio pin complex widget as the ELD valid status bit.

Value	Name	Description
0b	Invalid	ELD data invalid (default, when writing ELD data, set 0 by software)
1b	Valid	ELD data valid (Set by video software only)

27:24 **Reserved**

Access:	RO
Format:	MBZ

23 **WiGig Widi Mode**

Access:	R/W

This field indicates Wigig or Widi Mode.

Value	Name	Description
0b	WidiMode **[Default]**	default mode is Widi mode. When bit 30 is set to 1 and this bit is set to 0 Widi is enabled
1b	WiGigMode	When bit 30 is set to 1 and this bit is set to 1 WiGig is enabled

22:20 **WiGig TFD Size**

Access:	R/W

This is TFD size. The total circular buffer should be a multiple of this number.

Value	Name	Description
000b	512B **[Default]**	default size of TFD is 512B
001b	1024B	TFD Size is 1024B
010b	2048B	TFD Size is 2048B
011b	4096B	TFD Size is 4096B
100b	8192B	TFD Size is 8192B
101b	Reserved	Reserved
110b	Reserved	Reserved
111b	Reserved	Reserved

19:11 **Reserved**

Access:	RO
Format:	MBZ

10:6 **ELD buffer size**

Default Value:	10101b
Access:	RO

This field reflects the size of the ELD buffer in DWORDs (84 Bytes of ELD)

5:1 **ELD access address**

Selects the DWORD address for access to the ELD buffer (84 bytes). The value wraps back to zero when incremented past the max addressing value 0x1F. This field change takes effect immediately after being written. The read value indicates the current access address.

AUD_WD_CNTRL		
	0	**ELD ACK** Acknowledgement from the audio driver that ELD read has been completed

AUD_WD_DMA_HDPTR

AUD_WD_DMA_HDPTR		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	65880h-65883h	
Name:	Audio WD Input DMA Head Pointer for slice 1	
ShortName:	AUD_WD_DMA_HDPTR_1	
Reset:	soft	
Address:	65980h-65983h	
Name:	Audio WD Input DMA Head Pointer for slice 2	
ShortName:	AUD_WD_DMA_HDPTR_2	
Reset:	soft	

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Aud WD HEAD PTR** Access: R/W This field provides write of the head pointer from WDBOX/WNIC. Comes in as message to Display Engine. Head Pointer always rolls over after it reaches the Audio WD Buffer size.

AUD_WD_DMA_TAILPTR

AUD_WD_DMA_TAILPTR	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	65890h-65893h
Name:	Audio WD Input DMA Tail Pointer for slice 1
ShortName:	AUD_WD_DMA_TAILPTR_1
Reset:	soft
Address:	65990h-65993h
Name:	Audio WD Input DMA Tail Pointer for slice 2
ShortName:	AUD_WD_DMA_TAILPTR_2
Reset:	soft

There are two sets of these registers. One for each wireless Audio slice.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Aud WD TAILPTR** Access: RO This field provides readback of the tail pointer sent to the WDBOX. Tail Pointer always rolls over after it reaches the Audio WD Buffer size.

AUD_WD_EDID_DATA

AUD_WD_EDID_DATA	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	65810h-65813h
Name:	Audio WD EDID Data for slice 1
ShortName:	AUD_WD_EDID_DATA_1
Reset:	soft
Address:	65910h-65913h
Name:	Audio WD EDID Data for slice 2
ShortName:	AUD_WD_EDID_DATA_2
Reset:	soft

THere are two sets of these registers. One for each Wireless Audio Slice.

This register contains the Wireless data block from the EDID. The graphics driver reads the EDID and writes the structure to these registers. The vendor specific data block may be longer than 8 bytes, but the driver must not write more than 48 bytes to the buffer. The EDID format is Version 3 within the CEA-861B specification. The HDMI/DP Vendor Specific Data Block is described in version 1.1 of the HDMI specification. These values are returned from the device as the HDMI/DP Vendor Specific Data Block response to a Get Wireless Widget command. Writing sequence:

- Video software sets ELD invalid, and sets the ELD access address to 0, or to the desired DWORD to be written.
- Video software writes ELD data 1 DWORD at a time. The ELD access address autoincrements with each DWORD write, wrapping around to address 0 when the max buffer address size has been reached.
- Please note that software must write an entire DWORD at a time.
- Please note that the audio driver checks the valid bit with each byte read of the ELD. This means that the video driver can unilaterally write ELD irrespective of audio driver ELD read status.

Reading sequence:

- Video software sets the ELD access address to 0, or to the desired DWORD to be read.
- Video software reads ELD data 1 DWORD at a time. The ELD access address autoincrements with each DWORD read, wrapping around to address 0 when the max buffer address size has been reached.

DWord	Bit	Description
0	31:0	**EDID Data Block** This field specifies the EDID data block. Please note that the contents of this buffer are not cleared when ELD is disabled. The contents of this buffer are cleared during a device 2 FLR.

AUD_WNIC_2_AUD_RESET

AUD_WNIC_2_AUD_RESET	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6589Ch-6589Fh
Name:	WNIC to Audio RESET
ShortName:	AUD_WNIC_2_AUD_RESET_1
Reset:	soft
Address:	6599Ch-6599Fh
Name:	WNIC to Audio RESET
ShortName:	AUD_WNIC_2_AUD_RESET_2
Reset:	soft

There are two sets of these registers. One for each Audio wireless slice.

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**WNIC to AUDIO Reset** When set, • HW shall reset the audio TFD head and tail pointers. • Audio immediately stops sending audio TFD tail pointer to WNIC. • HW shall drain and throw away any remaining audio WDE packets left in the pipeline. Audio packets continue to stream internally; however, none of these shall be put in the TFD. • When reset request is clear, WDBOX resumes transmission as soon as enough audio packets exist.

AUD_WNIC_PCR_LOWADDROFFSET

AUD_WNIC_PCR_LOWADDROFFSET	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	658A0h-658A3h
Name:	Audio WNIC PCR Low offset address for slice 1
ShortName:	AUD_WNIC_PCR_LOWADDROFFSET_1
Reset:	soft
Address:	659A0h-659A3h
Name:	Audio WNIC PCR Low offset address for slice 2
ShortName:	AUD_WNIC_PCR_LOWADDROFFSET_2
Reset:	soft
There are two sets of these registers. One for each Audio wireless slice.	

DWord	Bit	Description
0	31:0	**Aud WNIC PCR LOW ADDRESS OFFSET** This field provides low base address offset which will be used to sent the PCR updates to WNIC.

AUD_WNIC_PCR_UPADDROFFSET

AUD_WNIC_PCR_UPADDROFFSET	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	658A4h-658A7h
Name:	Audio WNIC PCR Upper offset address for slice 1
ShortName:	AUD_WNIC_PCR_UPADDROFFSET_1
Reset:	soft
Address:	659A4h-659A7h
Name:	Audio WNIC PCR Upper offset address for slice 2
ShortName:	AUD_WNIC_PCR_UPADDROFFSET_2
Reset:	soft
There are two sets of these registers. One for each Audio Wireless slice.	

DWord	Bit	Description
0	31:0	**Aud WNIC PCR UPPER ADDRESS OFFSET** This field provides upper base address offset which will be used to sent the PCR updates to WNIC. Only bits 7:0 should be programmed as total address space of 39:0 is available.

AUD_WNIC_TAILPTR_ADDROFFSET

AUD_WNIC_TAILPTR_ADDROFFSET	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	65894h-65897h
Name:	Audio WNIC Tail Pointer offset address for slice 1
ShortName:	AUD_WNIC_TAILPTR_ADDROFFSET_1
Reset:	soft
Address:	65994h-65997h
Name:	Audio WNIC Tail Pointer offset address for slice 2
ShortName:	AUD_WNIC_TAILPTR_ADDROFFSET_2
Reset:	soft
There are two sets of these registers. One for each Audio Wireless slice.	

DWord	Bit	Description
0	31:0	**Aud WNIC TAIL PTR OFFSET** This field provides address offset which will be used to sent the tail point updates to WNIC.

AUD_WNIC_TAILPTR_UPADDROFFSET

AUD_WNIC_TAILPTR_UPADDROFFSET	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	65898h-6589Bh
Name:	Audio WNIC Tail Pointer offset upper address for slice 1
ShortName:	AUD_WNIC_TAILPTR_UPADDROFFSET_1
Reset:	soft
Address:	65998h-6599Bh
Name:	Audio WNIC Tail Pointer offset upper address for slice 2
ShortName:	AUD_WNIC_TAILPTR_UPADDROFFSET_2
Reset:	soft
There are two sets of these registers. One for each Audio Wireless Slice.	

DWord	Bit	Description
0	31:0	**Aud WNIC TAIL PTR Upper address offset** This field provides upper address offset which will be used to sent the tail point updates to WNIC. Only bits 7:0 should be programmed as total address space of 39:0 is available.

AUDIO_PIN_BUF_CTL

AUDIO_PIN_BUF_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	48414h-48417h
Name:	Audio Pins Buffer Control
ShortName:	AUDIO_PIN_BUF_CTL
Reset:	soft

This register controls the display audio pins I/O buffers.

DWord	Bit	Description
0	31	**Enable** This field enables the audio buffer. Value: 0b = Disable; 1b = Enable
	30	**Reserved** Access: RO Format: MBZ
	29:28	**Hysteresis**
	27	**Reserved** Access: RO Format: MBZ
	26:24	**Spare**
	23:21	**Reserved** Access: RO Format: MBZ
	20:16	**Pulldown Strength**
	15:12	**Pulldown Slew**
	11:9	**Reserved** Access: RO Format: MBZ
	8:4	**Pullup Strength**
	3:0	**Pullup Slew**

Audio Codec Interrupt Definition

Audio Codec Interrupt Definition	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	44480h-4448Fh
Name:	Audio Codec Interrupts
ShortName:	AUD_INTERRUPT
Reset:	soft

This table indicates which events are mapped to each bit of the Audio Codec Interrupt registers.
0x44480 = ISR
0x44484 = IMR
0x44488 = IIR
0x4448C = IER

DWord	Bit	Description
0	31	**Audio_Power_State_change_Transcoder_D** The ISR is an active high pulse when there is a power state change for audio for DDI D.
	30	**Audio_Power_State_change_Transcoder_C** The ISR is an active high pulse when there is a power state change for audio for DDI C.
	29	**Audio_Power_State_change_Transcoder_B** The ISR is an active high pulse when there is a power state change for audio for DDI B.
	28	**Reserved**
	27	**Reserved**
	26	**Audio_Function_Group_Power_State_change** The ISR is an active high pulse when there is a power state change for audio of function group widget.
	25	**Audio_Conv1_Power_State_change** The ISR is an active high pulse when there is a power state change for audio of Converter 1 widget.
	24	**Audio_Conv2_Power_State_change** The ISR is an active high pulse when there is a power state change for audio of Converter 2 widget.
	23	**Audio_Conv3_Power_State_change** The ISR is an active high pulse when there is a power state change for audio of Converter 3 widget.
	22	**Audio_Conv4_Power_State_change** The ISR is an active high pulse when there is a power state change for audio of Converter 4 widget.
	21	**Spare 21**
	20	**Spare 20**
	19	**Spare 19**

	5	**Reserved**
	4:3	**Unused_Int_4_3** These interrupts are currently unused.
	2	**Reserved**
	1	**Reserved**
	0	**Audio_Mailbox_Write** The ISR is an active high pulse when there is a write to any of the four Audio Mail box verbs in vendor defined node ID 8

Auto Draw End Offset

3DPRIM_END_OFFSET - Auto Draw End Offset	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02420h-02423h
Name:	Auto Draw End Offset
ShortName:	3DPRIM_END_OFFSET_RCSUNIT_BE_GEOMETRY
Address:	18420h-18423h
Name:	Auto Draw End Offset
ShortName:	3DPRIM_END_OFFSET_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**End Offset** Format: U32 This register is used to store the end offset value used by the Vertex Fetch to determine when to stop processing the 3D_PRIMITIVE command. This register is valid when the End Offset Enable is set in the 3D_PRIMITIVE command.

AVP av1 status

AVP_STATUS_ADDR - AVP av1 status	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	1C2B04h-1C2B07h
Name:	AVP av1 status
ShortName:	AVP_STATUS_ADDR_AWM_REG0
Address:	1C6B04h-1C6B07h
Name:	AVP av1 status
ShortName:	AVP_STATUS_ADDR_AWM_REG1
Address:	1D2B04h-1D2B07h
Name:	AVP av1 status
ShortName:	AVP_STATUS_ADDR_AWM_REG2
Address:	1D6B04h-1D6B07h
Name:	AVP av1 status
ShortName:	AVP_STATUS_ADDR_AWM_REG3
Address:	1E2B04h-1E2B07h
Name:	AVP av1 status
ShortName:	AVP_STATUS_ADDR_AWM_REG4
Address:	1E6B04h-1E6B07h
Name:	AVP av1 status
ShortName:	AVP_STATUS_ADDR_AWM_REG5
Address:	1F2B04h-1F2B07h
Name:	AVP av1 status
ShortName:	AVP_STATUS_ADDR_AWM_REG6
Address:	1F6B04h-1F6B07h
Name:	AVP av1 status
ShortName:	AVP_STATUS_ADDR_AWM_REG7

This register stores the number of clock cycles spent decoding/encoding the current frame.

DWord	Bit	Description
0	31	**AVP Pipe Active** Access: RO Indicate AVP Pipe is currently active in processing the frame/tile

AVP_STATUS_ADDR - AVP av1 status		
	30:2	**Reserved** Access: RO Format: MBZ
	1	**Final MV Overflow Error** Access: RO Format: U1 Indicate the final MV is overflowing
	0	**Bitstream Upper Bound Error** Access: RO Format: U1 Indicate the bitstream access has reached the upper bound of the buffer and overflow

AVP av1 unit done

AVP_UNIT_DONE_ADDR - AVP av1 unit done	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	1C2B00h-1C2B03h
Name:	AVP av1 unit done
ShortName:	AVP_UNIT_DONE_ADDR_AWM_REG0
Address:	1C6B00h-1C6B03h
Name:	AVP av1 unit done
ShortName:	AVP_UNIT_DONE_ADDR_AWM_REG1
Address:	1D2B00h-1D2B03h
Name:	AVP av1 unit done
ShortName:	AVP_UNIT_DONE_ADDR_AWM_REG2
Address:	1D6B00h-1D6B03h
Name:	AVP av1 unit done
ShortName:	AVP_UNIT_DONE_ADDR_AWM_REG3
Address:	1E2B00h-1E2B03h
Name:	AVP av1 unit done
ShortName:	AVP_UNIT_DONE_ADDR_AWM_REG4
Address:	1E6B00h-1E6B03h
Name:	AVP av1 unit done
ShortName:	AVP_UNIT_DONE_ADDR_AWM_REG5
Address:	1F2B00h-1F2B03h
Name:	AVP av1 unit done
ShortName:	AVP_UNIT_DONE_ADDR_AWM_REG6
Address:	1F6B00h-1F6B03h
Name:	AVP av1 unit done
ShortName:	AVP_UNIT_DONE_ADDR_AWM_REG7

This register stores all the done signals for AVP pipe.
"0" means unit is done and idle; "1" means unit is active.

DWord	Bit	Description
0	31:18	**Reserved** Access: RO Format: MBZ

AVP_UNIT_DONE_ADDR - AVP av1 unit done

	17	**APP Done Signal (Inverted)** Access: RO Format: U1
	16	**APR Done Signal (Inverted)** Access: RO Format: U1
	15	**AIT Done Signal (Inverted)** Access: RO Format: U1
	14	**AIQ Done Signal (Inverted)** Access: RO Format: U1

	9	**ALN Done Signal (Inverted)** Access: RO Format: U1
	8:0	**Reserved** Access: RO Format: MBZ

Base of DMA Protected Range

BDPR - Base of DMA Protected Range

Register Space:	MMIO: 0/2/0
Size (in bits):	64
SOC_Consumer:	BIOS
Address:	108140h

This register indicates the Base of DMA Protected Range. It contains TSEGMB, lowered by the DPR size (if enabled).

DWord	Bit	Description
0..1	63:32	**BDPR_MSB** Default Value: 000h Access: RO _Custom_GTIReset: BUS 1MB aligned base of DMA Range.
	31:20	**BDPR_LSB** Default Value: 000h Access: RO _Custom_GTIReset: BUS 1MB aligned base of DMA Protected Memory Range.
	19:0	**Reserved** Access: RO Format: MBZ

Batch Address Difference Register

BB_ADDR_DIFF - Batch Address Difference Register	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02154h-02157h
Name:	Batch Address Difference Register
ShortName:	BB_ADDR_DIFF_RCSUNIT
Address:	18154h-18157h
Name:	Batch Address Difference Register

Address:	1F8154h-1F8157h
Name:	Batch Address Difference Register
ShortName:	BB_ADDR_DIFF_VECSUNIT3

Address:	1A154h-1A157h
Name:	Batch Address Difference Register
ShortName:	BB_ADDR_DIFF_CCSUNIT0

This register contains the difference between the start of the last batch and where the last initiated Batch Buffer is currently fetching commands.

Programming Notes

Programming Restriction:
This register should NEVER be programmed by driver, this is for HW internal use only.

DWord	Bit	Description
0	31:2	**Batch Buffer Address Difference** Format: GraphicsAddress[31:2] This field specifies the DWord-aligned difference between the starting address of the batch buffer and where the last initiated Batch Buffer is currently fetching commands.
	1:0	**Reserved** Access: RO Format: MBZ

Batch Buffer Head Pointer Preemption Register

BB_PREEMPT_ADDR - Batch Buffer Head Pointer Preemption Register	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02148h-0214Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_RCSUNIT
Address:	18148h-1814Bh

Address:	1F4148h-1F414Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_VCSUNIT7

Address:	1F8148h-1F814Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_VECSUNIT3

Address:	1A148h-1A14Bh
Name:	Batch Buffer Head Pointer Preemption Register
ShortName:	BB_PREEMPT_ADDR_CCSUNIT0

This register gets updated with the DWord-aligned graphics memory address of the PREEMPTABLE command in the batch buffer on which preemption has occurred.
This register gets updated with the DWord-aligned graphics memory address of the command following the MI_BATCH_START corresponding to the second level batch buffer, when the preemption has occurred in the second level batch buffer.
This register value should be looked at only when the preemption has occurred in the batch buffer. This is indicated by "Ring/Batch Indicator" in "RING_BUFFER_HEAD_PREEMPT_REG". This register value retains its previous value and doesn't change when the preemption occurs on a preemptable command in ring buffer.
Preemption is triggered by valid UHPTR in ring buffer mode of scheduling and by a pending execlist in Exec-List mode of scheduling.
This is a global register and context save/restored as part of power context image.

Preemptable Commands	Source
MI_ARB_CHECK 3D_PRIMITIVE GPGPU_WALKER MEDIA_STATE_FLUSH	RenderCS

BB_PREEMPT_ADDR - Batch Buffer Head Pointer Preemption Register

PIPE_CONTROL (Only in GPGPU mode of pipeline selection) MI_ATOMIC (Post Sync Operation set in GPGPU mode of pipeline selection) MI_SEMAPHORE_SIGNAL (Post Sync Operation set in GPGPU mode of pipeline selection)	

Preemptable Commands	Source
MI_ARB_CHECK	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS

Programming Notes

Programming Restriction: This register should NEVER be programmed by driver, this is for HW internal use only.

DWord	Bit	Description
0	31:2	**Batch Buffer Head Pointer** Format: GraphicsAddress[31:2] This field specifies the DWord-aligned Graphics Memory Address of the PREEMPTABLE commandin a batch buffer where the Preemption has occurred.
	1:0	**Reserved** Access: RO Format: MBZ

Batch Buffer Head Pointer Register

BB_ADDR - Batch Buffer Head Pointer Register

Description

This field specifies the DWord-aligned Graphics Memory Address of commands being fetched for the most recently initiated batch buffer. This register has valid values only when the Valid bit is set to0. Level of the batch buffer is indicated based on the Batch Buffer Stack Pointer value in BB_STATE register.

- Stack Pointer holding a value 0 indicates First Level batch buffer.
- Stack Pointer holding a value 1 indicates Second Level batch buffer.
- Stack Pointer holding a value 2 indicates Third Level batch buffer.

Programming Notes

Programming Restriction: This register should NEVER be programmed by driver. This is for HW internal use only.

DWord	Bit	Description
0	31:2	**Batch Buffer Head Pointer** Format: GraphicsAddress[31:2] This field specifies the DWord-aligned Graphics Memory Address of commands being fetched for the most recently initiated batch buffer. This register have valid values only when the Valid bit is set to0. Level of the batch buffer is indicated based on the Batch Buffer Stack Pointer value in BB_STATE register.

BB_ADDR - Batch Buffer Head Pointer Register

- Stack Pointer holding a value 0 indicates First Level batch buffer.
- Stack Pointer holding a value 1 indicates Second Level batch buffer.
- Stack Pointer holding a value 2 indicates Third Level batch buffer.

ShortName:	BB_PER_CTX_PTR_CCSUNIT0

This register is used to program the batch buffer address to be executed between context restore and execution of ring/execution list if enabled. This will only get executed due to regular context save/restore and not during power restore. This register is part of the execution list context and will be executed per context. Only supported if execution list is enabled. There is no preempting workloads within the Per Context Batch Buffer.

Programming Notes

BlitterCS/VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be programmed for these command streamers.

Render CS: Per Context Batch Buffer execution must not look at the MI_RS_CONTROL or Wait For Event status that are restored for the corresponding context. Ex: A context with MI_RS_CONTROL status with RS disabled doesn't stop Render CS from triggering Resource Streamer to execute Per Context Batch Buffer when "**RS Enabled Batch Buffer Per Context**" is set.

RenderCS: The following commands are not supported within a Per Context Batch Buffer:

Command Name
MI_WAIT_FOR_EVENT
MI_ARB_CHECK
MI_REPORT_HEAD
MI_URB_ATOMIC_ALLOC
MI_SUSPEND_FLUSH

BB_PER_CTX_PTR - Batch Buffer Per Context Pointer

MI_TOPOLOGY_FILTER
MI_SET_CONTEXT
MI_URB_CLEAR
MI_SEMAPHORE_WAIT (Memory Poll Mode). Note: MI_SEMAPHORE_WAIT in register poll mode is supported.
MI_SEMAPHORE_SIGNAL
MI_BATCH_BUFFER_START
MI_CONDITIONAL_BATCH_BUFFER_END
MEDIA_OBJECT_WALKER
GPGPU_WALKER

DWord	Bit	Description
0	31:12	**Batch Buffer Per Context Address** Format: U20 Pointer to the Context in memory to be executed as a batch.
	11:3	**Reserved** Access: RO Format: MBZ
	2	**FORCE BB_PER_CTX_PTR** On detecting a context restore (not lite restore) with head pointer equals to tail pointer, command stream optimizes context switch process by not doing engine context restore and context save for the corresponding context. As part of this optimization command stream doesn't execute batch buffer per context pointer (BB_PER_CTX_PTR). Setting this bit allows command stream to execute BB_PER_CTX_PT even on context restore flows with head pointer equals to tail pointer. **Value** / **Name** / **Description** 0 / **[Default]** / Command stream does not execute BB_PER_CTX_PTR on context restore with head pointer equals to tail pointer.

BB_PER_CTX_PTR - Batch Buffer Per Context Pointer

	1	Command stream does execute BB_PER_CTX_PTR on context restore with head pointer equals to tail pointer.

Reserved

Access:	RO
Format:	MBZ

Batch Buffer Per Context Valid

Format:	U1

If set, the command stream will execute the context from the **Batch Buffer Per Context Address** prior to the execution of actual submitted workloads.

DWord	Bit	Description
0	31:0	**Batch Buffer Stack Pointer** Format: U32 This register provides a mechanism to update the entries of the Batch Buffer Stack in hardware. Consecutive writes to this register results in updating consecutive entries of the Batch Buffer Stack, starts fromEntry0(bottom of the stack) of the stack, reaches the last entry of the stack (top of the stack) and wraps around to Entry0. Note that each entry of the stack is a qword and two consecutive MMIO writes are required to update an entry of a stack. This register must not be written by SW and is only meant for hardware internal usage to context save/restore batch buffer stack values. BATCH_BUFFER_STACK_STRUCTURE defines the structure of the batch buffer stack implemented in hardware.

Description

This register specifies the state of the most recently executed batch buffer. Contents of this register are only valid when Valid bit in BB_ADDR register is set.
Level of the batch buffer is indicated by the Batch Buffer Stack Pointer value in BB_STATE register.
Stack Pointer holding a value 0 indicates First Level batch buffer.
Stack Pointer holding a value 1 indicates Second Level batch buffer.
Stack Pointer holding a value 2 indicates Third Level batch buffer.

This register should not be written by software. These fields should only get written by a context restore. Software should always set these fields via the MI_BATCH_BUFFER_START command when initiating a batch buffer. This register is saved and restored with context.

Programming Notes

Contents of this register are valid only when "Valid" bit in BB_ADDR register is set.

DWord	Bit	Description
0	31:10	**Reserved** Access: RO Format: MBZ

BB_STATE - Batch Buffer State Register

9 — POSH Start

Exists If:	//RCS, POCS

This bit reflects the POSH Start value programmed by the active first level MI_BATCH_BUFFER_START command.

8 — POSH Enable

Exists If:	//RCS, POCS

This bit reflects the POSH Enable value programmed by the active first level MI_BATCH_BUFFER_START command.

7 — Reserved

Access:	RO
Format:	MBZ

6 — Clear Command Buffer Enable

Source:	RenderCS
Format:	U1

5 — Address Space Indicator

Note: This field reflects the effective address space indicator security level and may not be the same as the Address Space Indicator written using MI_BATCH_BUFFER_START.

Value	Name	Description
0h	GGTT **[Default]**	This Batch buffer is located in GGTT memory and is privileged
1h	PPGTT	This Batch buffer is located in PPGTT memory and is non-privileged.

4 — Reserved

3:2 — Reserved

Access:	RO
Format:	MBZ

1:0 — Batch Buffer Stack Pointer

Format:	U2

This field holds the index of the stack entry which got recently updated on executing a next level batch buffer (stack push). This index points to the entry on top of the stack. Stack pointer having a value of '00b indicates stack empty and a value of '11b indicates stack full.

Value	Name	Description
0h		Stack has no data and is empty.
1h		Stack has one valid entry and have first level batch buffer details.
2h		Stack has two valid entries and have first and second level batch buffer details.
3h		Stack has three valid entries and have first, second and third level batch buffer details.

Address:	1F8168h-1F816Bh
Name:	Batch Buffer Upper Head Pointer Register
ShortName:	BB_ADDR_UDW_VECSUNIT3
Address:	1A168h-1A16Bh
Name:	Batch Buffer Upper Head Pointer Register
ShortName:	BB_ADDR_UDW_CCSUNIT0

Description

This register specifies the upper 32 bits of the 4GB aligned base address, within the 64-bit host virtual address space of the commands being fetched from the most recently initiated batch buffer. This register have valid values only when the Valid bit in BB_ADDR register is set to1. Level of the batch buffer is indicated based on the Batch Buffer Stack Pointer value in BB_STATE register. GraphicsAddress is 64-bit value [63:0], but only a portion of it is used by hardware. The uppermost reserved bits are ignored and MBZ.
Stack Pointer holding a value 0 indicates First Level batch buffer.
Stack Pointer holding a value 1 indicates Second Level batch buffer.
Stack Pointer holding a value 2 indicates Third Level batch buffer.

Programming Notes

This register should NEVER be programmed by driver. This is for HW internal use only.

Name:	Batch Offset Register
ShortName:	BB_OFFSET_VCSUNIT7
Address:	1F8158h-1F815Bh
Name:	Batch Offset Register
ShortName:	BB_OFFSET_VECSUNIT3
Address:	1A158h-1A15Bh
Name:	Batch Offset Register
ShortName:	BB_OFFSET_CCSUNIT0

This register contains the offset value to be added to the Batch Buffer Start Address in the MI_BATCH_BUFFER_START command when the Enable Offset bit in MI_BATCH_BUFFER_START command is set.

Preemptable Commands	Source
• MI_ARB_CHECK • 3D_PRIMITIVE • GPGPU_WALKER • MEDIA_STATE_FLUSH • PIPE_CONTROL (Only in GPGPU mode of pipeline selection) • MI_ATOMIC (Post Sync Operation set in GPGPU mode of pipeline selection) • MI_SEMAPHORE_SIGNAL (Post Sync Operation set in GPGPU mode of pipeline selection)	RenderCS

Preemptable Commands	Source
MI_ARB_CHECK	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS

Programming Notes

On preemption occurring within a primary/chain batch buffer this register is loaded with the offset value of the preempted command header from the batch start address when the Enable Load is set. Preemption of 3D or

BB_OFFSET - Batch Offset Register

GP_GPU workloads can only occur on preemptable commands. Batch buffer offset always points to the preemptable command if preempted on preemption or the immediate command following it if not preempted on preemption. EX: Preemption occurs on 3D_PRIMITVE command

- If the 3D_PRIMTIVE command is completely processed by render pipe then the BB_OFFSET points to the command following 3D_PRIMITIVE
- If the 3D_PRIMTIVE command is not completely processed by render pipe then the BB_OFFSET points to the 3D_PRIMITIVE command.

DWord	Bit	Description
0	31:2	**Batch Buffer Offset** Format: GraphicsAddress[31:2] This field specifies the DWord-aligned offset between the starting address of the batch buffer and where the last initiated Batch Buffer is currently fetching commands.
	1	**Reserved** Access: RO Format: MBZ
	0	**Enable Load** Default Value: 1 Format: Enable If this bit is set then the Batch Buffer Offset is loaded with the preempted command offset or the following command whenever a batch buffer is ended due to a Preemptable command.

BCS Context Sizes

BCS_CXT_SIZE - BCS Context Sizes			
Register Space:	MMIO: 0/2/0		
Access:	Read/32 bit Write Only		
Size (in bits):	32		
Address:	221A8h		
DWord	**Bit**	**Description**	
0	31:13	**Reserved**	
		Access:	RO
		Format:	MBZ
	12:8	**BCS Context Size**	
		Format:	U5
	7:5	**Reserved**	
		Access:	RO
		Format:	MBZ
	4:0	**Execlist Context Size**	
		Format:	U5

BCS CSB

BCS_CSB - BCS CSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SW reads this offset to read the Context Status Buffer entry at the top of the CSB FIFO. Reads must occur in pairs to obtain a single 64 bit CSB entry. The second read of a pair pops the CSB entry off the CSB fifo.		
DWord	**Bit**	**Description**
0	31:0	**Context Status Buffer DW** Access: RO This DW holds CSB bits[31:0] for the first read and CSB bits[63:32] for the second read.

BCS CSB Fifo Status Register

BCS_CSB_FSR - BCS CSB Fifo Status Register

Register Space: MMIO: 0/2/0

Size (in bits): 32

This RO register holds status of the CSB fifo.

DWord	Bit	Description
0	31	**Not Empty** Access: RO
	30:16	**Reserved** Access: RO Format: MBZ
	15:8	**FIFO Maximum Occupancy Count** This field is a read-only field. It reflects the depth of the FIFO, which is a static value for each product.
	7:0	**FIFO Occupancy Count** Access: RO This is a second bit field in a register template

BCS Ring Buffer Next Context ID Register

BCS_RNCID - BCS Ring Buffer Next Context ID Register	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	22198h-2219Fh

This register contains the *next* ring context ID associated with the ring buffer.

Programming Notes

The current context (RCCID) register can be updated indirectly from this register on a context switch event. Note that the only time a context switch can occur is when MI_ARB_CHECK enables preemption or the current context runs dry (head pointer becomes equal to tail pointer).

DWord	Bit	Description
0	63:0	**Unnamed** See Context Descriptor for BCS

BCS SW Control

BCS_SWCTRL - BCS SW Control

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	22200h

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask _Custom_GTIReset: BUS
	15:4	**Reserved** Access: RO Format: MBZ
	3	**Shrink Blitter Cache** Format: U1 _Custom_GTIReset: BUS This bit is primarily used for validation purposes to speed up the test time. The full cache depth of 128 CLs should be used for production. This bit is part of the context save/restore. This bit only applies to the XY_FAST_COPY_BLT command. **Value** / **Name** / **Description** 0 / **[Default]** / Blitter/BCS flush will flush and invalidate all cachelines in the Blitter/BLB cache (default). 1 / / Blitter Cache depth will be shortened from 128 CLs to 16 CLs.
	2	**Not Invalidate Blitter Cache on BCS Flush** Format: U1 _Custom_GTIReset: BUS Programming this bit allows optimal/maximal cache hit usage, when the destination surface of a Fast Copy Blit, is to be used as the Source for a follow on Fast Copy blit, even if the destination surface is flushed out for Display coherency reasons (where the destination surface is also needed to be Displayed). Such a flush with clean cacheline state is suggested when the intermediate blit operation results are being required to maintain memory coherency. The legacy method of cache invalidation on flush can be still pursued at the end of all blit operations or when switching happens due to other prescribed legacy reasons, or when switching from the new Fast Copy Engine blit, to legacy Engine blits. This bit should be programmed set only when used with Fast Copy Blit commands. This bit is part of the context save/restore. This bit only applies to the XY_FAST_COPY_BLT command.

BCS_SWCTRL - BCS SW Control

Value	Name	Description
0	**[Default]**	Blitter/BLB Cache will be 128 cache lines in depth (default).
1		BCS flush will put all dirty CL in the Blitter cache in the clean state. Any CL already in the clean state will remain clean.

1 **Tile Y Destination**

Description
Programming this bit makes the HW treat all destination surfaces as Tile Y. This bit over-rides the setting of the destination format in the packet provided to the blitter command streamer. SW is required to flush the HW before changing the polarity of this bit. This bit is part of the context save/restore. This bit does not impact the operations of the XY_FAST_COPY_BLT command.

0 **Tile Y Source**

Description
Programming this bit makes the HW treat all source surfaces as Tile Y. This bit over-rides the setting of the source format in the packet provided to the blitter command streamer. SW is required to flush the HW before changing the polarity of this bit. This bit is part of the context save/restore. This bit does not impact the operations of the XY_FAST_COPY_BLT command.

BIOS2DRIVER Scratch0

B2D_SCRATCH0 - BIOS2DRIVER Scratch0

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	102000h

This register is used by Software and for software purposes only. Preliminary definition. The bit definitions may change later as the driver team has better clarity on what information is required and how best to format. Any updates will have no effect on the hardware.

Bitstream Output Bit Count for the last Syntax Element Report Register

MFC_BITSTREAM_SE_BITCOUNT_SLICE - Bitstream Output Bit Count for the last Syntax Element Report Register	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	128D4h
Name:	SE Output Bit Count
ShortName:	SE_Output_Bit_Count

This register stores the count of number of bits in the bitstream for the last syntax element before padding. The bit count is before the byte-aligned alignment padding insertion, but includes the stop-one-bit. This register is part of the context save and restore.

DWord	Bit	Description
0	31:0	**MFC Bitstream Syntax Element Bit Count** Total number of bits in the bitstream output before padding. This count is updated each time the internal counter is incremented.

Bitstream Output Byte Count Per Slice Report Register

MFC_BITSTREAM_BYTECOUNT_SLICE - Bitstream Output Byte Count Per Slice Report Register		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	128D0h	
This register stores the count of bytes of the bitstream output. This register is part of the context save and restore.		
DWord	**Bit**	**Description**
0	31:0	**MFC Bitstream Byte Count** Total number of bytes in the bitstream output from the encoder. This count is updated for every time the internal bitstream counter is incremented.

Bitstream Output Minimal Size Padding Count Report Register

MFC_AVC_MINSIZE_PADDING_COUNT - Bitstream Output Minimal Size Padding Count Report Register	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	12814h
Name:	Minimal Size Padding
ShortName:	Minimal_Size_Padding

This register stores the count in bytes of **minimal size padding insertion. It is primarily provided for statistical data gathering.** This register is part of the context save and restore.

DWord	Bit	Description
0	31:0	**MFC AVC MinSize Padding Count** Total number of bytes in the bitstream output contributing to minimal size padding operation. This count is updated each time when the padding count is incremented.

BLC_PWM_CTL

BLC_PWM_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	48250h-48253h
Name:	Backlight PWM Control
ShortName:	BLC_PWM_CTL
Reset:	soft

This register controls the backlight PWM logic going to the display utility pin on the CPU.

DWord	Bit	Description
0	31	**PWM Enable** This bit enables the PWM logic.

Value	Name	Description
0b	Disable	PWM disabled
1b	Enable	PWM enabled

Restriction
The display utility pin must be configured correctly to output the PWM. Program the frequency and duty cycle before enabling PWM.

DWord	Bit	Description
	30:29	**Pipe Select** This field selects which vertical blank will be used for backlight blinking.

Value	Name	Description
00b	Pipe A	Use Pipe A
01b	Pipe B	Use Pipe B
10b	Pipe C	Use Pipe C
11b	Pipe D	

DWord	Bit	Description
	28	**Blinking Enable** This bit enables backlight blinking. When enabled, the backlight will be driven on at the programmed brightness during vertical blank and driven off during vertical active.

Value	Name
0b	Disable
1b	Enable

BLC_PWM_CTL

	27	**PWM Granularity** This field controls the granularity (minimum increment) of the PWM backlight control counter. **Value** / **Name** / **Description** 0b / 128 / PWM frequency adjustment on 128 clock increments 1b / 8 / PWM frequency adjustment on 8 clock increments
	26:0	**Reserved** Access: RO Format: MBZ

BLC_PWM_DATA

BLC_PWM_DATA		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	48254h-48257h	
Name:	Backlight PWM Data	
ShortName:	BLC_PWM_DATA	
Reset:	soft	

DWord	Bit	Description
0	31:16	**Backlight Frequency** This field determines the number of time base events in total for a complete cycle of modulated backlight control. This field is programmed based on the frequency of the clock that is being used and the desired PWM frequency. This value represents the period of the PWM stream in CD clocks multiplied by 128 (default increment) or 8 (alternate increment selected by BLC_PWM_CTL PWM_Granularity).
	15:0	**Backlight Duty Cycle** This field determines the number of time base events for the active portion of the PWM backlight control. A value of zero will turn the backlight off. A value equal to the backlight modulation frequency field will be full on. Updates will take affect at the end of the current PWM cycle. This value represents the active time of the PWM stream in CD clock periods multiplied by 128 (default increment) or 8 (alternate increment selected by BLC_PWM_CTL PWM_Granularity). **Restriction** This should never be larger than the frequency field.

Blitter Cache Control Register

BLIT_CCTL - Blitter Cache Control Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	22204h

DWord	Bit	Description
0	31:23	**Reserved** Access: RO Format: MBZ
	22:16	**Pattern MOCS** Format: MEMORY_OBJECT_CONTROL_STATE MOCS for blitter pattern operands.
	15	**Pattern MOCS Select** This bit is used to select what MOCS bits (pattern or source) are driven on the shared pattern/source MOCS bus. Value 0b: **[Default]** Drive source MOCS bits on the shared MOCS bus. Value 1b: Drive pattern MOCS bits on the shared MOCS bus.
	14:8	**Destination MOCS** Format: MEMORY_OBJECT_CONTROL_STATE MOCS for blitter destination operands.
	7	**Reserved** Access: RO Format: MBZ
	6:0	**Source MOCS** Format: MEMORY_OBJECT_CONTROL_STATE MOCS for blitter source operands.

Boot Hash Check Status

BOOT_HASH_CHK - Boot Hash Check Status

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

Programming Notes

This register is saved in the power context

DWord	Bit	Description
0	31	**Valid uKernel Loaded** Whether there is a valid uKernel loaded into the SRAM. During boot this bit is set when the ukernel is moved from graphics memory to WOPCM & SRAM. During RC6 resume this bit is set when the uKernel is moved from WOPCM to SRAM. On initial Boot: BootROM code shall check this bit during the process of bringing up MinuteIA to determine when the uKernel is in-place in the SRAM before transferring control to it. On RC6 exit: If C068[4] is 0 (Early Jump): Bootrom code does not poll on C010[31] before jumping to ukernel in SRAM. Any reads/writes to SRAM area not yet restored by DMA are stalled based on "CL data present" bit for that cacheline. If C068[4] is 1 (Skip Early Jump): C010[31] is used same as in initial boot case.
	30:9	**Reserved** Access: RO Format: MBZ
	8	**Reserved**
	7:3	**Reserved** Access: RO Format: MBZ
	2	**Reserved**
	1	**Reserved**
	0	**uKernel Hash Ready** Indicates HW has completed SHA computation and loaded the value into the uKernel hash register

BOOT VECTOR

BOOTMSG - BOOT VECTOR

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	08504h

Boot Message Register
This register gets locked by the Hardware once written and is cleared only during the reset. This is extra protection given against Illegal Programming.

DWord	Bit	Description
0	31:0	**Boot Vector Message** Access: R/W Lock _Custom_GTIReset: BUS Boot vector is pass through. MBC gets the boot message from GPMunit and forwards it to MSQC. Breakdown of message is done in MSQC. Details: if b[26] = 1 C6SliceA = b[20:17]; C6SliceB= d[13:10] C6Way = 0 C6Area = 0 if b[26] = 0 C6Way = b[25:21], C6Slice = d[20:17]; C6Area = d[17:10] Context Restore = b[7] Reset Type = b[6:5] Ring Stop ID = b[4:0]

Built In Self Test

BIST_0_2_0_PCI - Built In Self Test		
Register Space:	PCI: 0/2/0	
Size (in bits):	8	
Address:	0000Fh	
This register is used for control and status of Built In Self Test (BIST).		
DWord	**Bit**	**Description**
0	7	**BIST Supported** Default Value: 0b Access: RO _Custom_GTIReset: BUS BIST is not supported. This bit is hardwired to 0.
	6:0	**Reserved** Access: RO Format: MBZ

BW_BUDDY_CTL

BW_BUDDY_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Address:	45140h-45143h
Name:	Bandwidth Buddy1 Control
ShortName:	BW_BUDDY1_CTL
Reset:	soft

Address:	45150h-45153h
Name:	Bandwidth Buddy2 Control
ShortName:	BW_BUDDY2_CTL
Reset:	soft

DWord	Bit	Description
0	31	**BW Buddy Disable** Access: R/W This field indicates if the address buddy logic is disabled. 0b: Enabled **[Default]** 1b: Disabled
	30	**Reserved**
	29	**Reserved** Access: RO Format: MBZ
	28:23	**Plane Request Timer** Access: R/W This is the timer to pick when a tracker gets allocated by a regular HP plane Request and starts to wait for its buddy (based on the mask) to come in. 010000b: 16 **[Default]** [1,63]
	22	**Reserved** Access: RO Format: MBZ

BW_BUDDY_CTL

	21:16	**TLB Request Timer** Access: R/W This is the timer to pick when a tracker gets allocated by a TLB Request and starts to wait for its buddy (based on the mask) to come in. Value: 0010000b — Name: 8 **[Default]** Value: [1,63] — Name:
	15	**Reserved**
	14:0	**Reserved** Access: RO Format: MBZ

BW_BUDDY_PAGE_MASK

BW_BUDDY_PAGE_MASK			
Register Space:	MMIO: 0/2/0		
Access:	R/W		
Size (in bits):	32		
Address:	45144h-45147h		
Name:	Bandwidth Buddy1 Page Mask		
ShortName:	BW_BUDDY1_PAGE_MASK		
Reset:	soft		
Address:	45154h-45157h		
Name:	Bandwidth Buddy2 Page Mask		
ShortName:	BW_BUDDY2_PAGE_MASK		
Reset:	soft		
DWord	**Bit**	**Description**	
0	31:28	**Reserved**	
		Access:	RO
		Format:	MBZ
	27:0	**BW Buddy Page Mask**	
		Default Value:	0000000h All address bits are not Masked
		Access:	R/W
		When set, bits in this register will cause Address bits to be excluded from the buddy address comparison. Mask bit[0] is associated with address bit[9], mask bit[1] is associated with address bit[10] and so on. For example, if bit [0] of the mask register is set, then address bit[9] is not used in the buddy address comparison. The default is to compare all address bits.	
		Programming Notes	
		Optimal programming will depend on the memory configuration used. See **Arbiter** page for details.	

C6 Entry latency

C6_ENTRY_LATENCY - C6 Entry latency

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 00D80h
Name: C6 Entry latency
ShortName: C6_ENTRY_LATENCY
_Custom_GTIContextMappedUnit: mgsr

The C6 Entry Latency written by GPMunit

DWord	Bit	Description
0	31:0	**Count for C6 entry Latency** Access: R/W _Custom_GTIReset: BUS C6 Entry Latency written by GPM Measure latency of C6 entry in terms usec pulses

Cache Line Size

CLS_0_2_0_PCI - Cache Line Size		
Register Space:	PCI: 0/2/0	
Size (in bits):	8	
Address:	0000Ch	
DWord	**Bit**	**Description**
0	7:0	**Cache Line Size Value** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS This field is implemented by PCI Express devices as a read-write field for legacy compatibility purposes but has no effect on any PCI Express device behavior.

Cache Mode Register 0

CACHE_MODE_0 - Cache Mode Register 0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	07000h
Name:	Cache Mode Register 0
ShortName:	CACHE_MODE_0

This register is used to control the operation of the Render and Sampler L2 Caches. All reserved bits are implemented as read/write.
Before changing the value of this register, GFX pipeline must be idle i.e. full flush is required.
This Register is saved and restored as part of Context.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask _Custom_GTIReset: DEV A 1 in a bit in this field allows the modification of the corresponding bit in Bits 15:0.
	15	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	14:12	**MSAA Compression Plane Number Threshold for eLLC** Access: R/W _Custom_GTIReset: DEV

Value	Name	Description
0h	threshold0 **[Default]**	Cache only planeID = 0 in eLLC.
1h	threshold1	Cache only planeID = 0, 1 in eLLC.
2h	threshold2	Cache only planeID = 0..2 in eLLC.
3h	threshold3	Cache only planeID = 0..3 in eLLC.
4h	threshold4	Cache only planeID = 0..4 in eLLC.
5h	threshold5	Cache only planeID = 0..5 in eLLC.
6h	threshold6	Cache only planeID = 0..6 in eLLC.
7h	threshold7	Cache only planeID = 0..7 in eLLC.

CACHE_MODE_0 - Cache Mode Register 0

Programming Notes
This bit-field is programmed based on MSAA. When MSAA compression is enabled, these settingsaffect HW, else it is ignored. For 16X MSAA only lower 8 planes can be cached in eLLC.

11 Reserved

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

10 RCZ PMA Not-Promoted Allocation stall optimization Disable due to change in depth parameters

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

Setting this bit will force the RCZ cache to stall at the allocation of a CL if any of the values in {Depth-mode, DTE, DWE, DTF} are different between the old and new requests to the same CL. The default is a smart stall depending on the New requests depth-test and depth write fields.

Value	Name	Description
0h	**[Default]**	Optimization is enabled
1h		Optimization is disabled

9 Sampler L2 TLB Prefetch Enable

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name	Description
0h	**[Default]**	TLB Prefetch Disabled
1h		TLB Prefetch Enabled

8 Reserved

7 Reserved

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

6:5 Reserved

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

CACHE_MODE_0 - Cache Mode Register 0

4 — RCC Eviction Policy

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

If this bit is set, RCCunit will have LRA as replacement policy. The default value i.e.(when this bit is reset) indicates that non-LRA eviction policy. This bit must be reset. LRA replacement policy is not supported.

3 — Reserved

2 — Hierarchical Z RAW Stall Optimization Disable

Access:	R/W

Description
The Hierarchical Z RAW Stall Optimization allows non-overlapping polygons in the same 8x4 pixel/sample area to be processed without stalling waiting for the earlier ones to write to Hierarchical Z buffer.

Value	Name	Description
0h	Enable **[Default]**	Enables the hierarchical Z RAW Stall Optimization.
1h	Disable	Disables the hierarchical Z RAW Stall Optimization.

Programming Notes
This bit must be set to 0 to enable the Hierarchical Z RAW stall optimization.

1 — Disable clock gating in the pixel backend

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

MCL related clock gating is disabled in the pixel backend. Before setting this bit to 1,the instruction/state caches must be invalidated. [DevGT:{WKA}]

0 — Disable Byte sharing for 3D TYF LOD1 surfaces for 32/64/128 bpp

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name	Description
1		Enable byte sharing for 3D TYF LOD1 surfaces - 32/64/128 bpp
0	**[Default]**	Disable Byte Sharing for 3D TYF surfaces LOD1 , 32/64/128 bpp

Cache Mode Register 1

CACHE_MODE_1 - Cache Mode Register 1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Reset:	DEV
Address:	07004h
Name:	Cache Mode Register 1
ShortName:	CACHE_MODE_1

RegisterType: MMIO_SVL

Before changing the value of this register, GFX pipeline must be idle; i.e., full flush is required. This Register is saved and restored as part of Context.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Mask: MASK Format: Mask _Custom_GTIReset: DEV Must be set to modify corresponding data bit. Reads to this field returns zero.
	15	**Color Compression Disable** Access: R/W _Custom_GTIReset: DEV Setting this bit causes Lossless Render Target Color Compression to be disabled in Classic Clear (1x) Mode of Operation. Default value, i.e. resetting this bit, Enables Color Compression in Classic Clear Mode (1x) when CCS is Enabled.

Value	Name	Description
0h	**[Default]**	Enables Color Compression in Classic Clear Mode (1x) when CCS is Enabled.
1h		Causes Lossless Render Target Color Compression to be disabled in Classic Clear (1x) Mode of Operation

Programming Notes

The Below programming forces Color Compression to be disabled for MSAA modes explicitly as a HW WA. When switching from 1x ==> MSAA. Program this bit to 1 When switching from MSAA ==> 1x. Program this bit to 0

CACHE_MODE_1 - Cache Mode Register 1

14 Render Target 64B Read Disabled by RCC

Access:	R/W
Format:	U1
_Custom_GTIReset:	DEV

Setting this bit causes RCC to disable 64B reads and switch to legacy 128B Reads per RCC CL

Value	Name
1h	
0h	**[Default]**

13 NP EARLY Z FAILS DISABLE

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name	Description
0h	**[Default]**	IZ does conservatively fail any NP/R pixels.
1h		Disables IZ to conservatively fail pixels.

12 Reserved

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

11 Reserved

Access:	R/W

9 MSC RAW Hazard Avoidance Bit

Access:	R/W
Format:	Enable
_Custom_GTIReset:	DEV

When this field is set, MSC will enable RAW Hazard prevention mechanism, when lossless compression is enabled.

Value	Name	Programming Notes
0h	**[Default]**	
1h		This field should be programmed to 1 only if need arise to avoid RAW hazard when lossless compression is enabled

CACHE_MODE_1 - Cache Mode Register 1

8 Reserved

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

7 Reserved

_Custom_GTIReset:	DEV

6 Shader Independent Evaluate Enable

When this bit is enabled, any shader stage can send evaluate messages. Hardware ignores AMFS state programming.

Value	Name	Description
0	Shader Independent Evaluate Disabled **[Default]**	Only Pixel Shaders can do evaluate
1		ALl shader stages can do evaluate

5 MCS Cache Disable

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

For Programming restrictions please refer to the 3D Pipeline.

Value	Name	Description
0h	**[Default]**	MCS cache enabled. It allows RTs with MCS buffer enabled to be rendered using either MSAA compression for MSRT OR with color clear feature for non MSRT.
1h		MCS cache is disabled. Hence no MSAA compression for MSRT and no color clear for non-MSRT.

4 Reserved

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

3 RCZ PMA Promoted 2 Not-Promoted Allocation stall optimization Disable

Access:	R/W
_Custom_GTIReset:	DEV

Setting this bit will force the RCZ cache to stall at the allocation of a CL until the old Promoted writes retire in the RCZ$. Default mode is to stall at the IZ-read point until promoted writes are complete.

Value	Name	Description
0h	**[Default]**	Optimization is enabled
1h		Optimization is disabled

CACHE_MODE_1 - Cache Mode Register 1

2 **AMFS Disable Overshading**

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name
0	**[Default]**
1	

Programming Notes
SW must set this bit to disable Overshading in AMFS control cache If this bit is set to 1, every eval message is allocated in the Control Cache. If this bit to set to 0, eval messages bypass control cache and all texels in the cacheline are shaded

1 **YCoCg DIsable**

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

Value	Name	Description
0h	**[Default]**	YCoCg will be enabled by Defualt
1h		Setting this bit to 1 will disable YCoCg Compression and only compress using legacy RGB color space

0 **Disable Lossless Compression of partial Evictions on Previous Uncompressed Cache line**

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

Value	Name	Description
0h	**[Default]**	Lossless Compression of partial Evictions on Previous Uncompressed Cache line is Enabled
1h		Lossless Compression of partial Evictions on Previous Uncompressed Cache line is Disabled

Cache Mode Subslice Register

CACHE_MODE_SS - Cache Mode Subslice Register

Register Space:	MMIO: 0/2/0
Access:	R/W

Catastrophic Event FIFO Status

CT_FIFO_STATUS - Catastrophic Event FIFO Status

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Status of the catastrophic event FIFO.

Programming Notes

When servicing page response interrupts is done, a '1' will be written to the "Done Reading" field. Note that "Done Reading" can be set before "FIFO Occupancy Count" becomes 0 (i.e. the interrupt handler may choose to not service all of the pending catastrophic events). If "Done Reading" is set prior to the FIFO going empty, then there will be a catastrophic event interrupt arbitration in the IOMMU to produce another interrupt (since catastrophic events have the highest priority).The Interrupt-Routing bit is sampled by HW when a 1 is written by SW to the Done-Reading bit. As a result, SW shall program Interrupt-Routing bit appropriately to maintain the routing of the interrupts (Host shall write 0) when updating the Done-Reading bit. This register is saved in the power context.

DWord	Bit	Description
0	31:25	**Reserved** Access: RO Format: MBZ
	24	**Done Reading** Set by host CPU at the end of servicing the IOMMU page response event interrupt. Setting this field will lead to a new catastrophic event interrupt if the FIFO has at least one valid entry. "Done Reading" is cleared by hardware when the IOMMU interrupt is accepted. Note that there is a programming requirement for the Interrupt-routing bit when this bit is set by SW. 0h – Not done – Not done reading the event FIFO. 1h – Done **[Default]** – Done reading the event FIFO, so a new interrupt can be generated if the FIFO is not empty.
	23:18	**Reserved** Access: RO Format: MBZ
	17	**Mask** This bit, when set, causes HW to not report an interrupt to SW even when valid entries exist. HW continues to accumulate FIFO data when this bit is set. An interrupt is generated when this bit is cleared. SW must periodically clear bit and consume data to prevent HW stalls resulting from lack of credits. This bit being set when valid data is present will prevent RC6 entry.

CT_FIFO_STATUS - Catastrophic Event FIFO Status

16 — Interrupt Routing

Where interrupts will be routed. This field can be read or written by the host CPU.

Value	Name	Description
0h	Host **[Default]**	Interrupts will be routed to the host CPU.
1h	Reserved	Reserved

15:9 — Reserved

Access:	RO
Format:	MBZ

8 — Not Empty

Whether the catastrophic event FIFO has at least one valid entry. This field is written by the graphics hardware and can be read by the host CPU.

Value	Name
0h	FIFO empty **[Default]**
1h	FIFO not empty

7:2 — Reserved

Access:	RO
Format:	MBZ

1:0 — FIFO Occupancy Count

The number of valid entries in the catastrophic event FIFO. This field is updated every time the host CPU reads the FIFO or an IOMMU catastrophic event message write is received from the IOMMU/GAM. It is written by the graphics hardware and can be read by the host CPU.

Value	Name
[0,2]	Number of valid FIFO entries

Catastrophic Interrupt Context ID

CT_INTR_CTX_ID - Catastrophic Interrupt Context ID

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

Reports the context ID at the top of the catastrophic interrupt FIFO. It is written by the graphics hardware and is read by the microkernel and host CPU.

Programming Notes

Catastrophic interrupt FIFO output's a qword data consisting of CTX_INTR_ERR_ID and CT_INTR_CTX_ID registers.
As part of the CAT Error interrupt service routine, SW/FW must first read to CT_INTR_ERR_ID register prior to reading this register.
Each read of this register results in a pop of the catastrophic interrupt FIFO.

DWord	Bit	Description
0	31:0	**Context ID** The context ID at the top of the catastrophic interrupt FIFO. This FIFO collects information about contexts that caused catastrophic faults.

CCS CSB

CCS_CSB - CCS CSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SW reads this offset to read the CSB entry at the top of the CSB fifo. Reads must occur in pairs to obtain a single 64 bit entry. The second read pops the entry off the CSB fifo.		
DWord	**Bit**	**Description**
0	31:0	**Context Status Buffer DW** Access: RO This DW holds CSB bits[31:0] for the first read and CSB bits[63:32] for the second read.

CCS CSB Fifo Status Register

CCS_CSB_FSR - CCS CSB Fifo Status Register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
This RO register holds status of the CSB fifo.		
DWord	**Bit**	**Description**
0	31	**Not Empty** Access: RO
	30:16	**Reserved** Access: RO Format: MBZ
	15:8	**FIFO Maximum Occupancy Count** This field is a read-only field. It reflects the depth of the FIFO, which is a static value for each product.
	7:0	**FIFO Occupancy Count** Access: RO

CDCLK_CTL

CDCLK_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	46000h-46003h
Name:	CD Clock Control
ShortName:	CDCLK_CTL
Reset:	global

This register is not reset by the device 2 FLR.

Restriction
These fields should only be changed as part of the Display Sequences for Changing CD Clock Frequency.

DWord	Bit	Description
0	31:24	**Reserved** Access: RO Format: MBZ
	23:22	**CD2X Divider Select** Access: Double Buffered _Custom_Display_DoubleBufferUpdatePoint: Pipe off or start of vertical blank This field selects how the CDCLK PLL output is divided before driving the display CD2X clock. This field is double buffered to align with the pipe from CD2X Pipe Select. It will update at the start of vertical blank of the selected pipe, or immediately if the selected pipe is disabled or no pipe is selected. Value: 00b – Name: Divide by 1 Value: 10b – Name: Divide by 2 **[Default]** **Restriction** CD2X Divider Select must not be changed while more than one pipe is enabled. When one pipe is enabled, the CD2X Pipe Select must be set to that pipe before changing CD2X Divider Select.
	21:19	**CD2X Pipe Select** This field selects the pipe enable and vertical blank to be used for double buffering the CD2X Divider Select. Value: 000b – Name: Pipe A Value: 010b – Name: Pipe B

100b	Pipe C	
110b	Pipe D	
111b	None	Double buffer enable is tied to 1 so that writes to the CD2X Divider Select will take effect immediately.

18	**Reserved**
17	**Reserved**
16	**SSA Precharge Enable** This field is unused.

Value	Name
0b	Disable

15	**Reserved**
14:11	**Reserved**

Access:	RO
Format:	MBZ

10:0 **CD Frequency Decimal**

Format:	U10.1

This field selects the decimal value of the frequency for CD clock, which is used to generate divided down clocks for some display engine timers. This value is represented in a 10.1 format with 10 integer bits and 1 fractional bit.
Many possible values are listed here, and not all valid values are included. To find which values are valid for a project, refer to the clocks page for that project.

Program this field to select the pre-defined value that matches the CD frequency chosen by the CDCLK PLL and CD2X Divider. If no value is defined, program this field with the CD frequency, rounded to the closest 0.5, then minus one.

Value	Name	Description
00 1010 0111 0b	168 MHz CD **[Default]**	This value is default, but not valid.
00101011000b	172.8 MHz CD	
00101100100b	179.2 MHz CD	
00101100110b	180 MHz CD	
00101111110b	192 MHz CD	
01001100100b	307.2 MHz CD	
01 0011 0111 0b	312 MHz CD	
01010000110b	324 MHz CD	
01010001011b	326.4MHz CD	
01110111110b	480MHz CD	
10 0010 0111 0b	552 MHz CD	

CDCLK_CTL				
		10 0010 1100 0b	556.8 MHz CD	
		10 1000 0111 0b	648 MHz CD	
		10 1000 1100 0b	652.8 MHz CD	

CDCLK_PLL_ENABLE

CDCLK_PLL_ENABLE

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
CrashLogSaved:	true
CrashLogPriority:	2
CrashLogVisibility:	public
ExternalLongName:	DE CDCLK PLL Enable
ExternalDescription:	Display engine core PLL enable

Address:	46070h-46073h
Name:	CDCLK PLL Enable
ShortName:	CDCLK_PLL_ENABLE
Reset:	soft

This register is used to control the CDCLK PLL.

DWord	Bit	Description
0	31	**PLL Enable** This field enables or disables the CDCLK PLL. Value: 0b – Disable; 1b – Enable
	30	**PLL Lock** Access: RO This fields indicates the status of the CDCLK PLL Lock. Value: 0b – Not locked or not enabled; 1b – Locked
	29:28	**Reserved** Access: RO Format: MBZ
	27	**Slow Clock Enable** This field enables or disables the slow clock that can be used when the CDCLK PLL is disabled. If the CDCLK PLL is disabled, and slow clock is disabled or not locked, then the crystal clock will be used instead. Value: 0b – Disable; 1b – Enable

CDCLK_PLL_ENABLE

26 — Slow Clock Lock

Access:	RO

This fields indicates the status of the slow clock lock.

Value	Name
0b	Not locked or not enabled
1b	Locked

These are the weights contained in the lookup up table (LUT) used in pipe color gamut enhancement. LUT index 0 contains the weight for the least saturated colors, and LUT index 16 contains the weight for the most saturated colors. Weight values can range from 00000b (100% of the enhanced output color is from the pipe gamma and CSC output corrected color) to 100000b (100% of the enhanced output color is from the pipe gamma and CSC input color).

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:24	**CGE Weight Index 3** This is the weight value for this color gamut enhancement LUT index.

Clipper Invocation Counter

CL_INVOCATION_COUNT - Clipper Invocation Counter	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02338h-0233Fh
Name:	Clipper Invocation Counter
ShortName:	CL_INVOCATION_COUNT_RCSUNIT_BE_GEOMETRY
Address:	18338h-1833Fh
Name:	Clipper Invocation Counter
ShortName:	CL_INVOCATION_COUNT_POCSUNIT_BE_GEOMETRY

This register stores the count of objects entering the Clipper stage. This register is part of the context save and restore.

DWord	Bit	Description
0	63:32	**CL Invocation Count Report UDW** Number of objects entering the clipper stage. Updated only when Statistics Enable is set in CLIP_STATE (see the Clipper Chapter in the 3D Volume.)
	31:0	**CL Invocation Count Report LDW** Number of objects entering the clipper stage. Updated only when Statistics Enable is set in CLIP_STATE (see the Clipper Chapter in the 3D Volume.)

Clipper Primitives Counter

CL_PRIMITIVES_COUNT - Clipper Primitives Counter	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02340h-02347h
Name:	Clipper Primitives Counter
ShortName:	CL_PRIMITIVES_COUNT_RCSUNIT_BE_GEOMETRY
Address:	18340h-18347h
Name:	Clipper Primitives Counter
ShortName:	CL_PRIMITIVES_COUNT_POCSUNIT_BE_GEOMETRY

This register reflects the total number of primitives that have been output by the clipper. This register is part of the context save and restore.

DWord	Bit	Description
0	63:32	**Clipped Primitives Output Count UDW** Total number of primitives output by the clipper stage. This count is updated for every primitive output by the clipper stage, as long as Statistics Enable is set in SF_STATE (see the Clipper and SF Chapters in the 3D Volume.)
	31:0	**Clipped Primitives Output Count LDW** Total number of primitives output by the clipper stage. This count is updated for every primitive output by the clipper stage, as long as Statistics Enable is set in SF_STATE (see the Clipper and SF Chapters in the 3D Volume.)

Command Buffer Caching Control Register

CMD_BUF_CCTL - Command Buffer Caching Control Register	
Register Space:	MMIO: 0/2/0

Name:	CMD_BUF_CCTL
ShortName:	CMD_BUF_CCTL_CCSUNIT0

This register informs the size of the command buffer cache allocated in L3 for DMA requests from Command Streamer. This register also defines the MOCS index that need be send on command buffer read request to be cached in L3.

Programming Notes

This register only functionally impacts the render command streamer as the **Enable Command Cache** bit in PIPE_CONTROL is only supported for the render command streamer. Only render command streamer enables this register a non-privilege.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask Mask bits act as write enables for the bits in the lower bits of this register
	15:14	**Reserved** Access: RO Format: MBZ

CMD_BUF_CCTL - Command Buffer Caching Control Register

13:12 **Reserved**

Access:	RO
Format:	MBZ

11:8 **Command Buffer Cache Size**

Format:	U4

The value programmed to this field should be less than or equal to the actual physical cache space reserved in L3 for command buffercaching through L3 configuration. Command buffer DMA engine uses the cache size programmed in this field to limit the read requests of a cacheable batch buffer to be cached in L3. DMA engine does this by tracking the amount of read requests made cacheable and stops caching when the read requested data size equals to the size of the command cache allocated. DMA engine resets the command caching tracker on events listed below. This avoids thrashing of cache for Batch Buffers larger in size compared to the command buffer cache allocated in L3.

- On an End Of Tile in PTRBR/POSH mode of operation.
- On a context save of a context.
- On command cache invalidation through PIPE_CONTROL.

Value	Name	Description
1h	Cache Size 16 KB **[Default]**	Size of the command buffer cache allocated in L3 is 16KB
2h	Cache Size 32 KB	Size of the command buffer cache allocated in L3 is 32KB
3h	Cache Size 64 KB	Size of the command buffer cache allocated in L3 is 64KB
4h	Cache Size 128 KB	Size of the command buffer cache allocated in L3 is 128KB
5h	Cache Size 256 KB	Size of the command buffer cache allocated in L3 is 256KB
6h	Cache Size 512 KB	Size of the command buffer cache allocated in L3 is 512KB
0h,7h,8h,9h, Ah, Bh, Ch, Dh, Eh, Fh	Reserved	Reserved.

7 **Reserved**

Access:	RO
Format:	MBZ

6:0 **Memory Object Control State MOCS for Command Buffer Caching**

Format:	MEMORY_OBJECT_CONTROL_STATE

This field has the standard format defined for MOCS globally. Index to MOCS Tables field of MOCS is used for L3 and System cache memory properties.
Index to MOCS Tables attribute of this field is used for defining the caching properties for requests made for batch buffer command fetches.

Comp Ctx TLB Invalidation Register

COMPCTX_TLB_INV_CR - Comp Ctx TLB Invalidation Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0CF04h

DWord	Bit	Description
0	31:16	**Mask Bits** Default Value: 0000000000000000b Access: R/W
	15:8	**Reserved** Access: RO Format: MBZ
	7	**Invalidate Compute Ctx TLBs bit7** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated Compute Context and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's (compute context's) HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. Bit[7:0] invalidates Compute Context[7:0] TLBs. No Effect on non-existent Compute Contexts. These bits self clear.
	6	**Invalidate Compute Ctx TLBs bit6** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated Compute Context and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's (compute context's) HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. Bit[7:0] invalidates Compute Context[7:0] TLBs. No Effect on non-existent Compute Contexts. These bits self clear.
	5	**Invalidate Compute Ctx TLBs bit5** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated Compute Context and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's (compute context's) HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. Bit[7:0] invalidates Compute Context[7:0] TLBs. No Effect on non-existent Compute Contexts. These bits self clear.

COMPCTX_TLB_INV_CR - Comp Ctx TLB Invalidation Register

	4	**Invalidate Compute Ctx TLBs bit4** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated Compute Context and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's (compute context's) HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. Bit[7:0] invalidates Compute Context[7:0] TLBs. No Effect on non-existent Compute Contexts. These bits self clear.
	3	**Invalidate Compute Ctx TLBs bit3** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated Compute Context and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's (compute context's) HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. Bit[7:0] invalidates Compute Context[7:0] TLBs. No Effect on non-existent Compute Contexts. These bits self clear.
	2	**Invalidate Compute Ctx TLBs bit2** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated Compute Context and HW clears the bitwhen invalidation is complete. To ensure proper invalidation of the TLBs, SW has toensure the corresponding engine's (compute context's) HW pipeline is flushed and cleared from all itsmemory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates Compute Context[7:0] TLBs. No Effect on non-existent Compute Contexts. These bits self clear.
	1	**Invalidate Compute Ctx TLBs bit1** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated Compute Context and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's (compute context's) HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. Bit[7:0] invalidates Compute Context[7:0] TLBs. No Effect on non-existent Compute Contexts. These bits self clear.
	0	**Invalidate Compute Ctx TLBs bit0** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated Compute Context and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's (compute context's) HW pipeline is flushed and cleared from all its

COMPCTX_TLB_INV_CR - Comp Ctx TLB Invalidation Register		
		memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. Bit[7:0] invalidates Compute Context[7:0] TLBs. No Effect on non-existent Compute Contexts. These bits self clear.

Compute Engine DSS Reservation

CE_DSS_RSERVATION - Compute Engine DSS Reservation

Register Space: MMIO: 0/2/0

Size (in bits): 32

This register indicates the number of DSSs to be reserved for compute engine. This register is privileged and power context save/restored by HW.

DWord	Bit	Description
0	31:16	**MASK** Access: RO Format: Mask Must be set to modify corresponding bit in Bits 15:0. (All implemented bits)
	15:8	**Reserved** Format: PBC
	7:0	**Number ComputeEngine DSS Reservation** Format: U8 This field indicates the number of DSSs to be reserved for compute engine. These DSSs will be exclusively reserved for compute engine and will never be allocated for render engine. **Programming Notes** Value programmed must be less than the maximum number of DSS's available on a given GT SKU.

Configuration Register0 for RPMunit

CONFIG0 - Configuration Register0 for RPMunit

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00D00h

Lock bit LOCK applies to all RW/L fields in this register. Lock is overridden during context restore.

DWord	Bit	Description
0	31	**Lock for RW/L Fields in this Register** Access: R/W Lock _Custom_GTIReset: BUS 0 = Bits of CONFIG0 register are R/W. 1 = All bits of CONFIG0 register are RO (including this lock bit). Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). Lock is reset on a restore after context is captured.
	30:7	**Placeholder Bits** Access: R/W Lock _Custom_GTIReset: BUS
	6	**Reserved**
	5:3	**Crystal Clock Freq Selector** Access: RO _Custom_GTIReset: BUS This indicates the crystal clock frequency. BIOS will read this bit and then program the shift parameters, below, appropriately

Value	Name
0b	Crystal clock is at 24 MHz **[Default]**
1b	Crystal clock is at 19.2 MHz
10b	Crystal clock is at 38.4 MHz
11b	Crystal clock is at 25 MHz
100b	Rsvd for future use

	2:1	**CTC SHIFT parameter** Default Value: 10b Access: R/W Lock _Custom_GTIReset: BUS 00 - use bit 7 as microsecond, bit 3 as lowest *CS timestamp 01 - use bit 6 as microsecond, bit 2 as lowest *CS timestamp 10 - use bit 5 as microsecond, bit 1 as lowest *CS timestamp (default) 11 - use bit 4 as microsecond, bit 0 as lowest *CS timestamp

CONFIG0 - Configuration Register0 for RPMunit

	0	**Disable TSC Synchronization** Access: R/W Lock _Custom_GTIReset: BUS 'b0 - TSC synchronization enabled in GT (default) 'b1 - TSC synchronization DISABLED in GT

Configuration Register1 for RPMunit

CONFIG1 - Configuration Register1 for RPMunit

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00D04h

Lock bit LOCK applies to all RW/L fields in this register. Lock is overridden during context restore.

DWord	Bit	Description
0	31	**Lock for RW/L Fields in this Register** Access: R/W Lock _Custom_GTIReset: BUS 0 = Bits of CONFIG0 register are R/W. 1 = All bits of CONFIG0 register are RO (including this lock bit). Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). Lock is reset on a restore after context is captured.
	30:10	**Placeholder Bits** Access: R/W Lock _Custom_GTIReset: BUS
	9	**Reserved**
	8:0	**RCP L3 FREQ DETECT** Default Value: 000011110b Access: R/W Lock _Custom_GTIReset: BUS This is control signal needed from clock unit that can be set at 1 when 2X clock frequency is less than or equal to 1GHz. It needs to be at 0 when 2X clock frequency is >1GHz. Without this circuit changes, the GT L3 cache will not be functional at lower frequency due to Vcc is less than Vccmin of 0.9V for the array. default value: low2xthresh=0x01Eh corresponding to a 1x frequency of 500Mhz.

Programming Notes

This register is only functional on RenderCS and ComputeCS and must be only programmed on RenderCS and ComputeCS. This register is context save/restored on a context switch.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask Mask bits act as write enables for the bits in the lower bits of this register
	15:2	**Reserved** Format: PBC
	1:0	**Reserved** Format: PBC

Context Info of Per-process GTT Space HDW

CTXT_INFO_HDW - Context Info of Per-process GTT Space HDW	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register matches the format required by GAM in the Element Descriptor register. HW stores the programmed values of the Per Process GTT registers across RC6 and re-sends them to the GAM on a RC6 resume, causing GAM to attempt to reload per process table pointers from memory. To avoid loading Per Process structures un-necessarily and to avoid issues with stale Per Process loads (if a application or context that used a per process table terminates), SW shall program the Per Process registers when needed and disable right after use. This register is saved in the power context.

DWord	Bit	Description
0	31:0	**Context ID** This field is available for SW to set to any value it wishes. It can be used to differentiate different instances of the same context or to serve as a lookup value in a context structure so SW does not have to search for a context by LRCA. This ID will also appear in the status writes and can be used to associate status with submitted contexts.

Context Info of Per-process GTT Space LDW

CTXT_INFO_LDW - Context Info of Per-process GTT Space LDW

Register Space: MMIO: 0/2/0

Access: R/W

Size (in bits): 32

This register matches the format required by GAM in the Element Descriptor register. HW stores the programmed values of the Per Process GTT registers across RC6 and re-sends them to the GAM on a RC6 resume, causing GAM to attempt to reload per process table pointers from memory. To avoid loading Per Process structures un-necessarily and to avoid issues with stale Per Process loads (if a application or context that used a per process table terminates), SW shall program the Per Process registers when needed and disable right after use. This register is saved in the power context.

DWord	Bit	Description
0	31:12	**Logical Ring Context Address (LRCA)** Format: GraphicsAddress[31:12] This field contains the 4 KB-aligned address of the Logical Ring Context associated with this execlist element.
	11:9	**Function Number** GFX device is considered to be on Bus0 with device number of 2. Function number is normally assigned as "0" however for gfx virtualization; there would be different function numbers which needs to be attached to context.
	8	**Privileged Context / GGTT vs PPGTT mode** Differs in legacy vs advanced context modes: **In Legacy Context**: Defines the page tables to be used. This is how page walker come to know PPGTT vs GGTT selection for the entire context. **In Advanced Context**: Defines the privilege level for the context

Value	Name	Exists If
0h	Use Global GTT	[Context Type] == 'Legacy Context'
1h	Use Per-Process GTT	[Context Type] == 'Legacy Context'
0h	User Mode Context	[Context Type] == 'Advanced Context'
1h	Supervisor Mode Context	[Context Type] == 'Advanced Context'

Fault Handling

Value	Name
00b	Fault & Hang
01b	Fault & Halt/Wait
10b	Fault & Stream & Switch
11b	Reserved

Deeper IA coherency Support

In Advanced Context: Defines the level of IA coherency

Value	Name	Description
0h		IA coherency is provided at LLC level for all streams of GPU (i.e. gen7.5 like mode)

CTXT_INFO_LDW - Context Info of Per-process GTT Space LDW

	1h		IA coherency is provided at L3 level for EU data accesses of GPU

4 — A&D Support / 32&64b Address Support

Differs in legacy vs advanced context modes: **In Legacy Context**: Defines 32b vs 64b (48b canonical) addressing format **In Advanced Context**: Defines A&D bit support

Value	Name	Exists If
0h	32b addressing format	[Context Type] == 'Legacy Context'
1h	64b (48b canonical) addressing format	[Context Type] == 'Legacy Context'
0h	A&D bit management in page tables is NOT supported	[Context Type] == 'Advanced Context'
1h	A&D bit management in page tables is supported.	[Context Type] == 'Advanced Context'

3 — Context Type

Defines the context type. *Note that: Bits [8:4] differs in functions when legacy vs advanced context modes are selected.*

Value	Name	Description
0h	Advanced Context	Defines the rest of the advanced capabilities (i.e. OS page table support, fault models). Note that advanced context is not bounded to GPGPU.
1h	Legacy Context	Defines the context as legacy mode which is similar to prior

2 — Force Restore

Setting this bit will force a context restore operation when switching to this context even if the LRCA in the CCID register (normally the LRCA of the last context from the prior execlist) matches this one. Note that it is legal (and likely desirable) for the **Render Context Restore Inhibit** bit (part of the CTXT_SR_CTL register) in the context image being restored to also be set. The "ring" context is being forced to be restored from a newly initialized context despite a possible LRCA match; however, the render context for such a newly initialized context will likely be uninitialized and so should not be restored

1 — Scheduling Mode

Value	Name	Description
0h		Not valid
1h	**[Default]**	Indicates Execlist mode of scheduling.

0 — Valid

Indicates that element descriptor is valid. If GAM is programmed with an invalid descriptor, it will continue but flag an error.

Context Restore Request To TDL

TDL_CONTEXT_RESTORE - Context Restore Request To TDL

Register Space:	MMIO: 0/2/0
Access:	WO
Size (in bits):	32

	0	**Context Restore** Value: 1 — Name: — Description: Bit 0 and bit 16 both need to be 1 for Context restore request

Context Sizes

CXT_SIZE - Context Sizes

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	021A8h

The actual size of a logical rendering context is the amount of data stored/restored during a context switch and is measured in 64B cache lines.

This register will be power context save/restored. Note that this register will default to the correct value, so software should not have to modify it.

DWord	Bit	Description
0	31:28	**Reserved** Access: RO Format: MBZ
	27:16	**Render Engine Context Size** This field indicates the size of the render engine context data that needs to be save/restored when extended mode is not enabled for a context; this excludes URB context size. Note that this excludes the ring context image size and the engine context saved by CSFE. Value: 15Eh — Name: **[Default]**
	15:8	**SOL Context Offset** This field indicates the cacheline aligned offset of the SOL context in the render context image starting from Ring Context. Note that in execlist of scheduling Ring context itself is at 4KBoffset from LRCA. Value: 66h — Name: **[Default]**
	7:0	**Reserved** Access: RO Format: MBZ

Hardware generates context switch interrupt and the associated context switch status report for the context switch reasons unmasked in this register. By default the context switch interrupts for all context switch reasons are un-masked. This register is privileged and global across all contexts and power context save/restored by hardware.
Note that on a context switch status report even the status of the masked context switch reasons are reported.

Programming Notes

Software must program this register through direct MMIO when hardware is idle and not processing any contexts.

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7	**Active to Idle** This mask bit controls the context switch interrupt generation and the associated context switch status report on a context switch leading hardware to go idle. Active-to-Idle is a special case of element switch due to ring done or un-successful semaphore wait or un-successful display wait

for event following which hardware goes idle.

Value	Name	Description
0	**[Default]**	Context switch interrupt and associated context switch status report is generated on a context switch leading hardware to go idle.
1		Context switch interrupt and associated context switch status report is not generated on a context switch leading hardware to go idle.

6 **Preempt to Idle**

This mask bit controls the context switch interrupt generation and the associated context switch status report on a context switch due to Preempt-to-Idle.

Value	Name	Description
0	**[Default]**	Context switch interrupt and associated context switch status report is generated on a context switch due to Preempt-to-Idle.
1		Context switch interrupt and associated context switch status report is not generated on a context switch due to Preempt-to-Idle.

5 **Lite Restore**

This mask bit controls the context switch interrupt generation and the associated context switch status report on a context switch due to lite restore.

Value	Name	Description
0	**[Default]**	Context switch interrupt and associated context switch status report is generated on a context switch due to lite restore.
1		Context switch interrupt and associated context switch status report is not generated on a context switch due to lite restore.

4 **Preemption**

This mask bit controls the context switch interrupt generation and the associated context switch status report on a context switch due to preemption. Preemption of an ongoing context is triggered due to loading of submission queue to execution queue on a "Load".

Value	Name	Description
0	**[Default]**	Context switch interrupt and associated context switch status report is generated on a context switch due to preemption.
1		Context switch interrupt and associated context switch status report is not generated on a context switch due to preemption.

3 **Display Wait For Event**

This mask bit controls the context switch interrupt generation and the associated context switch status report on Ring-Done context switch.

Value	Name	Description
0	**[Default]**	Context switch interrupt and associated context switch status report is generated on a context switch due to un-successful display wait for event. Context switch on un-successful display wait for even wait is a part of element switch.

CSB_INTERRUPT_MASK - Context Status Buffer Interrupt Mask Register

		1		Context switch interrupt and associated context switch status report is not generated on a context switch due to un-successful display wait for event.
	2	**Semaphore Wait** This mask bit controls the context switch interrupt generation and the associated context switch status report on Ring-Done context switch.		
		Value	**Name**	**Description**
		0	**[Default]**	Context switch interrupt and associated context switch status report is generated on a context switch due to un-successful sempahore wait. Context switch on un-successful semaphore wait is a part of element switch.
		1		Context switch interrupt and associated context switch status report is not generated on a context switch un-successful semaphore wait.
	1	**Ring Done** This mask bit controls the context switch interrupt generation and the associated context switch status report on Ring-Done context switch.		
		Value	**Name**	**Description**
		0	**[Default]**	Context switch interrupt and associated context switch status report is generated on a context switch reason due to Ring-Done. Context switch on ring done is a part of element switch.
		1		Context switch interrupt and associated context switch status report is not generated on a context switch due to Ring-Done.
	0	**Idle To Active** This mask bit controls the context switch interrupt generation and the associated context switch status report on Idle-to-Active context switch.		
		Value	**Name**	**Description**
		0	**[Default]**	Context switch interrupt and associated context switch status report is generated on a context switch due to Idle-to-Active. Idle2Active is a special case of submission queue acceptance by hardware.
		1		Context switch interrupt and associated context switch status report is not generated on a context switch due to Idle-to-Active.

Name:	Context Status Buffer Read Register
ShortName:	CSB_STATUS_CCSUNIT0

This 32 bit address contains the value of the context status that is next to be read by scheduler.

Programming Notes

This register functionality is not supported and must not be programmed for Position command streamer.

DWord	Bit	Description
0	31:0	**Context Status** Access: RO This field contains the value of the Context Status depending on the value of **Context Status Buffer Read Pointer** in the CTXT_ST_PTR. Read Pointer value of zero will point to context status zero, read pointer value of one will pointer to context status one, and so on. The scheduler must read this register twice to get the full 64b of context status. The first read returns the lower DW of the status and the second read returns the upper DW of the status.

This register provides a mechanism to obtain cumulative run time of a GPU context on HW. This register gets context save/restored on a context switch. SW must reset this register on very first submission of a context to HW, then afterwards gets context save/restored maintaining the cumulative run time of the corresponding context. This register (effectively) counts at a constant frequency by adjusting the increment amount according to the actual reference clock frequency. SW therefore does not need to know the reference clock frequency. This register gets reset on an engine reset.

This register is context save restore on a context switch.

DWord	Bit	Description
0	31:0	**Timestamp Value** Format: U32 The granularity of this toggle is at the rate of the bit 3 in the "Reported Timestamp Count" register(0x2358).. The toggle will be 8 times slower that "Reported Timestamp Count". The granularity of the time stamp base unit for "Reported Timestamp Count" is defined in the Timestamp Bases subsection in Power Management chapter.

This register gets power context save/restored. Bit[0] contents of this register does't get save/restored.Note: Even though this register exists in BlitterCS, VideoCS, VidoeEnhancmentCS, individual bit driven functionality is not supported.

Programming Notes
This register is functional for RenderCS only and must not be programmed for other command streamers.
This register functionality is not supported and must not be programmed for Position command streamer.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask Must be set to modify corresponding bit in Bits 15:0. (All implemented bits)
	15	**Selective Read Addressing Enable** Source: RenderCS, ComputeCS This field controls the outbound read request originating from Render Command Streamer. This field enables to read the MMIO register from selected unit in a given slice and sub-slice instead of multicasting the read cycle to all slices/sub-slices.

WAIT_FOR_RC6_EXIT - Control Register for Power Management

Value	Name	Description
0h	**[Default]**	Lowest Slice and Lowest Sub-Slice Enabled. Ex: Slice-0, Sub-Slice-0 are the lowest in GT.
1h	Selective Unit Enabled	Unit selected based on **Selective Read Slice Select** and **Selective Read Sub-Slice Select**.

14 **Reserved**

Source:	RenderCS, ComputeCS
Format:	PBC

13:12 **Selective Read Slice Select**

Source:	RenderCS, ComputeCS

This field selects the slice from which the read return data value has to be considered when **Selective Read Addressing Enable** is set. Below value must be programmed with a legal value supported by the GT configuration, one must not program this to a slice that is disabled or not supported by GT.

Value	Name
0h	Slice-0
1h	Slice-1
2h	Slice-2
3h	Slice-3

11:9 **Selective Read Sub-Slice Select**

Source:	RenderCS, ComputeCS

This field selects the sub-slice from which the read return data value has to be considered when **Selective Read Addressing Enable** is set. Below value must be programmed with a legal value supported by the GT configuration, one must not program this to a sub-slice that is disabled or not supported by GT.

8 **Selective Write Addressing Enable**

Source:	RenderCS, ComputeCS

This field controls the outbound write request on message channel originating from Render Command Streamer on executing LRI, LRR and LRM commands. Setting this field doesn't affect the execution of LRI commands from context image during context restore. This field enables to

select the unit in given slice and sub-slice instead of multicasting the write cycle to all slices/half-slices.

Value	Name	Description
0h	Multi Cast **[Default]**	
1h	Selective Unit Enabled	Unit selected based on **Selective Write Slice Select** and **Selective Write Sub-Slice Select**.

Programming Notes
This field is used to implement per-slice performance counting by limiting which slices receive Flex EU programming.

7 **Reserved**

Source:	RenderCS, ComputeCS
Format:	PBC

6:5 **Selective Write Slice Select**

Source:	RenderCS, ComputeCS

This field selects the slice to which the write has to be done when **Selective Write Addressing Enable** is set. Below value must be programmed with a legal value supported by the GT configuration, one must not program this to a slice that is disabled or not supported by GT.

Value	Name
000b	Slice-0
001b	Slice-1
010b	Slice-2
011b	Slice-3

Programming Notes
This field is used to implement per-slice performance counting by limiting which slices receive Flex EU programming. Please refer to Flex EU event for more details.

4:2 **Selective Write Sub-Slice Select**

Source:	RenderCS, ComputeCS

This field selects the Sub-Slice to which the write has to be done when **Selective Write Addressing Enable** is set. Below value must be programmed with a legal value supported by the GT configuration, one must not program this to a sub-slice that is disabled or not supported by GT.

Value	Name
000b	Sub Slice-0
001b	Sub Slice-1
010b	Sub Slice-2
011b	Sub Slice-3

Count Active Channels Dispatched

TS_GPGPU_THREADS_DISPATCHED - Count Active Channels Dispatched

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV

Address:	02290h-02297h
Name:	Count Active Channels Dispatched
ShortName:	TS_GPGPU_THREADS_DISPATCHED_RCSUNIT_BE_COMPUTE

Address:	1A290h-1A297h
Name:	Count Active Channels Dispatched
ShortName:	TS_GPGPU_THREADS_DISPATCHED_CCSUNIT_BE_COMPUTE0

This register is used to count the number of active channels that TS sends for dispatch. For each dispatch the active bits in the execution mask are summed and added to this register. This register is reset when a write occurs to 2290h

DWord	Bit	Description
0..1	63:32	**GPGPU_THREADS_DISPATCHED UDW** Format: U32 This count is increased by the number of active bits in the execution mask each time the TS sends a GPGPU dispatch.
	31:0	**GPGPU_THREADS_DISPATCHED LDW** Format: U32 This count is increased by the number of active bits in the execution mask each time the TS sends a GPGPU dispatch.

Count of C6 Latency maximum

C6_EXIT_LATENCY_MAX - Count of C6 Latency maximum		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	0A620h	
Name:	Count of C6 Latency maximum	
ShortName:	C6_EXIT_LATENCY_MAX	
This register keeps track of the maximum Latency taken for C6 exit i.e from Boot evt to go to DILE		
DWord	**Bit**	**Description**
0	31:0	**C6 Latency Maximum** Access: RO _Custom_GTIReset: DEV Maximum C6 Latency

Count of Media License latency

CNT_MED_LIC_LAT - Count of Media License latency	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0A0ECh
Name:	Count of Media License Latency
ShortName:	CNT_MED_LIC_LAT
This register keeps track of the Latency taken for Media License	

DWord	Bit	Description

ShortName:	CSC_MODE_D
Reset:	soft

Writes to this register arm CSC registers for this pipe.

DWord	Bit	Description
0	31	**Pipe CSC Enable** This bit enables the pipe color space conversion.
	30	**Pipe Output CSC Enable** This bit enables the pipe output color space conversion.
	29	**Allow Double Buffer Update Disable** Access: R/W This field controls whether double buffer updates are allowed to be disabled for the Color Space Conversionregisters that are double buffered. The DOUBLE_BUFFER_CTL register can be configured to globally disable double buffer updates for those resources that allow them to be disabled. Value: 0b — Not Allowed Value: 1b — Allowed **[Default]**

CSC_MODE		
	28	**Reserved** Access: RO Format: MBZ
	27:0	**Reserved** Access: RO Format: MBZ

CSC_POSTOFF

CSC_POSTOFF	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	96
_Custom_Display_DoubleBufferArmedBy:	Write to CSC_MODE
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank after armed

Address:	49040h-4904Bh
Name:	Pipe CSC Post-Offsets
ShortName:	CSC_POSTOFF_A
Reset:	soft

Address:	49140h-4914Bh
Name:	Pipe CSC Post-Offsets
ShortName:	CSC_POSTOFF_B
Reset:	soft

Address:	49240h-4924Bh
Name:	Pipe CSC Post-Offsets
ShortName:	CSC_POSTOFF_C
Reset:	soft

Address:	49340h-4934Bh
Name:	Pipe CSC Post-Offsets
ShortName:	CSC_POSTOFF_D
Reset:	soft

The post-offset is intended to add an offset from 0 on the Y or RGB channels and to convert UV channels from 2's complement to excess 0.5 as they exit pipe color space conversion (CSC).

DWord	Bit	Description
0	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PostCSC High Offset** This value is used to give an offset to the high color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
1	31:13	**Reserved** Access: RO Format: MBZ

CSC_POSTOFF		
	12:0	**PostCSC Medium Offset** This value is used to give an offset to the medium color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
2	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PostCSC Low Offset** This value is used to give an offset to the low color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).

CSC_PREOFF

CSC_PREOFF	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	96
_Custom_Display_DoubleBufferArmedBy:	Write to CSC_MODE
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank after armed

Address:	49030h-4903Bh
Name:	Pipe CSC Pre-Offsets
ShortName:	CSC_PREOFF_A
Reset:	soft

Address:	49130h-4913Bh
Name:	Pipe CSC Pre-Offsets
ShortName:	CSC_PREOFF_B
Reset:	soft

Address:	49230h-4923Bh
Name:	Pipe CSC Pre-Offsets
ShortName:	CSC_PREOFF_C
Reset:	soft

Address:	49330h-4933Bh
Name:	Pipe CSC Pre-Offsets
ShortName:	CSC_PREOFF_D
Reset:	soft

The pre-offset is intended to remove an offset from 0 on the Y or RGB channels and to convert UV channels from excess 0.5 to 2's complement as they enter pipe color space conversion (CSC).

DWord	Bit	Description
0	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PreCSC High Offset** This value is used to give an offset to the high color channel as it enters CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
1	31:13	**Reserved** Access: RO Format: MBZ

CSC_PREOFF		
	12:0	**PreCSC Medium Offset** This value is used to give an offset to the medium color channel as it enters CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
2	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PreCSC Low Offset** This value is used to give an offset to the low color channel as it enters CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).

CS CSB

CS_CSB - CS CSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SW reads this offset to read the Context Status Buffer entry at the top of the CSB fifo. Reads must occur in pairs to obtain a single 64bit CSB entry. The second read pops the CSB entry off the FIFO.		
DWord	**Bit**	**Description**
0	31:0	**Context Status Buffer DW** Access: RO This DW holds CSB bits[31:0] for the first read and CSB bits[63:32] for the second read.

CS CSB _FSR

CS_CSB_FSR - CS CSB _FSR		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
This RO register holds status of the CSB fifo.		
DWord	**Bit**	**Description**
0	31	**Not Empty** Access: RO
	30:16	**Reserved** Access: RO Format: MBZ
	15:8	**FIFO Maximum Occupancy Count** This field is a read-only field. It reflects the depth of the FIFO, which is a static value for each product.
	7:0	**FIFO Occupancy Count**

CS Indirect Base

CS_INDIRECT_BASE - CS Indirect Base

Register Space: MMIO: 0/2/0

Size (in bits): 32

This is a general-purpose register to hold data. This register is power context save/restored across idle sequences.
Data in this register is used as a base address in below mentioned MI commands upon ADD_INDIRECT_BASE field set.

- MI_LOAD_REGISTER_IMM
- MI_STORE_REGISTER_MEM
- MI_LOAD_REGISTER_MEM
- MI_LOAD_REGISTER_REG

DWord	Bit	Description
0	31:0	**Indirect Base** Access: R/W Format: U32

CS-LTISEQ Flush Message Register

CS_LTISEQ_FLSH_MSG - CS-LTISEQ Flush Message Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B464h

This register handles flush messaging between CS and LTISEQ.
Valid values are :
1. 0x00010001 : Tile Cache Flush Request
2. 0x00020002 : RCS Fabric Flush Request
2. 0x00040004 : CCS Fabric Flush Request

DWord	Bit	Description
0	31:3	**Reserved** Access: RO Format: MBZ
	2	**CCS Fabric Flush Request Message Bit** Access: R/W Hardware Clear _Custom_GTIReset: DEV Message Bit of Fabric flush request from CCS to LTISEQ. Bit[2] must be set to "1", along with Bit[18]=1, for Valid Fabric Flush Requests from Compute CS to LTISEQ.
	1	**Fabric Flush Request Message Bit** Access: R/W Hardware Clear _Custom_GTIReset: DEV Message Bit of Fabric flush request from CS to LTISEQ. Bit[1] must be set to "1", along with Bit[17]=1, for Valid Fabric Flush Requests from Render CS to LTISEQ.
	0	**Tile Cache Flush Request Message Bit** Access: R/W Hardware Clear _Custom_GTIReset: DEV Message Bit of Tile Cache flush request from CS to LTISEQ. Bit[0] must be set to "1", along with Bit[16]=1, for Valid Tile Cache Flush Requests from CS to LTISEQ.

CSPREEMPT

CSPREEMPT - CSPREEMPT

Programming Notes

This is for HW internal usage and must not be written by SW.

DWord	Bit	Description
0	31:16	**Mask Bits** Format: Mask[15:0] Must be set to modify corresponding bit in Bits 15:0. (All implemented bits)
	15:1	**Reserved** Access: RO Format: MBZ
	0	**Unnamed** Format: Disable This is a message bit written by the cross CS in case of GT4-CBR/SFR mode of operation. To set this bit both bit[0] and bit[16] (mask) needs to be set. This bit set indicates CS in other GT has reached a preemption point. This bit gets reset by CS when preemption takes place.

CUR_BASE

CUR_BASE	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank or pipe not enabled
Address:	70084h-70087h
Name:	Cursor Base Address

Address:	73084h-73087h
Name:	Cursor Base Address
ShortName:	CUR_BASE_D
Reset:	soft

Writes to this register arm cursor registers for this pipe.

DWord	Bit	Description
0	31:12	**Cursor Base 31 12** Format: GraphicsAddress[31:12] This field specifies bits 31:12 of the graphics address of the base of the cursor for hi-res mode. When performing 180 degree rotation, this address does not need to change, hardware will internally offset to start from the last pixel of the last line of the cursor. **Workaround** To prevent false VT-d type 6 errors, use 64KB address alignment and allocate an extra 2 Page Table Entries (PTEs) beyond the end of the displayed surface. Only the PTEs will be used, not the pages themselves. **Restriction** The cursor surface address must be 4K byte aligned. The cursor must be in linear memory, it cannot be tiled.

The cursor is enabled by programming a valid cursor mode in the cursor mode select fields. The cursor is disabled by programming all 0s in the cursor mode select fields.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30:28	**Pipe Slice Arbitration Slots** This field specifies the number of slots allocated to cursor in pipe slice request arbitration. This field is ignored when the 'PIPE_SLICE_ARBITRATION_CTL->Use Programmed Slots' is not set. This field is zero based; a programmed value of 0 results in 1 slot allocation.

CUR_CTL

27 Reserved

Access:	RO
Format:	MBZ

26 Gamma Enable

This bit enables pipe gamma correction for the cursor pixel data. In VGA pop-up operation, the cursor data will always bypass gamma.

This field is deprecated.

Value	Name
0b	Disable
1b	Enable

25 Reserved

Access:	RO
Format:	MBZ

24 Pipe CSC Enable

This bit enables pipe color space conversion for the cursor pixel data.

Use CSC_MODE.Pipe CSC Enable, GAMMA_MODE.*_GAMMA_ENABLE for enabling pipe color space conversion and gamma respectively across all pixels from all planes. Cursor CSC must be used for cursor specific color space conversion.

This field is deprecated.

Value	Name
0b	Disable
1b	Enable

23 Allow Double Buffer Update Disable

Access:	R/W

This field controls whether double buffer updates are allowed to be disabled for this cursor. The DOUBLE_BUFFER_CTL register can be configured to globally disable double buffer updates for resources that allow them to be disabled.

Value	Name
0b	Not Allowed
1b	Allowed

22:19 Reserved

Access:	RO
Format:	MBZ

CUR_CTL

18 Pre CSC Gamma Enable

This bit enables the cursor pre-CSC gamma for the cursor pixel data. This is generally used with HDR to de-gamma the sRGB cursor pixel data before the RGB2020 conversion.

Value	Name
0b	Disable
1b	Enable

17 Reserved

Access:	RO
Format:	MBZ

16 CSC Enable

This bit enables the cursor color space conversion for the cursor pixel data. Hardware uses the coefficients programmed in the CUR_CSC_COEFF registers to perform the color space conversion.

Value	Name
0b	Disable
1b	Enable

15 180 Rotation

This mode causes the cursor image to be rotated 180 degrees. In addition to setting this bit, the cursor position must be adjusted to match the physical orientation of the display.

Value	Name
0b	No rotation
1b	180 degree rotation

Restriction
Only 32 bits per pixel cursors can be rotated. This field must be zero when the cursor format is 2 bits per pixel.

14:12 Reserved

Access:	RO
Format:	MBZ

11:10 Force Alpha Plane Select

This field selects which planes the cursor alpha value will be forced for. It is used together with the Force Alpha Value field.

Value	Name	Description
00b	Disable	Disable alpha forcing
01b	Pipe CSC Enabled	Enable alpha forcing where cursor overlaps a plane that has enabled pipe CSC
10b	Pipe CSC Disabled	Enable alpha forcing where cursor overlaps plane that has disabled pipe CSC
11b	Reserved	Reserved

CUR_CTL

9:8 Force Alpha Value

This field controls the behavior of cursor when alpha blending onto certain plane pixels. It is used together with the Force Alpha Plane Select field.

Value	Name	Description
00b	Disable	Cursor pixels alpha blend normally over any plane.
01b	50	Cursor pixels with alpha >= 50% are made fully opaque where they overlap the selected plane(s). Cursor pixels with alpha < 50% are made fully transparent where they overlap the selected plane(s).
10b	75	Cursor pixels with alpha >= 75% are made fully opaque where they overlap the selected plane(s). Cursor pixels with alpha < 75% are made fully transparent where they overlap the selected plane(s).
11b	100	Cursor pixels with alpha = 100% are made fully opaque where they overlap the selected plane(s). Cursor pixels with alpha < 100% are made fully transparent where they overlap the selected plane(s).

Restriction
Force Alpha is only for use with ARGB cursor formats.

7:6 Reserved

Access:	RO
Format:	MBZ

5:0 Cursor Mode Select

This field selects the cursor mode. Cursor is disabled when the selection is 000000b and enabled when the selection is any other value. The cursor vertical size can be overriden by the size reduction mode.

Color channels should be pre-multiplied with alpha by software.

Value	Name	Description
000000b	Disable	Cursor is disabled
000010b	128x128 32bpp AND/INV	128x128 32bpp AND/INVERT
000011b	256x256 32bpp AND/INV	256x256 32bpp AND/INVERT
000100b	64x64 2bpp 3-color	64x64 2bpp Indexed 3-color and transparency
000101b	64x64 2bpp 2-color	64x64 2bpp Indexed AND/XOR 2-color
000110b	64x64 2bpp 4-color	64x64 2bpp Indexed 4-color
000111b	64x64 32bpp AND/INV	64x64 32bpp AND/INVERT
100010b	128x128 32bpp ARGB	128x128 32bpp ARGB (8:8:8:8 MSB-A:R:G:B)
100011b	256x256 32bpp ARGB	256x256 32bpp ARGB (8:8:8:8 MSB-A:R:G:B)
100100b	64x64 32bpp AND/XOR	64x64 32bpp AND/XOR
100101b	128x128 32bpp AND/XOR	128x128 32bpp AND/XOR
100110b	256x256 32bpp AND/XOR	256x256 32bpp AND/XOR
100111b	64x64 32bpp ARGB	64x64 32bpp ARGB (8:8:8:8 MSB-A:R:G:B)

Others	Reserved	Reserved

Programming Notes
INVERT, XOR, and alpha blends may not look as expected when the plane underlying the cursor is YUV or extended range RGB. Out of range RGB values will be clamped prior to alpha blending, INVERT, or XOR with cursor. It is recommended to use Force Alpha when cursor is alpha blending onto a plane of a different color space or extended gamut.
The AND/INVERT format uses the most significant byte (MSB) to control the color. If MSB is 0xFF: Cursor is opaque. Show cursor color from three least significant bytes. If MSB is 0x00: Cursor is transparent. Three least significant bytes must be zero. If MSB is not 0x00 or 0xFF: Cursor inverts the color of the surface underneath.
The AND/XOR format uses the most significant byte (MSB) to control the color. If MSB is 0xFF: Cursor is opaque. Show cursor color from three least significant bytes. If MSB is 0x00: Cursor is transparent. Three least significant bytes must be zero. If MSB is not 0x00 or 0xFF: The three least significant bytes are XOR'd with the color of the surface underneath.

Name:	Cursor Position
ShortName:	CUR_POS_D
Reset:	soft

This register specifies the screen position of the cursor. The origin of the cursor position is always the upper left corner of the display pipe source image area. When performing 180 degree rotation, the cursor image is rotated by hardware, but the position is not, so it should be adjusted if it is desired to maintain the same apparent position on a physically rotated display.

Restriction
The cursor must have at least a single pixel positioned over the pipe source area. The cursor must not overlap both the left and right sides of the pipe source area.

DWord	Bit	Description
0	31	**Y Position Sign** This specifies the sign of the vertical position of the cursor upper left corner.
	30:29	**Reserved** Access: RO Format: MBZ

CUR_POS		
	28:16	**Y Position Magnitude** This specifies the magnitude of the vertical position of the cursor upper left corner in lines.
	15	**X Position Sign** This specifies the sign of the horizontal position of the cursor upper left corner.
	14:13	**Reserved** Access: RO Format: MBZ
	12:0	**X Position Magnitude** This specifies the magnitude of the horizontal position of the cursor upper left corner in pixels.

CUR_PRE_CSC_GAMC_DATA

CUR_PRE_CSC_GAMC_DATA	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	700B4h-700B7h
Name:	Cursor Pre CSC Gamma Data
ShortName:	CUR_PRE_CSC_GAMMA_DATA_A
Reset:	soft
Address:	710B4h-710B7h
Name:	Cursor Pre CSC Gamma Data
ShortName:	CUR_PRE_CSC_GAMMA_DATA_B
Reset:	soft
Address:	720B4h-720B7h
Name:	Cursor Pre CSC Gamma Data
ShortName:	CUR_PRE_CSC_GAMMA_DATA_C
Reset:	soft
Address:	730B4h-730B7h
Name:	Cursor Pre CSC Gamma Data
ShortName:	CUR_PRE_CSC_GAMMA_DATA_D
Reset:	soft

CUR_PRE_CSC_GAMC_INDEX and CUR_PRE_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the cursor pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion if desired.
The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.
For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as 16 bits per color in an unsigned 0.16 format with 0 integer and 16 fractional. The 33rd, 34th and 35th entries are stored as 19 bits per color in an unsigned 3.16 format with 3 integer and 16 fractional bits.
For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 33rd and 34th gamma entries to create the result value.
For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.
For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.
Pre-CSC Gamma correction gets enabled or disabled based on the "Pre CSC Enable" bit in the CUR_CTL register.

CUR_PRE_CSC_GAMC_DATA

Programming Notes
To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.

Restriction
The gamma curve must be flat or increasing, never decreasing. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

DWord	Bit	Description

Customizable Event Creation 5-0

CEC5_0 - Customizable Event Creation 5-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02798h

Description
This register is used to define custom counter event 5, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. 0b – Pass-through – Input bit is passed through to comparator as is 1b – Negated – Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). 01b – Prev Event – Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b – Reserved –
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.

CEC5_0 - Customizable Event Creation 5-0

2:0 **Compare Function**

Format:	U3
_Custom_GTIReset:	DEV

This field selects the function used by the CEC comparator when comparing the compare value to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved

DWord	Bit	Description
0	31	**Send Busy** Access: R/W Set Writing this bit with 1b initiates the transaction, when read this bit will be a 1b until the transmission completes. The transaction is completed when the response is received or when a timeout occurs. This is a sticky bit. Write a 1b to this bit to set it and initiate the transaction. Hardware will clear it when the transaction completes. **Programming Notes** Aux IO power must be enabled in PWR_WELL_CTL prior to starting an Aux transaction. **Restriction** Do not change any fields while Send Busy is asserted. Do not write a 1b again until transaction completes.
	30	**Done** Access: R/WC A sticky bit that indicates the transaction has completed. Write a 1 to this bit to clear the event 0b – Not done 1b – Done
	29	**Interrupt on Done** Access: R/W Enable an interrupt when the transaction completes or times out. 0b – Disable 1b – Enable
	28	**Time out error** Access: R/WC A sticky bit that indicates the transaction has timed out. Write a 1 to this bit to clear the event. 0b – Not error 1b – Error

DDI_AUX_CTL

27:26 Time out timer value

Access:	R/W

Used to determine how long to wait for receiver response before timing out.

Value	Name
01b	600us **[Default]**
10b	800us
11b	4000us

25 Receive error

Access:	R/WC

A sticky bit that indicates that the data received was corrupted, not in multiples of a full byte, or more than 20 bytes. Write a 1 to this bit to clear the event.

Value	Name
0b	Not Error
1b	Error

24:20 Message Size

Access:	Write/Read Status

The value written to this field indicates the total number bytes to transmit (including the header). The value read from this field indicates the number of bytes received, including the header, in the last transaction. Sync/Stop are not part of the message or the message size. Reads of this field will give the response message size. The read value will not be valid while Send/Busy bit 31 is asserted.

Restriction
Message sizes of 0 or >20 are not allowed. Reads and writes are valid only when the done bit is set and timeout or receive error has not occurred.

19:16 Reserved

Access:	RO
Format:	MBZ

15 Reserved

14 Reserved

13 Reserved

12 Reserved

11 IO Select

Access:	R/W

This field selects which IO will be used for the Aux transaction. It must not be switched while a transaction is in progress.

Value	Name	Description
1b	TBT	Use Thunderbolt IO
0b	Legacy	Use legacy IO. Either typeC or regular DDI, depending on project and SKU

DDI_AUX_CTL

	10	**Reserved** Access: RO Format: MBZ
	9:5	**Fast Wake Sync Pulse Count** Default Value: 1 0001b 18 pulses Access: R/W This field determines the total number of SYNC pulses sent during the SYNC phase of a fast wake transaction. The value programmed is the number of pulses minus 1. When this is field is set to "n" the aux controller will send "n+1" SYNC pulses before transmitting the STOP pattern. **SW must always program this field to the value of decimal 7.**
	4:0	**Sync Pulse Count** Default Value: 1 1111b 32 pulses Access: R/W This field determines the total number of SYNC pulses sent during the SYNC phase of a standard transaction. The value programmed is the number of pulses minus 1. When this is field is set to "n" the aux controller will send "n+1" SYNC pulses before transmitting the STOP pattern. **Restriction** This field must be programmed to at least 25 decimals to send the minimum amount of pulses required for a standard transaction.

Format:	MBZ

16 Port Reversal

This field enables lane reversal within the port. Lane reversal swaps the data on the lanes as they are output from the port.

Value	Name
0b	Not reversed
1b	Reversed

Programming Notes

Type-C/TBT dynamic connections:
The DDIs going to thunderbolt or USB-C DP alternate mode should not be reversed here. The reversal is taken care of in the FIA.
Static/fixed connections (DP/HDMI) through FIA:
In the case of static connections such as "No pin assignment (Non Type-C DP)", DDIs will use this lane reversal bit.
All other connections:
DDIs will use this lane reversal bit.

Restriction

This field must not be changed while the DDI is enabled.

15:8 USB Type-C DP Lane Staggering Delay

Specifies the number of symbol clocks delay used to stagger assertion/deassertion of the port lane enables. The target time recommended by circuit team is 100ns or greater. The delay should be programmed based on link clock frequency. This staggering delay is ONLY required when the port is used in USB Type C mode. Otherwise the default delay is zero which means no staggering. Example: 270MHz link clock = 1/270MHz = 3.7ns. (100ns/3.7ns)=27.02 symbols. Round up to 28.

7 DDI Idle Status

Access:	RO

This bit indicates when the DDI buffer is idle.

Value	Name
0b	Buffer Not Idle
1b	Buffer Idle

6 Reserved

Access:	RO
Format:	MBZ

5:4 Reserved

Access:	RO
Format:	MBZ

DDI_BUF_CTL

	3:1	**DP Port Width Selection** This bit selects the number of lanes to be enabled on the DDI link for DisplayPort.

Value	Name	Description
000b	x1	x1 Mode
001b	x2	x2 Mode
011b	x4	x4 Mode
Others	Reserved	Reserved

Restriction
When in DisplayPort mode the value selected here must match the value selected in TRANS_DDI_FUNC_CTL attached to this DDI.
This field must not be changed while the DDI is enabled.

	0	**Init Display Detected**

Access:	RO

Strap indicating whether a display was detected on this port during initialization. It signifies the level of the port detect pin at boot. This bit is only informative. It does not prevent this port from being enabled in hardware. This field only indicates the DDIA detection.

Value	Name	Description
0b	Not Detected	Digital display not detected during initialization
1b	Detected	Digital display detected during initialization

DDI_CLK_SEL

DDI_CLK_SEL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	4610Ch-4610Fh
Name:	DDI USBC1 Clock Select
ShortName:	DDI_CLK_SEL_USBC1
Reset:	soft
Address:	46110h-46113h
Name:	DDI USBC2 Clock Select
ShortName:	DDI_CLK_SEL_USBC2
Reset:	soft
Address:	46114h-46117h
Name:	DDI USBC3 Clock Select
ShortName:	DDI_CLK_SEL_USBC3
Reset:	soft
Address:	46118h-4611Bh
Name:	DDI USBC4 Clock Select
ShortName:	DDI_CLK_SEL_USBC4
Reset:	soft
Address:	4611Ch-4611Fh
Name:	DDI USBC5 Clock Select

Reset:	soft
Address:	46120h-46123h
Name:	DDI USBC6 Clock Select
ShortName:	DDI_CLK_SEL_USBC6
Reset:	soft

DWord	Bit	Description
0	31:28	**Clock Select** Select which clock to use for this DDI.

Value	Name	Description
0000b	None	Nothing selected. Clock is disabled for this DDI.
1000b	MG	Type-C PHY PLL output
1100b	TBT 162	Thunderbolt 162 MHz

		1101b	TBT 270	Thunderbolt 270 MHz
		1110b	TBT 540	Thunderbolt 540 MHz
		1111b	TBT 810	Thunderbolt 810 MHz

Restriction

This must not be changed while the DDI is enabled or any transcoder directed to the DDI is enabled.

27:0 **Reserved**

Access:	RO
Format:	MBZ

DE_FUSA_IOSF_PARITY_CNTRL

DE_FUSA_IOSF_PARITY_CNTRL - DE_FUSA_IOSF_PARITY_CNTRL

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100140h

This register controls the parity generation, checking, and error insertion logic in the DE IOSF end points : PSF 0 and PSF DIP

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29	**PSF DIP Cmd Parity Gen Dis** Default Value: 0h Access: R/W _Custom_GTIReset: BUS When 1 command parity generation is disabled
	28	**Reserved** Access: RO Format: MBZ
	27:26	**Reserved** Access: RO Format: MBZ
	25	**PSF DIP Cmd Parity Chk En** Default Value: 0h Access: R/W _Custom_GTIReset: BUS When 1 checking of command parity is enabled
	24	**PSF DIP Data Parity Chk En** Default Value: 0h Access: R/W _Custom_GTIReset: BUS When 1 checking of data parity is enabled

DE_FUSA_IOSF_PARITY_CNTRL - DE_FUSA_IOSF_PARITY_CNTRL

23	**Reserved** Access: RO Format: MBZ
22	**PSF DIP Cmd Parity Err Inj** Default Value: 0h Access: R/W _Custom_GTIReset: BUS 0: No error injection 1: Invert mcparity Once set the next command mcparity is corrupted and then the bit is cleared by HW.
21:20	**Reserved** Access: RO Format: MBZ
19:14	**Reserved** Access: RO Format: MBZ
13	**PSF 0 Cmd Parity Gen Dis** Default Value: 0h Access: R/W _Custom_GTIReset: BUS When 1 command parity generation is disabled
12	**PSF 0 Data Parity Gen Dis** Default Value: 0h Access: R/W _Custom_GTIReset: BUS When 1 data parity generation is disabled
11:10	**Reserved** Access: RO Format: MBZ
9	**PSF 0 Cmd Parity Chk En** Default Value: 0h Access: R/W _Custom_GTIReset: BUS When 1 checking of command parity is enabled

DE_FUSA_IOSF_PARITY_CNTRL - DE_FUSA_IOSF_PARITY_CNTRL

8	**PSF 0 Data Parity Chk En** Default Value: 0h Access: R/W _Custom_GTIReset: BUS When 1 checking of data parity is enabled
7	**Reserved** Access: RO Format: MBZ
6	**PSF 0 Cmd Parity Err Inj** Default Value: 0h Access: R/W _Custom_GTIReset: BUS 0: No error injection 1: Invert mcparity Once set the next command mcparityis corrupted and then the bit is cleared by HW.
5:4	**PSF 0 Data Parity Error Inj** Default Value: 0h Access: R/W _Custom_GTIReset: BUS 00: No error injected 01:Invert mdparity[0] 10:Invert mdparity[1] 11: Invert mdparity[1:0] Once set the next command with data is corrupted and then the bit is cleared by HW. Note: mdparity[1] is only present forIOSF data widths of 512
3:1	**Reserved** Access: RO Format: MBZ
0	**DE_FUSA_IOSF_PARITY_CNTRL_LOCK** Default Value: 000b _Custom_GTIReset: BUS Writing 1 to this bit will lock the register from further updates

DE_PIPE_INTERRUPT

DE_PIPE_INTERRUPT	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	44400h-4440Fh
Name:	Display Engine Pipe A Interrupts
ShortName:	DE_PIPE_INTERRUPT_A
Reset:	soft
Address:	44410h-4441Fh
Name:	Display Engine Pipe B Interrupts
ShortName:	DE_PIPE_INTERRUPT_B
Reset:	soft
Address:	44420h-4442Fh
Name:	Display Engine Pipe C Interrupts
ShortName:	DE_PIPE_INTERRUPT_C
Reset:	soft
Address:	44430h-4443Fh
Name:	Display Engine Pipe D Interrupts
ShortName:	DE_PIPE_INTERRUPT_D
Reset:	soft

This table indicates which events are mapped to each bit of the Display Engine Pipe Interrupt registers. The IER enabled Display Engine Pipe Interrupt IIR (sticky) bits are ORed together to generate the DE_Pipe Interrupts Pending bit in the next level up interrupt registers. There is one full set of Display Engine Pipe interrupts per display pipe. The STEREO3D_EVENT_MASK selects between left eye and right eye reporting of vertical blank, vertical sync, and scanline events in stereo 3D modes.

0x44400 = ISR A, 0x44410 = ISR B, 0x44420 = ISR C, 0x44430 = ISR D
0x44404 = IMR A, 0x44414 = IMR B, 0x44424 = IMR C, 0x44434 = IMR D
0x44408 = IIR A, 0x44418 = IIR B, 0x44428 = IIR C, 0x44438 = IIR D
0x4440C = IER A, 0x4441C = IER B, 0x4442C = IER C, 0x4443C = IER D

DWord	Bit	Description
0	31	**Underrun** Description: The ISR is an active high pulse when there is an underrun on the transcoder attached to this pipe.
	30	**VRR Double Buffer Update** The ISR is an active high pulse on the eDP/DP Variable Refresh Rate double buffer update event on this pipe.
	29	**Reserved**

DE_PIPE_INTERRUPT

	28	**Reserved**
	27	**Isoch Ack** The ISR is an active high pulse when the IsocReq for this pipe receives an Ack.
	26	**PIPEDMC_Interrupt** The ISR is an active high pulse when the PIPE DMC has an interrupt.
	25	**PIPEDMC_gtt_fault_status** The ISR is an active high pulse when the PIPE DMC gtt fault occurs.
	24	**Unused_Int_24** These interrupts are currently unused.
	23	**LACE Fast Access Interrupt** The ISR is an active high level indicating an interrupt is set in DPLC_FA_STATUS.
	22	**Plane7_GTT_Fault_Status** The ISR is an active high pulse when a GTT fault is detected for plane 7 on this pipe.
	21	**Plane6_GTT_Fault_Status** The ISR is an active high pulse when a GTT fault is detected for plane 6 on this pipe.
	20	**Plane5_GTT_Fault_Status** Description The ISR is an active high pulse when a GTT fault is detected for plane 5 on this pipe.
	19	**Vblank unmodified** The ISR is an active high level for the duration of the vertical blank of the transcoder attached to this pipe, the unmodified vertical blank, as opposed to the modified vertical blank that the pipe units use. The transcoder vertical blank always begins at the end of transcoder vertical active (unmodified). When the transcoder vertical blank start is programmed later than transcoder vertical active, the pipe vertical blank will start later than the transcoder vertical blank (modified).
	18	**Plane7_Flip_Done** The ISR is an active high pulse when the flip is done for plane 7 on this pipe.
	17	**Plane6_Flip_Done** The ISR is an active high pulse when the flip is done for plane 6 on this pipe.
	16	**Plane5_Flip_Done** The ISR is an active high pulse when the flip is done for plane 5 on this pipe.

DE_PIPE_INTERRUPT

	15	**DSB_2_Interrupt** The ISR is an active high pulse when there is interrupt from DSB 2. SW must read the DSB interrupt registers to check what is caused interrupt in DSB.
	14	**DSB_1_Interrupt** The ISR is an active high pulse when there is interrupt from DSB 1. SW must read the DSB interrupt registers to check what is caused interrupt in DSB..
	13	**DSB_0_Interrupt** The ISR is an active high pulse when there is interrupt from DSB 0. SW must read the DSB interrupt registers to check what is caused interrupt in DSB..
	12	**DPST_Histogram_event** The ISR is an active high pulse on the DPST Histogram event on this pipe.
	11	**Cursor_GTT_Fault_Status** **Description** The ISR is an active high pulse when a GTT fault is detected for the cursor on this pipe.
	10	**Plane4_GTT_Fault_Status** **Description** The ISR is an active high pulse when a GTT fault is detected for plane 4 on this pipe.
	9	**Plane3_GTT_Fault_Status** **Description** The ISR is an active high pulse when a GTT fault is detected for plane 3 on this pipe.
	8	**Plane2_GTT_Fault_Status** **Description** The ISR is an active high pulse when a GTT fault is detected for plane 2 on this pipe.
	7	**Plane1_GTT_Fault_Status** **Description** The ISR is an active high pulse when a GTT fault is detected for plane 1 on this pipe.
	6	**Plane4_Flip_Done** The ISR is an active high pulse when the flip is done for plane 4 on this pipe.
	5	**Plane3_Flip_Done** The ISR is an active high pulse when the flip is done for plane 3 on this pipe.
	4	**Plane2_Flip_Done** The ISR is an active high pulse when the flip is done for plane 2 on this pipe.
	3	**Plane1_Flip_Done** The ISR is an active high pulse when the flip is done for plane 1 on this pipe.
	2	**Scan_Line_Event** The ISR is an active high pulse on the scan line event of the transcoder attached to this pipe.

DE_PIPE_INTERRUPT		
	1	**Vsync** The ISR is an active high level for the duration of the vertical sync of the transcoder attached to this pipe.
	0	**Vblank** **Description** The ISR is an active high level for the duration of the vertical blank of the transcoder attached to this pipe. This represents the vertical blank observed by units within the pipe and used for updating double-buffered registers in the pipe. The transcoder vertical blank always begins at the end of transcoder vertical active (unmodified). When the transcoder vertical blank start is programmed later than transcoder vertical active, the pipe vertical blank will start later than the transcoder vertical blank (modified).

DE_POWER1

DE_POWER1	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	42400h-42403h
Name:	Display Engine Power 1
ShortName:	DE_POWER1
Reset:	global

DWord	Bit	Description
0	31	**Power Well 2 State** This field indicates the status of display power well 2. Value: 0b = Off; 1b = On
	30	**Display Pipes Enabled** This field indicates if any display pipes are enabled. Value: 0b = Disabled (All display pipes disabled); 1b = Enabled (One or more display pipes enabled)
	29	**Reserved** Access: RO Format: MBZ
	28	**Power Well 1 State** This field indicates the status of display power well 1. Value: 0b = Off; 1b = On
	27:26	**SRD Status** This field indicates the live status of the SRD link on transcoder A. Value: 00b = Full Off (Link is fully off. DDI lanes are disabled and most memory reads are disabled.); 01b = Full On (Link is fully on. Normal operation.); 11b = Reserved (Reserved)
	25	**KVM Session Status** This field indicates the status of KVM session.

DE_POWER1

Value	Name	Description
0b	Disabled	KVM session disabled
1b	Enabled	KVM session enabled

24:20	**Transmit Lanes Enabled** The total number of DDI lanes enabled.
19:14	**Reserved** Access: RO Format: MBZ
13:10	**Enabled Pipe Scalers** Indicates total usage of the Scaler EBBs.
9:8	**Enabled DEPLLs** The total number of display CCU PLLs enabled.
7	**Reserved** Access: RO Format: MBZ
6:4	**Reserved** Access: RO Format: MBZ
3	**Enabled CDPLLs** Indicates if CD PLL is enabled.
2:0	**Enabled MGPLLs** The total number of type-C PLLs enabled by display.

DE_POWER2

DE_POWER2	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	42404h-42407h
Name:	Display Engine Power 2
ShortName:	DE_POWER2
Reset:	global

DWord	Bit	Description
0	31:0	**DE bandwidth counter** This counter increments on every cache line put arriving at the DE. The bandwidth is estimated by taking the difference between two reads at a known interval. Access is actually a read/write variant. Writes to this register will load the write data into the counter. **Restriction** This register will measure the memory Bandwidth of the Low Priority channel to memory. It is associated with ABOX. It does not measure BW associated with ABOX1 or ABOX2.

DE_RR_DEST

DE_RR_DEST

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	44058h-4405Bh
Name:	Render Response Destination
ShortName:	DE_RR_DEST
Reset:	soft

This register selects the destination of certain render responses that may go to CS, BCS, or both. In order for a response to be sent to a particular destination, the event most occur, the event must be unmasked, and that destination must be selected.

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7:6	**Pipe D Vertical Blank Destination** This field selects the destination for the render response sent on pipe D start of vertical blank. 00b: CS 01b: BCS 10b,11b: Both CS and BCS
	5:4	**Pipe C Vertical Blank Destination** This field selects the destination for the render response sent on pipe C start of vertical blank. 00b: CS 01b: BCS 10b,11b: Both CS and BCS
	3:2	**Pipe B Vertical Blank Destination** This field selects the destination for the render response sent on pipe B start of vertical blank. 00b: CS 01b: BCS 10b,11b: Both CS and BCS

<table>

</table>

DE_RRMR

DE_RRMR	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	44050h-44053h
Name:	Render Response Mask
ShortName:	DE_RRMR
Reset:	soft

This register contains a bit mask which selects which events cause and are reported in the render response message.
See the render response message definition table to find the source event for each bit.
The render response message is sent from the display engine to the render command streamer (CS) or blitter command streamer (BCS). The message is used to inform CS and BCS of certain display events.
This register is used to control which render response message bits are masked or unmasked.
Unmasked bits will cause a render response message to be sent and will be reported in that message.
Masked bits will not be reported and will not cause a render response message to be sent.
Vertical blank events occur periodically while the associated display pipe timing generator is running and will be reported in a render response to CS or BCS (depending on DE_RR_DEST destination selection) if un-masked here.
Scanline events occur after they have been initiated through MMIO writes or LRI to the Display Load Scan Lines register. A scanline done event will be reported in a render response to CS if un-masked here and the Display Load Scanline source is CS. A scanline done event will be reported in a render response to BCS if un-masked here and the Display Load Scanline source is BCS.
Flip done events occur after they have been initiated through MI_DISPLAY_FLIP or MMIO write to plane surface address registers. A flip event will be reported in a render response to CS if un-masked here and the flip source is CS. A flip event will be reported in a render response to BCS if un-masked here and the flip source is BCS.

This register defines the DWord 0 of the render response bit mask. DWord 1and DWord 2 are defined inDE_RRMR_DW1 and DE_RRMR_DW2 registers.

Programming Notes

Programming this register can be done through MMIO or a command streamer LOAD_REGISTER_IMMEDIATE (LRI) command.
When using LRI, care must be taken to follow all the programming rules for LRI targeting the display engine.
Unmasked events will wake GT as they occur, so for improved power savings it is recommended to only unmask events while they are required.

Restriction

Events must be unmasked prior to waiting for them with a MI_WAIT_FOR_EVENT ring command, or in the case of flips or scanlines, prior to starting the flip or loading the scanline.

	0	**Mask 0** Value: 0b — Name: Not Masked Value: 1b — Name: Masked **[Default]**

DE_RRMR_DW2

DE_RRMR_DW2

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	4404Ch-4404Fh
Name:	Render Response Mask DW 2
ShortName:	DE_RRMR_DW2
Reset:	soft

This register contains the DWord 2 of the CS/BCS render response bit mask. For more details refer to DE_RRMR.

DWord	Bit	Description
0	31	**Mask 31** Value: 0b – Not Masked Value: 1b – Masked **[Default]**
	30	**Mask 30** Value: 0b – Not Masked Value: 1b – Masked **[Default]**
	29	**Mask 29** Value: 0b – Not Masked Value: 1b – Masked **[Default]**
	28	**Mask 28** Value: 0b – Not Masked Value: 1b – Masked **[Default]**
	27	**Mask 27** Value: 0b – Not Masked Value: 1b – Masked **[Default]**
	26	**Mask 26** Value: 0b – Not Masked Value: 1b – Masked **[Default]**

Decouple Register 0 DW0

DECOUPREG0DW0 - Decouple Register 0 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F00h-00F03h	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg0DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 0 DW0 Data.

Decouple Register 0 DW1

DECOUPREG0DW1 - Decouple Register 0 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F04h-00F07h	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 1 DW0

DECOUPREG1DW0 - Decouple Register 1 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F08h-00F0Bh	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg1DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 1 DW0 Data.

Decouple Register 1 DW1

DECOUPREG1DW1 - Decouple Register 1 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F0Ch-00F0Fh	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 2 DW0

DECOUPREG2DW0 - Decouple Register 2 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F10h-00F13h	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg2DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 2 DW0 Data.

Decouple Register 2 DW1

DECOUPREG2DW1 - Decouple Register 2 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F14h-00F17h	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 3 DW0

DECOUPREG3DW0 - Decouple Register 3 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F18h-00F1Bh	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg3DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 3 DW0 Data.

Decouple Register 3 DW1

DECOUPREG3DW1 - Decouple Register 3 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F1Ch-00F1Fh	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 4 DW0

DECOUPREG4DW0 - Decouple Register 4 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F20h-00F23h	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg4DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 4 DW0 Data. DCR requests on the NP path will be blocked during CPD

Decouple Register 4 DW1

DECOUPREG4DW1 - Decouple Register 4 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F24h-00F27h	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 5 DW0

DECOUPREG5DW0 - Decouple Register 5 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F28h-00F2Bh	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg5DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 5 DW0 Data.

Decouple Register 5 DW1

DECOUPREG5DW1 - Decouple Register 5 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F2Ch-00F2Fh	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 6 DW0

DECOUPREG6DW0 - Decouple Register 6 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F30h-00F33h	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg6DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 6 DW0 Data.

Decouple Register 6 DW1

DECOUPREG6DW1 - Decouple Register 6 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F34h-00F37h	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 7 DW0

DECOUPREG7DW0 - Decouple Register 7 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F38h-00F3Bh	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg7DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 7 DW0 Data.

Decouple Register 7 DW1

DECOUPREG7DW1 - Decouple Register 7 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F3Ch-00F3Fh	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 8 DW0

DECOUPREG8DW0 - Decouple Register 8 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F40h-00F43h	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg8DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 8 DW0 Data.

Decouple Register 8 DW1

DECOUPREG8DW1 - Decouple Register 8 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F44h-00F47h	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 9 DW0

DECOUPREG9DW0 - Decouple Register 9 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F48h-00F4Bh	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg9DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 9 DW0 Data.

Decouple Register 9 DW1

DECOUPREG9DW1 - Decouple Register 9 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F4Ch-00F4Fh	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 10 DW0

DECOUPREG10DW0 - Decouple Register 10 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F50h-00F53h	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg10DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 10 DW0 Data.

Decouple Register 10 DW1

DECOUPREG10DW1 - Decouple Register 10 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F54h-00F57h	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 11 DW0

DECOUPREG11DW0 - Decouple Register 11 DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00F58h-00F5Bh	
DWord	**Bit**	**Description**
0	31:0	**DecoupReg11DW0Data** Access: R/W _Custom_GTIReset: BUS Decouple Register 11 DW0 Data.

Decouple Register 11 DW1

DECOUPREG11DW1 - Decouple Register 11 DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00F5Ch-00F5Fh	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Decouple Register 12 DW0

DECOUPREG12DW0 - Decouple Register 12 DW0

Address:	00F7Ch-00F7Fh	
DWord	**Bit**	**Description**
0	31	**GO** Access: R/W Lock Decouple Register Go/Status Bit: Software sets this bit along with attributes (full DW write) to initiate a DCR request. Hardware clears this bit to 0 when the command is complete. This bit serves as a lock for the register pair preventing software from updating the status/values once set.
	30:28	**OP** Access: R/W Lock Decouple Register Opcode: 3'b000 = Read, 3'b001 = Write; All others undefined (Request ignored and go/status cleared).
	27:24	**BE_B** Access: R/W Lock Decouple Register Active Low Byte Enables. Byte enables affect data merging into MGSR shadow storage however GT only supports full dword accesses.
	23:0	**Addr** Access: R/W Lock Decouple Register Address.

Dedicated Path Arbiter Credits

DEDICATED_PATH_ARB_CREDITS - Dedicated Path Arbiter Credits

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100180h

This register holds the credits for arbitrating between different ABOXs for streaming HP traffic to the dedicated memory path

DWord	Bit	Description
0	31:15	**Spare_0** Default Value: 0000h Access: R/W _Custom_GTIReset: BUS Spare bits
	14:8	**ABOX1 Credits** Default Value: 00h Access: R/W _Custom_GTIReset: BUS Number of Credits for ABOX1
	7	**Spare_1** Default Value: 0b Access: R/W _Custom_GTIReset: BUS Spare bit
	6:0	**ABOX0 Credits** Default Value: 00h Access: R/W _Custom_GTIReset: BUS Number of Credits for ABOX0

DE HPD Interrupt Definition

DE HPD Interrupt Definition	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	44470h-4447Fh
Name:	Display Engine HPD Interrupts
ShortName:	DE_HPD_INTERRUPT
Reset:	soft

This table indicates which events are mapped to each bit of the Display Engine HPD Interrupt registers.
0x44470 = ISR
0x44474 = IMR
0x44478 = IIR
0x4447C = IER
The HPD bits use a modified interrupt structure where the live value goes to the ISR and a processed event goes to the IMR and IIR path.

DWord	Bit	Description
0	31	**Unused 31**
	30	**Unused 30**

	9	**Unused 9**
	8	**Unused 8**
	7	**TBT8 Hotplug** The ISR gives the live state of the HPD for thunderbolt. The IIR is set if a short or long pulse is detected when HPD input is enabled.
	6	**TBT7 Hotplug** The ISR gives the live state of the HPD for thunderbolt. The IIR is set if a short or long pulse is detected when HPD input is enabled.
	5	**TBT6 Hotplug** The ISR gives the live state of the HPD for thunderbolt. The IIR is set if a short or long pulse is detected when HPD input is enabled.
	4	**TBT5 Hotplug** The ISR gives the live state of the HPD for thunderbolt. The IIR is set if a short or long pulse is detected when HPD input is enabled.
	3	**TBT4 Hotplug** The ISR gives the live state of the HPD for thunderbolt. The IIR is set if a short or long pulse is detected when HPD input is enabled.
	2	**TBT3 Hotplug** The ISR gives the live state of the HPD for thunderbolt. The IIR is set if a short or long pulse is detected when HPD input is enabled.

DE HPD Interrupt Definition		
	1	**TBT2 Hotplug** The ISR gives the live state of the HPD for thunderbolt. The IIR is set if a short or long pulse is detected when HPD input is enabled.
	0	**TBT1 Hotplug** The ISR gives the live state of the HPD for thunderbolt. The IIR is set if a short or long pulse is detected when HPD input is enabled.

DE Misc Interrupt Definition

DE Misc Interrupt Definition

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	44460h-4446Fh
Name:	Display Engine Miscellaneous Interrupts
ShortName:	DE_MISC_INTERRUPT
Reset:	soft

This table indicates which events are mapped to each bit of the Display Engine Miscellaneous Interrupt registers.
0x44460 = ISR
0x44464 = IMR
0x44468 = IIR
0x4446C = IER

DWord	Bit	Description
0	31	**Poison** The ISR is an active high pulse on receiving the poison response to a memory transaction.
	30	**ECC_Double_Error** The ISR is an active high level while any of the ECC Double Error status bits are set.
	29	**Reserved** Access: RO Format: MBZ
	28	**Isoch_msg_error** The ISR is an active high pulse on the Isoch messages error.
	27	**Isoch_rsptimeout_error** The ISR is an active high pulse on the Isoch response timeout error.
	26	**Reserved** Access: RO Format: MBZ
	25	**Reserved**
	24	**Reserved**
	23	**WD0_Interrupts_Combined** The ISR is an active high level while any of the WD0_IIR bits are set.
	22:20	**Reserved** Access: RO Format: MBZ

DE Misc Interrupt Definition

	19	**SRD_Interrupts_Combined** The ISR is an active high level while any of the SRD_IIR bits are set.
	18	**WD1_Interrupts_Combined** The ISR is an active high level while any of the WD1_IIR bits are set.
	17:16	**Reserved** Access: RO Format: MBZ
	15	**GTC_Interrupts_Combined** The ISR is an active high level while any of the GTC_IIR bits are set.

	7	**Reserved**
	6	**Reserved**
	5	**Reserved**
	4	**Reserved**
	3	**NonPipe Isoch Ack** The ISR is an active high pulse when the Non-Pipe IsocReq receives an Ack.
	2	**Reserved** Access: RO Format: MBZ
	1:0	**Reserved** Access: RO Format: MBZ

DE Port Interrupt Definition

DE Port Interrupt Definition

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	44440h-4444Fh
Name:	Display Engine Port Interrupts
ShortName:	DE_PORT_INTERRUPT
Reset:	soft

This table indicates which events are mapped to each bit of the Display Engine Port Interrupt registers.
0x44440 = ISR
0x44444 = IMR
0x44448 = IIR
0x4444C = IER

DWord	Bit	Description
0	31	**DSI1** The ISR is an active high level indicating a non-TE interrupt is set in DSI_INTER_IDENT_REG_1.
	30	**DSI0** The ISR is an active high level indicating a non-TE interrupt is set in DSI_INTER_IDENT_REG_0.
	29:25	**Reserved** Access: RO Format: MBZ
	24	**DSI1 TE** The ISR is an active high level indicating a TE interrupt is set in DSI_INTER_IDENT_REG_1.
	23	**DSI0 TE** The ISR is an active high level indicating a TE interrupt is set in DSI_INTER_IDENT_REG_0.
	22:21	**Reserved** Access: RO Format: MBZ
	20:14	**Reserved** Access: RO Format: MBZ
	13	**AUX USBC6** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.

DE Port Interrupt Definition

	12	**AUX USBC5** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.
	11	**AUX USBC4** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.
	10	**AUX USBC3** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.
	9	**AUX USBC2** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.
	8	**AUX USBC1** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.
	7:3	**Reserved** Access: RO Format: MBZ
	2	**AUX DDIC** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.
	1	**AUX DDIB** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.
	0	**AUX DDIA** The ISR is an active high pulse on the AUX done event. This event will not occur for HW triggered AUX transactions.

Device 2 Control

DEV2CTL_0_2_0_PCI - Device 2 Control			
Register Space:	PCI: 0/2/0		
Size (in bits):	8		
Address:	00058h		
This register implements a control bit to disable and hide the IOBAR register in systems that do not require legacy IOBAR access to Gfx MMIO registers.			
DWord	**Bit**	**Description**	
0	7:1	**Reserved**	
		Access:	RO
		Format:	MBZ
	0	**Reserved**	

Device Capabilities

DEVICECAP_0_2_0_PCI - Device Capabilities

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00074h

PCI Express Device Capabilities

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28	**Functional Level Reset Capability** Default Value: 1b Access: RO _Custom_GTIReset: BUS Hardwired to 1b to indicate the Function supports the optional Function Level Reset mechanism.
	27:26	**Captured Slot Power Limit Scale** Default Value: 00b Access: RO _Custom_GTIReset: BUS Not applicable for a Root Complex Integrated Endpoint with no Link or Slot. Hardwired to 00b
	25:18	**Captured Slot Power Limit Value** Default Value: 00000000h Access: RO _Custom_GTIReset: BUS Not applicable for a Root Complex Integrated Endpoint with no Link or Slot. Hardwired to 00h
	17:16	**Reserved** Access: RO Format: MBZ
	15	**Role-Based Error Reporting** Default Value: 1b Access: RO _Custom_GTIReset: BUS When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated

DEVICECAP_0_2_0_PCI - Device Capabilities

		into PCI Express Base Specification, Revision 1.1.Hardwired to 1b as this bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1, or subsequent PCI Express Base Specification revisions.
	14:12	**Reserved** Access: RO Format: MBZ
	11:9	**Endpoint L1 Acceptable Latency** Default Value: 000b Access: RO _Custom_GTIReset: BUS This field indicates the acceptable total latency that an Endpoint can withstand due to the transition from the L1 state to the L0 state. This does not apply to the integrated graphics device, so it is hardwired to 000b (Maximum of 1 us).
	8:6	**Endpoint L0s Acceptable Latency** Default Value: 000b Access: RO _Custom_GTIReset: BUS This field indicates the acceptable total latency that an Endpoint can withstand due to the transition from the L0s state to the L0 state. This does not apply to the integrated graphics device, so it is hardwired to 000b (Maximum of 64 ns).
	5	**Extended Tag Field Supported** Default Value: 0b Access: RO _Custom_GTIReset: BUS This bit indicates the maximum supported size of the Tag field as a Requester.This does not apply to the integrated graphics device, so it is hardwired to 0b (5-bit Tag field supported).
	4:3	**Phantom Functions Supported** Default Value: 00b Access: RO _Custom_GTIReset: BUS This field indicates the support for use of unclaimed Function Numbers to extend the number of outstanding transactions for PCIe devices.This does not apply to the integrated graphics device, so it is hardwired to 00b to indicate no Function Number bits are used for Phantom Functions.

DEVICECAP_0_2_0_PCI - Device Capabilities

	2:0	**Max Payload Size Supported** Default Value: 000b Access: RO _Custom_GTIReset: BUS This field indicates the maximum payload size that the Function can support for TLPs. Hardwired to 000b to represents 128 bytes, the minimum allowed value.

Device Enable

DEVEN_0_0_0_PCI - Device Enable

Register Space: PCI: 0/0/0
Size (in bits): 32

Address: 00054h

Allows for enabling/disabling of PCI devices and functions that are within the CPU package.

DWord	Bit	Description
0	31:15	**Reserved** Access: RO Format: MBZ
	14	**Chap Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS Unused - Bit field not relevant for the current project
	13	**Device 6 Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS Unused - Bit field not relevant for the current project
	12:11	**Reserved** Access: RO Format: MBZ
	10	**Device 5 Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS Unused - Bit field not relevant for the current project
	9:8	**Reserved** Access: RO Format: MBZ

DEVEN_0_0_0_PCI - Device Enable

	7	**Device 4 Enable** Default Value: 1b Access: R/W _Custom_GTIReset: BUS Unused - Bit field not relevant for the current project
	6	**Reserved** Access: RO Format: MBZ
	5	**Device 3 enable for Display HD Audio** Default Value: 1b Access: R/W _Custom_GTIReset: BUS
	4	**Internal Graphics Engine** Default Value: 1b Access: R/W _Custom_GTIReset: BUS 0: Bus 0 Device 2 is disabled and hidden1: Bus 0 Device 2 is enabled and visible This bit will be set to 0b and remain 0b if Device 2 capability is disabled.
	3	**PEG10 Enable** Default Value: 1b Access: R/W _Custom_GTIReset: BUS Unused - Bit field not relevant for the current project
	2	**PEG11 Enable** Default Value: 1b Access: R/W _Custom_GTIReset: BUS Unused - Bit field not relevant for the current project
	1	**PEG12 Enable** Default Value: 1b Access: R/W _Custom_GTIReset: BUS

DEVEN_0_0_0_PCI - Device Enable		
	0	**Host Bridge** Default Value: 1b Access: RO _Custom_GTIReset: BUS

Device Identification

DID2_0_2_0_PCI - Device Identification

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	00002h

This register combined with the Vendor Identification register uniquely identifies any PCI device.

DWord	Bit	Description
0	15:7	**Device Identification Number MSB** Default Value: 100110100b Access: R/W Variant _Custom_GTIReset: BUS All 16 bits of Device ID is acquired through fuse pull as per Chassis 2.1 updates.
	6:0	**Device Identification Number SKU** Default Value: 1000000b Access: RO Variant _Custom_GTIReset: BUS All 16 bits of Device ID is acquired through fuse pull as per Chassis 2.1 updates.

DFSDONE

DFSDONE	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	51080h-51083h
Name:	Display Fuse Done
ShortName:	DFSDONE
Reset:	global

This register is not reset by FLR.

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Download Done** This field indicates when fuse download is complete. 0b – Note Done 1b – Done

DFSM

DFSM

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	51000h-51003h
Name:	Display Fuse
ShortName:	DFSM
Reset:	global

This register contains fuse and strap settings for display. This register is not reset by FLR.

DWord	Bit	Description
0	31	**Reserved**
	30	**Display PipeA Disable** This bit indicates whether the display pipe A (first pipe) capability is disabled. Value / Name / Description: 0b / Enable / Pipe A Capability Enabled 1b / Disable / Pipe A Capability Disabled
	29	**Reserved**
	28	**Display PipeC Disable** This bit indicates whether the display pipe C (third pipe) capability is disabled. Value / Name / Description: 0b / Enable / Pipe C Capability Enabled 1b / Disable / Pipe C Capability Disabled
	27	**Display PM Disable** This bit indicates whether the display power management FBC and DPST capabilities are disabled. Value / Name / Description: 0b / Enable / PM Capability Enabled 1b / Disable / PM Capability Disabled
	26	**Display eDP Disable** Description: This fuse indicates that all combo PHY ports are disabled by the SoC and cannot be used. Value / Name / Description: 0b / Enable / eDP Capability Enabled 1b / Disable / eDP Capability Disabled
	25	**Reserved**
	24	**Reserved**

23	**Reserved**
22	**Display PipeD Disable** This bit indicates whether the display pipe D (fourth pipe) capability is disabled. **Value** / **Name** 0b – Enable 1b – Disable
21	**Display PipeB Disable** This bit indicates whether the display pipe B (second pipe) capability is disabled. **Value** / **Name** 0b – Pipe B Capability Enabled 1b – Pipe B Capability Disabled
20	**Display WD Disable** This bit indicates whether the display WD capability is disabled. **Value** / **Name** / **Description** 0b – Enable – WD Capability Enabled 1b – Disable – WD Capability Disabled
19	**Reserved**
18	**Reserved**
17	**Reserved**
16	**Isolated Decode Disable** This field indicates whether the Isolated Decode feature is disabled. **Value** / **Name** 0b – Isolated Decode Capability Enabled 1b – Isolated Decode Capability Disabled
15:8	**Audio Codec ID** This field indicates the lower 8 bits of the audio codec device ID. See the root node F00 verb for the device IDs on each project. **Value** / **Name** / **Description** 0Bh – Audio Codec ID 280Bh **[Default]** – Default value is N/A. Fuse download will override with correct value for this project.
7	**Display DSC Disable** This field indicates whether the DSC (port Display Stream Compression) feature is disabled. **Value** / **Name** 0b – DSC Capability Enabled 1b – DSC Capability Disabled
6	**Display RSB Enable** This bit indicates whether the remote screen blanking feature is enabled in the display engine.

DFSM

		Value / **Name** / **Description** 0b / Disable / RSB Capability Disabled 1b / Enable / RSB Capability Enabled
	5	**Reserved**
	4	**Reserved**
	3	**Reserved**
	2	**Reserved**
	1	**Reserved**
	0	**Display Audio Codec Disable** This bit indicates whether the display audio codec capability is disabled. **Value** / **Name** / **Description** 0b / Enable / Audio Codec Capability Enabled 1b / Disable / Audio Codec Capability Disabled

DG_CLKREQ_POLICY

DG_CLKREQ_POLICY - DG_CLKREQ_POLICY

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	101038h

Various bits that control clock req functionality in DG. This register should be programmed as part of graphics initialization.

DWord	Bit	Description
0	31:24	**SPARE2** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS Reserved
	23:16	**CLKREQ_HYST_CNTR** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS Register to store the parameter used to counting IDLE cycles during Hysteris state. Deassert clkreq when DG is idle for the number of cycles this register is programmed to.
	15:2	**SPARE1** Default Value: 00000000000000b Access: R/W _Custom_GTIReset: BUS Reserved
	1	**Reserved**
	0	**Reserved**

Discard counter status register

L3DISCARDCNTR - Discard counter status register		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
_Custom_GTIReset:	DEV	
Address:	0B130h	
DWord	**Bit**	**Description**
0	31:16	**Discard Counter** Counter indicating Total evictions (in multiple of 64 events) dropped due to discard mechanism
	15:0	**C/Z Active Tile Eviction Counter** Counter indicating total number of eviction (in multiple of 64 events) from C/Z (or unified tile cache) ways when the tile it belongs to is active

Discard Enables for Z streams

Z_DISCARD_EN - Discard Enables for Z streams

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	07040h
ShortName:	Z_DISCARD_EN

Under Posh Based Tiled Rendering (aka PTBR), at the end of tile, certain streams can be discarded from the on-chip caches i.e. without evicting to memory. SW programs LOAD_REG_MEMORY command in the RCS command buffer to program this register. HW uses this value live from the register
This register defines the discard bits for Z streams.
Setting the discard enable bit for a stream, allows HW to drop writing back dirty cachelines from on-chip caches to memory.

Programming Notes

This register value must not change during the render pass (aka tile pass).

DWord	Bit	Description
0	31:2	**Reserved** Access: RO Format: MBZ
	1	**STC Discard Enable** When this bit is set, Stencil (STC) stream can be discarded at the end of tile in the PTBR mode. 0 – Disable **[Default]** 1 – Enable
	0	**Z Discard Enable** Access: R/W **Description** When this bit is set, all Z streams i.e. HiZ and Z can be discarded at the end of tile in the PTBR mode. 0 – Disable **[Default]** 1 – Enable

DISMBASE_LSB

DISMBASE_LSB - DISMBASE_LSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	108410h	
32 bit register that defines LSB of Display Stolen Memory base.		
DWord	**Bit**	**Description**
0	31:24	**DISM_BASE_LSB** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS
	23:0	**Reserved** Access: RO Format: MBZ

DISMBASE_MSB

DISMBASE_MSB - DISMBASE_MSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	108414h	
32 bit register that defines MSB of Display Stolen memory base.		
DWord	**Bit**	**Description**
0	31:0	**DISM_BASE_MSB** Default Value: 00000000000000000000000000000000b Access: R/W _Custom_GTIReset: BUS

DISMLIMIT_LSB

DISMLIMIT_LSB - DISMLIMIT_LSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	108418h	
32 bit register that defines LSB of Display Stolen Memory limit.		
DWord	**Bit**	**Description**
0	31:24	**DISM_LIMIT_LSB** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS
	23:0	**Reserved** Access: RO Format: MBZ

DISMLIMIT_MSB

DISMLIMIT_MSB - DISMLIMIT_MSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	10841Ch	
32 bit register that defines MSB of Display Stolen Memory limit.		
DWord	**Bit**	**Description**
0	31:0	**DISM_LIMIT_MSB** Default Value: 00000000000000000000000000000000b Access: R/W _Custom_GTIReset: BUS

DISPLAY_INT_CTL

DISPLAY_INT_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Address:	44200h-44203h
Name:	Display Interrupt Control
ShortName:	DISPLAY_INT_CTL
Reset:	soft

This register has the primary enable for display interrupts and gives an overview of what interrupts are pending. An interrupt pending bit will read 1b while one or more interrupts of that category are set (IIR) and enabled (IER). All Pending Interrupts are ORed together to generate the combined interrupt.
The combined interrupt is ANDed with the Display Interrupt enable to create the display enabled interrupt.
The display enabled interrupt goes to graphics interrupt processing.

DWord	Bit	Description
0	31	**Display Interrupt Enable** Access: R/W This is the ultimate control for display interrupts. This must be enabled for any of these interrupts to propagate to graphics interrupt processing. 0b: Disable 1b: Enable
	30:26	**Reserved** Access: RO Format: MBZ
	25	**Direct PICA Interrupts Pending** Access: RO This field indicates if PICA interrupts are pending. This is use on SoCs that connect the PICA interrupt to North DE. Other SoCs connect the PICA interrupt to south DE because of partitioning and power domains. The PICA interrupt is configured through the PICA interrupt registers.
	24	**Audio Codec Interrupts Pending** Access: RO This field indicates if audio codec interrupts are pending.
	23	**DE PCH Interrupts Pending** Access: RO This field indicates if South (PCH) display interrupts are pending. The South Display interrupt is configured through the SDE interrupt registers.

DISPLAY_INT_CTL		
	22	**DE Misc Interrupts Pending** Access: RO This field indicates if DE Misc interrupts are pending.
	21	**DE HPD Interrupts Pending** Access: RO This field indicates if North DE HPD interrupts are pending.
	20	**DE Port Interrupts Pending** Access: RO This field indicates if Port interrupts are pending.
	19	**DE Pipe D Interrupts Pending** Access: RO This field indicates if Pipe D interrupts are pending.
	18	**DE Pipe C Interrupts Pending** Access: RO This field indicates if Pipe C interrupts are pending.
	17	**DE Pipe B Interrupts Pending** Access: RO This field indicates if Pipe B interrupts are pending.
	16	**DE Pipe A Interrupts Pending** Access: RO This field indicates if Pipe A interrupts are pending.
	15:0	**Reserved** Access: RO Format: MBZ

DKL_BIAS

DKL_BIAS	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B3Ch-168B3Fh
Name:	DKL_BIAS_NULL
ShortName:	DKL_BIAS_NULL
Reset:	global

This register is not reset by the device 2 FLR.
This register is associated with the display PLL instance (PLL1).

DWord	Bit	Description
0	31	**i_tdc_fine_res** Default Value: 1b TDC fine resolution select 0: Coarse resolution / 8 1: Coarse resolution / 4
	30	**i_fracnen_h** Default Value: 1b Enables fractional modulator. For SSC, this bit needs to be set to '1', even though it starts with integer division ratio.
	29:24	**i_fbdiv_frac_21_16** Default Value: 1Eh Fractional modulator settings.
	23:16	**i_fbdiv_frac_15_8** Default Value: 00h Fractional modulator settings.
	15:8	**i_fbdiv_frac_7_0** Default Value: 00h Fractional modulator settings.
	7:0	**i_sscinj_stepsize_7_0** Default Value: 00h SSC injection step size.

DKL_CLKTOP2_CORECLKCTL1

DKL_CLKTOP2_CORECLKCTL1 - DKL_CLKTOP2_CORECLKCTL1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B34h-168B37h
Name:	DKL_CLKTOP2_CORECLKCTL1_NULL
ShortName:	DKL_CLKTOP2_CORECLKCTL1_NULL
Reset:	global

This register is not reset by device 2 FLR.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29	**od_clktop2_coreclkd_bypass** bypass enable of coreclkd to take input refclk.
	28	**od_clktop2_coreclkd_divretimeren_h** Default Value: 1b retimer enable: 0 for odd division ratio, 1 for even division ratio
	27	**Reserved** Access: RO Format: MBZ
	26	**od_clktop2_coreclkc_bypass** bypass enable of coreclkc to take input refclk
	25	**od_clktop2_coreclkc_divretimeren_h** retimer enable: 0 for odd division ratio, 1 for even division ratio
	24	**Reserved** Access: RO Format: MBZ
	23:16	**od_clktop2_coreclkb_divratio** Default Value: 8h divider ratio for coreclkb divider 8'h00: div/256 8'h01: div/257 8'h02 - 8'hff: div/2 - div/255 8'h08: PCIe4/PCIE3
	15:8	**od_clktop2_coreclka_divratio** Default Value: 5h divider ratio for coreclka divider 8'h00: div/256 8'h01: div/257 8'h02 - 8'hff: div/2 - div/255 8'h05: HBR3/HBR2 8'h0A: HBR/RBR

DKL_CLKTOP2_CORECLKCTL1 - DKL_CLKTOP2_CORECLKCTL1		
	7:6	**Reserved** Access: RO Format: MBZ
	5	**od_clktop2_coreclkb_bypass** bypass enable of coreclkb to take input refclk
	4	**od_clktop2_coreclkb_divretimeren_h** Default Value: 1b retimer enable: 0 for odd division ratio, 1 for even division ratio
	3	**Reserved** Access: RO Format: MBZ
	2	**od_clktop2_coreclka_bypass** bypass enable of coreclka to take input refclk
	1	**od_clktop2_coreclka_divretimeren_h** retimer enable: 0 for odd division ratio, 1 for even division ratio
	0	**Reserved** Access: RO Format: MBZ

DKL_CLKTOP2_HSCLKCTL

DKL_CLKTOP2_HSCLKCTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B30h-168B33h
Name:	DKL_CLKTOP2_HSCLKCTL_NULL

DKL_CLKTOP2_HSCLKCTL

Value	Name
0b	Disable
1b	Enable

17 **Reserved**

Access:	RO
Format:	MBZ

16 **od_clktop2_coreclk_inputsel**

mux select for input clock to coreclk divhub

Value	Name
0b	hsdiv output
1b	dsdiv output

15:14 **od_clktop2_tlinedrv_clksel**

mux select for non-dedicated tlinedrv clock

Value	Name
00b	hsclkdiv output
01b	iclk_bypass input from other clktop
10b	dsdiv output clock
11b	non-divided pll clock

13:12 **od_clktop2_hsdiv_divratio**

Divider ratio for high speed divider. Div1

Value	Name
00b	Divide by 2
01b	Divide by 3
10b	Divide by 5
11b	Divide by 7

11:8 **od_clktop2_dsdiv_divratio**

Divider ratio settings for programmable divider. Div2

Value	Name
0000b	No Division
0001b	No Div **[Default]**
0010b	Divide by 2
0011b	Divide by 3
0100b	Divide by 4
0101b	Divide by 5
0110b	Divide by 6
0111b	Divide by 7
1000b	Divide by 8

DKL_CLKTOP2_HSCLKCTL

	1001b	Divide by 9
	1010b	Divide by 10

7 — od_clktop2_tlinedrv_overrideen

override enable for following 4 tlinedrv enables

Value	Name
0b	Disable
1b	Enable

6 — od_clktop2_tlinedrv_enleft_ded_h_ovrd

enable of left side dedicated tlinedrv to output full-rate clock to left lanes

Value	Name
0b	Disable
1b	Enable

5 — od_clktop2_tlinedrv_enright_ded_h_ovrd

enable of right side dedicated tlinedrv to output full-rate clock to right lanes

Value	Name
0b	Disable
1b	Enable

4 — od_clktop2_tlinedrv_enleft_h_ovrd

enable of left side tlinedrv to output divided clock to left lanes

Value	Name
0b	Disable
1b	Enable **[Default]**

3 — od_clktop2_tlinedrv_enright_h_ovrd

enable of right side tlinedrv to output divided clock to right lanes

Value	Name
0b	Disable
1b	Enable **[Default]**

2 — od_clktop2_dsdiv_en_h

Enable dsdiv clock divider. Div2.

Value	Name
0b	Disable
1b	Enable **[Default]**

1 — Reserved

Access:	RO
Format:	MBZ

DKL_CLKTOP2_HSCLKCTL		
	0	**od_clktop2_hsdiv_en_h** Enable high speed clock divider. Div1 **Value** / **Name** 0b – Disable 1b – Enable **[Default]**

DKL_CMN_ANA_DWORD28

Reset:	global

This register is not reset by the device 2 FLR.

DWord	Bit	Description
0	31:30	**i_truelock_criteria_1_0** Default Value: 01b True lock indicator criteria. After early lock generation, external PLL lock indicator asserted high when phase error is less than threshold value 00: 16 consecutive cycles 01: 32 consecutive cycles 10: 48 consecutive cycles 11: 64 consecutive cycles
	29:28	**i_earlylock_criteria_1_0** Default Value: 11b Early lock indicator criteria. Early PLL lock indicator asserted high when phase error is less than threshold value. 00: 16 consecutive cycles 01: 32 consecutive cycles 10: 48 consecutive cycles 11: 64 consecutive cycles
	27:25	**i_afc_startup_2_0** Default Value: 000b This is for AFC start point. 000: fine = 511 001: fine = 639 (+128) 010: fine = 767 (+256) 011: fine = 895 (+384) 100: NA 101: fine = 127 (-384) 110: fine = 255 (-256) 111: fine = 383 (-128).

DKL_PLL_DIV0		
	24	**i_divretimeren** Retiming of feedback clock
	23:21	**i_gainctrl_2_0** Default Value: 001b Adjustable gain for loop filter. Both coefficients shifted right by gainctrl before lock.
	20:16	**i_int_coeff_4_0** Default Value: 07h integral coeff. = 2^(-int_coeff), tageting up to 2^-11.
	15:12	**i_prop_coeff_3_0** Default Value: 0010b proportional coeff. = 2^(-prop_coeff+1).
	11:8	**i_fbprediv_3_0** Default Value: 10b predivider ratio 0000,0001 : reserved 0010: /2 0100: /4 0011: reserved Rest: reserved
	7:0	**i_fbdiv_intgr** Default Value: 69h Feedback divider post division (M2 integer)

DKL_PLL_DIV1

DKL_PLL_DIV1	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B40h-168B43h
Name:	DKL_PLL1_DIV1_NULL
ShortName:	DKL_PLL1_DIV1_NULL
Reset:	global

This register is not reset by the device 2 FLR.

DWord	Bit	Description
0	31	**i_bw_ampmeas_window** Default Value: 0b 0: 10 modulation cycles of averaging for mplitude measurement 1: 20 modulation cycles of averaging for mplitude measurement
	30:29	**i_bias_calib_stepsize_1_0** Default Value: 00b Bias Calibration Step Size during linear search 00: 1 01: 2 10: 3 11: 4
	28:24	**i_ctrim_4_0** Default Value: 0Ch Cap trimming for irefout. This also has refclock dependency. Current default is for 24MHz.
	23	**i_fastlock_internal_reset** Default Value: 1b Clears internal fastlock memory so that next cold start will do both TDC and AFC calibration instead of fast lock. NOTE: this does not clear the i_fastlock_en_h register bit, clears functional register and self-clears[br]Formerly, i_bbthresh[3] (no longer strap).
	22:21	**i_bias_r_programmability** Default Value: 10b Bias Filter R programmability - note mapped to bias_bonus[1:0].

DKL_PLL_DIV1

	20:16	**i_ireftrim_4_0** Default Value: 1Ch Output current trim . Mirror ratio is changed based on constant current requirement. SInce it is refclock dependent, needs to be reconfigurable i_ireftrim[4:0] - 38.4/19.2 MHz= 5'h1C i_ireftrim[4:0] - 25.0/100.0 MHz = 5'h18 Step size: 20 uA.
	15	**i_biasfilter_en_delay** Default Value: 1b 0: Filter enabled even before pll enabled 1: Filter enable is delay until lock acquisition This bit is sensitive only when i_bias_filter_en is set (bit3)
	14	**i_bias_filter_en** Value: 0b — Name: Disable Value: 1b — Name: Enable **[Default]**
	13	**i_biascal_en_h** Bias Calibration Signal. Bias cal should be disable when override DCO coarse code.
	12	**i_dcodither_config** Whenever we have binary weighted MFC cap, this should be set to 1'b0. Ex: i_dcofine_resolution = 1'b0. For this case, this should be set to 1'b0. 0: No floating dither 1: Floating dither (511+Nobinary - Floating dither).
	11:8	**i_lockthresh_3_0** Default Value: 4h Digital lock detect threshold, the PLL will generate plllockout when the phase error detected by TDC is within lockthresh number of TDC counts for 64 consecutive cycles 5*16 (TDC Code) = 80 (16 is internally hard coded scalar value) - This setting isin middle of coarse range.
	7:0	**i_tdctargetcnt_7_0** Default Value: 22h TDC tristate buffer calibration counter value. Delay line loop oscillation is counted over two refclk cycles. This is used for TDC coarse code calibration.

DKL_PLL_FRAC_LOCK

DKL_PLL_FRAC_LOCK

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B08h-168B0Bh
Name:	DKL_PLL1_FRAC_LOCK_NULL
ShortName:	DKL_PLL1_FRAC_LOCK_NULL
Reset:	global

This register is not reset by the device 2 FLR.

DWord	Bit	Description
0	31:30	**i_cml2cmosbonus_1_0** Default Value: 10b NOTE: These bits are ported to anatop bit [0] mapped to cml2cmosbonus[1] port - o_plllc_ck_dcocmosclkp_ana disable '1' = o_plllc_ck_dcocmosclkp_ana is disabled (ie for MG B0) '0' = both phases of the cmos clock toggle at the interface bit[1] mapped to cml2cmosbonus[2] port - available.
	29:27	**i_bb_gain2_2_0** Default Value: 000b BB gain for second BB range.
	26:24	**i_bb_gain1_2_0** Default Value: 000b BB gain for first BB range.
	23	**i_fastlock_en_h** Enable FLL based AFC; this replaces binary search based AFC. FLL based AFC faster than binary search. Value: 0b – Disable Value: 1b – Enable
	22:19	**i_fllafc_gain_3_0** Default Value: 1000b Initial FLL gain that decrements down to 1 every refclk cycle in the beginning of FLL based AFC.
	18:16	**i_fllafc_lockcnt_2_0** Default Value: 100b Number of refclk cycles for FLL lock after gain is reduced to 1.

DKL_PLL_FRAC_LOCK		
	15:8	**i_max_cselafc_7_0** Default Value: B5h Max. AFC code for a given DCO.
	7:0	**i_init_cselafc_7_0** Default Value: 6Ah Initial AFC code for FLL AFC; apply approximate AFC, and starting at closer frequency helps fast/accurate calibration.

DKL_PLL_LF

DKL_PLL_LF	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B04h-168B07h
Name:	DKL_PLL_LF_NULL
ShortName:	DKL_PLL_LF_NULL
Reset:	global

This register is not reset by the device 2 FLR.

DWord	Bit	Description
0	31	**i_afc_divratio** 0: DCO/4 (prediv: 2, Mdithdiv: 2) 1: DCO/8 (prediv: 4 Mdithdiv: 2)
	30:29	**i_plllock_sel_1_0** Default Value: 00b select between lockdetect-based plllock or counter based plllock 11: Sticky lock 10: Counter-based 01: Lock Detection + Counter 00: Lock Detection.
	28:24	**i_bwphase_4_0** Default Value: 00h Phase amplitude for bandwidth measurement
	23:21	**i_ft_mode_sel_2_0** Default Value: 010b ftmodesel[2:0] : 9b vs 10b finetune selection, lsb0 tuning 3'b000 : 10b Nom -> Dither = LSB0, LSB0 = LSB0 3'b001 : 10b+ -> Dither = LSB+, LSB0 = LSB0+ 3'b010 : 10b- -> Dither = LSB-, LSB0 = LSB0- 3'b011 : 10b DNL -> Dither = LSB01, LSB0 = LSB0+ 3'h1xx: 9b -> Dither = LSB1, LSB0 = N/A
	20:19	**i_bw_mode_1_0** Default Value: 00b 00: No measurement 01: BW measurement 10: BW calibration up to +1 direction 11: BW calibration up to +2 direction

DKL_PLL_LF		
	18:16	**i_bw_upperbound_2_0** Default Value: 000b Upper bound setting for BW 000: 0.1MHz 001: 1 MHz 010: 2 MHz 011: 5 MHz 100: 6 MHz 101: 8 MHz 110: 16 MHz]111: 25MHz
	15:13	**i_bw_lowerbound_2_0** Default Value: 000b Lower bound setting for BW 000: 0.1MHz 001: 1 MHz 010: 2 MHz 011: 5 MHz 100: 6 MHz 101: 8 MHz 110: 16 MHz 111: 25MHz
	12:9	**i_dcoamp_3_0** Default Value: 1001b Amplitude override value for DCO, 0000 is min amplitude, 1111 is max amplitude, applied when i_dcoampovrden_h is high. 4bit is left shifted to generate 6bit code (x4).
	8	**i_dcoampovrrden_h** Default Value: 1b DCO amplitude override enable: 0 DCO amplitude set internally (default) 1 DCO amplitude is set by i_dcoamp[3:0]
	7:5	**i_bbthresh2_2_0** Default Value: 0b threshold for second (inner) bang-bang (BB) range.
	4:2	**i_bbthresh1_2_0** Default Value: 0b threshold for first (inner) bang-bang (BB) range.
	1:0	**i_tdc_offset_1_0** Default Value: 0b TDC Offset during lock for integer mode.

DKL_SSC

DKL_SSC	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B38h-168B3Bh
Name:	DKL_SSC_NULL
ShortName:	DKL_SSC_NULL
Reset:	global

This register is not reset by the device 2 FLR.

DWord	Bit	Description
0	31:29	**i_iref_ndivratio_2_0** Default Value: 10b SSC injection Adaptive Gain Change Enable
	28:26	**ssc_stepnum_offset_2_0** Default Value: 000b SSC spread step is calculated with two registers, i_sscstepnum and i_sscstepnum_offset. SSC steps = 2^(i_sscstepnum + 1) + 4*i_sscstepnum_offset.
	25	**i_sscinj_adapt_en_h** SSC injection Adaptive Gain Change Enable. Value: 0b – Disable Value: 1b – Enable
	24	**i_sscinj_en_h** SSC inject enable. Value: 0b – Disable Value: 1b – Enable
	23:16	**i_sscsteplength_7_0** Default Value: 13h Number of ref clock cycles in one SSC step.
	15:14	**i_sscfll_update_sel_1_0** Default Value: 0b Select frequency update rate for FLL SSC.

DKL_SSC

	13:11	**i_sscstepnum_2_0** Default Value: 100b Number of SSC steps (=2^sscstepnum).
	10	**i_ssc_openloop_en_h** Default Value: 0b Open loop SSC enable.
	9	**i_sscen_h** Default Value: 1b Dynamic control of SSC modulator.
	8	**i_sscfllen_h** Default Value: 0b Frequency adjustment for FLL SSC.
	7:6	**i_bias_gb_sel_1_0** Default Value: 11b Select guardband after bias calibration.
	5:0	**i_init_dcoamp_5_0** Default Value: 3Fh initial DCOAMP value.

DKL_TDC_COLDST_BIAS

DKL_TDC_COLDST_BIAS	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B44h-168B47h
Name:	DKL_TDC_COLDST_BIAS_NULL
ShortName:	DKL_TDC_COLDST_BIAS_NULL
Reset:	global

This register is not reset by the device 2 FLR.

DWord	Bit	Description
0	31:29	**i_cloadctrlext_4_2** Default Value: 00h cload control override for H Vernier line. This is applied when i_tdccalexten_h = 1.
	28:24	**i_tribufctrlext_4_0** Default Value: 00h Tribufctrl control override. This is applied when i_tdccalexten_h = 1.
	23:16	**i_dcocoarse_7_0** Default Value: 00h DCO coarse tune frequency value, when dcocoarse_ovrd_h is '1', this input is used to override the value calculated from the Automatic Frequency Calibration (AFC) block.
	15:8	**i_sscstepsize_7_0** Default Value: 0Fh Fractional value for one SSC frequency step.
	7:0	**i_feedfwdgain_7_0** Default Value: 23h Feed forwad gain for fractional mode/SSC mode PLL [br]This setting is needed whenever PLL is configured in fractional mode or configured for SSC clock generation.

DKL_TX_DPCNTL0

DKL_TX_DPCNTL0 - DKL_TX_DPCNTL0	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B14h-168B17h
Name:	DKL_TX_DPCTRL0_TX1LN0_NULL
ShortName:	DKL_TX_DPCTRL0_TX1LN0_NULL
Reset:	global

This register is not reset by device 2 FLR.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30	**Trainingen_tx1** Enable set for programming in compliance mode.
	29	**Pipe_select_tx1** Override this bit to 0 to take the BIOS programmed Values and not pipe
	28	**Slow_trim_enable_tx1** Default Value: 1b Enable or Disable the slow trim.
	27:23	**shunt_cm_tx1** Back mode select for the Shunt CM
	22:18	**shunt_cp_tx1** Preshoot Co-efficients
	17:13	**Preshoot Control l0** Pre-shoot coefficients
	12:8	**de_emphasis_control_l0_tx1** De-emphasis co-efficient
	7:3	**Cursor_Control_tx1** Backup mode for shunt on C0
	2:0	**Vswing Control_tx1** Default Value: 111b 3'b000 = 1V + 0dB (Full Swing) 3'b001 = 800 mV + 0dB 3'b100 = 600 mV + 0dB 3'b111 = 400 mV + 0dB

DKL_TX_DPCNTL1

DKL_TX_DPCNTL1 - DKL_TX_DPCNTL1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B1Ch-168B1Fh
Name:	DKL_TX_DPCNTL1_TX2LN0_NULL
ShortName:	DKL_TX_DPCNTL1_TX2LN0_NULL
Reset:	global

This register is not reset by device 2 FLR.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30	**Trainingen_tx2** Enable set for programming in compliance mode.
	29	**Pipe_select_tx2** Override this bit to 0 to take the BIOS programmed Values and not pipe
	28	**Slow_trim_enable_tx2** Default Value: 1b Enable or Disable the slow trim.
	27:23	**shunt_cm_tx2** Back mode select for the Shunt CM
	22:18	**shunt_cp_tx2** Preshoot Co-efficients
	17:13	**Preshoot Control l0** Pre-shoot coefficients
	12:8	**de_emphasis_control_l0_tx2** De-emphasis co-efficient
	7:3	**Cursor_Control_tx2** Backup mode for shunt on C0
	2:0	**Vswing Control_tx2** Default Value: 111b 3'b000 = 1V + 0dB (Full Swing) 3'b001 = 800 mV + 0dB 3'b100 = 600 mV + 0dB 3'b111 = 400 mV + 0dB

DKL_TX_DPCNTL2

DKL_TX_DPCNTL2 - DKL_TX_DPCNTL2

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	168B24h-168B27h
Name:	DKL_TX_DPCNTL2_TX2LN0_NULL
ShortName:	DKL_TX_DPCNTL2_TX2LN0_NULL
Reset:	global

This register is not reset by device 2 FLR.

DWord	Bit	Description
0	31:23	**Reserved** Access: RO Format: MBZ
	22:10	**reserved_dp3**
	9	**dp_fifo_depth_tx1**
	8	**dp_fifo_depth_tx2**
	7	**dp_2ui_4ui_mode_en** Value: 0 — Name: 4UI Value: 1 — Name: 2UI
	6:5	**loadgenselect_tx2** loadgen select for datapath2ui - Look at the sheet for CFG per Tx
	4:3	**loadgenselect_tx1** loadgen select for datapath2ui - Look at the sheet for CFG per Tx
	2	**dp20bitmode** 20 bit mode support. This will need to be set to 1 if Pipe width does not reflect the 20bit mode.
	1	**rate8boverrideen** 8bit override enable. The pisorate_8b signal is normally decoded from PHYMODE and RATE. When 1, the pisorate_8b signal will take with pisorate8bit_ovrd value.
	0	**rate8boverride** value used for pisorate_8b when pisorate8bit_overden = 1.

DKL_TX_DW17

DKL_TX_DW17 - DKL_TX_DW17	
Register Space:	MMIO: 0/2/0
Access:	R/W

	20	**cfg_cfg_dig_pwrgate_timer_bypass** Default Value: 0b cfg_cfg_dig_pwrgate_timer_bypass_defaultreset Access: R/W When this bit is 1, bypass the pwrgate ip74pppxdkltypecfamilyew_timer, which is configurable with cfg_ldo_powerup_timer
	19	**cfg_cfg_crireg_cold_boot_done** Default Value: 0b cfg_cfg_crireg_cold_boot_done_defaultreset Access: R/W set cold boot done

DKLP_ACU_ACU_DWORD8

18	**cfg_cfg_vr_pulldwn2gnd_tr2** Default Value: 0b cfg_cfg_vr_pulldwn2gnd_tr2_defaultreset Access: R/W if there is a chance of high voltage from hotplug through diodes. Needed for tr/tr2 LDO
17	**cfg_cfg_vr_pulldwn2gnd_tr** Default Value: 0b cfg_cfg_vr_pulldwn2gnd_tr_defaultreset Access: R/W if there is a chance of high voltage from hotplug through diodes. Needed for tr/tr2 LDO
16	**cfg_cfg_ldo_powerup_timer_8** Default Value: 0b cfg_cfg_ldo_powerup_timer_8_defaultreset Access: R/W ip74pppxdkltypecfamilyew_Timer to decide when LDO would be up, in case pwr_gate is used instead of LDO, it's configured to wait 20us, i.e 9'd500 by default using 25 MHz susclk
15	**cfg_cfg_corepwr_ack_with_pcs_pwrreq** Default Value: 0b cfg_cfg_corepwr_ack_with_pcs_pwrreq_defaultreset Access: R/W if this bit is 1, send corepwr_ack to pcs only when pcs_pwrreq is 1
14	**cfg_cfg_cri_digpwr_req** Default Value: 0b cfg_cfg_cri_digpwr_req_defaultreset Access: R/W Keep dig up during burst CRI transactions, this also bypasses handshake with the susclk domain, greatly reducing the latency.
13	**cfg_cfg_laneclkreq_force** Default Value: 1b cfg_cfg_laneclkreq_force_defaultreset Access: R/W When cfg_laneclkreq_gating_ctrl is low, this value will be used for the lane sus_clk request
12	**cfg_cfg_laneclkreq_gating_ctrl** Default Value: 0b cfg_cfg_laneclkreq_gating_ctrl_defaultreset Access: R/W 1'b1 - lanesusclk req gating enabled
11	**cfg_cfg_susclk_gating_ctrl** Default Value: 0b cfg_cfg_susclk_gating_ctrl_defaultreset Access: R/W 1'b1 - susclk gating enabled

DKLP_ACU_ACU_DWORD8

10	**cfg_cfg_rawpwr_req_override** Default Value: 0b cfg_cfg_rawpwr_req_override_defaultreset Access: R/W Keep rawpwr on when this bit is 1
9	**cfg_cfg_digpwr_req_override** Default Value: 0b cfg_cfg_digpwr_req_override_defaultreset Access: R/W Keep digpwr on when this bit is 1
8	**cfg_cfg_rawpwr_gating_ctrl** Default Value: 0b cfg_cfg_rawpwr_gating_ctrl_defaultreset Access: R/W Power gating enable reg for raw power
7	**cfg_cfg_dp_x2_mode** Default Value: 0b cfg_cfg_dp_x2_mode_defaultreset Access: R/W {cfg_dp_x2_mode,cfg_dp_x1_mode}: 00 -) Only main tx on {cfg_dp_x2_mode,cfg_dp_x1_mode}: 01 -) Only secondary tx on {cfg_dp_x2_mode,cfg_dp_x1_mode}: 1x -) Both tx on
6	**cfg_cfg_dp_x1_mode** Default Value: 0b cfg_cfg_dp_x1_mode_defaultreset Access: R/W {cfg_dp_x2_mode,cfg_dp_x1_mode}: 00 -) Only main tx on {cfg_dp_x2_mode,cfg_dp_x1_mode}: 01 -) Only secondary tx on {cfg_dp_x2_mode,cfg_dp_x1_mode}: 1x -) Both tx on
5	**cfg_cfg_tr2pwr_gating_ctrl** Default Value: 0b cfg_cfg_tr2pwr_gating_ctrl_defaultreset Access: R/W Power gating enable reg for tr2
4	**cfg_cfg_trpwr_gating_ctrl** Default Value: 0b cfg_cfg_trpwr_gating_ctrl_defaultreset Access: R/W Power gating enable reg for tr
3	**cfg_cfg_clnpwr_gating_ctrl** Default Value: 0b cfg_cfg_clnpwr_gating_ctrl_defaultreset Access: R/W Power gating enable reg for cln

DKLP_ACU_ACU_DWORD8		
	2	**cfg_cfg_digpwr_gating_ctrl** Default Value: 0b cfg_cfg_digpwr_gating_ctrl_defaultreset Access: R/W Power gating enable reg for dig
	1	**cfg_cfg_gaonpwr_gating_ctrl** Default Value: 0b cfg_cfg_gaonpwr_gating_ctrl_defaultreset Access: R/W Power gating enable reg for gaon
	0	**cfg_cfg_suspwr_gating_ctrl** Default Value: 0b cfg_cfg_suspwr_gating_ctrl_defaultreset Access: R/W Power gating enable reg for sus

CLKTOP1_HSCLKCTL		
DWord	**Bit**	**Description**
0	31:27	**cfg_reserved504** Default Value: 00h cfg_reserved504_defaultreset Access: RO Power well:DIG
	26:25	**cfg_od_clktop1_clkobs_muxsel_1_0** Default Value: 00b cfg_od_clktop1_clkobs_muxsel_1_0_defaultreset Access: R/W mux select for oc_dfx_ck_clk2obs[0] digobs output 2'b00: hsdiv output clock 2'b01: iclk_bypass input from the other clktop 2'b10: dsdiv output clock 2'b11: non-dvided pll clock (test mode)
	24	**cfg_od_clktop1_clk2obs_en_h** Default Value: 0b cfg_od_clktop1_clk2obs_en_h_defaultreset Access: R/W enable of oc_dfx_ck_clk2obs[0] digobs output
	23:22	**cfg_reserved501** Default Value: 00b cfg_reserved501_defaultreset Access: RO Power well:DIG
	21:20	**cfg_od_clktop1_clktop1_vhfclk_testen_h_1_0** Default Value: 00b cfg_od_clktop1_clktop1_vhfclk_testen_h_1_0_defaultreset Access: R/W test mode enable of pll clock bit[0]: enable of pll clock to non-dedicated tlinedrv bit[1]: enable of pll clock to dfx ouput
	19	**cfg_reserved502** Default Value: 0b cfg_reserved502_defaultreset Access: RO Power well:DIG
	18	**cfg_od_clktop1_outclk_bypassen_h** Default Value: 0b cfg_od_clktop1_outclk_bypassen_h_defaultreset Access: R/W enable of bypass clock output to the other clktop

DKLP_CMN_ANA_CMN_ANA_DWORD0

	17	**cfg_reserved503** Default Value: 0b cfg_reserved503_defaultreset Access: RO Power well:DIG
	16	**cfg_od_clktop1_coreclk_inputsel** Default Value: 0b cfg_od_clktop1_coreclk_inputsel_defaultreset Access: R/W mux select for input clock to coreclk divhub 1'b0: select hsdiv output;1'b1: select dsdiv output
	15:14	**cfg_od_clktop1_tlinedrv_clksel_1_0** Default Value: 00b cfg_od_clktop1_tlinedrv_clksel_1_0_defaultreset Access: R/W mux select for non-dedicated tlinedrv clocks 2'b00: hsclkdiv output 2'b01: dsdiv output clktop 2'b10: iqdiv2 clock 2'b11: iqdiv2 clock
	13:12	**cfg_od_clktop1_hsdiv_divratio_1_0** Default Value: 00b cfg_od_clktop1_hsdiv_divratio_1_0_defaultreset Access: R/W divider ratio for high speed divider. 2'b00: div/2 2'b01: div/3 2'b10: div/5 2'b11: div/7
	11:8	**cfg_od_clktop1_dsdiv_divratio_3_0** Default Value: Ah cfg_od_clktop1_dsdiv_divratio_3_0_defaultreset Access: R/W divider ratio settings for programmable divider: 4'b0000: no division 4'b0001: no division 4'b0010 - 4'b1010: div/2 - div/10 4'b1011 - 4'b1111: not used (div/10)
	7	**cfg_od_clktop1_tlinedrv_overrideen** Default Value: 0b cfg_od_clktop1_tlinedrv_overrideen_defaultreset Access: R/W override enable for follwing 4 tlinedrv enables
	6	**cfg_od_clktop1_tlinedrv_enleft_ded_h_ovrd** Default Value: 1b cfg_od_clktop1_tlinedrv_enleft_ded_h_ovrd_defaultreset Access: R/W enable of left side dedicated tlinedrv to output full-rate clock to left lanes

DKLP_CMN_ANA_CMN_ANA_DWORD0

	5	**cfg_od_clktop1_tlinedrv_enright_ded_h_ovrd** Default Value: 1b cfg_od_clktop1_tlinedrv_enright_ded_h_ovrd_defaultreset Access: R/W enable of right side dedicated tlinedrv to output full-rate clock to right lanes
	4	**cfg_od_clktop1_tlinedrv_enleft_h_ovrd** Default Value: 0b cfg_od_clktop1_tlinedrv_enleft_h_ovrd_defaultreset Access: R/W enable of left side tlinedrv to output divided clock to left lanes
	3	**cfg_od_clktop1_tlinedrv_enright_h_ovrd** Default Value: 0b cfg_od_clktop1_tlinedrv_enright_h_ovrd_defaultreset Access: R/W enable of right side tlinedrv to output divided clock to right lanes
	2	**cfg_od_clktop1_dsdiv_en_h** Default Value: 1b cfg_od_clktop1_dsdiv_en_h_defaultreset Access: R/W enable of dsdiv clock divider
	1	**cfg_reserved500** Default Value: 0b cfg_reserved500_defaultreset Access: RO Power well:DIG
	0	**cfg_od_clktop1_hsdiv_en_h** Default Value: 1b cfg_od_clktop1_hsdiv_en_h_defaultreset Access: R/W enable of high speed clock divider

CMN_UC::cmn_uc_dword27

DWord	Bit	Description
0	31:29	**cfg_reserved_dw27_2** Default Value: 000b cfg_reserved_dw27_2_defaultreset Access: RO CMN_UC::cmn_uc_dword27::reserved_dw27_2
	28	**cfg_forcepwrpok_req** Default Value: 0b cfg_forcepwrpok_req_defaultreset Access: RO CMN_UC::cmn_uc_dword27::forcepwrpok_req
	27	**cfg_phy_xtensa_ana_restore_done** Default Value: 0b cfg_phy_xtensa_ana_restore_done_defaultreset Access: RO CMN_UC::cmn_uc_dword27::phy_xtensa_ana_restore_done
	26	**cfg_phy_xtensa_unblock_ack** Default Value: 0b cfg_phy_xtensa_unblock_ack_defaultreset Access: RO Reserved
	25	**cfg_phy_xtensa_unblock_req** Default Value: 0b cfg_phy_xtensa_unblock_req_defaultreset Access: RO phy_xtensa_unblock_ack from firmware downloader block.
	24	**cfg_uc_xclkgatedstat** Default Value: 0b cfg_uc_xclkgatedstat_defaultreset Access: RO Phy_xtensa_unblock_request from firmware_downloader block. Can be used by firmware to determine the abort scenario. Cleared on reading this register.

DKLP_CMN_UC_CMN_UC_DWORD27

23	**cfg_phy_xtensa_ana_save_done** Default Value: 0b cfg_phy_xtensa_ana_save_done_defaultreset Access: RO Status register for xclk gated state. Cleared when xclk_gatedstat_clr bit is set.
22:21	**cfg_phy_xtensa_pllclk_change_req** Default Value: 00b cfg_phy_xtensa_pllclk_change_req_defaultreset Access: RO Consolidated version of all DLs ana save done status. CL should also have all the ana save done bits in RO status.
20	**cfg_phy_xtensa_block_req** Default Value: 0b cfg_phy_xtensa_block_req_defaultreset Access: RO PHY to set this register bit based on internal conditions and Xtensa to poll thru TIE. 0: PLL1 1: PLL2 ConfigID value MSB indicate original or shadow register write. Cleared when pllclk_change_ack is high.
19	**cfg_phy_xtensa_cl_corewell_wake** Default Value: 0b cfg_phy_xtensa_cl_corewell_wake_defaultreset Access: RO Set: When PM_block message is decoded for DEKEL10. Reset: When xtensa_phy_block_ack is 1
18	**cfg_phy_xtensa_sb_trigger_ack** Default Value: 0b cfg_phy_xtensa_sb_trigger_ack_defaultreset Access: RO This is set by CL-corewell wake logic (if it was dynamically power gated before). Cleared when Xtensa read this register.
17	**cfg_phy_xtensa_clk_switch_req** Default Value: 0b cfg_phy_xtensa_clk_switch_req_defaultreset Access: RO PHY to set this register If the request from Xtensa is read, then completion will be loaded in to 32-bit CRI-RO register and this bit is set. If request from Xtensa is write, then as soon as CL-hw sends the request to iosf-sb this bit is set. This bit is cleared when trigger_req is 1 -> 0.
16	**cfg_trigger_xtensa_to_start_restore** Default Value: 1b cfg_trigger_xtensa_to_start_restore_defaultreset Access: RO PHY has a need to switch clock source to Xtensa due to external conditions. 1: Indication to uC about its own clock switch. uC to move to idle and respond with ack. Cleared when the clk switching is complete.

DKLP_CMN_UC_CMN_UC_DWORD27

15	**cfg_uc_health** Default Value: 0b cfg_uc_health_defaultreset Access: R/W Set by CL hw after IP_READY is done and restore_b == 0 and internal restore is needed. This acts as trigger for uC to start internal restore process. Set during restore phase. Cleared on PM unblock ack msg.
14:13	**cfg_reseverd_dw27_1** Default Value: 00b cfg_reseverd_dw27_1_defaultreset Access: RO uc_health bit, indicating the firmware is up
12	**cfg_forcepwrpok_ack** Default Value: 0b cfg_forcepwrpok_ack_defaultreset Access: R/W Reserved
11	**cfg_xclkgatedstat_clr** Default Value: 0b cfg_xclkgatedstat_clr_defaultreset Access: R/W xclk gated status bit, used after coming back from clock gating. cleared on falling edge of xclk_gatedstat.
10	**cfg_xtensa_phy_send_block_nak** Default Value: 0b cfg_xtensa_phy_send_block_nak_defaultreset Access: R/W 0: No action 1: CL fsm can send NAK response to PM-REQ block message without delay. This bit can be set by Xtensa in ip74pppxdkltypecfamilyew_SOC where block message requires either ACK or NAK response without delay. ip74pppxdkltypecfamilyew_soc mode this bit is never set thus allowing CL logic/Xtensa to do DRAM save. This can be set by Xtensa if PM-REQ response delay is not tolerated by Punit. Cleared on falling edge of phy_block_req.
9	**cfg_xtensa_phy_block_ack** Default Value: 1b cfg_xtensa_phy_block_ack_defaultreset Access: R/W Once Xtensa takes control, it can SET the bit to ensure all housekeeping is done before PM-REQ is allowed to be responded 1: CL fsm can send block ack based on other internal conditions (like firmware download in progress) 0: CL fsm should look for Xtensa_phy_send_block_NAK to take further action for PM_REQ message in processing. this is cleared after DRAM save is done and phy_xtensa_block_req is TRUE. This is cleared by Xtensa after internal housekeeping is done. Cleared on falling edge of phy_block_req.

DKLP_CMN_UC_CMN_UC_DWORD27

	8	**cfg_xtensa_phy_sb_trigger_req** Default Value: 0b cfg_xtensa_phy_sb_trigger_req_defaultreset Access: R/W
	7:6	**cfg_xtensa_phy_pllclk_change_ack** Default Value: 00b cfg_xtensa_phy_pllclk_change_ack_defaultreset Access: R/W Xtensa has done PLL configuration writes in to main bank or shadow bank (depending on configID value). This bit is cleared after Phy_xtensa_pllclk_change_req is 0. 0: PLL1 1: PLL2
	5	**cfg_xtensa_phy_cl_corewell_pg_ok** Default Value: 1b cfg_xtensa_phy_cl_corewell_pg_ok_defaultreset Access: R/W Xtensa allows CL-sus-fsm to power gate CL-corewell. Other PG-entry conditions are decided by CL-logic. Default is CL-corewell power gating allowed. This bit gets cleared if any interrupt comes. Firmware needs to set it when it is ok to power gate. This bit is regular CRI domain flop and not saved.
	4	**cfg_xtensa_phy_clk_switch_ack** Default Value: 0b cfg_xtensa_phy_clk_switch_ack_defaultreset Access: R/W Xtensa has reduced pending external dependencies and ok for clock source switch. Cleared on falling edge of clk_switch_req.
	3	**cfg_xtensa_int_restore_done** Default Value: 0b cfg_xtensa_int_restore_done_defaultreset Access: R/W This is used in CL-fsm to notify ACU/DL to start internal ANA-restore if needed. Applicable for phy mode and used along with restore_b of 0. 1: Internal restore done for both CL/DL 0: Internal restore not done. This bit is cleared after unblock PM-ACK is sent out to PMC.
	2	**cfg_anasave_at_pm_req** Default Value: 1b cfg_anasave_at_pm_req_defaultreset Access: R/W Abutted to all DLs. Used along with PM_REQ block message. Once Xtensa takes control, it can clear/set this bit to either bypass ANA snapshot trigger or allow. Default is bypass as power gating of DL by ip74pppxdkltypecfamilyew_soc would erase the ANA register contents. 1: DL ACU fsm will trigger ANA-snap shot during save op. 0: DL ACU fsm should bypass ANA-snap shot during external or internal save. Set/Cleared by firmware

DKLP_CMN_UC_CMN_UC_DWORD27

	1	**cfg_xtensa_ok4_pll_disable** Default Value: 0b cfg_xtensa_ok4_pll_disable_defaultreset Access: R/W Set by Xtensa: If PLL is enabled forcefully and ok to be disabled to save power. cleared when the clock is gated.
	0	**cfg_xtensa_ok4_cg** Default Value: 0b cfg_xtensa_ok4_cg_defaultreset Access: R/W If xtensa is idle for X clocks and ok to gate its clock. RUNSTALL is applied prior to clock gate properly followed by explicit clock gating at source. cleared when the clock is gated.

Dp control 2 register

DWord	Bit	Description
0	31:13	**cfg_reserved_dp3** Default Value: 000000h cfg_reserved_dp3_defaultreset Access: RO PCS_Glue::TX_DPCNTL2::reserved_dp3
	12	**loadgen_sharing_pmd_disable** Access: R/W For DP1p62, HDMI5p94: This bit is used if we want to fall-back to older logic where no loadgen sharing will be there inside PMD logic by setting this bit to 1. For other modes: This bit can be set to 1 for enabling loadgen sharing feature if needed. Internally its used as inversion for these modes. Value: 0b – Disable **[Default]**; 1b – Enable
	11	**cfg_dp_mode_cg_enable** Access: R/W This bit enables the feature of power saving in non-dp modes by clock gating few clocks in Tx2. To disable this feature we need to program this bit to 0. Value: 1b – Enable **[Default]**; 0b – Disable
	10	**usb3_gen1_2ui_mode_en** Access: R/W This bit is to enable 2UI path to counter the lane2lane skew in USB3.2 Gen1 mode. Value: 1b – Enable **[Default]**; 0b – Disable
	9	**cfg_dp_fifo_depth_tx1** Default Value: 0b cfg_dp_fifo_depth_tx1_defaultreset Access: R/W PCS_Glue::TX_DPCNTL2::dp_fifo_depth_tx1

DKLP_PCS_GLUE_TX_DPCNTL2

8	**cfg_dp_fifo_depth_tx2** Default Value: 0b cfg_dp_fifo_depth_tx2_defaultreset Access: R/W PCS_Glue::TX_DPCNTL2::dp_fifo_depth_tx2
7	**cfg_dp_2ui_4ui_mode_en** Default Value: 0b cfg_dp_2ui_4ui_mode_en_defaultreset Access: R/W 1 - 2ui 0- 4ui
6:5	**cfg_loadgenselect_tx2** Default Value: 00b cfg_loadgenselect_tx2_defaultreset Access: R/W loadgen select for datapath2ui - Look at the sheet for CFG per Tx
4:3	**cfg_loadgenselect_tx1** Default Value: 00b cfg_loadgenselect_tx1_defaultreset Access: R/W loadgen select for datapath2ui - Look at the sheet for CFG per Tx
2	**cfg_dp20bitmode** Default Value: 0b cfg_dp20bitmode_defaultreset Access: R/W 20 bit mode supprot. This will need to be set to 1 if Pipe width does not reflect the 20bit mode
1	**cfg_rate8boverride_enable** Default Value: 0b cfg_rate8boverride_enable_defaultreset Access: R/W 8bit override enable. The pisorate_8b signal is normally decoded from PHYMODE and RATE. When 1, the pisorate_8b signal will take with pisorate8bit_ovrd value.
0	**cfg_rate8boverride** Default Value: 0b cfg_rate8boverride_defaultreset Access: R/W value used for pisorate_8b when pisorate8bit_overden = 1

DFXMISC 7E

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**cri_dfx_marginmode** Default Value: 0b cri_dfx_marginmode_defaultreset Access: R/W Margin mode. Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
	14:13	**cri_dfx_evenodd_mask** Default Value: 00b cri_dfx_evenodd_mask_defaultreset Access: R/W Even/odd bit select for comparison. 00 : no masking; 01: select odd path and mask the even path; 10: select even path and mask the odd path; 11: reserved;
	12	**dfx_chk_sel** Default Value: 0b dfx_chk_sel_defaultreset Access: R/W This is to select where the rx data is compared. 0 If compared after Kalgin, and rx data is in 10b domain and running on rxsymbclk; 1 if compared after 10b-)8b, the rx data is 8b domain and running on txsymbclk;

DKLP_PCS_INDEXED_PCS_ICL_INDEXED_DWORD0

11	**cri_dfx_synchdr_ignore_err** Default Value: 0b cri_dfx_synchdr_ignore_err_defaultreset Access: R/W Ignore Corrected Syncheader Errors. When enabled, the BoB LCE will ignore corrected single-bit syncheader errors in USB3 Gen2. 0: include corrected syncheader errors in errcnt 1: ignore corrected syncheader errors, do not add to errcnt. Applies only to BOB LCE.
10:8	**cri_dfx_maxerrcnt_2_0** Default Value: 000b cri_dfx_maxerrcnt_2_0_defaultreset Access: R/W Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. // 000 : Free running (default) // 001 : 2^16 // 010 : 2^10 // 011 : 2^8 // 100 : 2^4 // 101 : 2^2 // 110 : First Error // 111 : 2^32
7	**dfx_lcerx_dp_mode** Default Value: 0b dfx_lcerx_dp_mode_defaultreset Access: R/W 1= enable lcerx dp mode rxdata from upar sent to pipe as rxdata.
6	**cri_dfx_typec_dp_en** Default Value: 0b cri_dfx_typec_dp_en_defaultreset Access: R/W Enable to support Type-C TX1/TX2 data path in Base LCE. 0: ip74pppxdkltypecfamilyew_Normal LCE operating mode 1: LCE would replicate the lower 20/16b of it's output data on its upper 20/16b data. (16b/20b depends on whether encoder/decoder is bypassed or not)
5	**cri_dfx_eieos_sync_en** Default Value: 0b cri_dfx_eieos_sync_en_defaultreset Access: R/W BoB LCE Training Pattern control. 0: use EIEOS/SYNC + ISI pattern blocks 1: use only EIEOS/SYNC blocks

DKLP_PCS_INDEXED_PCS_ICL_INDEXED_DWORD0

4	**cri_dfx_patbuftrainovr** Default Value: 0b cri_dfx_patbuftrainovr_defaultreset Access: R/W Pattern Buffer Training Override. Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Patter Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
3	**cri_dfx_dword_align_en** Default Value: 0b cri_dfx_dword_align_en_defaultreset Access: R/W Dword align enable. 1: EnableDword 0: No Dword alignment (default)
2	**cri_dfx_patchken** Default Value: 0b cri_dfx_patchken_defaultreset Access: R/W Pattern Checker Enable. 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
1	**cri_dfx_patgenen** Default Value: 0b cri_dfx_patgenen_defaultreset Access: R/W Pattern Generator Enable. This will activate the DFx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1: Enable Pattern Generator
0	**lce_en** Default Value: 0b lce_en_defaultreset Access: R/W Enable lce clock gating, must be set to 1'b1 first before lce is used

DFXPATBUFSIZE

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**dfx_cri__lcerxtrain** Default Value: 0b dfx_cri__lcerxtrain_defaultreset Access: RO Indicates that the LCE RX has received at least 1 training pattern for BASE in non-raw PRBS and PATBUF modes.
	14:12	**cri_dfx_prbspoly_2_0** Default Value: 000b cri_dfx_prbspoly_2_0_defaultreset Access: R/W PRBS Polynomial. Selects the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. For Base: 000 x^16 +x^5 +x^4 +x^3 +1 (USB3/PCIe Scrambler) (8b/16b/32b) 001 x^16 +x^15 +x^13 +x^4 +1 (SATA scrambler) (8b/16b/32b) 010 x^31 +x^28 +1 (8b/16b/32b) 011 x^7 +x^6 +1 (8b/16b/32b) 100 x^7 +x^6 +1 (10b/20b/40b) 101 Reserved 110 Reserved 111 Reserved For BOB: (Only 2 bits 5:4 are used. bit 6 is a don't care): 00 x^23 + x^21 + x^16 + x^8 + x^5 + x^2 + 1 01 x^31 + x^28 + 1 10 x^7 + x^6 + 1 11 Reserved

DKLP_PCS_INDEXED_PCS_ICL_INDEXED_DWORD1

	11	**cri_dfx_patbuftrain** Default Value: 0b cri_dfx_patbuftrain_defaultreset Access: R/W Pattern Buffer Manual Training. When DFXPATBUFTRAINOVR and DFXLCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
	10	**cri_dfx_clrerrcnt** Default Value: 0b cri_dfx_clrerrcnt_defaultreset Access: R/W Clear Error ip74pppxdkltypecfamilyew_Counter. Resets the Pattern Checker's error ip74pppxdkltypecfamilyew_counter. 0 : Error ip74pppxdkltypecfamilyew_Counter allowed to run (default) 1 : Error ip74pppxdkltypecfamilyew_Counter held in reset
	9	**cri_dfx_lcereset** Default Value: 0b cri_dfx_lcereset_defaultreset Access: R/W Local Compare Engine Reset. Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
	8	**cri_dfx_lcestart** Default Value: 0b cri_dfx_lcestart_defaultreset Access: R/W Local Compare Engine Start. Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
	7	**cri_dfx_xor_data_en** Default Value: 0b cri_dfx_xor_data_en_defaultreset Access: R/W Patbuf data scrambling enable. Setting this bit will XOR the patbuf data with the PRBS pattern selected by cri_dfx_prbspoly. Applies to both Base and BoB pattern buffers. 0: Patbuf data is not scrambled by LFSR 1: Patbuf data is scrambled by selected LFSR pattern

DKLP_PCS_INDEXED_PCS_ICL_INDEXED_DWORD1

	6	**cri_dfx_last_sym_en** Default Value: 0b cri_dfx_last_sym_en_defaultreset Access: R/W Base Pattern Buffer Repeat Last Symbol. Enabling this mode will cause the Base patbuf to repeat bits [9:0] an extra 4 times at the end of each patbuf loop. 0: Do not repeat last symbol 1: Repeat last symbol 4 times
	5:4	**cri_dfx_patbufsize_1_0** Default Value: 00b cri_dfx_patbufsize_1_0_defaultreset Access: R/W Pattern Buffer Size. Selects how much of the Pattern Buffer to use, which allows for shorter pattern sequences. Base pattern gen: no effect, Base LCE is always 120 bits, 12 symbols. BoB pattern generator: The MSB will always be bit 127. The LSB will depend on this select. 00 : full 4x32b or 8x16b buffer (default) 01 : 3x32b (while in 32b mode), 7x16b (while in 16b mode) 10 : 2x32b (while in 32b mode), 5x16b (while in 16b mode) 11 : 1x32b (while in 32b mode), 3x16b (while in 16b mode)
	3	**cri_dfx_patbufloop** Default Value: 1b cri_dfx_patbufloop_defaultreset Access: R/W Pattern Buffer Looping enable. Enables looping of the Patter Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
	2	**cri_dfx_patbufdwidth** Default Value: 0b cri_dfx_patbufdwidth_defaultreset Access: R/W Pattern Buffer Data Width. For Base: Selects between 10/20/40 bit (8b/10b encoder on TX bypassed) or 8/16/32 bit data width for the Pattern Buffer. On the RX path, data is checked before K-align Block only for PRBS, when 10/20/40b mode is selected. 0 : 10/20/40b (default) 1 : 8/16/32b For BOB 0 : TX Block Encoder is bypassed/Data is Checked before RX Block Align, which is supported only in PRBS

<table>
<tr><th colspan="3">DKLP_PCS_INDEXED_PCS_ICL_INDEXED_DWORD1</th></tr>
<tr><td></td><td></td><td>1 : TX Block Encoder is used/Data is Checked after RX Block Align</td></tr>
<tr><td></td><td>1:0</td><td>cri_dfx_lcepatsrc
<table><tr><td>Default Value:</td><td>00b cri_dfx_lcepatsrc_defaultreset</td></tr><tr><td>Access:</td><td>R/W</td></tr></table>Local Compare Engine Pattern Source. Selects between using Pattern Buffer or PRBS as source of LCE patterns.
00 : Pattern Buffer; use LCE default training pattern;
01: Pattern Buffer; use the first 40b of pattern buffer for training.
10: PRBS; use LCE default training pattern;
11: PRBS; use the first 40b of pattern buffer for training.</td></tr>
</table>

	28:24	**cfg_reserved584** Default Value: 00h cfg_reserved584_defaultreset Access: RO Hysteresis ip74pppxdkltypecfamilyew_timer value for corewell gating. Power gating criteria(expect PMC) must me met for these many susclks before power gating is initiated. Crireg resides in suswell and retained in aonwell.
	23:21	**cfg_reserved581** Default Value: 000b cfg_reserved581_defaultreset Access: RO Reserved
	20:16	**cfg_reserved582** Default Value: 00h cfg_reserved582_defaultreset Access: RO Hysteresis ip74pppxdkltypecfamilyew_timer value for suswell gating. Power gating criteria(expect PMC) must me met for these many susclks before power gating is initiated. Crireg resides in aonwell.
	15:9	**cfg_reserved579** Default Value: 00h cfg_reserved579_defaultreset Access: RO Reserved
	8	**cfg_reserved580** Default Value: 0b cfg_reserved580_defaultreset Access: RO pianclkbufen assertion to rxidle deassertion delay ip74pppxdkltypecfamilyew_timer override

DKLP_PCS_PCS_DWORD23

	7:3	**cfg_reserved578** Default Value: 00h cfg_reserved578_defaultreset Access: RO Reserved
	2	**cfg_cri_disable_powerdown_based_gating** Default Value: 1b cfg_cri_disable_powerdown_based_gating_defaultreset Access: R/W This is for just incase something unexpected happen and internally we powergate in be;ow PS0.
	1	**cfg_reg_rxlpsen_enable_raw_all_powerdown** Default Value: 0b cfg_reg_rxlpsen_enable_raw_all_powerdown_defaultreset Access: R/W When set to 1 raw mode is enabled in all powerdown state. lfpsen from PIPE is passed to RxuP asynchronously.
	0	**cfg_reg_rxlfpsen_use_raw** Default Value: 0b cfg_reg_rxlfpsen_use_raw_defaultreset Access: R/W When set to 1, in PS3 (and above) susclk is not requested. As a result, lfps is not reported on rxelecidle. Additionally lfpsen from PIPE is passed to RxuP asynchronously. Implemented with AON retention.

DKLP_PCS_PCS_DWORD25

DKLP_PCS_PCS_DWORD25

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	168BECh-168BEFh
Name:	DKLP_PCS_PCS_DWORD25
ShortName:	DKLP_PCS_PCS_DWORD25
Reset:	global

Used for INDEX_REGISTERS programming, to program DKLP_PCS_INDEXED_PCS_ICL_INDEXED_DWORD* registers.
INDEX 0 refers to DWORD0 and INDEX 63 refers to DWORD63.

DWord	Bit	Description
0	31:24	**dfx_regaccess_31_24** Default Value: 00h dfx_regaccess_31_24_defaultreset Access: R/W Upper 3 bits are RNW(MSB) Bit31 - 0 - Read 1 - Write Bit30 - Byte1_sel Bit29 - Byte0_sel
	23:16	**dfx_regaccess_23_16** Default Value: 00h dfx_regaccess_23_16_defaultreset Access: R/W Lower 6bits i.e., [21:16] are address select
	15:8	**dfx_regaccess_15_8** Default Value: 00h dfx_regaccess_15_8_defaultreset Access: R/W Write or Read Data[15:8]
	7:0	**dfx_regaccess_7_0** Default Value: 00h dfx_regaccess_7_0_defaultreset Access: R/W Write or Read Data[7:0]

DKLP_PLL0_BIAS

DKLP_PLL0_BIAS		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
BIAS Register		
DWord	**Bit**	**Description**
0	31	**cfg_i_tdc_fine_res** Default Value: 1b cfg_i_tdc_fine_res_defaultreset Access: R/W RET DFUSE STRAP TDC fine resolution select 0: Coarse resolution / 8 1: Coarse resolution / 4
	30	**cfg_i_fracnen_h** Default Value: 1b cfg_i_fracnen_h_defaultreset Access: R/W RET DFUSE STRAP Enables fractional modulator. For SSC, this bit needs to be set to '1', even though it starts with integer division ratio. This is not part of direct pin IF. This is only integer to integer with BW optimization across all supported interger divisions or fractional to fractional with small PPM changes. Integer to fractional or vice versa is not supported.
	29:24	**cfg_i_fbdiv_frac_21_16** Default Value: 0Dh cfg_i_fbdiv_frac_21_16_defaultreset Access: R/W RET DFUSE STRAP Fractional Modulator settings
	23:16	**cfg_i_fbdiv_frac_15_8** Default Value: 55h cfg_i_fbdiv_frac_15_8_defaultreset Access: R/W RET DFUSE STRAP Fractional Modulator settings
	15:8	**cfg_i_fbdiv_frac_7_0** Default Value: 55h cfg_i_fbdiv_frac_7_0_defaultreset Access: R/W RET DFUSE STRAP Fractional Modulator settings
	7:0	**cfg_i_sscinj_stepsize_7_0** Default Value: 00h cfg_i_sscinj_stepsize_7_0_defaultreset Access: R/W RET DFUSE SSCInjection Step Size [7:0]

DKLP_PLL0_DIV0

DKLP_PLL0_DIV0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
DIV0 Register		
DWord	**Bit**	**Description**
0	31:30	**cfg_i_truelock_criteria_1_0** Default Value: 01b cfg_i_truelock_criteria_1_0_defaultreset Access: R/W RET DFUSE STRAP True lock indicator criteria. After early lock generation, external PLL lock indicator asserted high when phase error is less than threshold value for 00: 16 consecutive cycles 01: 32 consecutive cycles 10: 48 consecutive cycles 11: 64 consecutive cycles
	29:28	**cfg_i_earlylock_criteria_1_0** Default Value: 11b cfg_i_earlylock_criteria_1_0_defaultreset Access: R/W RET DFUSE STRAP Early lock indicator criteria. Early PLL lock indicator asserted high when phase error is less than threshold value for 00: 16 consecutive cycles 01: 32 consecutive cycles 10: 48 consecutive cycles 11: 64 consecutive cycles
	27:25	**cfg_i_afc_startup_2_0** Default Value: 000b cfg_i_afc_startup_2_0_defaultreset Access: R/W RET DFUSE STRAP This is for AFC start point. NOTE: i_afc_startup[2] - DW4, byte17, bit[0] 000: fine = 511 001: fine = 639 (+128) 010: fine = 767 (+256) 011: fine = 895 (+384) 100: NA 101: fine = 127 (-384) 110: fine = 255 (-256) 111: fine = 383 (-128)
	24	**cfg_i_divretimeren** Default Value: 0b cfg_i_divretimeren_defaultreset Access: R/W RET DFUSE STRAP Retiming of feedback clock
	23:21	**cfg_i_gainctrl_2_0** Default Value: 001b cfg_i_gainctrl_2_0_defaultreset Access: R/W RET DFUSE STRAP Adjustable gain for loop filter. Both coefficients shifted right by gainctrl before lock

DKLP_PLL0_DIV0

	20:16	**cfg_i_int_coeff_4_0** Default Value: 07h cfg_i_int_coeff_4_0_defaultreset Access: R/W RET DFUSE STRAP integral coeff. = 2^(-int_coeff), tageting up to 2^-11
	15:12	**cfg_i_prop_coeff_3_0** Default Value: 3h cfg_i_prop_coeff_3_0_defaultreset Access: R/W RET DFUSE STRAP proportional coeff. = 2^(-prop_coeff+1)
	11:8	**cfg_i_fbprediv_3_0** Default Value: 2h cfg_i_fbprediv_3_0_defaultreset Access: R/W RET DFUSE STRAP predivider ratio 0000,0001 : reserved 0010: /2 0100: /4 0011: reserved Rest: reserved For external IF pin use case with
	7:0	**cfg_i_fbdiv_intgr_7_0** Default Value: 82h cfg_i_fbdiv_intgr_7_0_defaultreset Access: R/W RET DFUSE STRAP Feedback divider post division (M2)

DKLP_PLL0_DIV1

DKLP_PLL0_DIV1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
DIV1 Register		
DWord	**Bit**	**Description**
0	31	**cfg_i_bw_ampmeas_window** Default Value: 0b cfg_i_bw_ampmeas_window_defaultreset Access: R/W RET DFUSE STRAP 0: 10 modulation cycles of averaging for mplitude measurement 1: 20 modulation cycles of averaging for mplitude measurement
	30:29	**cfg_i_bias_calib_stepsize_1_0** Default Value: 00b cfg_i_bias_calib_stepsize_1_0_defaultreset Access: R/W RET DFUSE STRAP Bias Calibration Step Size during linear search 00: 1 01: 2 10: 3 11: 4
	28:24	**cfg_i_ctrim_4_0** Default Value: 0Ch cfg_i_ctrim_4_0_defaultreset Access: R/W RET DFUSE STRAP ip74pppxdkltypecfamilyew_Cap trimming for irefout. This also has refclock dependency. Current default is for 24MHz.
	23	**cfg_i_fastlock_internal_reset** Default Value: 1b cfg_i_fastlock_internal_reset_defaultreset Access: R/W RETCLR DFUSE STRAP clears internal fastlock memory so that next cold start will do both TDC and AFC calibration instead of fast lock. NOTE: this does not clear the i_fastlock_en_h register bit, clears functional register and self-clears Formerly, i_bbthresh[3] (no longer strap)
	22:21	**cfg_i_bias_r_programability_1_0** Default Value: 10b cfg_i_bias_r_programability_1_0_defaultreset Access: R/W RET DFUSE STRAP [1:0] : Bias Filter R programmability - note mapped to bias_bonus[1:0]
	20:16	**cfg_i_ireftrim_4_0** Default Value: 1Ch cfg_i_ireftrim_4_0_defaultreset Access: R/W RET DFUSE STRAP Output current trim . Mirror ratio is changed based on constant current

DKLP_PLL0_DIV1

		requirement. SInce it is refclock dependent, needs to be reconfigurable. i_ireftrim[4:0] - 38.4/19.2 MHz - 5'h1C i_ireftrim[4:0] - 25/100 MHz = 5'h18 Step size: 20 uA
	15	**cfg_i_biasfilter_en_delay** Default Value: 1b cfg_i_biasfilter_en_delay_defaultreset Access: R/W RET DFUSE 0: Filter enabled even before pll enabled 1: Filter enable is delay until lock acquisition This bit is sensitive only when i_bias_filter_en is set (bit3)
	14	**cfg_i_bias_filter_en** Default Value: 1b cfg_i_bias_filter_en_defaultreset Access: R/W RET DFUSE 0: Disables bias filter 1: Enables bias filter
	13	**cfg_i_biascal_en_h** Default Value: 0b cfg_i_biascal_en_h_defaultreset Access: R/W RET DFUSE STRAP Bias Calibration Signal. Bias cal should be disable when override DCO coarse code.
	12	**cfg_i_dcodither_config** Default Value: 0b cfg_i_dcodither_config_defaultreset Access: R/W RET DFUSE Whenever we have binary weighted MFC ip74pppxdkltypecfamilyew_cap, this should be set to 1'b0. Ex: i_dcofine_resolution = 1'b0. For this case, this should be set to 1'b0. 0: No floating dither 1: Floating dither (511+Nobinary - Floating dither)
	11:8	**cfg_i_lockthresh_3_0** Default Value: 5h cfg_i_lockthresh_3_0_defaultreset Access: R/W RET DFUSE STRAP Digital lock detect threshold, the PLL will generate plllockout when the phase error detected by TDC is within lockthresh number of TDC counts for 64 consecutive cycles 5*16 (TDC Code) = 80 (16 is internally hard coded scalar value) - This setting isin middle of coarse range
	7:0	**cfg_i_tdctargetcnt_7_0** Default Value: 11h cfg_i_tdctargetcnt_7_0_defaultreset Access: R/W RET DFUSE STRAP TDC tristate buffer calibration ip74pppxdkltypecfamilyew_counter value. Delay line loop oscillation is counted over two refclk cycles. This is used for TDC coarse code calibration

DKLP_PLL0_FRAC_LOCK

DKLP_PLL0_FRAC_LOCK		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
FRAC_LOCK Register		
DWord	**Bit**	**Description**
0	31:30	**cfg_i_cml2cmosbonus_1_0** Default Value: 00b cfg_i_cml2cmosbonus_1_0_defaultreset Access: R/W RET DFUSE STRAP NOTE: These bits are ported to anatop bit [0] mapped to cml2cmosbonus[1] port - o_plllc_ck_dcocmosclkp_ana disable '1' = o_plllc_ck_dcocmosclkp_ana is disabled (ie for MG B0) '0' = both phases of the cmos clock ip74pppxdkltypecfamilyew_toggle at the interface bit[1] mapped to cml2cmosbonus[2] port - available
	29:27	**cfg_i_bb_gain2_2_0** Default Value: 000b cfg_i_bb_gain2_2_0_defaultreset Access: R/W RET DFUSE STRAP bb_gain2[2:0] : BB gain for second BB range; expect bb_gain2 >= bb_gain1
	26:24	**cfg_i_bb_gain1_2_0** Default Value: 000b cfg_i_bb_gain1_2_0_defaultreset Access: R/W RET DFUSE STRAP BB gain for first BB range
	23	**cfg_i_fastlock_en_h** Default Value: 0b cfg_i_fastlock_en_h_defaultreset Access: R/W RET DFUSE STRAP Enable FLL based AFC; this replaces binary search based AFC. FLL based AFC faster than binary search
	22:19	**cfg_i_fllafc_gain_3_0** Default Value: 8h cfg_i_fllafc_gain_3_0_defaultreset Access: R/W RET DFUSE STRAP Initial FLL gain that decrements down to 1 every refclk cycle in the beginning of FLL based AFC

DKLP_PLL0_FRAC_LOCK

	18:16	**cfg_i_fllafc_lockcnt_2_0** Default Value: 100b cfg_i_fllafc_lockcnt_2_0_defaultreset Access: R/W RET DFUSE STRAP Number of refclk cycles for FLL lock after gain is reduced to 1
	15:8	**cfg_i_max_cselafc_7_0** Default Value: 3Fh cfg_i_max_cselafc_7_0_defaultreset Access: R/W RET DFUSE STRAP Max. AFC code for a given DCO
	7:0	**cfg_i_init_cselafc_7_0** Default Value: 6Ah cfg_i_init_cselafc_7_0_defaultreset Access: R/W RET DFUSE STRAP Initial AFC code for FLL AFC; apply approximate AFC, and starting at closer frequency helps fast/accurate calibration

DKLP_PLL0_LF

DKLP_PLL0_LF

NOTE: this does not clear the i_fastlock_en_h register bit, clears functional register and self-clears Formerly, i_bbthresh[3] (no longer strap)
	22:21	**cfg_i_bias_r_programability_1_0** Default Value: 10b cfg_i_bias_r_programability_1_0_defaultreset Access: R/W RET DFUSE STRAP [1:0] : Bias Filter R programmability - note mapped to bias_bonus[1:0]
	20:16	**cfg_i_ireftrim_4_0** Default Value: 1Ch cfg_i_ireftrim_4_0_defaultreset Access: R/W RET DFUSE STRAP Output current trim . Mirror ratio is changed based on constant current

DKLP_PLL1_DIV1

		requirement. SInce it is refclock dependent, needs to be reconfigurable. i_ireftrim[4:0] - 38.4/19.2 MHz - 5'h1C i_ireftrim[4:0] - 25/100 MHz = 5'h18 Step size: 20 uA
	15	**cfg_i_biasfilter_en_delay** Default Value: 1b cfg_i_biasfilter_en_delay_defaultreset Access: R/W RET DFUSE 0: Filter enabled even before pll enabled 1: Filter enable is delay until lock acquisition This bit is sensitive only when i_bias_filter_en is set (bit3)
	14	**cfg_i_bias_filter_en** Default Value: 1b cfg_i_bias_filter_en_defaultreset Access: R/W RET DFUSE 0: Disables bias filter 1: Enables bias filter
	13	**cfg_i_biascal_en_h** Default Value: 0b cfg_i_biascal_en_h_defaultreset Access: R/W RET DFUSE STRAP Bias Calibration Signal. Bias cal should be disable when override DCO coarse code.
	12	**cfg_i_dcodither_config** Default Value: 0b cfg_i_dcodither_config_defaultreset Access: R/W RET DFUSE Whenever we have binary weighted MFC ip74pppxdkltypecfamilyew_cap, this should be set to 1'b0. Ex: i_dcofine_resolution = 1'b0. For this case, this should be set to 1'b0. 0: No floating dither 1: Floating dither (511+Nobinary - Floating dither)
	11:8	**cfg_i_lockthresh_3_0** Default Value: 5h cfg_i_lockthresh_3_0_defaultreset Access: R/W RET DFUSE STRAP Digital lock detect threshold, the PLL will generate plllockout when the phase error detected by TDC is within lockthresh number of TDC counts for 64 consecutive cycles 5*16 (TDC Code) = 80 (16 is internally hard coded scalar value) - This setting isin middle of coarse range
	7:0	**cfg_i_tdctargetcnt_7_0** Default Value: 22h cfg_i_tdctargetcnt_7_0_defaultreset Access: R/W RET DFUSE STRAP TDC tristate buffer calibration ip74pppxdkltypecfamilyew_counter value. Delay line loop oscillation is counted over two refclk cycles. This is used for TDC coarse code calibration

DKLP_PLL1_FRAC_LOCK

DKLP_PLL1_FRAC_LOCK

Register Space: MMIO: 0/2/0

Size (in bits): 32

FRAC_LOCK Register

DWord	Bit	Description
0	31:30	**cfg_i_cml2cmosbonus_1_0** Default Value: 00b cfg_i_cml2cmosbonus_1_0_defaultreset Access: R/W RET DFUSE STRAP NOTE: These bits are ported to anatop bit [0] mapped to cml2cmosbonus[1] port - o_plllc_ck_dcocmosclkp_ana disable '1' = o_plllc_ck_dcocmosclkp_ana is disabled (ie for MG B0) '0' = both phases of the cmos clock ip74pppxdkltypecfamilyew_toggle at the interface bit[1] mapped to cml2cmosbonus[2] port - available
	29:27	**cfg_i_bb_gain2_2_0** Default Value: 000b cfg_i_bb_gain2_2_0_defaultreset Access: R/W RET DFUSE STRAP bb_gain2[2:0] : BB gain for second BB range; expect bb_gain2 >= bb_gain1
	26:24	**cfg_i_bb_gain1_2_0** Default Value: 000b cfg_i_bb_gain1_2_0_defaultreset Access: R/W RET DFUSE STRAP BB gain for first BB range
	23	**cfg_i_fastlock_en_h** Default Value: 0b cfg_i_fastlock_en_h_defaultreset Access: R/W RET DFUSE STRAP Enable FLL based AFC; this replaces binary search based AFC. FLL based AFC faster than binary search
	22:19	**cfg_i_fllafc_gain_3_0** Default Value: 8h cfg_i_fllafc_gain_3_0_defaultreset Access: R/W RET DFUSE STRAP Initial FLL gain that decrements down to 1 every refclk cycle in the beginning of FLL based AFC
	18:16	**cfg_i_fllafc_lockcnt_2_0** Default Value: 100b cfg_i_fllafc_lockcnt_2_0_defaultreset Access: R/W RET DFUSE STRAP Number of refclk cycles for FLL lock after gain is reduced to 1

DKLP_PLL1_FRAC_LOCK		
	15:8	**cfg_i_max_cselafc_7_0** Default Value: 7Fh cfg_i_max_cselafc_7_0_defaultreset Access: R/W RET DFUSE STRAP Max. AFC code for a given DCO
	7:0	**cfg_i_init_cselafc_7_0** Default Value: 6Ah cfg_i_init_cselafc_7_0_defaultreset Access: R/W RET DFUSE STRAP Initial AFC code for FLL AFC; apply approximate AFC, and starting at closer frequency helps fast/accurate calibration

DKLP_PLL1_LF

DKLP_PLL1_LF		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
LF Register		
DWord	**Bit**	**Description**
0	31	**cfg_i_afc_divratio** Default Value: 0b cfg_i_afc_divratio_defaultreset Access: R/W RET DFUSE STRAP 0: DCO/4 (prediv: 2, Mdithdiv: 2) 1: DCO/8 (prediv: 4 Mdithdiv: 2)
	30:29	**cfg_i_plllock_sel_1_0** Default Value: 00b cfg_i_plllock_sel_1_0_defaultreset Access: R/W RET DFUSE select between lockdetect-based plllock or ip74pppxdkltypecfamilyew_counter based plllock 11: Sticky lock 10: ip74pppxdkltypecfamilyew_Counter-based 01: Lock Detection + ip74pppxdkltypecfamilyew_Counter 00: Lock Detection
	28:24	**cfg_i_bwphase_4_0** Default Value: 00h cfg_i_bwphase_4_0_defaultreset Access: R/W RET DFUSE STRAP Phase amplitude for bandwidth measurement
	23:21	**cfg_i_ft_mode_sel_2_0** Default Value: 010b cfg_i_ft_mode_sel_2_0_defaultreset Access: R/W RET DFUSE STRAP ftmodesel[2:0] : 9b vs 10b finetune selection, lsb0 tuning 3'b000 : 10b Nom -> Dither = LSB0, LSB0 = LSB0 3'b001 : 10b+ -> Dither = LSB+, LSB0 = LSB0+ 3'b010 : 10b- -> Dither = LSB-, LSB0 = LSB0- 3'b011 : 10b DNL -> Dither = LSB01, LSB0 = LSB0+ 3'h1xx: 9b -> Dither = LSB1, LSB0 = N/A
	20:19	**cfg_i_bw_mode_1_0** Default Value: 00b cfg_i_bw_mode_1_0_defaultreset Access: R/W RET DFUSE STRAP 00: No measurement 01: BW measurement 10: BW calibration up to +1 direction 11: BW calibration up to +2 direction
	18:16	**cfg_i_bw_upperbound_2_0** Default Value: 000b cfg_i_bw_upperbound_2_0_defaultreset Access: R/W RET DFUSE STRAP Upper bound setting for BW 000: 0.1MHz 001: 1 MHz 010: 2 MHz 011: 5 MHz 100: 6 MHz 101: 8 MHz 110: 16 MHz 111: 25MHz

DKLP_PLL1_LF

	15:13	**cfg_i_bw_lowerbound_2_0** Default Value: 000b cfg_i_bw_lowerbound_2_0_defaultreset Access: R/W RET DFUSE STRAP Lower bound setting for BW 000: 0.1MHz 001: 1 MHz 010: 2 MHz 011: 5 MHz 100: 6 MHz 101: 8 MHz 110: 16 MHz 111: 25MHz
	12:9	**cfg_i_dcoamp_3_0** Default Value: 0h cfg_i_dcoamp_3_0_defaultreset Access: R/W RET DFUSE Amplitude override value for DCO, 0000 is min amplitude, 1111 is max amplitude, applied when i_dcoampovrden_h is high. 4bit is left shifted to generate 6bit code (x4)
	8	**cfg_i_dcoampovrden_h** Default Value: 0b cfg_i_dcoampovrden_h_defaultreset Access: R/W RET DFUSE DCO amplitude override enable: 0 DCO amplitude set internally (default) 1 DCO amplitude is set by i_dcoamp[3:0]
	7:5	**cfg_i_bbthresh2_2_0** Default Value: 000b cfg_i_bbthresh2_2_0_defaultreset Access: R/W RET DFUSE STRAP threshold for second (outer) BB range; expect bbthresh2 >= bbthresh1
	4:2	**cfg_i_bbthresh1_2_0** Default Value: 000b cfg_i_bbthresh1_2_0_defaultreset Access: R/W RET DFUSE STRAP threshold for first (inner) bang-bang (BB) range
	1:0	**cfg_i_tdc_offset_lock_1_0** Default Value: 00b cfg_i_tdc_offset_lock_1_0_defaultreset Access: R/W RET DFUSE TDC Offset during lock for integer mode

DKLP_PLL1_TDC_COLDST_BIAS

DKLP_PLL1_TDC_COLDST_BIAS		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
TDC_COLDST_BIAS Register		
DWord	**Bit**	**Description**
0	31:29	**cfg_i_cloadctrllext_4_2** Default Value: 000b cfg_i_cloadctrllext_4_2_defaultreset Access: R/W RET VFUSE cload control override for H Vernier line. This is applied when i_tdccalexten_h = 1
	28:24	**cfg_i_tribufctrlext_4_0** Default Value: 00h cfg_i_tribufctrlext_4_0_defaultreset Access: R/W RET VFUSE Tribufctrl control override. This is applied when i_tdccalexten_h = 1
	23:16	**cfg_i_dcocoarse_7_0** Default Value: 00h cfg_i_dcocoarse_7_0_defaultreset Access: R/W RET VFUSE STRAP DCO coarse tune frequency value, when dcocoarse_ovrd_h is '1', this input is used to override the value calculated from the Automatic Frequency Calibration (AFC) block
	15:8	**cfg_i_sscstepsize_7_0** Default Value: 0Fh cfg_i_sscstepsize_7_0_defaultreset Access: R/W RET DFUSE STRAP Fractional value for one SSC frequency step.
	7:0	**cfg_i_feedfwrdgain_7_0** Default Value: 23h cfg_i_feedfwrdgain_7_0_defaultreset Access: R/W RET DFUSE STRAP Feedforwad gain for fractional mode/SSC mode PLL This setting is needed whenever PLL is configured in fractional mode or configured for SSC clock generation.

DKLP_PMD_LANE_ANA_CSR_DIG_LFPS_CAL

DKLP_PMD_LANE_ANA_CSR_DIG_LFPS_CAL

Register Space: MMIO: 0/2/0

Size (in bits): 32

PMD_LANE_ANA_CSR::DIG_LFPS_CAL

DWord	Bit	Description
0	31:23	**cfg_reserved1** Default Value: 000h cfg_reserved1_defaultreset Access: R/W PMD_LANE_ANA_CSR::DIG_LFPS_CAL::reserved1
	22	**cfg_filter1** Default Value: 0b cfg_filter1_defaultreset Access: R/W PMD_LANE_ANA_CSR::DIG_LFPS_CAL::filter1
	21	**cfg_osc_dfx_en** Default Value: 0b cfg_osc_dfx_en_defaultreset Access: R/W PMD_LANE_ANA_CSR::DIG_LFPS_CAL::osc_dfx_en
	20:19	**cfg_ck2logic_sel** Default Value: 00b cfg_ck2logic_sel_defaultreset Access: R/W PMD_LANE_ANA_CSR::DIG_LFPS_CAL::ck2logic_sel
	18	**cfg_ck_div_en** Default Value: 1b cfg_ck_div_en_defaultreset Access: R/W PMD_LANE_ANA_CSR::DIG_LFPS_CAL::ck_div_en
	17:12	**cfg_osc_trim** Default Value: 3Fh cfg_osc_trim_defaultreset Access: R/W Reserved

DKLP_PMD_LANE_ANA_CSR_DIG_LFPS_CAL

	11	**cfg_reserved** Default Value: 0b cfg_reserved_defaultreset Access: R/W added by Yoni to provide local fix.
	10:1	**cfg_amon_sel** Default Value: 000h cfg_amon_sel_defaultreset Access: R/W added by Yoni to provide local fix.
	0	**cfg_amon_puldn_en** Default Value: 1b cfg_amon_puldn_en_defaultreset Access: R/W modified by Yoni to provide local fix. originally width 24 RW, reset value - 800FDA

DKLP_PMD_LANE_CDR_CDR_SAVE_RESTORE1

DKLP_PMD_LANE_CDR_CDR_SAVE_RESTORE1		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
PMD_LANE_CDR::CDR_SAVE_RESTORE1		
DWord	**Bit**	**Description**
0	31:28	**cfg_reserved1** Default Value: 0h cfg_reserved1_defaultreset Access: R/W PMD_LANE_CDR::CDR_SAVE_RESTORE1::reserved1
	27:19	**cfg_dco_coarse_backup_sr** Default Value: 000h cfg_dco_coarse_backup_sr_defaultreset Access: R/W this is a save restore register, to save last dco calibration code, for reuse in warm boot.
	18:10	**cfg_dco_coarse_init** Default Value: 098h cfg_dco_coarse_init_defaultreset Access: R/W PMD_LANE_CDR::CDR_SAVE_RESTORE1::dco_coarse_init
	9:5	**cfg_kp_datalock_acq** Default Value: 16h cfg_kp_datalock_acq_defaultreset Access: R/W PMD_LANE_CDR::CDR_SAVE_RESTORE1::kp_datalock_acq
	4:0	**cfg_ki_datalock_acq** Default Value: 18h cfg_ki_datalock_acq_defaultreset Access: R/W PMD_LANE_CDR::CDR_SAVE_RESTORE1::ki_datalock_acq

DKLP_PMD_LANE_SUSWELL_LFPS_SPARE

DKLP_PMD_LANE_SUSWELL_LFPS_SPARE		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
PMD_LANE_SUSWELL::LFPS_SPARE		
DWord	**Bit**	**Description**
0	31:17	**cfg_reserved1** Default Value: 0000h cfg_reserved1_defaultreset Access: R/W Reserved
	16	**cfg_enable_squelch_periodic_cal** Default Value: 0b cfg_enable_squelch_periodic_cal_defaultreset Access: R/W PMD_LANE_SUSWELL::LFPS_SPARE::enable_squelch_periodic_cal
	15:11	**cfg_rx_lfps_delay_filter_depth** Default Value: 04h cfg_rx_lfps_delay_filter_depth_defaultreset Access: R/W rx_lfps_delay_filter_depth
	10:9	**cfg_counter_init** Default Value: 00b cfg_counter_init_defaultreset Access: R/W PMD_LANE_SUSWELL::LFPS_SPARE::counter_init
	8	**cfg_1ms_timer_en** Default Value: 0b cfg_1ms_timer_en_defaultreset Access: R/W PMD_LANE_SUSWELL::LFPS_SPARE::1ms_timer_en
	7	**cfg_rx_lfps_delay_timer_en** Default Value: 0b cfg_rx_lfps_delay_timer_en_defaultreset Access: R/W PMD_LANE_SUSWELL::LFPS_SPARE::rx_lfps_delay_timer_en
	6	**cfg_mipi_dif_pn_hs_filt_dis** Default Value: 0b cfg_mipi_dif_pn_hs_filt_dis_defaultreset Access: R/W PMD_LANE_SUSWELL::LFPS_SPARE::mipi_dif_pn_hs_filt_dis
	5	**cfg_ecsr_force_val_pmd_txdorxdetect_tx1** Default Value: 0b cfg_ecsr_force_val_pmd_txdorxdetect_tx1_defaultreset Access: R/W PMD_LANE_SUSWELL::LFPS_SPARE::ecsr_force_val_pmd_txdorxdetect_tx1

DKLP_PMD_LANE_SUSWELL_LFPS_SPARE		
	4	**cfg_ecsr_force_en_pmd_txdorxdetect_tx1** Default Value: 0b cfg_ecsr_force_en_pmd_txdorxdetect_tx1_defaultreset Access: R/W PMD_LANE_SUSWELL::LFPS_SPARE::ecsr_force_en_pmd_txdorxdetect_tx1
	3:0	**cfg_idig_lfps_spare** Default Value: 0h cfg_idig_lfps_spare_defaultreset Access: R/W PMD_LANE_SUSWELL::LFPS_SPARE::idig_lfps_spare

DKLP_PMD_LANE_SUSWELL_TX1_RCV_DETECT_CTRL

DKLP_PMD_LANE_SUSWELL_TX1_RCV_DETECT_CTRL		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
PMD_LANE_SUS_LN0/1::TX1_RCV_DETECT_CTRL		
DWord	**Bit**	**Description**
0	31	**reserved1** Access: RO
	30	**ecsr_tx_rcv_detect_shunt_low_tx1** HASH(0x18841C0)
	29	**ecsr_tx_rcv_detect_shunt_high_tx1** HASH(0x18CD070)
	28:22	**ecsr_tx_rcv_detect_cell_hz_tx1** Default Value: 0x7F HASH(0x188F060)
	21	**Reserved**
	20:19	**ecsr_tx_rcv_detect_fltr_sel_tx1** Default Value: 0x2 wait state during sampling select beween 1,2,3 wait states
	18	**ecsr_tx_rcv_detect_status_force_val_tx1** force detection value
	17	**ecsr_tx_rcv_detect_status_force_en_tx1** force detection value
	16:12	**ecsr_tx_rcv_detect_fsm_force_val_tx1** force rcv detect fsm state
	11	**ecsr_tx_rcv_detect_fsm_force_en_tx1** force rcv detect fsm
	10:4	**ecsr_tx_rcv_detect_cnt_limit_tx1** Default Value: 0x5 count limit of valid to sample tx detect signal
	3	**ecsr_tx_rcv_detect_p_on_high_en_tx1** take detect on high level
	2	**ecsr_tx_rcv_detect_n_on_high_en_tx1** HASH(0x1AC4C40)

	0	**ecsr_tx_rcv_detect_inv_n_ana_sig_tx1** HASH(0x197E1B0)

DKLP_TX_GLUE_TX_DWORD14

DKLP_TX_GLUE_TX_DWORD14		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
TX related, imported from PMD_LANE_MISC		
DWord	**Bit**	**Description**
0	31:25	**cfg_reserved_1** Default Value: 00h cfg_reserved_1_defaultreset Access: R/W Tx_Glue::tx_dword14::reserved_1
	24:14	**cfg_ecsr_tx_clk_dccdacctrl_offset** Default Value: 000h cfg_ecsr_tx_clk_dccdacctrl_offset_defaultreset Access: R/W reserved
	13	**cfg_ecsr_tx_dccdacenrbp** Default Value: 0b cfg_ecsr_tx_dccdacenrbp_defaultreset Access: R/W if set, chooses coarse step (x2) of dccdacctrl
	12:0	**cfg_ecsr_tx_clk_dccdacctrl** Default Value: 148Ch cfg_ecsr_tx_clk_dccdacctrl_defaultreset Access: R/W ecsr_tx_clk_dccdacctrl

DKLP_TX2_PMD_LANE_MISC_TX1_SPARE

DKLP_TX2_PMD_LANE_MISC_TX1_SPARE		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
TX2_PMD_LANE_MISC::TX1_SPARE		
DWord	**Bit**	**Description**
0	31:8	**cfg_reserved1** Default Value: 000000h cfg_reserved1_defaultreset Access: R/W Reserved
	7:0	**cfg_dig_tx_spare_tx1** Default Value: 0Fh cfg_dig_tx_spare_tx1_defaultreset Access: R/W Spare Config Bits for Tx

DMA Address Register 0 High

DMA_ADDR_0_HIGH - DMA Address Register 0 High

Register Space: MMIO: 0/2/0
Access: R/W
Size (in bits): 32

The lower 32 bits of the first DMA address register.

Programming Notes

This register is saved in the power context

DWord	Bit	Description
0	31:25	**Reserved** Access: RO Format: MBZ
	24	**Access Region** 0h: Main Memory **[Default]** 1h: SRAM
	23:21	**Reserved** Access: RO Format: MBZ
	20:16	**Address Space** 0h: Normal Memory Access **[Default]** – Use the Per-process GTT if enabled, otherwise uses the Global GTT 7h: WOPCM Access 8h: Global GTT Memory Access **Programming Notes**: This field is ignored if the selected Access Region is SRAM.
	15:0	**Address Upper DWord** Format: GraphicsAddress[47:32]

DMA Address Register 0 Low

DMA_ADDR_0_LOW - DMA Address Register 0 Low		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
The lower 32 bits of the first DMA address register.		
Programming Notes		
This register is saved in the power context		

DWord	Bit	Description
0	31:0	**Address** Format: GraphicsAddress[31:0] This field contains an offset into the associated space or a Graphics Address.

DMA Address Register 1 High

DMA_ADDR_1_HIGH - DMA Address Register 1 High

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

The lower 32 bits of the second DMA address register.

Programming Notes

This register is saved in the power context

DWord	Bit	Description
0	31:25	**Reserved** Access: RO Format: MBZ
	24	**Access Region** 0h: Main Memory **[Default]** 1h: SRAM
	23:21	**Reserved** Access: RO Format: MBZ
	20:16	**Address Space** 0h: Normal Memory Access **[Default]** 7h: WOPCM Access 8h: Global GTT Memory Access **Programming Notes** This field is ignored if the selected Access Region is SRAM.
	15:0	**Address Upper DWord** Format: GraphicsAddress[47:32]

DMA Address Register 1 Low

DMA_ADDR_1_LOW - DMA Address Register 1 Low	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

The lower 32 bits of the second DMA address register.

Programming Notes
This register is saved in the power context

DWord	Bit	Description
0	31:0	**Address** Format: GraphicsAddress[31:0] This field contains an offset into the associated space or a Graphics Address.

DMA Configuration

DMA_CFG - DMA Configuration

Register Space: MMIO: 0/2/0
Access: R/W
Size (in bits): 32

Programming Notes
This register is saved in the power context. SW shall set bits[1:0] = '00'
Programming of Bits[1:0] are only applies to explicit DMA operation's triggered by FW Or HOST.

DWord	Bit	Description
0	31:3	**Reserved** Access: RO Format: MBZ
	2	**C6 Restore Control** 0h – Active C6 Restore **[Default]** – SRAM contents will be restored as part of the C6 restore. 1h – Lazy C6 Restore – SRAM contents will only be restored on the first active write to the GuC. **Programming Notes**: Hardware restores SRAM contents coming out of RC6 only after a valid kernel has been loaded. If host SW uses DMA to load multiple entities (e.g micro-apps and then kernel), it shall inhibit RC6 entry till the kernel is loaded.
	1	**Main Memory To SRAM Performance Optimization Mode** Mode selection control when bit 0 is set. 0h – **[Default]** – If bit 0 is set, stream writes will be done only uOS/uApp being DMA-ed. 1h – If bit 0 is set, stream writes will be done for all DMA to SRAM. Note that if MinIA is active, this setting can cause writes to be dropped.
	0	**Main Memory To SRAM Performance Optimization** 0h – Reorder Writes **[Default]** – Reorder DMA writes to be in order when DMA'ing from GAM to SRAM. 1h – Stream – Stream DMA writes as the read data comes in. Use the 'tag' field in the read return as the address to SRAM.

DMA Control

DMA_CTRL - DMA Control

Register Space: MMIO: 0/2/0
Access: R/W
Size (in bits): 32

Programming Notes

This register is saved in the power context
The DMA hardware performs several checks of the parameters provided in the DMA registers before allowing DMA to proceed. These checks are documented in the GuC DMA description PRM section.
If these checks fail then DMA will not start (i.e: it will appear that writes to this register were dropped)

DWord	Bit	Description
0	31:16	**Write Enable Mask** Format: Mask[15:0] A write enable mask for bits 15:0
	15	**Catastrophic Error Encountered during DMA** This bit is set if the DMA transfer encountered a catastrophic fault during its operation. Bit is reset when the next DMA transfer is initiated.
	14:11	**Reserved** Access: RO Format: MBZ
	10	**Last DFX DMA** Allow for SHA to preserve signature between DMA transfers - This feature should be enabled only when DFX PRIMARY Control bit C068[7] is 1 . Dfx now needs to indicate to GUC which is the last DMA in its set of DMA transfers, whose SHA is being accumulated. Dfx will program all these DMAs as uApp at different destination addresses. When Dfx sets this bit along with C314[0], it indicates the last DMA in Dfx's set of DMA transfers.
	9	**Reserved**
	8	**BOOTROM in WOPCM** Allows host to DMA BootROM code to WOPCM region.BootROM code shall be located at offset 0 in GuC's WOPCM regionMode available with fuse_auth_disable == '1'
	7:6	**uApp Index** Specific AppID for one of the 2 uApps, for storing into WOPCM area as destination. Will be only valid when WOPCM is the Destination. Value: [0,1] Name:
	5	**uApp Move** Whether the uApp (index specified the "uApp Index" field) is being moved to WOPCM.

DMA_CTRL - DMA Control

		Programming Notes Must be set only when the DMA is moving uApp Code, and not uOS code.
	4	**uOS Move** Whether the uOS is being moved to WOPCM. **Programming Notes** Must be set only when the DMA is moving uOS Code, and not uApp code.
	3	**DMA Completion Interrupt Enable** Whether an interrupt will be generated when the DMA copy is complete.
	2	**DMA Completion Interrupt Routing** Where the DMA completion interrupt will be routed. **Value** / **Name** / **Description** 0h / Host **[Default]** / Interrupt will be routed to the host CPU. 1h / Reserved / Reserved
	1	**DMA Source** Which DMA address register contains the source of the DMA transfer. **Value** / **Name** / **Description** 0h / Register 0 **[Default]** / Address register 0 is the source of the DMA transfer, address register 1 is the destination. 1h / Register 1 / Address register 1 is the source of the DMA transfer, address register 0 is the destination.
	0	**Start DMA Transfer** This bit should be programmed last since it will trigger the DMA transfer. Hardware will clear this bit once DMA completes.

DMA Copy Size

DMA_COPY_SIZE - DMA Copy Size

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Size of the DMA copy.

Programming Notes

The following rules hold good regarding the uOS and uApp size:

- uOS and uApps sizes are always divisible by 64-bytes.
- uOS and uApps hash value take into account any padding needed for uOS/uApps divisible by 64-byte requirement.

This register is saved in the power context

DWord	Bit	Description
0	31:0	**DMA Transfer Size** **Description** Size of the DMA transfer, in bytes. For smaller transfers SW should use the MinuteIA core directly (DMA programming overhead is higher than copying the data using the MinuteIA core. Approximate inflection point would be ~ 256 bits.)

DMA Global MicroController WOPCM Offset

DMA_GUC_WOPCM_OFFSET - DMA Global MicroController WOPCM Offset

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Programming Notes

The WOPCM space referenced by this base address/offset is not IA visible space. uKernel/uApps are stored here.

This register is required to be programmed before the DMA engine can be invoked to load uKernel (access WOPCM memory). The register is locked after the write - (Write Once).

This register is saved in the power context

DWord	Bit	Description
0	31:14	**GuC WOPCM Offset** Format: WOPCMBaseOffset[31:14] This bit field defines the "GuC WOPCM Start Address" as an 16KB alligned offset from "WOPCM Base".
	13:2	**Reserved** Access: RO Format: MBZ
	1	**Reserved**
	0	**Offset Valid** Reports whether the "GuC WOPCM Offset" is valid and loaded. HW sets this bit when the register is programmed with the GuC WOPCM Offset value.

DMA Microkernel Base

DMA_UOS_BASE - DMA Microkernel Base

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

Programming Notes

This register is saved in the power context

DWord	Bit	Description
0	31:6	**Microkernel Base Offset** Format: WOPCMBaseOffset[31:6] This is the value that was programmed by the host. The value is relative to the SRAM base == 0x0 offset in WOPCM.
	5:4	**State of Microkernel** This field is valid only if the "Valid" field (bit 0) is set Value / Name / Description: 0h / In WOPCM **[Default]** / The microkernel is in WOPCM. 1h / In WOPCM and SRAM / The microkernel is in WOPCM and SRAM. 2h / In WOPCM and SRAM and partially SRAM / The microkernel is in WOPCM and partially in SRAM.
	3:1	**Reserved** Access: RO Format: MBZ
	0	**Valid** Format: Boolean Whether a microkernel has been loaded into WOPCM and the hash check has passed.

DMA Microkernel Top

DMA_UOS_TOP - DMA Microkernel Top

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

Programming Notes
This register is saved in the power context

DWord	Bit	Description
0	31:6	**Microkernel Top Address** Format: WOPCMBaseOffset[31:6] This value is derived from the initial uOS DMA programming to WOPCM by the host. The value is relative to the SRAM base == 0x0 offset in WOPCM. This offset will point to the beginning of the last cacheline DMA'd.
	5:0	**Reserved** Access: RO Format: MBZ

DMA Protected Range

DPR_0_0_0_PCI - DMA Protected Range

Register Space:	PCI: 0/0/0
Size (in bits):	32
Address:	0005Ch

DMA protected range register.

DWord	Bit	Description
0	31:20	**Top of DPR** Default Value: 000000000000b Access: RO _Custom_GTIReset: BUS RESERVED for DEVICE 2 shadow copy. Device 0 maintains these register bits. Top address + 1 of DPR. This is the base of TSEG. Bits 19:0 of the BASE reported here are 0x0_0000.
	19:12	**Reserved** Access: RO Format: MBZ
	11:4	**DPRSIZE** Default Value: 00000000b Access: R/W Lock _Custom_GTIReset: BUS This is the size of memory, in MB, that will be protected from DMA accesses. A value of 0x00 in this field means no additional memory is protected. The maximum amount of memory that will be protected is 255MB. The amount of memory reported in this field will be protected from all DMA accesses, including translated CPU accesses and graphics. The top of the protected range is the BASE of TSEG -1. Note: If TSEG is not enabled, then the top of this range becomes the base of stolen graphics, or ME stolen space or TOLUD, whichever would have been the location of TSEG, assuming it had been enabled. The DPR range works independently of any other range, including the NoDMA.TABLE protection or the PMRC checks in VTd, and is done post any VTd translation or LT NoDMA lookup. Therefore incoming cycles are checked against this range after the VTd translation and faulted if they hit this protected range, even if they passed the VTd translation or were clean in the NoDMA lookup. All the memory checks are OR'ed with respect to NOT being allowed to go to memory. So if either PMRC, DPR, NoDMA table lookup, NoDMA.TABLE.PROTECT OR a VTd translation disallows the cycle, then the cycle is not allowed to go to memory. Or in other words, all of the above checks must pass before a cycle is allowed to DRAM.
	3	**Reserved** Access: RO Format: MBZ

DPR_0_0_0_PCI - DMA Protected Range

	2	**EPM** Default Value: 0b Access: R/W Lock _Custom_GTIReset: BUS This field controls DMA accesses to the DMA Protected Range (DPR) region. 0: DPR is disabled. 1: DPR is enabled. All DMA requests accessing DPR region are blocked. Dev 0 HW reports the status of DPR enable/disabled through the PRS field in this register.
	1	**Protected Range Status** Default Value: 0b Access: RO _Custom_GTIReset: BUS RESERVED for DEVICE 2 shadow copy. Dev0 maintains this bit. This field indicated the status of DPR. 0: DPR protection disabled. 1: DPR protection enabled.
	0	**Lock** Default Value: 0b Access: R/W Key Lock _Custom_GTIReset: BUS All bits which may be updated by SW in this register are locked down when this bit is set.

Doorbell Control

DOORBELL_CTRL - Doorbell Control

Register Space: MMIO: 0/2/0
Access: R/W
Size (in bits): 32

Programming Notes
This register is saved in the power context

DWord	Bit	Description
0	31:25	**Reserved** Access: RO Format: MBZ
	24:16	**Write Enable Mask** Format: Mask[8:0] A write enable mask for bits 8:0
	15:9	**Reserved** Access: RO Format: MBZ
	8	**Interrupt Routing** Where interrupts will be routed. 0h – Host **[Default]** – Interrupts will be routed to the host CPU. 1h – Reserved – Reserved
	7	**Doorbell Rung in Group 7** Format: Boolean Whether a doorbell has rung in group 7 (doorbells 224 through 255). This field is written by GTI, or the host CPU. It is cleared by the GuC interrupt hardware, and is read by the host CPU. 0h – None **[Default]** – No doorbell in the group was rung 1h – Doorbell Rung – A doorbell in the group was rung.
	6	**Doorbell Rung in Group 6** Format: Boolean Whether a doorbell has rung in group 6 (doorbells 192 through 223). This field is written by GTI, or the host CPU. It is cleared by the GuC interrupt hardware, and is read by the host CPU. 0h – None **[Default]** – No doorbell in the group was rung 1h – Doorbell Rung – A doorbell in the group was rung.

DOORBELL_CTRL - Doorbell Control

5 — Doorbell Rung in Group 5

Format:	Boolean

Whether a doorbell has rung in group 5 (doorbells 160 through 191). This field is written by GTI, or the host CPU. It is cleared by the GuC interrupt hardware, and is read by the host CPU..

Value	Name	Description
0h	None **[Default]**	No doorbell in the group was rung
1h	Doorbell Rung	A doorbell in the group was rung.

4 — Doorbell Rung in Group 4

Format:	Boolean

Whether a doorbell has rung in group 4 (doorbells 128 through 159). This field is written by GTI, or the host CPU. It is cleared by the GuC interrupt hardware, and is read by the host CPU.

Value	Name	Description
0h	None **[Default]**	No doorbell in the group was rung
1h	Doorbell Rung	A doorbell in the group was rung.

3 — Doorbell Rung in Group 3

Format:	Boolean

Whether a doorbell has rung in group 3 (doorbells 96 through 127). This field is written by GTI, or the host CPU. It is cleared by the GuC interrupt hardware, and is read by the host CPU.

Value	Name	Description
0h	None **[Default]**	No doorbell in the group was rung
1h	Doorbell Rung	A doorbell in the group was rung.

2 — Doorbell Rung in Group 2

Format:	Boolean

Whether a doorbell has rung in group 2 (doorbells 64 through 95). This field is written by GTI, or the host CPU. It is cleared by the GuC interrupt hardware, and is read by the host CPU.

Value	Name	Description
0h	None **[Default]**	No doorbell in the group was rung
1h	Doorbell Rung	A doorbell in the group was rung.

1 — Doorbell Rung in Group 1

Format:	Boolean

Whether a doorbell has rung in group 1 (doorbells 32 through 63). This field is written by GTI, or the host CPU. It is cleared by the GuC interrupt hardware, and is read by the host CPU.

Value	Name	Description
0h	None **[Default]**	No doorbell in the group was rung
1h	Doorbell Rung	A doorbell in the group was rung.

DOORBELL_CTRL - Doorbell Control

	0	**Doorbell Rung in Group 0** Format: Boolean Whether a doorbell has rung in group 0 (doorbells 0 through 31). This field is written by GTI, or the host CPU. It is cleared by the GuC interrupt hardware, and is read by the host CPU. **Value** / **Name** / **Description** 0h / None **[Default]** / No doorbell in the group was rung 1h / Doorbell Rung / A doorbell in the group was rung.

Doorbell Cookie Register 0..255

DRB0..255COOK - Doorbell Cookie Register 0..255		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 01A00h - 01DFCh		
DWord	**Bit**	**Description**
0	31:0	**Doorbell #0 Cookie Data** Access: R/W _Custom_GTIReset: BUS Value of the cookie data for doorbell.
..	..	..
255	31:0	**Doorbell #255 Cookie Data** Access: R/W _Custom_GTIReset: BUS Value of the cookie data for doorbell.

Doorbell IDI Register

DRBIDI1 - Doorbell IDI Register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	01988h	
DWord	**Bit**	**Description**
0	31:10	**Reserved** Access: RO Format: MBZ
	9:8	**Doorbell Class of Service** Access: R/W _Custom_GTIReset: BUS Identifies the Class of Service (CLOS) to send with all C2UREQ initiated by doorbell unit. CLOS determines one of 4 possible uses in number of ways of LLC. Since the doorbells are used with only all 16 ways available, these registers should be programmed to match the CLOS which allocates all 16 ways. It is also expected that these values are changed once before any doorbells are armed/active and will stay static for the duration of any test. 00=> MDRB will echo CLOS of 0 with each C2UREQ - DEFAULT 01=> MDRB will echo CLOS of 1 with each C2UREQ 10=> MDRB will echo CLOS of 2 with each C2UREQ 11=> MDRB will echo CLOS of 3 with each C2UREQ
	7:0	**Reserved** Access: RO Format: MBZ

Doorbell Lower Address Register 0..255

DRB0..255REGL - Doorbell Lower Address Register 0..255

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	01000h - 017F8h

DWord	Bit	Description
0	31:6	**Address to be monitored** Access: R/W _Custom_GTIReset: BUS Address to be Monitored: Value of the cacheline address that needs to be monitored. This address has to be HPA in case of 2nd level translations are enabled, else it is GPA.
	5:3	**Reserved** Access: RO Format: MBZ
	2	**RFO request** Access: RO _Custom_GTIReset: BUS RFO request pending: This is a hardware-maintained flag that an RFO (Request for ownership) needs to be sent to BGF. This is set to 1 when Ownership pending is activated and reset to 0 when the RFO is sent to uncore via BGF. This bit is reflected to MMIO else managed within HW.
	1	**Ownership Flow Pending** Access: RO _Custom_GTIReset: BUS Ownership Flow Pending: This is a hardware-maintained flag which would indicate that corresponding flag has lost ownership and pending for RFO. This is set to 1 when RFO is needed through snoop hit or activation of valid and reset to 0 when the RFO is completed (data and response received). It is reflected to MMIO else managed within HW.
	0	**Valid** Access: R/W _Custom_GTIReset: BUS Valid: Determines whether the doorbell is active or not. As part of the register update flow, SW first need to write the upper portion of this register (i.e. 63:32) and update the lower portion along with the VALID flag which activates the monitor system. SW has to clear the contents of this register before allocating a new doorbell.
..	..	..

DRB0..255REGL - Doorbell Lower Address Register 0..255

255	31:6	**Address to be monitored** Access: R/W _Custom_GTIReset: BUS Address to be Monitored: Value of the cacheline address that needs to be monitored. This address has to be HPA in case of 2nd level translations are enabled, else it is GPA.
	5:3	**Reserved** Access: RO Format: MBZ
	2	**RFO request** Access: RO _Custom_GTIReset: BUS RFO request pending: This is a hardware-maintained flag that an RFO (Request for ownership) needs to be sent to BGF. This is set to 1 when Ownership pending is activated and reset to 0 when the RFO is sent to uncore via BGF. This bit is reflected to MMIO else managed within HW.
	1	**Ownership Flow Pending** Access: RO _Custom_GTIReset: BUS Ownership Flow Pending: This is a hardware-maintained flag which would indicate that corresponding flag has lost ownership and pending for RFO. This is set to 1 when RFO is needed through snoop hit or activation of valid and reset to 0 when the RFO is completed (data and response received). It is reflected to MMIO else managed within HW.
	0	**Valid** Access: R/W _Custom_GTIReset: BUS Valid: Determines whether the doorbell is active or not. As part of the register update flow, SW first need to write the upper portion of this register (i.e. 63:32) and update the lower portion along with the VALID flag which activates the monitor system. SW has to clear the contents of this register before allocating a new doorbell.

Doorbell Upper Address Register 0..255

DRB0..255REGU - Doorbell Upper Address Register 0..255

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 01004h - 017FCh

DWord	Bit	Description
0	31:7	**Reserved** Access: RO Format: MBZ
	6:0	**Address to be monitored** Access: R/W _Custom_GTIReset: BUS Upper Address to be Monitored: Value of the cacheline address that needs to be monitored. This address corresponds to address bits [38:32],and has to be HPA in case of 2nd level translations are enabled, else it is GPA.
..	..	..
255	31:7	**Reserved** Access: RO Format: MBZ
	6:0	**Address to be monitored** Access: R/W _Custom_GTIReset: BUS Upper Address to be Monitored: Value of the cacheline address that needs to be monitored. This address corresponds to address bits [38:32],and has to be HPA in case of 2nd level translations are enabled, else it is GPA.

DOUBLE_BUFFER_CTL

DOUBLE_BUFFER_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	44500h-44503h
Name:	Double Buffer Control
ShortName:	DOUBLE_BUFFER_CTL
Reset:	soft

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7:4	**Reserved** Access: RO Format: MBZ
	3:1	**Reserved** Access: RO Format: MBZ
	0	**Global Double Buffer Update Disable** Description: This field is used to disable double buffer updates for all pipes and transcoders. 0b – Not Disabled 1b – Disabled

DP_TP_CTL

DP_TP_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	60540h-60543h
Name:	DisplayPort Transport Control
ShortName:	DP_TP_CTL_A
Reset:	soft
Address:	61540h-61543h
Name:	DisplayPort Transport Control
ShortName:	DP_TP_CTL_B
Reset:	soft
Address:	62540h-62543h
Name:	DisplayPort Transport Control
ShortName:	DP_TP_CTL_C
Reset:	soft
Address:	63540h-63543h
Name:	DisplayPort Transport Control
ShortName:	DP_TP_CTL_D
Reset:	soft

DWord	Bit	Description
0	31	**Transport Enable** This bit enables the DisplayPort transport function. Value: 0b – Disable; 1b – Enable
	30	**FEC Enable** Forward Error Correction (FEC) coding for Display Ports (DP). The data M and data N must account for the FEC overhead when FEC is enabled. FEC can only be enabled after DP_TP_CTL isenabled. FEC can only be disabled after DP_TP_CTL is disabled. Value: 0b – disable; 1b – enable

DP_TP_CTL

29:28 **Reserved**

Access:	RO
Format:	MBZ

27 **Transport Mode Select**

This bit selects between DisplayPort SST and MST modes of operation.

This bit must be programmed for all version of displayport protocol.

Value	Name	Description
0b	SST mode	DisplayPort SST mode
1b	MST mode	DisplayPort MST mode

Restriction
The DisplayPort mode (SST or MST) selected here must match the mode selected in the Transcoder DDI Function Control registers for the transcoders attached to this transport. This field must not be changed while the DDI function is enabled.

26 **Reserved**

Access:	RO
Format:	MBZ

25 **Force ACT**

This bit forces DisplayPort MST ACT to be sent one time at the next link frame boundary. After ACT is sent, as indicated in the ACT sent status bit, this bit can be cleared and set again to send ACT again.

Value	Name	Description
0b	Do not force	Do not force ACT to be sent
1b	Force	Force ACT to be sent one time

24:21 **Reserved**

Access:	RO
Format:	MBZ

20:19 **Training Pattern 4 Select**

Value	Name	Description
00b	Training Pattern 4a **[Default]**	**CP2520 Pattern 3**:SR-BS-BS-SR-248 00hs (after data symbol scrambling and ANSI8B/10B coding)
01b	Training Pattern 4b	**CP2520 Pattern 2**:SR-BF-BF-SR-248 00hs (after data symbol scrambling and ANSI8B/10B coding)
10b	Training Pattern 4c	**CP2520 Pattern 1**:SR-CP-CP-SR-248 of 00hs (after data symbol scrambling and ANSI8B/10B coding)
11b	Reserved	

DP_TP_CTL

18 Enhanced Framing Enable

This bit selects enhanced framing for DisplayPort SST.

Hardware internally enables enhanced framing for DisplayPort MST.

Value	Name
0b	Disabled
1b	Enabled

Restriction
In DisplayPort MST mode this bit must be set to Disabled. This field must not be changed while the DDI function is enabled.

17:11 Reserved

Access:	RO
Format:	MBZ

10:8 DP Link Training Enable

These bits are used for DisplayPort link initialization as defined in the DisplayPort specification. During training patterns, hardware will internally manage enabling and disabling of scrambling. Scrambling disable bit will be ignored at that time.
DP_TP_STATUS has an indication that the required number of idle patterns has been sent.

Value	Name	Description
000b	Pattern 1	Training Pattern 1 enabled.
001b	Pattern 2	Training Pattern 2 enabled.
010b	Idle	Idle Pattern enabled.
011b	Normal	Link not in training: Send normal pixels
100b	Pattern 3	Training Pattern 3 enabled.
101b	Pattern 4	Training Pattern 4 enabled.
Others	Reserved	Reserved

Restriction
When enabling or re-enabling the port, it must be turned on with pattern 1 enabled.

7 Reserved

6 Alternate SR Enable

This bit enables the DisplayPort Alternate Scrambler Reset, intended for use only with embedded DisplayPort receivers.

Value	Name
0b	Disable
1b	Enable

DP_TP_CTL		
		Restriction This field must not be changed while the DDI function is enabled.
	5:0	**Reserved** Access: RO Format: MBZ

DP_TP_STATUS

DP_TP_STATUS	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	60544h-60547h
Name:	DisplayPort Transport Status
ShortName:	DP_TP_STATUS_A
Reset:	soft
Address:	61544h-61547h
Name:	DisplayPort Transport Status
ShortName:	DP_TP_STATUS_B
Reset:	soft
Address:	62544h-62547h
Name:	DisplayPort Transport Status
ShortName:	DP_TP_STATUS_C
Reset:	soft
Address:	63544h-63547h
Name:	DisplayPort Transport Status
ShortName:	DP_TP_STATUS_D
Reset:	soft

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28	**FEC enable live status** Access: RO This bit provides live status of FEC enable/disable in hardware.
	27	**Idle Link Frame Status** Access: R/WC This bit indicates if a link frame boundary has been sent in idle pattern. This is a sticky bit, cleared by writing 1b to it. Value: 0b — Name: Idle link frame not sent Value: 1b — Name: Idle link frame sent

DP_TP_STATUS

26 **Active Link Frame Status**

Access:	R/WC

This bit indicates if a link frame boundary has been sent in active (at least one VC enabled). This is a sticky bit, cleared by writing 1b to it.

Value	Name
0b	Active link frame not sent
1b	Active link frame sent

25 **Min Idles Sent**

Access:	RO

This bit indicates that the minimum required number of idle patterns has been sent when DP_TP_CTL is set to send idle patterns. This bit will clear itself when DP_TP_CTL is not longer set to send idle patterns.

Value	Name
0b	Min idles not sent
1b	Min idles sent

24 **ACT Sent Status**

Access:	R/WC

This bit indicates if DisplayPort MST ACT has been sent. This is a sticky bit, cleared by writing 1b to it.

Value	Name
0b	ACT not sent
1b	ACT sent

23 **Mode Status**

Access:	RO

This bit indicates what mode the transport is currently in.

Value	Name	Description
0b	SST	Single-stream mode
1b	MST	Multi-stream mode

22 **DP Stream Status**

Access:	RO

Value	Name
0b	Init
1b	Active

21:19 **DP Init Status**

Access:	RO

Value	Name	Description

DP_TP_STATUS

000b	Pattern1	Training Pattern 1
001b	Pattern2	Training Pattern 2
010b	Pattern3	Training Pattern 3
100b	Idle SST	Sending SST Idle Pattern
101b	Idle MST	Sending MST Idle Pattern
110b	Active SST	In Active SST Mode
111b	Active MST	In Active MST Mode
011b	Reserved	Reserved

18:16 **Streams Enabled**

Access:	RO

This field indicates the number of streams (transcoders) enabled on this port during multistream operation. This field should be ignored in single stream mode.

Value	Name
000b	0
001b	1
010b	2
011b	3
100b	4

15:14 **Reserved**

Access:	RO
Format:	MBZ

13:12 **Payload Mapping VC3**

Access:	RO

This field indicates which transcoder is mapped to Virtual Channel 3 during multistream operation. This field should be ignored if the number of streams enabled is less than four. This field should be ignored in single stream mode.

Value	Name	Description
00b	A	Transcoder A mapped to this VC
01b	B	Transcoder B mapped to this VC
10b	C	Transcoder C mapped to this VC
11b	D	Transcoder D mapped to this VC

11:10 **Reserved**

Access:	RO
Format:	MBZ

DP_TP_STATUS

9:8 Payload Mapping VC2

Access:	RO

This field indicates which transcoder is mapped to Virtual Channel 2 during multistream operation. This field should be ignored if the number of streams enabled is less than three. This field should be ignored in single stream mode.

Value	Name	Description
00b	A	Transcoder A mapped to this VC
01b	B	Transcoder B mapped to this VC
10b	C	Transcoder C mapped to this VC
11b	D	Transcoder D mapped to this VC

7:6 Reserved

Access:	RO
Format:	MBZ

5:4 Payload Mapping VC1

Access:	RO

This field indicates which transcoder is mapped to Virtual Channel 1 during multistream operation. This field should be ignored if the number of streams enabled is less than two. This field should be ignored in single stream mode.

Value	Name	Description
00b	A	Transcoder A mapped to this VC
01b	B	Transcoder B mapped to this VC
10b	C	Transcoder C mapped to this VC
11b	D	Transcoder D mapped to this VC

3:2 Reserved

Access:	RO
Format:	MBZ

1:0 Payload Mapping VC0

Access:	RO

This field indicates which transcoder is mapped to Virtual Channel 0 during multistream operation. This field should be ignored if the number of streams enabled is less than one. This field should be ignored in single stream mode.

Value	Name	Description
00b	A	Transcoder A mapped to this VC
01b	B	Transcoder B mapped to this VC
10b	C	Transcoder C mapped to this VC
11b	D	Transcoder D mapped to this VC

DPFC_CONTROL_SA

DPFC_CTL_SA - DPFC_CONTROL_SA

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100100h

This register contains control bits related to Display Frame Buffer Compression Host Invalidation in System Agent.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29	**CPUFNCEN** Default Value: 0b Access: R/W _Custom_GTIReset: BUS 0: Display Buffer is not in a CPU fence. No modifications are allowed from CPU to the Display Buffer. 1: Display Buffer exists in a CPU fence.
	28:5	**Reserved** Access: RO Format: MBZ
	4:0	**CPUFNCNUM** Default Value: 00h Access: R/W _Custom_GTIReset: BUS This field specifies the CPU visible FENCE number corresponding to the placement of the uncompressed frame buffer.

DPFC_CPU_FENCE_OFFSET

DPFC_CFO - DPFC_CPU_FENCE_OFFSET

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100104h

This register contains control bits related to Display Frame Buffer Compression Host Invalidation in System Agent.

DWord	Bit	Description
0	31:22	**Reserved** Access: RO Format: MBZ
	21:0	**YFNCDISP** Default Value: 000000h Access: R/W _Custom_GTIReset: BUS Y offset from the CPU fence to the Display Buffer base

DPHY_CLK_TIMING_PARAM

DPHY_CLK_TIMING_PARAM

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Address:	162180h-162183h
Name:	DPHY 0 Clock Lane Timing Parameter
ShortName:	DPHY_CLK_TIMING_PARAM_0
Reset:	global

Address:	6C180h-6C183h
Name:	DPHY 1 Clock Lane Timing Parameter
ShortName:	DPHY_CLK_TIMING_PARAM_1
Reset:	global

This register specifies the D-PHY timing parameters for the Clock Lane, if SW is overriding the HW defaults.
This register is located within the combo-PHY and is used to apply the overrides to the Clock Lane. The DSI Controller within the Display Core has an identical register (DSI_CLK_TIMING_PARAM) that is used to calculate the transition latencies of the Clock Lane. Both registers should be programmed by Software if an override is to be applied to the Clock Lane.
All fields are defined in number of Escape clocks.

Restriction

Overall restriction is that the timing parameters must be non-zero if SW is overriding the HW timing parameters.
The programming of this register must be equal to or less than the programming of its sister register that lives within the Display Core (DSI_CLK_TIMING_PARAM).

DWord	Bit	Description
0	31	**CLK_PREPARE Override** Access: R/W This field controls the override of the CLK-PREPARE timing parameter. Value 0b: HW maintains **[Default]** Value 1b: SW overrides
	30:28	**CLK_PREPARE** Access: R/W This parameter defines the time that the Host drives the Clock Lane with the LP-00 Lane state (the Bridge state) immediately before the HS-0 Line state. This field represents a hexadecimal value with a precision of 1.2 i.e. the most significant bit is the integer and the least significant 2 bits are fraction bits. So, the field can represent a range of 0.25 to 1.75 (12.5ns to 87.5ns assuming an Escape clock with a 20MHz frequency) HW maintains this timing parameter at1 Escape clock (minimum50ns)

DPHY_CLK_TIMING_PARAM

Value	Name
001b	0.25 Escape clocks
010b	0.50 Escape clocks
011b	0.75 Escape clocks
100b	1.00 Escape clocks
101b	1.25 Escape clocks
110b	1.50 Escape clocks
111b	1.75 Escape clocks
Others	Reserved

Programming Notes
Caution: The MIPI D-PHY specification has a maximum of 95ns for this parameter.

27 **CLK_ZERO Override**

Access:	R/W

This field controls the override of the CLK-ZERO timing parameter

Value	Name
0	HW Maintains
1	SW overrides

26:24 **Reserved**

Access:	RO
Format:	MBZ

23:20 **CLK_ZERO**

Access:	R/W

This parameter defines the time that the Host drives the HS-0 Lane state on the Clock Lane.
HW maintains this parameter at 5 Escape clocks (minimum250ns)

19 **CLK_PRE Override**

Access:	R/W

This field controls the override of the CLK-PRE timing parameter.

Value	Name
0	HW Maintains
1	SW overrides

18 **Reserved**

Access:	RO
Format:	MBZ

DPHY_CLK_TIMING_PARAM

	17:16	**CLK_PRE** Access: R/W This parameter defines the time that the HS clock shall be driven by the Host prior to any Data Lane beginning its transition from the LP state to the HS state. HW maintains this parameter at 8 UI (1 Byte clock). This field will override the parameter with a value measured in Escape clocks which will be much greater than 8 UI.
	15	**CLK_POST Override** Access: R/W This field controls the override of the CLK-POST timing parameter Value: 0 — Name: HW Maintains Value: 1 — Name: SW overrides
	14:11	**Reserved** Access: RO Format: MBZ
	10:8	**CLK_POST** Access: R/W This parameter defines the time the Host continues to transmit the HS clock after the last Data Lane has transitioned to the LP state. HW maintains this parameter at 1.25 Escape clocks plus 7 Byte clocks (minimum62.5ns + 56 UI)
	7	**CLK_TRAIL Override** Access: R/W This field controls the override of the CLK-TRAIL timing parameter Value: 0 — Name: HW Maintains Value: 1 — Name: SW overrides
	6:3	**Reserved** Access: RO Format: MBZ
	2:0	**CLK_TRAIL** Access: R/W This parameter defines the time that the Host drives the HS-0 Lane state on the Clock Lane after the CLK-POST time has been achieved. HW maintains this parameter at 1.25 Escape clocks (minimum 62.5ns)

DPHY_DATA_TIMING_PARAM

DPHY_DATA_TIMING_PARAM

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Address:	162184h-162187h
Name:	DPHY 0 Data Lane Timing Parameter
ShortName:	DPHY_DATA_TIMING_PARAM_0
Reset:	global

Address:	6C184h-6C187h
Name:	DPHY 1 Data Lane Timing Parameter
ShortName:	DPHY_DATA_TIMING_PARAM_1
Reset:	global

This register specifies the D-PHY timing parameters for the Data Lane, if SW is overriding the HW defaults.
This register is located within the combo-PHY and is used to apply the overrides to the Data Lanes. The DSI Controller within the Display Core has an identical register (DSI_DATA_TIMING_PARAM) that is used to calculate the transition latencies of the Data Lanes. Both registers should be programmed by Software if an override is to be applied to the Clock Lane.
All fields are defined in number of Escape clocks.

Restriction

Overall restriction is that the timing parameters must be non-zero if SW is overriding the HW timing parameters.
The programming of this register must be equal to or less than the programming of it's sister register that lives within the Display Core (DSI_DATA_TIMING_PARAM).

DWord	Bit	Description
0	31	**HS_PREPARE Override** Access: R/W This field controls the override of the HS-PREPARE timing parameter. Value 0: HW maintains Value 1: SW overrides
	30:27	**Reserved** Access: RO Format: MBZ
	26:24	**HS_PREPARE** Access: R/W This parameter defines the time that the Host drives a Data Lane with the LP-00 Lane state (the Bridge state) immediately before driving the HS-0 Line state.

DPHY_DATA_TIMING_PARAM

This field represents a hexadecimal value with a precision of 1.2 i.e. the most significant bit is the integer and the least significant 2 bits are fraction bits. So, the field can represent a range of 0.25 to 1.75 (12.5ns to 87.5ns assuming an Escape clock with a 20MHz frequency)
HW maintains this parameter at 1 Escape clock (minimum 50ns)

Value	Name
001b	0.25 Escape clocks
010b	0.50 Escape clocks
011b	0.75 Escape clocks
100b	1.0 Escape clocks
101b	1.25 Escape clocks
110b	1.50 Escape clocks
111b	1.75 Escape clocks
Others	Reserved

Programming Notes
Caution: The MIPI D-PHY specification has a maximum of 85ns + 6UI for this parameter.

23 **HS_ZERO Override**

Access:	R/W

This field controls the override of the HS-ZERO timing parameter

Value	Name
0	HW maintains
1	SW overrides

22:20 **Reserved**

Access:	RO
Format:	MBZ

19:16 **HS_ZERO**

Access:	R/W

This parameter defines the time that the Host drives the HS-0 Lane state on a Data Lane.
HW maintains this parameter at 2 Escape clocks plus 1 Byte clock (minimum 100ns + 8UI)

15 **HS_TRAIL Override**

Access:	R/W

This field controls the override of the HS-TRAIL timing parameter

Value	Name
0	HW maintains
1	SW overrides

DPHY_DATA_TIMING_PARAM

	14:11	**Reserved** Access: RO Format: MBZ
	10:8	**HS_TRAIL** Access: R/W This parameter defines the time that the Host drives the flipped differential state of the last payload data bit of a HS transmission on a Data Lane. HW maintains this parameter at 1.5 Escape clocks (minimum 75ns)
	7	**HS_EXIT Override** Access: R/W This field controls the override of the HS-EXIT timing parameter Value: 0 — Name: HW maintains Value: 1 — Name: SW overrides
	6:3	**Reserved** Access: RO Format: MBZ
	2:0	**HS_EXIT** Access: R/W This parameter defines the time that the Host drives the LP-11 Lane state (i.e. the Stop state) following a HS burst. HW maintains this parameter at 2 Escape clocks (minimum 100ns)

DPHY_ESC_CLK_DIV

DPHY_ESC_CLK_DIV

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	162190h-162193h
Name:	DPHY 0 Escape Clock Divider
ShortName:	DPHY_ESC_CLK_DIV_0
Reset:	global
Address:	6C190h-6C193h
Name:	DPHY 1 Escape Clock Divider
ShortName:	DPHY_ESC_CLK_DIV_1
Reset:	global

This register defines the clock divider variable M needed to generate an Escape clock from the 8X clock.
This register is located within the combo-PHY. There is an identical register (DSI_ESC_CLK_DIV) located within the Display Core. Both of these registers should be programmed by Software.

Restriction :
The programming of this register must be identical to the programming of its sister register that lives within the Display Core (DSI_ESC_CLK_DIV).
If operating in Dual Link mode, then both Combo-PHY registers (DPHY_ESC_CLK_DIV_0 and DPHY_ESC_CLK_DIV_1) have to be programmed to the same value as the sister register that lives within the Display Core's primary port (DSI_ESC_CLK_DIV_0)

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20:16	**Byte Clocks per Escape Clock** Access: RO This field reports the number of Byte clocks present within a given Escape clock. The DSI transcoder calculates this variable based off of the Escape clock divider M. N = Ceiling(M/8) The DSI complex (transcoder and D-PHY) use this information to emulate an Escape clock using the Byte clock.
	15:9	**Reserved** Access: RO Format: MBZ

DPHY_ESC_CLK_DIV

	8:0	**Escape Clock Divider M** Access: R/W **Description** This field specifies the divider variable (M) needed to derive the Escape clock from the Link clock (i.e. the 8X frequency) Escape frequency= 8X frequency / M The DSI transcoder does not use a physical Escape clock, so there is no physical divider, but the transcoder needs to know the value of M to emulate the Escape clock in Byte clocks. **Restriction** The Escape clock frequency must be as close to, but not greater than 20MHz. Therefore, the programming of M should be: M = Ceiling(8X Frequency (in MHz) / 20 MHz)

DPHY_TA_TIMING_PARAM

DPHY_TA_TIMING_PARAM

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Address:	162188h-16218Bh
Name:	DPHY 0 Turnaround Timing Parameter
ShortName:	DPHY_TA_TIMING_PARAM_0
Reset:	global

Address:	6C188h-6C18Bh
Name:	DPHY 1 Turnaround Timing Parameter
ShortName:	DPHY_TA_TIMING_PARAM_1
Reset:	global

This register specifies the D-PHY timing parameters used for the Bus Turn-Around flow, if SW is overriding the HW defaults.
All fields are defined in number of Escape clocks.

Restriction
Overall restriction is that the timing parameters must be non-zero if SW is overriding the HW timing parameters. If operating in Dual Link mode, then SW should program both Combo-PHY registers (DPHY_TA_TIMING_PARAM_0 and DPHY_TA_TIMING_PARAM_1), if necessary.

DWord	Bit	Description
0	31	**TA_SURE Override** Access: R/W This field controls the override of the TA-SURE timing parameter Value: 0 — Name: HW maintains Value: 1 — Name: SW overrides
	30:21	**Reserved** Access: RO Format: MBZ
	20:16	**TA_SURE** Access: R/W This parameter defines the time that the new transmitter waits after the LP-10 state before transmitting the Bridge state (LP-00) during a Link Turnaround. This field represents a hexadecimal value with a precision of 3.2 i.e. the most significant 3 bits are the integer and the least significant 2 bits are fraction bits. So, the field can represent a range of 0.25 to 7.75 (12.5ns to 387.5ns assuming an Escape clock with a 20MHz frequency)

DPHY_TA_TIMING_PARAM

HW maintains this parameter at 1 Escape clock (minimum 50ns).

Programming Notes
1. Caution: The MIPI D-PHY specification has a maximum of 2 Escape clocks for this parameter 2. If operating at or below an 800MHz Link frequency, this parameter should be overridden and programmed to a value of 0

15 TA_GO Override

Access:	R/W

This field controls the override of the TA-GO timing parameter

Value	Name
0	HW maintains
1	SW overrides

14:12 Reserved

Access:	RO
Format:	MBZ

11:8 TA_GO

Access:	R/W

This parameter defines the time that the transmitter drives the Bridge state (LP-00) before releasing control during a Link Turnaround.
HW maintains this parameter at 4 Escape clocks (minimum 200ns)

Programming Notes
Caution: The MIPI D-PHY specification has a fixed requirement of 4 Escape clocks for this parameter

7 TA_GET Override

Access:	R/W

This field controls the override of the TA-GET timing parameter

Value	Name
0	HW maintains
1	SW overrides

6:4 Reserved

Access:	RO
Format:	MBZ

3:0 TA_GET

Access:	R/W

This parameter defines the time that the new transmitter drives the Bridge state (LP-00) after accepting control during a Link Turnaround.
HW maintains this parameter at 5 Escape clocks (minimum 250ns)

DPHY_TA_TIMING_PARAM		
		Programming Notes
		Caution: The MIPI D-PHY specification has a fixed requirement of 5 Escape clocks for this parameter

DPHY_TRIG_EXT

DPHY_TRIG_EXT	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	16218Ch-16218Fh
Name:	DPHY 0 Trigger Extension
ShortName:	DPHY_TRIG_EXT_0
Reset:	global
Address:	6C18Ch-6C18Fh
Name:	DPHY 1 Trigger Extension
ShortName:	DPHY_TRIG_EXT_1
Reset:	global

This register specifies the amount of time to extend a Trigger message to the Peripheral.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Trigger Extension** Access: R/W This field specifies the number of Escape clocks to extend a trigger message by. This effectively extends the duration that the trigger is asserted at the Peripherals Protocol Layer. This field is only used if a Trigger Message is initiated from the DSI_LP_MSG register.

DPLC_CTL

DPLC_CTL

Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank or pipe not enabled

Address:	49400h-49403h
Name:	Pipe A LDPST Control
ShortName:	DPLC_CTL_A
Reset:	soft

Restriction : LDPST is supported for horizontal and vertical pipe sizes up to 4096 pixels.

Restriction

In cases where software wants to use the Image enhancement functionality with pre-determined IE values when the pipe starts, the following programming sequence should be followed.

1. Enable LDPST with the Orientation and the Tile Size bits programmed correctly.
2. Program IE coefficients
3. Enable pipe.

Orientation and Tile Size must not be changed when the LDPST function is enabled.

DWord	Bit	Description
0	31	**Function Enable** This field enables the LDPST function. Histogram is enabled directly by this field. Image enhancement is enabled if both this field and IE Enable are set. **Value** / **Name** 0b / Disable 1b / Enable
	30	**IE Enable** This field enables LDPST image enhancement. This field is ignored if the function is disabled. **Value** / **Name** / **Description** 0b / Disable / Input pixels are routed to output with no modification 1b / Enable / Input pixels will go through image enhancement before output
	29	**Load IE** Access: R/W Set This field is set by software to request the new image enhancement table to be loaded into the working RAMs on the next start of vertical blank or Pipe not enabled. Hardware clears this field after the load is complete.

DPLC_CTL

Value	Name
0b	Ready/Done
1b	Loading

28 **Orientation**

This field sets the orientation. In case of preload when there is a change in Orientation for next frame, this bit needs to be set before the IE correction points are written.

Value	Name	Description
0b	Landscape	16x9 tile arrangement
1b	Portrait	9x16 tile arrangement

27 **Frame Histogram Done**

Access:	R/WC

This bit is set by H/W when done creating histograms for all valid tiles (based on hsize and vsize). S/W should start reading from histogram buffers only when this bit is set. S/W must clear the bit by a write of '1' once the histogram read is complete.

Value	Name	Description
0b	Not Done	Histogram creation not done
1b	Done	Histogram creation done

26 **Histogram Buffer ID**

Access:	RO

This bit is set or cleared by H/W to indicate which double buffered BANK H/W is working on for creating histogram for current frame. This bit toggles one clk after Vblank if Hist_buffer_delay bit is not set.

Value	Name	Description
0b	Bank0	Creating Histogram in Bank0
1b	Bank1	Creating Histogram in Bank1

25 **IE Buffer ID**

Access:	RO

This bit is set or cleared by H/W to indicate which double buffered BANK H/W is using for reading correction factors for current frame. This bit will toggle at Vblank when load IE bit is set.

Value	Name	Description
0b	Bank0	Reading correction factors from Bank 0
1b	Bank1	Reading correction factors from Bank 0

24 **Allow Double Buffer Update Disable**

Access:	R/W

This field controls whether double buffer updates are allowed to be disabled for the double buffered LACE (DPLC) registers. The DOUBLE_BUFFER_CTL register can be configured to globally disable double buffer updates for those resources that allow them to be disabled.

DPLC_CTL

		Value / **Name** 0b – Not Allowed 1b – Allowed **[Default]**
	23	**Fast Access Mode Enable** This field enables the fast access mode where hardware transfers the histogram and IET to and from memory. **Value** / **Name** 0b – Disable 1b – Enable

	3	**Reserved**
	2	**Reserved**

DPLC_CTL		
	1	**Hist Buffer Delay** Access: R/W This field controls when the histogram readback buffer is loaded in H/W. S/W can set this bit while reading the histogram bin registers to ensure that the H/W does not overwrite the histogram registers with the data for the new frame. This bit must be cleared by the S/W as soon as the histogram bin read is complete.
	0	**Reserved**

DPLC_FA_IIR

DPLC_FA_IIR

Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32
Address:	49468h-4946Bh
Name:	Pipe A LDPST Fast Access Interrupt Identity
ShortName:	DPLC_FA_IIR_A
Reset:	soft

This register holds the persistent values of the interrupt bits which are unmasked by IMR. Bits set in this register will propagate to the LACE interrupt in the Pipe Interrupts.

DWord	Bit	Description
0	31:23	**Reserved** Access: RO Format: MBZ
	22	**Part B Histogram Copy Done** This field is set by hardware when DMC indicates it has finished copying this part to memory. Clear by writing with a 1. 0b – Not Done 1b – Done

Access:	R/W
Size (in bits):	32
Address:	49404h-49407h
Name:	Pipe A LDPST Histogram Index
ShortName:	DPLC_HIST_INDEX_A
Reset:	soft

Description

The LDPST Histogram table tile entries are accessed through index and data registers.
Each tile is composed of 32 histogram bins in 32 data Dwords.
The index fields address the individual tiles and Dwords.
Hardware will automatically walk the indexes through each Dword and raster scan through the X and Y, starting from the upper left corner of the display. The automatic walk is based on the programmed pipe source size.
Software can manually program the index to access specific tiles and Dwords.

There are 260 tiles arranged in a 20x13 (horizontal x vertical) or 13x20 array, depending on the DPLC_CTL Orientation setting.

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20:16	**Y Index** Access: Write/Read Status This index points to the current vertical tile row in the array. This index auto increments by one after each horizontal tile row is completed. It will automatically rollover when the final (20th or 13th) vertical tile row is completed. Value: [0,19] — Name:
	15:13	**Reserved** Access: RO Format: MBZ
	12:8	**X Index** Access: Write/Read Status This index points to current horizontal tile in the array. This index auto increments by one after the final (32nd) Dword is accessed. It will automatically rollover when the final (20th or 13th) horizontal tile is completed.

	4:0	**DW Index** Access: Write/Read Status This index points to the next Dword within the tile. This index auto increments by one after each read to the data register is completed. It will automatically rollover when the final (32nd) Dword is accessed. **Value** / **Name** [0,31] /

DPLC_IE_DATA

DPLC_IE_DATA	
Register Space:	MMIO: 0/2/0
Access:	Write/Read Status
Size (in bits):	32
Address:	49410h-49413h
Name:	Pipe A LDPST Image Enhancement Data
ShortName:	DPLC_IE_DATA_A
Reset:	soft

This register contains the image enhanced pixel values for the array of LDPST Image Enhancement table entries. The data format is arranged as 17 dwords for each tile, containing 33 image enhancement points. The points are packed two per dword, aligned on 16 bit boundaries. The index register controls which bin and dword is accessed.
Point 34 is invalid and not used.
Direct Lookup mode:
If the calculated Image enhancement value is using less than 12 bits, it must be shifted left to 12 bits before programming.
Multiplicative mode:
Mulitplicative image enhancement values must be programmed directly in the 3.9 fixed point format.

DWord	Bit	Description

	23:0	**Data**
		If (DPST_CTL : Bin Register Function Select = Threshold Count) {
		Bits 23:0 are read only bits when the Restore DPST bit (DPST_CTL) is cleared and read/write when the Restore DPST bit is set.
		They indicate the total number of pixels in this bin. The bin value is updated when guardband interrupt delay is met, and is not valid until after a histogram event has occurred. The bin value will stop incrementing once the maximum has been reached.
		}
		Else (Image Enhancement) {
		Bits 23:10 are reserved and should be written as zeroes. Bits 9:0 are R/W double-buffered and program the correction value for this bin. Writes to this register are double buffered on the next vblank. The value written here is the 10bit corrected channel value for the lowest point of the bin.
		}

DPST_CTL

DPST_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	490C0h-490C3h
Name:	Pipe DPST Control
ShortName:	DPST_CTL_A
Reset:	soft
Address:	491C0h-491C3h
Name:	Pipe DPST Control
ShortName:	DPST_CTL_B

Address:	493C0h-493C3h
Name:	Pipe DPST Control
ShortName:	DPST_CTL_D
Reset:	soft

DWord	Bit	Description
0	31	**IE Histogram Enable** This bit enables the Image Enhancement histogram logic to collect data. The collected data will be valid after a histogram event has occurred. **Value** / **Name** 0b – Disable 1b – Enable **Programming Notes** If histogram is enabled while no planes are enabled on the pipe, it may get an incorrect pixel count for a frame.
	30:29	**Reserved** Access: RO Format: MBZ

DPST_CTL

28 Reserved

Access:	RO
Format:	MBZ

27 IE Modification Table Enable

This bit enables the Image Enhancement modification table. When enabled, modifications begin after the next vertical blank.

Value	Name
0b	Disable
1b	Enable

26:25 Reserved

Access:	RO
Format:	MBZ

24 Histogram Mode Select

Value	Name	Description
0b	YUV	YUV Luma Mode
1b	HSV	HSV Intensity Mode

23:16 Reserved

Access:	RO
Format:	MBZ

15 IE Table Value Format

This field indicates what format is used for the image enhancement table values in multiplicative mode. The other modes use a 0.10 (0 integer and 10 fractional bits) format.

Value	Name	Description
0b	1.9	1 integer and 9 fractional bits
1b	2.8	2 integer and 8 fractional bits

14:13 Enhancement mode

Value	Name	Description
00b	Direct	Direct look up mode
01b	Additive	Additive mode
10b	Multiplicative	Multiplicative mode
11b	Reserved	Reserved

12 Reserved

Access:	RO
Format:	MBZ

DPST_CTL

	11	**Bin Register Function Select** This field indicates what data is being written to or read from the bin data register. **Value** / **Name** / **Description** 0b / TC / Threshold Count. A read from the bin data register returns that bin's threshold value from the most recent vblank load event (guardband threshold trip). Valid range for the Bin Index is 0 to 31. 1b / IE / Image Enhancement Value. Valid range for the Bin Index is 0 to 32
	10:7	**Reserved** Access: RO Format: MBZ
	6:0	**Bin Register Index** This field indicates the bin number whose data can be accessed through the bin data register. This value is automatically incremented by a read or a write to the bin data register if the busy bit is not set.

DPST_GUARD

DPST_GUARD	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank
Address:	490C8h-490CBh
Name:	Pipe DPST Threshold Guardband
ShortName:	DPST_GUARD_A
Reset:	soft
Address:	491C8h-491CBh
Name:	Pipe DPST Threshold Guardband
ShortName:	DPST_GUARD_B
Reset:	soft
Address:	492C8h-492CBh

ShortName:	DPST_GUARD_C
Reset:	soft
Address:	493C8h-493CBh
Name:	Pipe DPST Threshold Guardband
ShortName:	DPST_GUARD_D
Reset:	soft

Updates take place at the start of vertical blank.

DWord	Bit	Description
0	31	**Histogram Interrupt enable** Value / Name / Description 0b / Disable / Disabled 1b / Enable / This generates a histogram interrupt once a Histogram event occurs.
	30	**Histogram Event status** Access: R/WC When a Histogram event has occurred, this will get set by the hardware. For any more Histogram events to occur, clear this bit by writing a '1'. Value / Name / Description 0b / Not Occurred / Histogram event has not occurred 1b / Occurred / Histogram event has occurred

DPST_GUARD		
	29:22	**Guardband Interrupt Delay** An interrupt is always generated after this many consecutive frames of the guardband threshold being surpassed .This value is double buffered on start of vblank. **Restriction** A value of 0 is invalid.
	21:0	**Threshold Guardband** This value is used to determine the guardband for the threshold interrupt generation. This single value is used for all the segments. This value is double buffered on start of vblank. This value is shifted left 2 bits (multiplied by 4) for use with the 24 bit bin values.

Driver Media Force Wake Ack

DRIVER_MEDIA_FWAKE_ACK - Driver Media Force Wake Ack	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00D88h

Message registers have bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16].
To set bit0, for example, the data would be 0x0001_0001.
To clear bit0, for example, the data would be 0x0001_0000.
Note that mask bit is the data bit offset + 16. Message registers are protected from non-GT writes via the Message Channel.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO
	15:0	**GPM Driver Media ForceWake Ack** Access: R/W _Custom_GTIReset: BUS 1'b0 : GT Media Can be powered down (default) 1'b1 : GT Media cannot be powered down

DRIVER MEDIA FORCE WAKE REQ

DRIVER_MEDIA_FWAKE - DRIVER MEDIA FORCE WAKE REQ

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0A270h

The newly loaded Gfx driver must first initialize this register by clearing all bits (0xFF00).

DWord	Bit	Description
0	31:16	**Multiple Force Wake Mask** Access: R/W _Custom_GTIReset: DEV Mask bits applied to [15:0] of same register. If mask is set to 1, corresponding bit in [15:0 is written. If mask is set to 0, corresponding bit in [15:0] is unaffected.
	15	**Force Wake Request for Thread 15** Access: R/W _Custom_GTIReset: DEV Thread 15 - When set with corresponding mask bit 31, Media cannot be powered down.
	14	**Force Wake Request for Thread 14** Access: R/W _Custom_GTIReset: DEV Thread 14 - When set with corresponding mask bit 30, Media cannot be powered down.
	13	**Force Wake Request for Thread 13** Access: R/W _Custom_GTIReset: DEV Thread 13 - When set with corresponding mask bit 29, Media cannot be powered down.
	12	**Force Wake Request for Thread 12** Access: R/W _Custom_GTIReset: DEV Thread 12 - When set with corresponding mask bit 28, Media cannot be powered down.
	11	**Force Wake Request for Thread 11** Access: R/W _Custom_GTIReset: DEV Thread 11 - When set with corresponding mask bit 27, Media cannot be powered down.

DRIVER_MEDIA_FWAKE - DRIVER MEDIA FORCE WAKE REQ

	10	**Force Wake Request for Thread 10** Access: R/W _Custom_GTIReset: DEV Thread 10 - When set with corresponding mask bit 26, Media cannot be powered down.
	9	**Force Wake Request for Thread 9** Access: R/W _Custom_GTIReset: DEV Thread 9 - When set with corresponding mask bit 25, Media cannot be powered down.
	8	**Force Wake Request for Thread 8** Access: R/W _Custom_GTIReset: DEV Thread 8 - When set with corresponding mask bit 24, Media cannot be powered down.
	7	**Force Wake Request for Thread 7** Access: R/W _Custom_GTIReset: DEV Thread 7 - When set with corresponding mask bit 23, Media cannot be powered down.
	6	**Force Wake Request for Thread 6** Access: R/W _Custom_GTIReset: DEV Thread 6 - When set with corresponding mask bit 22, Media cannot be powered down.
	5	**Force Wake Request for Thread 5** Access: R/W _Custom_GTIReset: DEV Thread 5 - When set with corresponding mask bit 21, Media cannot be powered down.
	4	**Force Wake Request for Thread 4** Access: R/W _Custom_GTIReset: DEV Thread 4 - When set with corresponding mask bit 20, Media cannot be powered down.
	3	**Force Wake Request for Thread 3** Access: R/W _Custom_GTIReset: DEV Thread 3 - When set with corresponding mask bit 19, Media cannot be powered down.

DRIVER_MEDIA_FWAKE - DRIVER MEDIA FORCE WAKE REQ

	2	**Force Wake Request for Thread 2** Access: R/W _Custom_GTIReset: DEV Thread 2 - When set with corresponding mask bit 18, Media cannot be powered down.
	1	**Force Wake Request for Thread 1** Access: R/W _Custom_GTIReset: DEV Thread 1 - When set with corresponding mask bit 17, Media cannot be powered down.
	0	**Force Wake Request for Thread 0** Access: R/W _Custom_GTIReset: DEV Thread 0 - When set with corresponding mask bit 16, Media cannot be powered down.

Driver Render Force Wake Ack

DRIVER_RENDER_FWAKE_ACK - Driver Render Force Wake Ack	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00D84h

Message registers have bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16].
To set bit0, for example, the data would be 0x0001_0001.
To clear bit0, for example, the data would be 0x0001_0000.
Note that mask bit is the data bit offset + 16. Message registers are protected from non-GT writes via the Message Channel.

This register controls the Display State Buffer (DSB) engines.

DWord	Bit	Description
0	31	**DSB Enable** Access: R/W This bit enables the DSB engine. Notes: 1. The act of enabling the DSB engine will not result in the engine to start fetching a state buffer from memory. Only a write to the Tail Pointer will start a fetch 2. A write to the Tail Pointer of the DSB engine will have no affect if the DSB engine is not enabled 3. SW should not update the DSB control registers while DSB engine is not in IDLE state. Bit 0 indicates the status of DSB engine. 4. If SW desires to reset the DSB engine then following sequence can be followed. This sequence is also described in the DSB programming details 1. To reset the DSB engine, SW can set this bit to 0. Bit31 transition from 1 to 0 initiates a reset sequence in the DSB HW. 2. Poll for the DSB status (bit 0) to be in IDLE. 3. If DSB status is 0 then the DSB engine reset sequence is complete and DSB is in reset state.

DSB_CTRL

Value	Name
0b	Disabled
1b	Enabled

30 **Reserved**

Access:	RO
Format:	MBZ

29 **Buffer Reiterate**

Access:	R/W

This bit controls what the DSB engine does when finished with a state buffer program.
If this bit is cleared, then the engine will stop and wait for Software to update the Head/Tail pointers before it starts processing the next state buffer.
If this bit is set, then the engine will start to re-fetch the state buffer defined by the current Head/Tail pointers when it finishes with the current program.
Note that the DSB engine will not take any action on this bit if it is not currently processing a state buffer. I.e. When Software sets this bit on an idle DSB engine, it must then write to the Tail Pointer to start the reiteration process.

Value	Name
0b	Disabled
1b	Enabled

Programming Notes
Software should ensure there is some form of flow control when this bit is set (i.e. the state buffer has a Wait opcode and/or the Wait for VBLANK bit of this register is set)

28 **Wait for VBLANK**

Access:	R/W

This bit controls when the DSB engine starts to fetch a state buffer from memory.
When cleared, then the DSB engine will start fetching the state buffer immediately after Software writes the Tail Pointer
When set, then the DSB engine will start fetching the state buffer only after it sees a rising edge of VBLANK following the write to the Tail Pointer.
SW cannot have both bits 27 and 28 set at the same time.

27 **Wait for Line in Range**

Access:	R/W

This bit controls when the DSB engine starts to fetch a state buffer from memory.
When cleared, then the DSB engine will start fetching the state buffer immediately after Software writes the Tail Pointer
When set, then the DSB engine will start fetching the state buffer only when the scanline falls in the range defined in DSB_LINERANGE_PF register following the write to the Tail Pointer.
SW cannot have both bits 27 and 28 set at the same time.

DSB_CTRL

	26:17	**Reserved** Access: RO Format: MBZ
	16	**DSB Halt** Access: R/W When this bit is set DSB engine will halt. DMA engine will stop generating new memory requests and all the pending instructions in the buffer will be executed and DSB will be halted. The pointers will stop moving. SW can read the DSB_CURRENT_HEAD_PTR register to check the DMA engine pointer status.
	15:9	**Reserved** Access: RO Format: MBZ
	8	**Non Posted Enable** Access: R/W When this bit is set all the MMIO writes including the indexed writes will be non posted to the clients. If SW sets this bit within the DSB program then SW must ensure to include at least 4 NO Ops instructions following this register programming. This is required to allow the register in the DSB to be set correctly.
	7:1	**Reserved** Access: RO Format: MBZ
	0	**DSB Status** Access: RO This field reflects the status of the DSB engine. It is set when the DMA starts to read the state buffer and is cleared when the state buffer is finished and last instruction is completed. **Value** / **Name** 0b – Idle 1b – Busy

This register can be updated only before the DSB_CTRL register is programmed to enable the DSB engine.

DWord	Bit	Description
0	31	**DSB HDR meta data delay en** Access: R/W SW must set this bit to 1 and program the bits 15:8 to correct values based on the cd and link clock ratios when DSB is used for HDR meta data transfer. Value: 0b — Name: Delay disabled **[Default]** Value: 1b — Name: Delay enabled
	30:16	**Reserved** Access: RO Format: MBZ
	15:8	**DSB MMIO Dead Clocks Count** Default Value: 00001000b Eight Access: R/W When this counter is enabled by programming bit 31 of this register, DSB will insert programmed number of dead clocks after every 8 back to back MMIO cycles. This is needed to take care of the clock crossing timing issues. Driver must ensure the cdclk/dotclock ratio to adjust the programming. Below is the formula to calculate the number of dead clock programming is as follows. If (cdclk/dotclk) <= 1 then DSB MMIO dead clock count = default value

<table>
<tr><th colspan="3">DSB_MMIOCTRL</th></tr>
<tr><td></td><td></td><td>else if (cdclk/dotclk) > 1 then DSB MMIO dead clock count = 11 *ROUNDUP(cdclk/dotclk)
elseDSB MMIO dead clock count = default value</td></tr>
<tr><td></td><td>7:0</td><td>DSB MMIO Cycles
<table><tr><td>Default Value:</td><td>00001000b Eight</td></tr><tr><td>Access:</td><td>R/W</td></tr></table>These bits can be programmed to change the number of clocks that the DSB engine has control over the MMIO bus. DSB will send programmed number of MMIO cycles before giving away access of RMBUS.</td></tr>
</table>

This register can be updated only before the DSB_CTRL register or it can also be updated within DSB program with appropriate byte enable settings.

DWord	Bit	Description
0	31	**MMIOGEN_DEWAKE_dis** Access: R/W Setting this bit will disable the dewake logic from MMIO generation logic.
	30:24	**Reserved** Access: RO Format: MBZ
	23	**FORCE_DEWAKE** Access: R/W Setting this bit will force a DEWAKE from the DSB engine.
	22:16	**Reserved** Access: RO Format: MBZ
	15	**BLOCK_DEWAKE_EXTENSION** Access: R/W

DSB_PMCTRL_2

Value	Name	Description
0	Extend Dewake	When this bit is set to 0 then the dewake is extended from the time it is set when the Program scanline number in PMCTRL is reached to the point when DSB is done processing all the instructions.
1	Disable Extend Dewake **[Default]**	When this bit is set to 1 then the dewake is not extended and will be de-asserted on a vblank. Dewake then depends on the other logic in DSB.

14:8 **Reserved**

Access:	RO
Format:	MBZ

7 **OVERRIDE_DC5_DC6_OK**

Access:	R/W

Setting this bit will force a DC5 or DC6 OK from the DSB engine.

6:0 **Reserved**

Access:	RO
Format:	MBZ

If poll function is needed, this register should be programmed before the Poll function is used in the DSB program. Can be part of the DSB program itself.

DWord	Bit	Description
0	31	**Poll Enable** This field enables the Poll function in DSB. Value: 0b – Disable **[Default]**; 1b – Enable
	30:23	**Wait in Microseconds** Default Value: 00000010b 2us Access: R/W This field defines the number of micro seconds that DSB will wait before retrying the poll.
	22:15	**Number of times** Default Value: 00110010b 50 times Access: R/W This field defines the number of times that DSB will retry the poll if not satisfied before time out.

DSB_POLLFUNC

DWord	Bit	Description
0	31:6	**Tail Pointer** Access: R/W This register defines the end address (i.e. tail pointer) of the Display Sate Buffer in memory. The address within this register is a graphics address. The act of writing to this register is the event that will activate the DSB engine (i.e. the DSB engine will start fetching the state buffer from memory) as long as the DSB is enabled Restriction : 1. The address is cacheline aligned (HW enforced) 2. The address should be pointing to the cacheline **after** the last cacheline of the state buffer (i.e. Tail Pointer = Number of State Buffer cachelines + 1) 3. This address should be greater than the Head Pointer address 4. Software should not modify this register while the DSB engine is busy
	5:0	**Reserved** Access: RO Format: MBZ

DWord	Bit	Description
0	31	**Allow Double Buffer Update Disable** Access: R/W This field controls whether double buffer updates are allowed to be disabled for this instance of DSC. The DOUBLE_BUFFER_CTL register can be configured to globally disable double buffer updates for resources that allow them to be disabled. NOTE: This bit itself is not double buffered Value: 0b – Not Allowed Value: 1b – Allowed
	30:26	**Reserved** Access: RO Format: MBZ
	25:20	**Reserved** Access: RO Format: MBZ
	19	**vbr_enable** Access: R/W Restriction : DSC variable bit rate mode is not supported. Value: 0b – Name: disable **[Default]** – Description: 0 padding bits are stuffed at the end of a slice to ensure that the total number of bits within the slice is equal to the slice bit budget. Value: 1b – Name: Enable – Description: Bit stuffing is bypassed
	18	**enable_422** Access: R/W This bit value shall be 0 if native_422 or native_420 is set to 1. DSC standard calls this mode as simple_422. This mode is currently not supported. Value: 0b – Name: 444 **[Default]** – Description: Input uses 4:4:4 sampling. Decoder does not drop samples to reconstruct a 4:2:2 picture Value: 1b – Name: 422 – Description: Input uses 4:2:2 sampling. Decoder drops samples to reconstruct a 4:2:2 picture.
	17	**convert_rgb** Access: R/W Indicates whether DSC color space conversion is active. Value: 0b – Name: YCbCr – Description: Color space is YCbCr

DSC_PICTURE_PARAMETER_SET_0

1b	convert_rgb	Encoder converts RGB to YCoCg-R, and decoder converts YCoCg-R to RGB.

16 block_pred_enable

Access:	R/W

Value	Name	Description
0b	disable	BP is not used to code any groups within the picture
1b	enable	Decoder must select between BP and MMAP

15:12 linebuf_depth

Access:	R/W

Contains the line buffer bit depth used to generate the bitstream. If a components bit depth (after color space conversion) is greater than this value, the line storage rounds the reconstructed values to this number of bits.
0x8 = 8 bits
0x9 = 9 bits
0xA = 10 bits
0xB = 11 bits
0xC = 12 bits
0xD = 13 bits
All other encodings are RESERVED

11:8 bits_per_component

Access:	R/W

Indicates the number of bits per component for the original pixels of the encoded picture.
0x8 = 8bpc
0xA = 10bpc
0xC = 12bpc
All other encodings are RESERVED

7:4 dsc_version_minor

Access:	R/W

Description
Contains the major version of DSC.

3:0 dsc_version_major

Access:	R/W

Contains the major version of DSC.
0x1 = Encoder implements DSC

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ
	19:10	**Reserved** Access: RO Format: MBZ
	9:0	**bits_per_pixel** Access: R/W Specifies the target bits/pixel (bpp) rate that is used by the encoder, in steps of 1 bit per pixel. Only values greater than or equal to 6.0 are allowed. If vbr_enable is cleared to 0, this value must be less than or equal to the sustained rate that would apply if MPP is always selected with QP = 0, which is a function of bits_per_component, convert_rgb, and rc_range_parameters[0]. If native_422 or native_420 is set to 1, this value shall be programmed to double the target bits per pixel rate.

DWord	Bit	Description
0	31:16	**pic_width** Access: Double Buffered **Description** Double buffer update will happen at the standard pipe double buffer point. On a single pipe if we are using 1 VDSC instance, picture_width of that VDSC instance = input frame picture_width. On a single pipe if we are using 2 VDSC instances, picture_width of each instance =input frame picture_width divided by 2. In the case a full frame is processed by2*N VDSC instances from N pipes, picture_width of each instance = input framepicture_width divided by 2*N.
	15:0	**pic_height** Access: Double Buffered **Description** Double buffer update will happen at the standard pipe double buffer point. This field is always programmed to input frame picture height.

DWord	**Bit**	**Description**
0	31:16	**nfl_bpg_offset** Access: R/W Specifies the number of bits (including fractional bits) that are deallocated for each group, for groups after the first line of a slice. This is an unsigned value with 11 fractional bits.
	15:0	**slice_bpg_offset** Access: R/W Specifies the number of bits (including fractional bits) that are deallocated for each group to enforce the slice constraint (i.e., the final buffer model fullness cannot exceed the initial transmission delay times bits per group), while allowing a programmable initial_offset. This is an unsigned value with 11 fractional bits.

DSI_CALIB_TO

DSI_CALIB_TO	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	6B050h-6B053h
Name:	DSI 0 Calibration Timeout
ShortName:	DSI_CALIB_TO_0
Reset:	soft
Address:	6B850h-6B853h
Name:	DSI 1 Calibration Timeout
ShortName:	DSI_CALIB_TO_1
Reset:	soft

This register specifies the amount of time that the Host will drive the Link with the HS calibration sequence. The values are specified in Byte clocks and the values specified should be zero based (i.e. value of 1 = 2 Byte clocks, value of 2 = 3 Byte clocks, etc.)

Restriction: The timeout values should be greater than zero if the respective calibration type is enabled.

DWord	Bit	Description
0	31:20	**Periodic Calibration Timeout** Default Value: 07Fh Access: R/W This field represents the amount of time that the Host will give to transmitting the HS calibration sequence for Periodic Calibrations. The transcoder will ignore this field if Periodic Calibration is not enabled within the TRANS_DSI_FUNC_CONF register. The default value will be set to 128 Byte clocks Restriction: When periodic calibration is enabled in Video Mode, the Horizontal size between synchronous packets must be great enough to support the HS calibration burst without the loss of synchronous packets. Software will need to ensure that the following equation is met to prevent synchronization packet loss: Periodic Calib Duration < (H. Size * Bits per Pixel) / (Link Width * 8) 16*N Notes: 1. The "H. Size" term is dependent on the mode of operation (i.e. Sync Pulse or Sync Event). In Sync Pulse, H. Size = H. Sync Start + (H. Total H. Sync End). In Sync Event, H. Size = H. Total. 2. HS bursts and calibrations cannot be concatenated together on Data Lanes which means the Data Lanes have to enter the LP state on either end of the calibration. The 16*N term within the equation is used to account for the HS to HS latency of transitioning the Data Lanes on either end of the calibration.The variable N is the number of Byte clocks within

DSI_CALIB_TO		
		an Escape clock (N = ceiling(((8X Frequency (in MHz) / 20 MHz) / 8))
	19:16	**Reserved** Access: RO Format: MBZ
	15:0	**Initial Calibration Timeout** Default Value: 0FFFh Access: R/W This field represents the amount of time the Host will give to transmitting the HS calibration sequence for the Initial Calibration, if enabled. The transcoder will ignore this field if Calibration is not enabled within the TRANS_DSI_FUNC_CONF register. The default value will be set to 4096 Byte clocks

DSI_CLK_TIMING_PARAM

DSI_CLK_TIMING_PARAM

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B080h-6B083h
Name:	DSI 0 Clock Lane Timing Parameter
ShortName:	DSI_CLK_TIMING_PARAM_0
Reset:	soft
Address:	6B880h-6B883h
Name:	DSI 1 Clock Lane Timing Parameter
ShortName:	DSI_CLK_TIMING_PARAM_1
Reset:	soft

This register specifies the D-PHY timing parameters for the Clock Lane, if SW is overriding the HW defaults.
This register is located within the Core Display and is used by the DSI Controller to calculate Link transition latencies of the Clock Lane. There is an identical register (DPHY_CLK_TIMING_PARAM) located within the combo-PHY that actually applies the overrides to the D-PHY Clock Lane. Both registers should be programmed by Software if an override needs to be applied to the Clock Lane within the D-PHY.
Since this register is being used to calculate the Link transition latencies of the Clock Lane, but does not actually affect the transition times within the D-PHY, this register can be used to add guardbands to the DSI Controller's transition latency calculations.
The lower 12 bits of the offset address for this register should correspond to the lower offset address of its sister D-PHY register within the combo-PHY.
All fields are defined in number of Escape clocks.

Restriction

Overall restriction is that the timing parameters must be non-zero if SW is overriding the HW timing parameters.
The programming of this register must be equal to or greater than the programming of its sister register that lives within the combo-PHY (DPHY_CLK_TIMING_PARAM).

DWord	Bit	Description
0	31	**CLK_PREPARE Override** Access: R/W This field controls the override of the CLK-PREPARE timing parameter. 0b: HW maintains **[Default]** 1b: SW overrides
	30:28	**CLK_PREPARE** Access: R/W This parameter defines the time that the Host drives the Clock Lane with the LP-00 Lane state (the Bridge state) immediately before the HS-0 Line state.

DSI_CLK_TIMING_PARAM

This field represents a hexadecimal value with a precision of 1.2 i.e. the most significant bit is the integer and the least significant 2 bits are fraction bits. So, the field can represent a range of 0.25 to 1.75 (12.5ns to 87.5ns assuming an Escape clock with a 20MHz frequency)
HW maintains this timing parameter at1 Escape clock (minimum50ns)

Value	Name
001b	0.25 Escape clocks
010b	0.50 Escape clocks
011b	0.75 Escape clocks
100b	1.00 Escape clocks
101b	1.25 Escape clocks
110b	1.50 Escape clocks
111b	1.75 Escape clocks
Others	Reserved

Programming Notes
Caution: The MIPI D-PHY specification has a maximum of 95ns for this parameter.

27 **CLK_ZERO Override**

Access:	R/W

This field controls the override of the CLK-ZERO timing parameter

Value	Name
0	HW Maintains
1	SW overrides

26:24 **Reserved**

Access:	RO
Format:	MBZ

23:20 **CLK_ZERO**

Access:	R/W

This parameter defines the time that the Host drives the HS-0 Lane state on the Clock Lane.
HW maintains this parameter at 5 Escape clocks (minimum250ns)

19 **CLK_PRE Override**

Access:	R/W

This field controls the override of the CLK-PRE timing parameter.

Value	Name
0	HW Maintains
1	SW overrides

18 **Reserved**

Access:	RO
Format:	MBZ

DSI_CLK_TIMING_PARAM

	17:16	**CLK_PRE** Access: R/W This parameter defines the time that the HS clock shall be driven by the Host prior to any Data Lane beginning its transition from the LP state to the HS state. HW maintains this parameter at 8 UI (1 Byte clock). This field will override the parameter with a value measured in Escape clocks which will be much greater than 8 UI.
	15	**CLK_POST Override** Access: R/W This field controls the override of the CLK-POST timing parameter Value: 0 — Name: HW Maintains Value: 1 — Name: SW overrides
	14:11	**Reserved** Access: RO Format: MBZ
	10:8	**CLK_POST** Access: R/W This parameter defines the time the Host continues to transmit the HS clock after the last Data Lane has transitioned to the LP state. HW maintains this parameter at 1.25 Escape clocks plus 7 Byte clocks (minimum62.5ns + 56 UI)
	7	**CLK_TRAIL Override** Access: R/W This field controls the override of the CLK-TRAIL timing parameter Value: 0 — Name: HW Maintains Value: 1 — Name: SW overrides
	6:3	**Reserved** Access: RO Format: MBZ
	2:0	**CLK_TRAIL** Access: R/W This parameter defines the time that the Host drives the HS-0 Lane state on the Clock Lane after the CLK-POST time has been achieved. HW maintains this parameter at 1.25 Escape clocks (minimum 62.5ns)

DSI_CMD_FRMCTL

DSI_CMD_FRMCTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B034h-6B037h
Name:	DSI Transcoder 0 Command Mode Frame Control
ShortName:	DSI_CMD_FRMCTL_0
Reset:	soft
Address:	6B834h-6B837h
Name:	DSI Transcoder 1 Command Mode Frame Control
ShortName:	DSI_CMD_FRMCTL_1
Reset:	soft

This register is used to control initiating frame updates to the Peripheral in Command Mode
The fields within this register are only observed by the DSI transcoder when it is in the Command Mode of operation

DWord	Bit	Description
0	31	**Frame Update Request** Access: R/W Set This bit controls when the transcoder will start the next frame when it is in Command Mode. The transcoder will act on this bit only when it is in the Command Mode and the Transcoder is enabled (TRANS_CONF). Software can write to this bit, but Hardware will be responsible for clearing it. 0b – No frame request present 1b – Frame request present
	30	**Reserved** Access: RO Format: MBZ
	29	**Periodic Frame Update Enable** Access: R/W When the Intel graphics driver is not present (e.g. the driver is uninstalled, the OS basic driver is present, or pre-boot time) there will be no frame update requests to the DSI transcoder through the Frame Update Request of this register. Therefore, this field will enable a mechanism that will initiate periodic frame update requests when TE events are received from the Panel. When enabling this feature, the expectation will be that SW has configured the Panel to send TE events to the Host (i.e. set_tear_on, etc.). HW will do the following when this bit is set: 1. It will override the TE Source bit of the TRANS_DSI_FUNC_CONF register to the GPIO setting. The DSI transcoder HW does not have a mechanism to automatically send Bus

Turn-Arounds to the Panel to receive in-band TE events

2. It will override the Mode of Operation of the TRANS_DSI_FUNC_CONF register to a non-gating Command Mode of operation

Value	Name
0b	Periodic Frame Update disabled
1b	Periodic Frame Update Enabled

Programming Notes
Note that when the Takeover MIPI DBI bit is set within the MSG_MEDE_KVMR_SPR_CTL register then HW will do the following if the DSI transcoder is operating in a Command Mode (i.e. DBI): 1. It will enable the Periodic Frame Update mode of operation 2. It will override the TE Source bit of the TRANS_DSI_FUNC_CONF register to the GPIO setting 3. It will override the Mode of Operation of the TRANS_DSI_FUNC_CONF register to a non-gating Command Mode of operation If the DSI transcoder is not operating in a DBI mode, then the transcoder will ignore the Takeover MIPI DBI bit.

28 **Null Packet Enable**

Access:	R/W

This bit controls whether Null Packets will be transmitted between Pixel Packets in Command Mode operation.
If a Pixel Packet ends and the next Pixel Packet is within the transcoders pipeline but not visible to the HS arbiter, then the transcoder will begin transmitting Null Packet bursts to keep the Link in the HS state.
If the current Pixel Packet ends and the next Pixel Packet is not within the transcoders pipeline, then the transcoder will allow the Link to enter the LP state.
This field is ignored when the transcoder is operating in Video Mode.

Value	Name
0b	Null packet injection disabled
1b	Null packet injection enabled

27 **Single Panel Update**

Access:	R/W

This is an attribute applied to the Frame Update Request bit.
When this transcoder is synchronized to another transcoder in Dual Link Dual Pipe Sync mode (i.e. both Port Sync Mode Enable and Dual Pipe Sync Enable are set), then this bit controls whether this transcoder waits for the other port to receive its Frame Update Request and TE event (i.e. both Panels are going to receive a frame), or whether this transcoder just waits for the other transcoders TE event (i.e. just this Panel is going to receive a frame)

Value	Name
0b	Dual Panel update

1b	Single Panel update

Programming Notes

1. HW only acts on this bit if the Port Sync Mode Enable is set for this transcoder. If the transcoders Port Sync Enable is not set, then a Frame Update Request is implicitly a single Panel update. The difference is that a non-synchronized transcoder will not wait for TE events from another port.
2. If this bit is set and the Port Sync Enable bit is set, then it is the responsibility of SW to ensure that the Panel for the other transcoder is generating TE events
3. Setting this bit should be mutually exclusive with the other Frame Update Request attributes Accumulate Frame Update Request and Forward Frame Update Request

26 **Accumulate Frame Update Requests**

Access:	R/W Set

This is an attribute applied to the Frame Update Request bit.
This bit will control whether two synchronized transcoders in a Dual Link - Dual Pipe mode of operation will synchronize the Frame Update Requests to each transcoder (i.e. the Frame Start to the two Pipes will be sent out from each transcoder at the same time)
HW will clear this bit when the V. Blank for this transcoder is observed

Value	Name
0b	No Accumulation
1b	Accumulate

Programming Notes

1. HW only acts on this attribute if:
   a. The Port Sync Enable is set for both transcoders
   b. The transcoders are in a Dual Link Dual Pipe sync mode
2. For Dual Link Single Pipe sync mode (i.e. Port Sync Enable is set and both transcoders are bound to the same Pipe), only DSI 0 sends a Frame Start
3. If SW is going to use this attribute, it must use it one of two ways:
   a. The attribute must be set to the same value for both Frame Update Requests
   b. The attribute must be set to a 1 for the first Frame Update Request and a 0 for the second Frame Update Request
4. HW will not start looking for TE events (if TE gating is enabled) until both Frame Update Requests have been received.
5. Setting this bit should be mutually exclusive with the other Frame Update Request attributes Single Panel Update and Forward Frame Update Request

25 **Forward Frame Update Request**

Access:	R/W

This is an attribute applied to the Frame Update Request bit.

DSI_CMD_FRMCTL

This bit will control whether the transcoder forwards the Frame Update Request received by this transcoder to a synchronized transcoder

Value	Name
0b	Request not forwarded
1b	Request forwarded

Programming Notes

1. HW ignores this bit if the Port Sync Enable bit for the transcoders are not set
2. HW will automatically override the setting of this bit for DSI0 when in Dual Link Single Pipe (DLSP) mode. In DLSP, HW ignores any Frame Update Requests made to DSI1 and automatically forwards DSI0 Frame Update Requests to DSI1.
3. Setting this bit should be mutually exclusive with the other Frame Update Request attributes Accumulate Frame Update Request and Single Panel Update

24:2 **Reserved**

Access:	RO
Format:	MBZ

1 **Reserved**

Access:	RO
Format:	MBZ

0 **Frame in Progress**

Access:	RO

This bit reflects whether the DSI transcoder is currently processing/sending a frame to the Peripheral.

DSI_CMD_RXCTL

DSI_CMD_RXCTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B0D4h-6B0D7h
Name:	DSI Transcoder 0 Command Receive Control
ShortName:	DSI_CMD_RXCTL_0
Reset:	soft
Address:	6B8D4h-6B8D7h
Name:	DSI Transcoder 1 Command Receive Control
ShortName:	DSI_CMD_RXCTL_1
Reset:	soft

This register controls how received DSI packets from the Peripheral are handled.

DWord	Bit	Description
0	31:17	**Reserved** Access: RO Format: MBZ
	16	**Read Unloads DW** Access: R/W This bit controls whether the DSI_RXDATA register read unloads the DW from the transcoders receive queue. If DSI_RXDATA reads do not unload the transcoders receive queue, then the transcoder will continue to return the DW of data at the head of the queue. Otherwise, every read to the DSI_RXDATA will return a new DW of data. Value 0b: DSI_RXDATA reads do not unload DW Value 1b: DSI_RXDATA reads unload DW
	15	**Received Unassigned Trigger** Access: R/WC The unassigned trigger (10100000 [lsb on the left to the msb on the right]) has been received. Value 0b: Trigger message not received Value 1b: Trigger message received
	14	**Received Acknowledge Trigger** Access: R/WC The Acknowledge trigger message (00100001 [lsb to msb]) has been received.

DSI_CMD_RXCTL

Value	Name
0b	Trigger message not received
1b	Trigger message received

13 **Received Tear Effect Trigger**

Access:	R/WC

The Tear Effect (TE) trigger message (01011101 [lsb to msb]) has been received.

Value	Name
0b	Trigger message not received
1b	Trigger message received

12 **Received Reset Trigger**

Access:	R/WC

The Reset trigger message (01100010 [lsb to msb]) has been received.
The Peripheral is not expected to send this trigger message to the Host, but even if it does, the hardware does not take any action on this message

Value	Name
0b	Trigger message not received
1b	Trigger message received

11 **Received Payload was Lost**

Access:	R/WC

This bit indicates if the DSI transcoder had to drop one or more of the payload bytes from a response packet being received from the Peripheral.
Software should check that the "Maximum Return Packet Size" programming is set correctly within the Peripheral

Value	Name
0b	No payload bytes dropped
1b	Payload bytes dropped

10 **Received CRC was Lost**

Access:	R/WC

When set, the DSI transcoder had to drop one or more of the CRC bytes from a response packet being received from the Peripheral.
If the "Received Payload was Lost" bit is set, then this bit will most likely also be set.
It is not imperative that the CRC is captured within the queue, so this is not an error but only a heads up that it may not be present.
If Software wishes the CRC to always be present within the Payload Receive queue, then it should adjust the "Maximum Return Packet Size" programming within the Peripheral to account for the CRC

Value	Name
0b	No CRC bytes dropped
1b	CRC bytes dropped

DSI_CMD_RXCTL		
	9:8	**Reserved** Access: RO Format: MBZ
	7:0	**Number Rx Payload DW** Access: RO This field represents the number of DWs currently within the transcoders Payload Receive queue. Note that the queue will be flushed at the beginning of a Bus Turn-Around (BTA) HW currently maintains an 8 DW queue.

DSI_CMD_RXHDR

DSI_CMD_RXHDR	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	6B0E0h-6B0E3h
Name:	DSI 0 Command Receive Header
ShortName:	DSI_CMD_RXHDR_0
Reset:	soft
Address:	6B8E0h-6B8E3h
Name:	DSI 1 Command Receive Header
ShortName:	DSI_CMD_RXHDR_1
Reset:	soft

This register reads the READ Response packet header received from the Periphery. This register is RO.

DWord	Bit	Description
0	31:0	**Received Header** Access: RO This field contains the READ Response packet header received from the Periphery. Software can read this as many times as it wishes (i.e. the Read Unloads DW bit of the DSI_CMD_RXCTL has no effect on this data).

DSI_CMD_RXPYLD

DSI_CMD_RXPYLD	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	6B0E4h-6B0E7h
Name:	DSI 0 Command Receive Payload
ShortName:	DSI_CMD_RXPYLD_0
Reset:	soft
Address:	6B8E4h-6B8E7h
Name:	DSI 1 Command Receive Payload
ShortName:	DSI_CMD_RXPYLD_1
Reset:	soft

This register reads from the Receive Payload queue within the transcoder which contains the payload data of READ Response packets received from the Periphery. A read to this register will pull a DW of data from a receive queue within the DSI transcoder unless the DSI_CMD_RXCTL is programmed to prevent this. This register is RO.

DWord	Bit	Description
0	31:0	**Received Payload** Access: RO This field contains the READ Response payload data and CRC received from the Periphery. This data is taken from the head of the DSI transcoders receive queue. If the Read Unloads DW bit of the DSI_CMD_RXCTL is set, then multiple reads to this register will return the same data (i.e. the data at the head of the receive queue). If there is a read to this register when the transcoders receive queue is empty (i.e. the Number Rx DW within DSI_CMD_RXDATA is zero), then the data returned will be all zeros. Note that the contents of the Receive Payload queue within the transcoder is flushed for every entry into a Bus Turn-Around state and for every exit from a content protection session.

DSI_CMD_TXCTL

DSI_CMD_TXCTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B0D0h-6B0D3h
Name:	DSI Transcoder 0 Command Transmit Control
ShortName:	DSI_CMD_TXCTL_0
Reset:	soft
Address:	6B8D0h-6B8D3h
Name:	DSI Transcoder 1 Command Transmit Control
ShortName:	DSI_CMD_TXCTL_1
Reset:	soft

This register controls how DSI command packets are built and transmitted over the DSI Link.

DWord	Bit	Description
0	31:25	**Reserved** Access: RO Format: MBZ
	24	**Keep Link in HS** Access: R/W This field will keep the Link in the HS state between SW initiated command packets to the Periphery. The transitions between the LP and HS states can result in significant latencies and can have a negative impact on SW performance. If between HS commands there is no other HS traffic to transmit, then the DSI transcoder will begin transmitting Null packets until the next HS packet arrives. **Restriction** Restrictions: 1. HW will only act on this bit when the DSI transcoder is in the Command Mode of operation. 2. SW must clear this bit if it is going to initiate a LP transaction (e.g. a LPDT, BTA, Trigger, etc.). 3. SW should clear this bit when it is finished sending its burst of commands to the Periphery.
	23:13	**Reserved** Access: RO Format: MBZ

DSI_CMD_TXCTL		
	12:8	**Free Header Credits** Access: RO This field represents the number of Header resources that are currently available to SW. SW will need a Header Credit to write to either the Command Tx Header (DSI_CMD_TXHDR) or the LP Message (DSI_LP_MSG) registers. A write to either of these registers will consume a Header Credit. The transcoder will release a Header Credit after it has pulled the command from its internal command header queue. HW currently maintains 16 Header Credits.
	7:0	**Free Payload Credits** Access: RO This field represents the number of Payload resources that are currently available to SW. SW will need a Payload Credit to write to the Command Tx Payload register (DSI_CMD_TXPYLD). A write to the Tx Payload register will consume 1 Payload Credit (i.e., 1 Payload Credit is equal to 1 to 4 bytes of payload). The transcoder will release a Payload Credit after it has pulled a DW of data from its internal command payload queue. HW currently maintains 64 Payload Credits (i.e. HW can accept payloads of up to 256 bytes).

DSI_CMD_TXHDR

DSI_CMD_TXHDR	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B100h-6B103h
Name:	DSI Transcoder 0 Transmit Packet Header
ShortName:	DSI_CMD_TXHDR_0
Reset:	soft
Address:	6B900h-6B903h
Name:	DSI Transcoder 1 Transmit Packet Header
ShortName:	DSI_CMD_TXHDR_1
Reset:	soft

This register is used to write a packet header to the DSI transcoder.

DWord	Bit	Description
0	31	**Payload** Access: R/W When set, the DSI packet carries a payload of data. 0b: Short packet format (no payload) 1b: Long packet format (payload) **Restriction** Restrictions: 1. SW must ensure that the Data Type encoding matches the packet format specified by this attribute. 2. SW must ensure that the payload data is written into the Command Payload queue before writing to this register, if this bit is set.
	30	**LPDT** Access: R/W Low Power Data Transfer. This field will direct the DSI transcoder on what mode (HS or LP) to transmit the packet in. 0b: Cmd transmitted in HS state 1b: Cmd transmitted in LP Escape mode **Restriction** SW must expect synchronization events to be missed, if it sets this attribute when the DSI

DSI_CMD_TXHDR

controller is in the Video Mode of operation and the Timing Generator is enabled.
SW is highly discouraged from setting this bit when in Video Mode.

29 Vertical Blank Fence

Access:	R/W

This field will direct the DSI transcoder to wait until the start of the next V. Blank (in Video Mode) or the end of the frame (in Command Mode) before it executes the Command.
This can be used for Frame Synchronized Commands that have to be fenced after the transmission of an Execute Queue.

Value	Name
0b	Cmd will not be fenced
1b	Cmd will be fenced

28 Reserved

Access:	RO
Format:	MBZ

27:24 Reserved

Access:	RO
Format:	MBZ

23:8 Word Count - Parameters

Access:	R/W

This field specifies either the DSI Word Count (i.e. the length of the payload in bytes), or the two bytes of Parameters.
The interpretation of this field by the DSI transcoder will be based off of the Payload attribute above.
When the Payload bit is '0', then these bytes represent Parameters
When the Payload bit is '1', then these bytes represent the Word Count of the Payload
The interpretation of this field by the Periphery will be based off of the Data Type field below

Restriction
When the command carries a payload, SW must ensure that the value within this field matches the amount of payload data loaded into the Command Payload queue associated with this packet For Short packets, it will be the responsibility of SW to adhere to the DSI protocols if the packet carries only one, or no parameter

7:6 Virtual Channel

Access:	R/W

This field specifies the virtual channel to transmit the command over the DSI Link.

5:0 Data Type

Access:	R/W

This field specifies the DSI command Data Type.

DSI_CMD_TXPYLD

DSI_CMD_TXPYLD	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B104h-6B107h
Name:	DSI Transcoder 0 Transmit Packet Payload
ShortName:	DSI_CMD_TXPYLD_0
Reset:	soft
Address:	6B904h-6B907h
Name:	DSI Transcoder 1 Transmit Packet Payload
ShortName:	DSI_CMD_TXPYLD_1
Reset:	soft

This register is used to write a DW of packet payload to the DSI transcoder.

DWord	Bit	Description
0	31:0	**Payload Data** Access: R/W This register is a proxy into the payload of the command packet to be injected onto the DSI Link. Writes to this register will load the DW of data into a Command Payload queue that will be unloaded by HW after the packet has been validated via a write to the DSI_CMD_TXHDR register. When reading from this register, only the payload data from the last write will be available. **Restriction** Software must have an available Payload credit to write to this register. SW must write the payload in ascending order (i.e. DW 0 is written first, the final DW is written last). SW must load the entire payload within the Command Payload queue before writing to the Command Header register (DSI_CMD_TXHDR). The write to the Command Header register validates the payload written to this queue. SW must ensure that the WC of the Packet Header matches the amount of data written to the Command Payload queue.

DSI_DATA_TIMING_PARAM

DSI_DATA_TIMING_PARAM

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B084h-6B087h
Name:	DSI 0 Data Lane Timing Parameter
ShortName:	DSI_DATA_TIMING_PARAM_0
Reset:	soft
Address:	6B884h-6B887h
Name:	DSI 1 Data Lane Timing Parameter
ShortName:	DSI_DATA_TIMING_PARAM_1
Reset:	soft

This register specifies the D-PHY timing parameters for the Data Lane, if SW is overriding the HW defaults.
This register is located within the Core Display and is used by the DSI Controller to calculate Link transition latencies of the Data Lanes. There is an identical register (DPHY_DATA_TIMING_PARAM) located within the combo-PHY that actually applies the overrides to the D-PHY Data Lanes. Both registers should be programmed by Software if an override needs to be applied to the Data Lanes within the D-PHY.
Since this register is being used to calculate the Link transition latencies of the Data Lanes, but does not actually affect the transition times within the D-PHY, this register can be used to add guardbands to the DSI Controller's transition latency calculations.
The lower 12 bits of the offset address for this register should correspond to the lower offset address of its sister D-PHY register within the combo-PHY.
All fields are defined in number of Escape clocks.

Restriction

Overall restriction is that the timing parameters must be non-zero if SW is overriding the HW timing parameters.
The programming of this register must be equal to or greater than the programming of it's sister register that lives within the combo-PHY (DPHY_DATA_TIMING_PARAM).

DWord	Bit	Description
0	31	**HS_PREPARE Override** Access: R/W This field controls the override of the HS-PREPARE timing parameter. Value 0: HW maintains Value 1: SW overrides
	30:27	**Reserved** Access: RO Format: MBZ

DSI_DATA_TIMING_PARAM

26:24 **HS_PREPARE**

Access:	R/W

This parameter defines the time that the Host drives a Data Lane with the LP-00 Lane state (the Bridge state) immediately before driving the HS-0 Line state.
This field represents a hexadecimal value with a precision of 1.2 i.e. the most significant bit is the integer and the least significant 2 bits are fraction bits. So, the field can represent a range of 0.25 to 1.75 (12.5ns to 87.5ns assuming an Escape clock with a 20MHz frequency)
HW maintains this parameter at 1 Escape clock (minimum 50ns)

Value	Name
001b	0.25 Escape clocks
010b	0.50 Escape clocks
011b	0.75 Escape clocks
100b	1.0 Escape clocks
101b	1.25 Escape clocks
110b	1.50 Escape clocks
111b	1.75 Escape clocks
Others	Reserved

Programming Notes
Caution: The MIPI D-PHY specification has a maximum of 85ns + 6UI for this parameter.

23 **HS_ZERO Override**

Access:	R/W

This field controls the override of the HS-ZERO timing parameter

Value	Name
0	HW maintains
1	SW overrides

22:20 **Reserved**

Access:	RO
Format:	MBZ

19:16 **HS_ZERO**

Access:	R/W

This parameter defines the time that the Host drives the HS-0 Lane state on a Data Lane.
HW maintains this parameter at 2 Escape clocks plus 1 Byte clock (minimum 100ns + 8UI)

15 **HS_TRAIL Override**

Access:	R/W

This field controls the override of the HS-TRAIL timing parameter

Value	Name
0	HW maintains
1	SW overrides

DSI_DATA_TIMING_PARAM

	14:11	**Reserved** Access: RO Format: MBZ
	10:8	**HS_TRAIL** Access: R/W This parameter defines the time that the Host drives the flipped differential state of the last payload data bit of a HS transmission on a Data Lane. HW maintains this parameter at 1.5 Escape clocks (minimum 75ns)
	7	**HS_EXIT Override** Access: R/W This field controls the override of the HS-EXIT timing parameter Value 0: HW maintains Value 1: SW overrides
	6:3	**Reserved** Access: RO Format: MBZ
	2:0	**HS_EXIT** Access: R/W This parameter defines the time that the Host drives the LP-11 Lane state (i.e. the Stop state) following a HS burst. HW maintains this parameter at 2 Escape clocks (minimum 100ns)

DSI_ESC_CLK_DIV

DSI_ESC_CLK_DIV

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	6B090h-6B093h
Name:	DSI 0 Escape Clock Divider
ShortName:	DSI_ESC_CLK_DIV_0
Reset:	soft
Address:	6B890h-6B893h
Name:	DSI 1 Escape Clock Divider
ShortName:	DSI_ESC_CLK_DIV_1
Reset:	soft

This register defines the clock divider variable M needed to generate an Escape clock from the 8X clock
This register is located within the Core Display. There is an identical register (DPHY_ESC_CLK_DIV) located within the combo-PHY. Both of these registers should be programmed by Software.
The lower 12 bits of the offset address for this register should correspond to the lower offset address of its sister D-PHY register within the combo-PHY.

Restriction : The programming of this register must be identical to the programming of its sister register that lives within the combo-PHY (DPHY_ESC_CLK_DIV)

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20:16	**Byte Clocks per Escape Clock** Access: RO This field reports the number of Byte clocks present within a given Escape clock. The DSI transcoder calculates this variable based off of the Escape clock divider M. N = Ceiling(M/8) The DSI complex (transcoder and D-PHY) use this information to emulate an Escape clock using the Byte clock. Note that the value reported here is zero-based (i.e. Ceiling(M/8) - 1)
	15:9	**Reserved** Access: RO Format: MBZ
	8:0	**Escape Clock Divider M** Access: R/W **Description** This field specifies the divider variable (M) needed to derive the Escape clock from the Link

DSI_ESC_CLK_DIV		
		clock (i.e. the 8X frequency) Escape frequency= 8X frequency / M The DSI transcoder does not use a physical Escape clock, so there is no physical divider, but the transcoder needs to know the value of M to emulate the Escape clock in Byte clocks. **Restriction** The Escape clock frequency must be as close to, but not greater than 20MHz. Therefore, the programming of M should be: M = Ceiling(8X Frequency (in MHz) / 20 MHz)

DSI_HTX_TO

DSI_HTX_TO	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B044h-6B047h
Name:	DSI 0 HS Transmit Timeout
ShortName:	DSI_HTX_TO_0
Reset:	soft
Address:	6B844h-6B847h
Name:	DSI 1 HS Transmit Timeout
ShortName:	DSI_HTX_TO_1
Reset:	soft

This register specifies the HS Tx timeout.

DWord	Bit	Description
0	31:16	**HS TX Timeout** Default Value: FFFFh Access: R/W This field represents the upper 16 bits of the HS Transmit Timeout (i.e. the timeout has a granularity of 64K). The time is specified in Byte clocks. This field will default to the maximum possible value. **Programming Notes** This timer is zero-based (i.e. a value of 0 will have a timeout of 64K) If the DSI transcoder is in the Video Mode and is not able to place the Link in the LP state during the H. Blank regions of the V. Active region, then SW must program this to be greater that the amount of time it takes to transmit the full frame (V. Total * H. Total). The value should be set to a value greater than the Peripherals HS RX Timeout.
	15:1	**Reserved** Access: RO Format: MBZ
	0	**HTX_TO** Access: R/WC The HS TX Timer has timed out. HW will set this bit, SW will clear it with a write of 1b.

DSI_INTER_IDENT_REG

DSI_INTER_IDENT_REG	
Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32
Address:	6B074h-6B077h
Name:	DSI Transcoder 0 Interrupt Identity Register
ShortName:	DSI_INTER_IDENT_REG_0
Reset:	soft
Address:	6B874h-6B877h
Name:	DSI Transcoder 1 Interrupt Identity Register
ShortName:	DSI_INTER_IDENT_REG_1
Reset:	soft

The DSI Interrupt Identity Register (IIR)logs non-masked DSI interrupts received from the Periphery and Host. The DSI_INTER_MSK_REG (IMR) controls which interrupts will be logged within the IIR.

DWord	Bit	Description
0	31	**TE Event** Access: R/WC A Tear Effect (TE) event was received
	30	**Rx Data / BTA Terminated** Access: R/WC READ response data has been received, or the BTA has been terminated
	29	**Tx Data** Access: R/WC A transmit credit has been freed
	28	**ULPS Entry Done** Access: R/WC A Ultra Low Power State Entry flow has completed
	27	**Non-TE Trigger Received** Access: R/WC A non-TE trigger has been received from the Periphery. The DSI_CMD_RXCTL will indicate the trigger received.
	26	**Host Checksum Error** Access: R/WC Host reported a checksum error
	25	**Host Multi ECC Error** Access: R/WC Host reported a multi-bit ECC error

DSI_INTER_IDENT_REG

	24	**Host Single ECC Error** Access: R/WC Host reported a single-bit ECC
	23	**Host Contention Detected** Access: R/WC Host reported a LP contention
	22	**Host False Control Error** Access: R/WC Host reported a False Control error
	21	**Host Timeout Error** Access: R/WC Host reported a Timeout error
	20	**Host Low Power Transmit Sync Error** Access: R/WC Host reported a LP Transmission byte alignment problem
	19	**Host Escape Mode Entry Command Error** Access: R/WC Host reported an Escape Mode entry command error
	18:17	**Spare 18_17** Access: R/WC Spare R/WC bits for future use
	16	**Frame Update Done** Access: R/WC A frame update is done. This interrupt is only valid when the transcoder is in Command Mode
	15	**Protocol Violation** Access: R/WC Peripheral reported a protocol violation
	14	**Spare 14** Access: R/WC Spare R/WC bit for future use
	13	**Invalid Tx Length** Access: R/WC Peripheral reported an invalid transmission length
	12	**Invalid VC** Access: R/WC Peripheral reported an invalid DSI VC ID
	11	**Invalid Data Type** Access: R/WC

DSI_INTER_IDENT_REG		
		Peripheral reported a non-recognizable DSI Data Type
	10	**Peripheral Checksum Error** Access: R/WC Peripheral reported a checksum error
	9	**Peripheral Multi ECC Error** Access: R/WC Peripheral reported a multi-bit ECC error
	8	**Peripheral Single ECC Error** Access: R/WC Peripheral reported a single-bit ECC error
	7	**Peripheral Contention Detected** Access: R/WC Peripheral reported a LP contention
	6	**Peripheral False Control Error** Access: R/WC Peripheral reported a False Control error
	5	**Peripheral Timeout Error** Access: R/WC Peripheral reported a timeout error
	4	**Peripheral Low Power Transmit Sync Error** Access: R/WC Peripheral reported a LP Transmission byte alignment problem
	3	**Peripheral Escape Mode Entry Command Error** Access: R/WC Peripheral reported an Escape Mode entry command error
	2	**EoT Sync Error** Access: R/WC Peripheral reported an End of Transmission byte alignment problem
	1	**SoT Sync Error** Access: R/WC Peripheral reported a Start of Transmission leader sequence corruption error
	0	**SoT Error** Access: R/WC Peripheral reported a Start of Transmission Error

DSI_INTER_MSK_REG

DSI_INTER_MSK_REG

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B070h-6B073h
Name:	DSI Transcoder 0 Interrupt Mask Register
ShortName:	DSI_INTER_MSK_REG_0
Reset:	soft
Address:	6B870h-6B873h
Name:	DSI Transcoder 1 Interrupt Mask Register
ShortName:	DSI_INTER_MSK_REG_1
Reset:	soft

The DSI Interrupt Mask Register (IMR) provides a filter to the events that can cause interrupts (i.e. the register will determine which events will be logged within the DSI Interrupt Identity Register (IIR))

DWord	Bit	Description
0	31	**TE Event** Access: R/W Tear Effect (TE) interrupt mask Value 0: Event Unmasked Value 1: Event Masked **[Default]**
	30	**Rx Data/BTA Terminated** Access: R/W READ response data received, or the BTA has been terminated interrupt mask Value 0: Event Unmasked Value 1: Event Masked **[Default]**
	29	**Tx Data** Access: R/W Freed transmit credit interrupt mask Value 0: Event Unmasked Value 1: Event Masked **[Default]**
	28	**ULPS Entry Done** Access: R/W Ultra Low Power State Entry flow interrupt mask

DSI_INTER_MSK_REG

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

27 **Non-TE Trigger Received**

Access:	R/W

Non-TE trigger received interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

26 **Host Checksum Error**

Access:	R/W

Host reported a checksum error interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

Programming Notes
Masking this event effectively disables the CRC checking for received payloads

25 **Host Multi ECC Error**

Access:	R/W

Host reported a multi-bit ECC error interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

Programming Notes
Masking this event along with the Host Single ECC Error mask bit will disable ECC checking for received packet headers

24 **Host Single ECC Error**

Access:	R/W

Host reported a single-bit ECC error interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

Programming Notes
Masking this event along with the Host Multi ECC Error mask bit will disable ECC checking for received packet headers

DSI_INTER_MSK_REG

23	**Host Contention Detected** Access: R/W Host reported a LP contention interrupt mask 0: Event Unmasked 1: Event Masked **[Default]**
22	**Host False Control Error** Access: R/W Host reported a False Control error interrupt mask 0: Event Unmasked 1: Event Masked **[Default]**
21	**Host Timeout Error** Access: R/W Host reported a Timeout error interrupt mask 0: Event Unmasked 1: Event Masked **[Default]**
20	**Host Low Power Transmit Sync Error** Access: R/W Host reported a LP Transmission byte alignment problem interrupt mask 0: Event Unmasked 1: Event Masked **[Default]**
19	**Host Escape Mode Entry Command Error** Access: R/W Host reported an Escape Mode entry command error interrupt mask 0: Event Unmasked 1: Event Masked **[Default]**
18:17	**Spare 18_17** Default Value: 11b Access: R/W Spare R/W bits for future use
16	**Frame Update Done** Frame update finished mask

DSI_INTER_MSK_REG

Value	Name
0b	Event Unmasked
1b	Event Masked **[Default]**

15 — Protocol Violation

Access:	R/W

Peripheral reported a protocol violation interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

14 — Spare 14

Default Value:	1b
Access:	R/W

Spare R/W bit for future use

13 — Invalid Tx Length

Access:	R/W

Peripheral reported an invalid transmission length interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

12 — Invalid VC

Access:	R/W

Peripheral reported an invalid DSI VC ID interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

11 — Invalid Data Type

Access:	R/W

Peripheral reported a non-recognizable DSI Data Type interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

10 — Peripheral Checksum Error

Access:	R/W

Peripheral reported a checksum error interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

DSI_INTER_MSK_REG

9 — Peripheral Multi ECC Error

Access:	R/W

Peripheral reported a multi-bit ECC error interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

8 — Peripheral Single ECC Error

Access:	R/W

Peripheral reported a single-bit ECC error interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

7 — Peripheral Contention Detected

Access:	R/W

Peripheral reported a LP contention interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

6 — Peripheral False Control Error

Access:	R/W

Peripheral reported a False Control error interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

5 — Peripheral Timeout Error

Access:	R/W

Peripheral reported a timeout error interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

4 — Peripheral Low Power Transmit Sync Error

Access:	R/W

Peripheral reported a LP Transmission byte alignment problem interrupt mask

Value	Name
0	Event Unmasked
1	Event Masked **[Default]**

DSI_INTER_MSK_REG

	3	**Peripheral Escape Mode Entry Command Error** Access: R/W Peripheral reported an Escape Mode entry command error interrupt mask **Value** / **Name** 0 – Event Unmasked 1 – Event Masked **[Default]**
	2	**EoT Sync Error** Access: R/W Peripheral reported an End of Transmission byte alignment problem interrupt mask **Value** / **Name** 0 – Event Unmasked 1 – Event Masked **[Default]**
	1	**SoT Sync Error** Access: R/W Peripheral reported a Start of Transmission leader sequence corruption error interrupt mask **Value** / **Name** 0 – Event Unmasked 1 – Event Masked **[Default]**
	0	**SoT Error** Access: R/W Peripheral reported a Start of Transmission Error interrupt mask **Value** / **Name** 0 – Event Unmasked 1 – Event Masked **[Default]**

DSI_IO_MODECTL

DSI_IO_MODECTL

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	6B094h-6B097h
Name:	DSI Transcoder 0 IO Mode Control
ShortName:	DSI_IO_MODECTL_0
Reset:	soft
Address:	6B894h-6B897h
Name:	DSI Transcoder 1 IO Mode Control
ShortName:	DSI_IO_MODECTL_1
Reset:	soft

This register is used to control the mode of operation within the Combo-PHY which is shared between the MIPI DSI transcoder and the eDP/DP DDI.
Each DSI transcoder is attached to the following Combo-PHY:
DSI0: Combo-PHY A
DSI1: Combo-PHY B
Note that the Combo-PHY's are also referred to as DDI A / DDI B

Restriction: If the Combo-PHY is going to be used by the DSI transcoder, then this register must be programmed **before** the power request is sent to the Combo-PHY

DWord	Bit	Description
0	31:18	**Reserved** Access: RO Format: MBZ
	17:16	**Reserved** Access: RO Format: MBZ
	15:2	**Reserved** Access: RO Format: MBZ
	1	**Reserved** Access: RO Format: MBZ
	0	**Combo PHY Mode** Access: R/W For products using a Combo-PHY for the DSI port, this bit selects the mode of operation within the Combo-PHY to which the DSI transcoder is attached. For products using a dedicated DSI PHY, this bit controls the clock request to the PHY.

DSI_IO_MODECTL			
		Value	Name
		0b	DDI Mode / No Clock Request
		1b	MIPI DSI Mode / Clock Request

DSI_LP_MSG

DSI_LP_MSG

Register Space:	MMIO: 0/2/0
Access:	R/W Set
Size (in bits):	32
Address:	6B0D8h-6B0DBh
Name:	DSI 0 Low Power Message
ShortName:	DSI_LP_MSG_0
Reset:	soft
Address:	6B8D8h-6B8DBh
Name:	DSI 1 Low Power Message
ShortName:	DSI_LP_MSG_1
Reset:	soft

This register contains the LP messages that can be sent to the Periphery.

Restriction

Software must have a Header credit to write to this register.

DWord	Bit	Description
0	31:19	**Reserved** Access: RO Format: MBZ
	18	**Link Direction** Access: RO This field advertises the current state of the Link direction 0b – Link is in the Forward direction 1b – Link is in the Reverse direction
	17	**LP Tx in Progress** Access: RO This status bit indicates whether the DSI transcoder is currently servicing a LP transaction. 0b – Transcoder is not transmitting in the LP Esc mode 1b – Transcoder is transmitting in the LP Esc mode
	16	**In ULPS** Access: RO This status bit indicates whether the DSI Link is in the Ultra-Low Power State (ULPS), or not. This bit should accurately reflect the ultra-low power state of the Link even when the DSI transcoder function is disabled.

DSI_LP_MSG

Value	Name
0b	The DSI Link is not in ULPS
1b	The DSI Link is in ULPS

15:11 **Reserved**

Access:	RO
Format:	MBZ

10:9 **Trigger Type**

Access:	R/W

This field specifies the type of Trigger Message to send the Peripheral. It is only sampled when a Trigger Message is being sent to the Peripheral.

Value	Name	Description
00b	Reset Trigger	Entry Command [lsb:msb]: 01100010
01b	Unknown 3	Entry Command [lsb:msb]: 01011101
10b	Unknown 4	Entry Command [lsb:msb]: 00100001
11b	Unknown 5	Entry Command [lsb:msb]: 10100000

Programming Notes
Note that the Unassigned triggers are not specifically assigned to a given action/function within the DSI spec. Therefore, these can be used as general-purpose trigger messages that the Periphery defines

8 **ULPS Type**

Access:	R/W

This bit specifies the LP state that the Lanes (both Data and Clock) will be left in after entering ULPS

Value	Name	Description
0b	LP-00	Lanes will be left in the LP-00 state
1b	LP-11	Lanes will be left in the LP-11 state

7:3 **Reserved**

Access:	RO
Format:	MBZ

2 **Trigger Message**

Access:	R/W Set

This bit will direct the DSI Transcoder to issue a Trigger Message to the Peripheral. The type of trigger is specified with the Trigger Type field within this register.
Trigger signaling is a mechanism to send a flag to the Protocol Layer of the Periphery using the Escape Mode of transmission.

Programming Notes
The trigger flag, as seen by the Peripheral, can be extended using the Trigger Extension in the DPHY_TRIG_EXT.

DSI_LP_MSG

		The DSI Transcoder will clear this bit when it is finished with the transmission of the message (including the Trigger Extension)
	1	**Bus Turnaround** Access: R/W Set This bit will direct the DSI Transcoder to issue a BTA request to the Periphery. **Programming Notes** When in Video Mode, the DSI transcoder will dispatch a BTA request (by itself) within the next Vertical blank line that it sees. SW must program the Turnaround Timeout (DSI_TA_TO) and the LP Rx (Host) Timeout (DSI_LRX_H_TO) properly to avoid having synchronization events being missed. In other words, the total amount of time it takes to send a BTA and receive a response from the Panel needs to be less than the Vertical blank line time.
	0	**ULPS Entry** Access: R/W Set Ultra-Low Power State Entry. When set, the DSI Transcoder will transmit the ULPS Entry Command on all Data Lanes and it will bring the Clock Lane to the ULPS state. The state of the Lanes at the end of the ULPS flow is dictated by the ULPS Type within this register. When HW has finished the UPLS sequence it will clear this bit. **Restriction** Before setting this bit, Software must disable the DSI's Timing Generator

DSI_LRX_H_TO

DSI_LRX_H_TO

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B048h-6B04Bh
Name:	DSI 0 LP Rx (Host) Timeout
ShortName:	DSI_LRX_H_TO_0
Reset:	soft
Address:	6B848h-6B84Bh
Name:	DSI 1 LP Rx (Host) Timeout
ShortName:	DSI_LRX_H_TO_1
Reset:	soft

This register specifies the LP Rx (Host)timeout.

DWord	Bit	Description
0	31:17	**Reserved** Access: RO Format: MBZ
	16	**LRX_H_TO** Default Value: 0b Access: R/WC The LP RX Timer has timed out. HW will set this bit, SW must clear it with a write of 1b.
	15:0	**LP RX_H Timeout** Access: R/W This field represents the maximum amount of time the DSI transcoder will give to the Peripheral to transmit its response back to the Host. If the timer times out, then the DSI transcoder will set the LRX_H_TO bit in this register and the Host Timeout Error bit within the DSI_INTER_IDENT_REG register, if this interrupt event is unmasked(DSI_INTER_MSK_REG). The time is specified in Escape clocks. **Programming Notes** The LP RX Timer will be disabled if this value is zero

DSI_PWAIT_TO

DSI_PWAIT_TO	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B040h-6B043h
Name:	DSI 0 Peripheral Wait Timeout
ShortName:	DSI_PWAIT_TO_0
Reset:	soft
Address:	6B840h-6B843h
Name:	DSI 1 Peripheral Wait Timeout
ShortName:	DSI_PWAIT_TO_1
Reset:	soft

This register represents a Peripheral wait time used in conjunction with either a BTA or a Trigger LP message.
The times specified within this register are in terms of Escape clocks.
The timers are zero-based (i.e. a value of 0 equals 1 Escape clock)

DWord	Bit	Description
0	31:16	**Peripheral Reset Timeout** Access: R/W This field represents the time to wait after a Reset Trigger has been transmitted to the Peripheral (PR_TO). The timer will start after the Trigger message has been sent and the DSI transcoder will block all other traffic until the timer reaches the timeout value.
	15:0	**Peripheral Response Timeout** Access: R/W This field represents the time to wait before asking the Peripheral for a response (PRESP_TO). The timer will start when the DSI transcoder receives the BTA request from SW and the Link enters the Stop state. When the timer reaches the timeout value, the DSI transcoder will begin the BTA request to the Peripheral.

DSI_T_INIT_PRIMARY

DSI_T_INIT_PRIMARY	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B088h-6B08Bh
Name:	DSI 0 Initialization Primary Time
ShortName:	DSI_T_INIT_PRIMARY_0
Reset:	soft
Address:	6B888h-6B88Bh
Name:	DSI 1 Initialization Primary Time
ShortName:	DSI_T_INIT_PRIMARY_1
Reset:	soft

This register specifies the amount of time (in Escape clocks) to drive the Link in the initialization state.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Primary Initialization Time** Default Value: 07D0h Access: R/W This field specifies the INIT_PRIMARY timing parameter used by the Host to drive the Link initialization. This field is specified in Escape clocks where the Escape clock operates at a maximum frequency of 20MHz. **Programming Notes** The default value of this register will produce an initialization duration of 100us which is the minimum requirement for the INIT timing parameter. The Periphery may require a longer initialization period (INIT + INTERNAL_DELAY), so the value programmed should be greater than the Periphery's initialization requirements.

DSI_T_WAKEUP

DSI_T_WAKEUP	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B08Ch-6B08Fh
Name:	DSI 0 Wakeup Timing Parameter
ShortName:	DSI_T_WAKEUP_0
Reset:	soft
Address:	6B88Ch-6B88Fh
Name:	DSI 1 Wakeup Timing Parameter
ShortName:	DSI_T_WAKEUP_1
Reset:	soft

This is the timing parameter T-WAKEUP used to drive the Mark-1 state on the Link when exiting ULPS.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Wakeup Time** Default Value: 4E20h Access: R/W This field represents the T_{WAKEUP} timing parameter used when ULPS is being exited. The time is specified in number of Escape clocks. The default of this field will be set to 1ms (MIPI DSI specification minimum). **Restriction** A value of zero is invalid

DSI_TA_TO

DSI_TA_TO	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B04Ch-6B04Fh
Name:	DSI 0 Turnaround Timeout
ShortName:	DSI_TA_TO_0
Reset:	soft
Address:	6B84Ch-6B84Fh
Name:	DSI 1 Turnaround Timeout
ShortName:	DSI_TA_TO_1
Reset:	soft

This register specifies the Turnaround timeout.

DWord	Bit	Description
0	31:17	**Reserved** Access: RO Format: MBZ
	16	**TA_TO** Access: R/WC The Turnaround Timer has timed out. HW will set this bit, SW must clear it with a write of 1b.
	15:0	**Turnaround Timeout** Access: R/W This field represents the maximum amount of time the Host will give to the Peripheral to acknowledge the Bus Turnaround request. If the timer times out, then the DSI transcoder will set the TA_TO bit in this register and the Host Timeout Error bit within the DSI_INTER_IDENT_REG register, if this interrupt event is unmasked (DSI_INTER_MSK_REG). The time is specified in Escape clocks. **Programming Notes** The TA TO Timer will be disabled if this value is zero

DSI_TRIG_TX_TIME

DSI_TRIG_TX_TIME

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B09Ch-6B09Fh
Name:	DSI 0 Trigger Transmission Time
ShortName:	DSI_TRIG_TX_TIME_0
Reset:	soft
Address:	6B89Ch-6B89Fh
Name:	DSI 1 Trigger Transmission Time
ShortName:	DSI_TRIG_TX_TIME_1
Reset:	soft

This register specifies the amount of time to present a LP Trigger request to the physical layer in Escape clocks When programming this register, SW must consider the following:

1. Escape mode entry and command transmission time: 20 Escape clocks
2. Trigger extension time: Panel specific

Software should not program the value within this register to be less than the time it takes to transmit the Escape mode entry and command. Doing so could pre-empt the transmission of the trigger causing an error at the Panel.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Trigger Tx Time** Default Value: 14h This field specifies the number of Escape clocks that the DSI controller should present a trigger message to the physical layer This field is only used if a Trigger Message is initiated from the DSI_LP_MSG register.

DS Invocation Counter

DS_INVOCATION_COUNT - DS Invocation Counter	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02308h
Name:	DS Invocation Counter
ShortName:	DS_INVOCATION_COUNT

This register stores the number of domain points shaded by the DS threads. Domain points which hit in the DS cache will not cause this register to increment. Note that the spawning of a DS thread which shades two domain points will cause this counter to increment by two. This register is part of the context save and restore.

DWord	Bit	Description
0..1	63:32	**DS Invocation Count UDW** Number of domain points shaded by the DS threads. Updated only when DS Function Enable and Statistics Enable are set in 3DSTATE_DS
	31:0	**DS Invocation Count LDW** Number of domain points shaded by the DS threads. Updated only when DS Function Enable and Statistics Enable are set in 3DSTATE_DS

DSMBASE

DSMBASE - DSMBASE

Register Space:	MMIO: 0/2/0
Size (in bits):	64
SOC_Consumer:	BIOS
Address:	1080C0h

This register contains the base address of graphics data stolen DRAM memory. BIOS determines the base of graphics data stolen memory. BIOS is now able to allocate Gfx Stolen Memory above the 4GB.

DWord	Bit	Description
0..1	63:20	**BDSM** Default Value: 000h Access: R/W _Custom_GTIReset: BUS This BitField contains bits 63 to 20 of the base address of stolen DRAM memory.
	19:1	**Reserved** Access: RO Format: MBZ
	0	**SPARE** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This was a lock bit prior.

DSSM

DSSM

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	51004h-51007h
Name:	Display Strap State
ShortName:	DSSM
Reset:	global

This register contains fuse and strap settings for display. This register is not reset by FLR.

DWord	Bit	Description
0	31:29	**Reference Frequency** Access: RO This field indicates the reference clock frequency. Software should use this value when programming the display clocks. 000b: 24 MHz 001b: 19.2 MHz 010b: 38.4 MHz
	28	**Spare 28**
	27	**Spare 27**
	26	**Spare 26**
	25	**Spare 25**
	24	**Spare 24**

	12	**Spare 12**
	11	**Spare 11**

DSSM

	10	**Spare 10**
	9	**Spare 9**
	8	**Spare 8**
	7	**Spare 7**
	6	**DE 8k Dis** DE_8K_DIS 8k capability fuse. This bit indicates whether hardware supports screens with widths greater than 5120 pixels. For tiled or joined displays, this is the total width after combining the widths of both pipes. Software must not enable these resolutions when the fuse is configured to disable 8k.

Value	Name	Description
0b	Enable	8k Capability Enabled
1b	Disable	8k Capability Disabled

	5	**Audio IO Flop Bypass** This field specifies whether the audio IO flop should be bypassed for dies with a long path to IO.

Value	Name
0b	Don't Bypass
1b	Bypass

	4	**Audio IO Select** This field specifies which audio IO location to use. It has to match where the PCH audio is connecting to the die.

Value	Name
0b	South
1b	North

	3	**WD Video Fault Continue** This field specifies whether WD video should continue data writes after a fault or stop the writes.

Value	Name
0b	Stop Writes
1b	Continue Writes

	2	**Reserved**
	1	**Part Is SOC**

Description
This field specifies whether this part is a SoC or not.

Value	Name
0b	Not SoC
1b	SoC

	0	**DisplayPort A Present** This bit specifies whether the port was present during initialization. This strap state can also be read in the DDI_BUF_CTL_A 0x64000 register bit 0.

DSSM				
		Value	Name	Description
		0b	Not Present	Port not present
		1b	Present	Port present

Dummy Context Save Register

UNUTILIZED_DUMMY_CTXSAVE - Dummy Context Save Register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	080FCh	
DWord	**Bit**	**Description**
0	31:0	**Context Save Register** Access: R/W _Custom_GTIReset: DEV This register is purely used as a dummy register when do context save of non-unslice clients. This is the last register saved as part of all other context saves and used as indication that restore is complete

EDRAMCAP

EDRAMCAP - EDRAMCAP		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	120010h	
Describes the presence and capabilities of the eDRAM cache.		
DWord	**Bit**	**Description**
0	31:0	**EDRAMCAP_VALUE** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS **Bits[31:22] - Reserved** **Bits[21:16] - CURRENT_ETAG_WAYS,** Default Value: 11b The total number of ways in each ETAG slice. This field is updated by PCODE after every ETAG shrink or ETAG expand. 0 if 4 ways 1 if 8 ways 2 if 12 ways 3 if 16 ways. **Bits[15:10] - Reserved** **Bits[9:8] - SETS_CONFIGURATION,** Default Value: 10b 1K or 2K sets, to support 64MB and 128MB EDRAM size configurations accordingly. 00 = Reserved. 01 if 1K sets 10 if 2K sets 11 reserved. **Bits[7:5] - WAYS_CONFIGURATION,** Default Value: 011b This field defines the total number of ETAG ways. 000 if 4 ways 001 if 8 ways 010 if 12 ways 011 if 16 ways 1xx reserved. **Bits[4:1] - Super Queue Internal Register Count,** Default Value: 0100b Number of EDRAM TAG banks should be always 4, meaning 4 banks. **Bit[0] - FUSE_EDRAM_ENABLE,** Default Value: 0b PCODE will update this field based on FUSE_EDRAM_ENABLE.

EMRR Mask LSB

EMRRMASK_LSB - EMRR Mask LSB		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 09208h		
EMRR Mask Value		
DWord	**Bit**	**Description**
0	31:12	**EMRR MASK LSB BITS** Access: RO _Custom_GTIReset: BUS EMRR MASK VALUE.
	11	**EMRR ENABLE** Access: RO _Custom_GTIReset: BUS EMRR Enable.
	10	**EMRR LOCK** Access: RO _Custom_GTIReset: BUS EMRR LOCK bit.
	9:0	**Spares** Access: RO _Custom_GTIReset: BUS

EMRR Mask MSB

EMRRMASK_MSB - EMRR Mask MSB		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 0920Ch		
EMRR Mask Value		
DWord	**Bit**	**Description**
0	31:0	**EMRR MASK MSB BITS** Access: RO _Custom_GTIReset: BUS EMRR MASK VALUE.

Encoded row max QP vector

ENC_ROW_MAX_QP_VEC - Encoded row max QP vector	
Register Space:	MMIO: 0/2/0

Name:	Max QP for each Tile row
ShortName:	ENC_ROW_MAX_QP_VEC_VDENC_REG7

This register holds the Max QP of the encoded bitstream for four consecutive LCU rows. Each, LCU row uses 8 bits.

DWord	Bit	Description
0	31:24	**MAX_QP_LCU_ROW_3** This Byte holds the maximum qp value of any CU coded in the row 3. The value could be used to determine the quality of encoded bitstream for row 3.

ENC_ROW_MAX_QP_VEC - Encoded row max QP vector		
	23:16	**MAX_QP_LCU_ROW_2** This Byte holds the maximum qp value of any CU coded in the row 2. The value could be used to determine the quality of encoded bitstream for row 2.
	15:8	**MAX_QP_LCU_ROW_1** This Byte holds the maximum qp value of any CU coded in the row 1. The value could be used to determine the quality of encoded bitstream for row 1.
	7:0	**MAX_QP_LCU_ROW_0** This Byte holds the maximum qp value of any CU coded in the row 0. The value could be used to determine the quality of encoded bitstream for row 0.

The EIR register contains the persistent values of Hardware-Detected Error Condition bits. Any bit set in this register will cause the error bit in the ISR to be set. The EIR register is also used by software to clear detected errors (by writing a 1 to the appropriate bit(s)), except for the unrecoverable bits described.)

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask
	15:0	**Error Identity Bits** This register contains the persistent values of ESR error status bits that are unmasked via the EMR register. (See Table 3-3. Hardware-Detected Error Bits). The logical OR of all (defined) bits in this register is reported in the error bit of the Interrupt Status Register. In order to clear an error condition, software must first clear the error by writing a 1 to the appropriate bit(s) in this field. If required, software should then proceed to clear the error bit of the IIR. Reserved bits are RO. Refer the table titled "Hardware-Detected Error Bits" for independent bit definitions. Value: 1h — Name: Error occurred

EIR - Error Identity Register

		Programming Notes
		Writing a 1 to a set bit will cause that error condition to be cleared. However, neither the Page Table Error bit (Bit 4) nor the Instruction Error bit (Bit 0) can be cleared except by reset (i.e., it is a fatal error).

ShortName:	EMR_CCSUNIT0

The EMR register is used by software to control which Error Status Register bits are masked or unmasked. Unmasked bits will be reported in the EIR, thus setting the error ISR bit and possibly triggering a CPU interrupt, and will persist in the EIR until cleared by software. Masked bits will not be reported in the EIR and therefore cannot generate error conditions or CPU interrupts. Reserved bits are RO.

DWord	Bit	Description
0	31:8	**Reserved** Default Value: FFFFFFh Format: PBC **Programming Notes** These bits are not implemented in HW and must be set to '1'
	7:0	**Error Mask Bits** This register contains a bit mask that selects which error condition bits (from the ESR) are reported in the EIR. Refer the table titled "Hardware-Detected Error Bits" for independent bit definitions.

EMR - Error Mask Register

Value	Name	Description
FFh	**[Default]**	
0h	Not Masked	Will be reported in the EIR
1h	Masked	Will not be reported in the EIR

ShortName:	ESR_CCSUNIT0

The ESR register contains the current values of all Hardware-Detected Error condition bits (these are all by definition persistent). The EMR register selects which of these error conditions are reported in the persistent EIR (i.e., set bits must be cleared by software) and thereby causing an error interrupt condition to be reported in the ISR.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Error Status Bits** This register contains the non-persistent values of all hardware-detected error condition bits. Refer the table titled "Hardware-Detected Error Bits" for independent bit definitions. Value: 1h — Name: Error Condition Detected

Name:	EXECLIST CONTROL
ShortName:	EXECLIST_CONTROL_CCSUNIT0

DWord	Bit	Description
0	31:3	**Reserved** Access: RO Format: MBZ
	2	**Use HW Element Pointer** HW element pointer gets saved on a context getting preempted due to Preempt to Idle(indicates the element number of the preempted context in the EQ). On a load following Preempt to Idle SW can set "Use Element Pointer" to indicate HW to resume from the element on which preemption has occurred due to Preempt to Idle, not setting Use Element Pointer will result in HW executing from Element-0. o UseHWElementPointer = 1 : HW saves its position in the N deep execution Q across any C6 events. When HW sees Load + UseHWElementPointer, HW will restart execution at the element pointed to by the Element Pointer. • This usage is only expected post a PreemptToIdle message, and is independent of C6 entry-exit in between PreemptToIdle and Load. • Load+UseHWElementPointer on the first load (out of reset) will cause execution to begin at the first valid element in the Q • Load+UseHWElementPointer without a preceding PreemptToIdle (i.e. when trying to Preempt a currently running Q) will cause undefined behavior.

EXECLIST_CONTROL - Execlist Control Register		
		○ UseHWElementPointer = 0 : HW begins execution at the first valid element in the Q.
	1	**Preempt to Idle** When SW writes a 1 to this bit, HW will immediately copy the contents of the Execution queue into the Submission queue. HW will preempt the executing context on appropriate preemption boundary, saves state and invalidates all the pending elements of the execution queue to be executed. HW saves the element pointer of the EQ on which it got preempted (indicates the element number of the preempted context in the EQ), element pointer is power context save/restored by HW. This forces HW to go idle triggering idle sequence for power management. A Preempt-to-idle message must be followed by a Load message to resume operation. This Load message may occur before or after a power gating/C6 sequence
	0	**Load** Writing to the Load bit triggers HW to sample Submission Queue (SQ) to Execution Queue (EQ) and start executing from Element-0 of Execution Queue. Doing a Load during an ongoing execution of an context will result in preemption and the new submission queue gets sampled to Execution Queue, however HW will not start executing from the newly updated Execution Queue until the preempted context is completely saved. Multiple loads occurring during the preemption of an executing context will result in EQ getting updated multiple times with the SQ and engine will only execute the most up to date EQ available upon completion of the preemption.

This register contains the pointers and full indicator for the Execlist Queue and the context ID of the currently running context.DefaultValue = UUUU UUU1h (4:0 default to 00001b, others UNDEFINED).

Programming Notes

This register functionality is not supported and must not be programmed for Position command streamer.

DWord	Bit	Description
0	63:32	**Current Context ID** Format: U32 Contains the context ID of the currently running context.
	31	**Reserved** Access: RO Format: MBZ
	30	**Pending Load** Format: U1 When set indicates the Load of SQ to EQ is complete. Hardware is in the process of making the first valid element of the EQ to be active (executing).

EXECLIST_STATUS - Execlist Status

29:28	**Reserved** Access: RO Format: MBZ
27	**Arbitration Enable** Format: U1 This field reflects the Arbitration Flag set by the MI_ARB_ON_OFF command in Command Streamer.
26:12	**Last Context Switch Reason** Access: R/W Format: U15

Description

This field contains the switch reason for the last context to switch away.

Bit	Defintion
12	Idle to Active (special case of Switch to New Queue)
13	Switch To New Queue
14	Element Switch
15	Active to Idle (special case of Element Switch)
16	Context Complete
17	Wait on Sync Flip
18	Wait on V-Blank
19	Wait on Semaphore
20	Wait on Scan Line
26:21	Reserved

Programming Notes

This field should not written by SW.

11:8	**Active Context Offset** When Active Context field is set, this field indicates the active context offset within the execution queue.
7	**Active Context** When set indicates there is an active context being executed in hardware.
6:5	**Reserved** Access: RO Format: MBZ
4	**Valid Execution Queue Duplicate** Indicates there is an active context or a pending context or a pending load in progress.

EXECLIST_STATUS - Execlist Status		
	3	**Valid Execution Queue** Indicates there is an active context or a pending context or a pending load in progress.
	2	**Preempt to Idle Pending** Preempt to Idle Pending: HW has received Preempt to Idle load request from the scheduler and hardware is in the process of switching out the active context if any to force HW go IDLE.
	1	**Two Pending Load's** Indicates there are two pending loads in HW, (n-1)th load's first valid element is being pursued by HW to be made active and the Nth loads first valid element will be considered once (N-1)th is active. This situation will arise when Nth load happens while (N-1)th load is pending in hardware. Any further Load (N+1) occurring while this bit is set will result in overwriting the Nth SQ load, that is Nth SQ load contents will never be seen by hardware.
	0	**Execution Queue Invalid** Default Value: 1h There are no contexts available in Execution Queue to be executed. There are no pending loads (including Preempt To Idle) to be processed by the hardware. Scheduler can look for this bit to be set before doing a load of SQ to avoid preemption of any active contexts in hardware.

ELSP provides a mechanism to load the elements of the Submission Queue in a cyclic order starting from Element-0 to Element-7. Consecutive writes to ELSP results in progressively updating lower dword followed by upper dword of successive elements starting from Element-0 to Element7. On reaching upper dword of Element-7 it wraps back to lower dword of Element-0.
Example: The first dword write to ELSP results in updating the lower dword of Element-0 and the following write updates the upper dword of Element-0 and the following write updates the lower dword of Element-1 and so on, on updating upper dword of Element-7 it wraps back to lower dword of Element-0.

DWord	Bit	Description
0	31:0	**Context Descriptor DW** Format: U32 See "Context Descriptor Format" for format. The element that this DW is submitted as and whether it is the high DW or the low DW is determined by order. This register must be written to 16 times in order to write to all the eight elements of an Submission Queue. .

This register contains user defined and hardware generated conditions that are used by MI_WAIT_FOR_EVENT commands. An MI_WAIT_FOR_EVENT instruction excludes the executing ring from arbitration if the selected event evaluates to a 1, while instruction is discarded if the condition evaluates to a 0. Once excluded a ring is enabled into arbitration when the selected condition evaluates to a 0. This register also contains control for the invalidation of indirect state pointers on context restore.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask These bits serves as a write enable for bits 15:0. If this register is written with any of these bits clear the corresponding bit in the field 15:0 will not be modified. Reading these bits always returns 0s.
	15	**Context Wait for V-blank on Pipe-D** This field when set indicates the corresponding context has executed MI_WAIT_FOR_EVENT with "Display Pipe C Vertical Blank Wait Enable" set. This is an internal HW flag and should not be accessed by SW.

EXCC - Execute Condition Code Register

	14	**Context Wait for V-blank on Pipe-C** Source: RenderCS, BlitterCS This field when set indicates the corresponding context has executed MI_WAIT_FOR_EVENT with "Display Pipe C Vertical Blank Wait Enable" set. This is an internal HW flag and should not be accessed by SW.
	13	**Context Wait for V-blank on Pipe-B** Source: RenderCS, BlitterCS This field when set indicates the corresponding context has executed MI_WAIT_FOR_EVENT with "Display Pipe B Vertical Blank Wait Enable" set. This is an internal HW flag and should not be accessed by SW.
	12	**Context Wait for V-blank on Pipe-A** Source: RenderCS, BlitterCS This field when set indicates the corresponding context has executed MI_WAIT_FOR_EVENT with "Display Pipe A Vertical Blank Wait Enable" set. This is an internal HW flag and should not be accessed by SW.
	11:5	**Reserved** Access: RO Format: MBZ
	4:0	**User Defined Condition Codes** Source: RenderCS The software may signal a Stream Semaphore by setting the Mask bit and Signal Bit together to match the bit field specified in a WAIT_FOR_EVENT (Semaphore).

This register captures the status of the elements executed from an Execution Queue on Preempt to Idle. HW looks at this register on Load with Use HW Element Pointer to pick the right element (instead of default Element-0) to execute in order to resume from where it got preempted on Preempt To Idle. This register must not be programmed by SW. This register is power context save/restored by HW.

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7:0	**Load** Each bit in the mask corresponds to an element in the execution queue. Bit[0] corresponds to Element-0 and Bit[7] corresponds to Element-7 of the EQ. Bit set for an element indicates the element is executed. Bit Reset for an element indicates either the element is invalid or pending execution (a preempted context is treated as pending execution).

FAULT_TLB_RD_DATA1 Register

FAULT_TLB_RD_DATA1 - FAULT_TLB_RD_DATA1 Register

Register Space:	MMIO: 0/2/0

FBC_CFB_BASE

FBC_CFB_BASE	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	43200h-43203h
Name:	FBC Compressed Buffer Address
ShortName:	FBC_CFB_BASE_A
Reset:	soft

Restriction
The contents of this register must not be changed while compression is enabled.

DWord	Bit	Description
0	31:28	**Reserved** Access: RO Format: MBZ
	27:12	**CFB Offset Address** This register specifies bits 27:12 of the offset of the Compressed Frame Buffer from the base of stolen memory. A programmed value of 0x0001 in this field corresponds to an offset of 0x1000 (4K) bytes. **Restriction** The buffer must be 4K byte aligned, which is enforced by reserving bits 11:0. The offset must be greater than 4K bytes, avoiding the first 4KB of stolen memory.
	11:0	**Reserved** Access: RO Format: MBZ

FBC_CTL

FBC_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	43208h-4320Bh
Name:	FBC Control
ShortName:	FBC_CTL_A
Reset:	soft

Description
FBC is tied to Plane 1 A.

Programming Notes
Frame Buffer Compression is not supported with per-pixel alpha. Software must disable FBC for per-pixel alpha formats.
Frame Buffer Compression is supported with surfaces of up to 8192 pixels x 4096 lines and plane sizes up to 5120 pixels x 4096 lines.
The FBC compressed vertical limit is 2560 lines, after which the remaining lines will be displayed correctly, but will not be compressed.
Compression ratios cannot be changed dynamically. FBC must be disabled and reenabled when changing compression ratios.

Restriction
The contents of this register must not be changed, except the enable bit, while compression is enabled.
Frame Buffer Compression is only supported with 16bpp and 32bpp 8:8:8 RGB plane source pixel formats. It is not supported with any other format. The 16bpp format requires the compression ratio to be set to 2:1 or 4:1. FBC is not supported with RGB 16bpp plane formats when plane 90/270 rotation is enabled. Frame Buffer Compression is only supported while the plane it is tied to has a source size of at least 200 pixels x 32 lines. Software must disable FBC for the non-supported pixel formats and sizes.
Frame Buffer Compression is not supported with interlaced fetch. With plane 90/270 rotation, all frame buffer modifications will result in full frame invalidation and recompression.

DWord	Bit	Description
0	31	**Enable FBC** This bit is used to globally enable FBC function at the next Vertical Blank start. FBC should not be enabled when the pipe is disabled.

Value	Name
0b	Disable

FBC_CTL

	1b	Enable

12:11	**Reserved** Access: RO Format: MBZ
10	**Reserved**
9:8	**Reserved**
7:6	**Compression Limit** This register sets a minimum limit on compression. This determines the maximum size of the compressed frame buffer. Display lines that do not meet the compression limit will not be compressed, so the best compression will be achieved with a 1:1 ratio. FBC processes received pixels as 32bpp irrespective of pixel format, so that CFB buffer sizing for 16bpp is indicated below: Compression Ratio 1, Pixel Format 16 bpp - Not Supported Compression Ratio 1, Pixel Format 32 bpp - Supported (CFB=FB) Compression Ratio 1/2, Pixel Format 16 bpp - Supported (CFB=FB) Compression Ratio 1/2, Pixel Format 32 bpp - Supported (CFB=1/2 FB) Compression Ratio 1/4, Pixel Format 16 bpp - Supported (CFB=1/2 FB) Compression Ratio 1/4, Pixel Format 32 bpp - Supported (CFB=1/4 FB) FB = Frame Buffer Size CFB = Compressed Frame Buffer Size

Value	Name	Description
00b	1:1	Compressed buffer is the same size as the uncompressed buffer.

01b	2:1	Compressed buffer is one half the size of the uncompressed buffer.
10b	4:1	Compressed buffer is one quarter the size of the uncompressed buffer.
11b	Reserved	Reserved

5:4 Write Back Watermark

The compressed data write back engine waits for this number of entries to be ready before writing the data out to memory.

Value	Name	Description
00b	4	4 entries
01b	8	8 entries
10b	16	16 entries
11b	32	32 entries

3:0 Reserved

FBC_RT_BASE_ADDR_REGISTER

FBC_RT_BASE_ADDR_REGISTER - FBC_RT_BASE_ADDR_REGISTER

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	07020h

This Register is saved and restored as part of Context.

DWord	Bit	Description
0	31:12	**FBC RT Base Address** Access: R/W Format: GraphicsAddress[31:12] _Custom_GTIReset: DEV 4KB aligned Base Address as mapped in the PPGTT or in the GGTT for the render target. This base address must be the one that is either front buffer or the back-buffer (a flip target). It must be programmed before any draw call binding that render target base address.
	11:2	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	1	**FBC Front Buffer Target** Access: R/W _Custom_GTIReset: DEV Value / Name / Description: 0h / **[Default]** / FBC is targeting the Back Buffer for compression. This buffer can be cached in the MLC/LLC, so a GFDT flush is required before FBC can begin compression. 1h / / FBC is targeting the Font Buffer for compression. This buffer cannot be cached in the MLC/LLC. FBC compression can begin after any RC flush.
	0	**PPGTT Render Target Base Address Valid for FBC** Access: R/W _Custom_GTIReset: DEV Value / Name / Description: 0h / **[Default]** / Base address in this register [31:12] is not valid and therefore FBC will not get any modifications from rendering. 1h / / Base address in this register [31:12] is valid and HW needs to compare the

FBC_RT_BASE_ADDR_REGISTER - FBC_RT_BASE_ADDR_REGISTER				
				current render target base address with this base address to provide modifications to FBC.

FBC_RT_BASE_ADDR_REGISTER_UPPER

FBC_RT_BASE_ADDR_REGISTER_UPPER - FBC_RT_BASE_ADDR_REGISTER_UPPER

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	07024h

This Register is saved and restored as part of Context.

Programming Notes

"Render Tracking with Nuke" is the only FBC functional mode supported by render engine. SW must always program the FBC_RT_BASE_ADDR_REGISTER_* register in Render Engine to a reserved value (0xFFFF_FFFF) such that the programmed value doesn't match the render target surface address programmed. This would disable render engine from generating modify messages to FBC unit in display. Refer "Frame Buffer Compression" section for more details related to FBC functionality and programming.

DWord	Bit	Description
0	31:16	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	15:0	**FBC RT Base Address Upper DWORD** Access: R/W Format: GraphicsAddress[47:32] _Custom_GTIReset: DEV Must be set to modify corresponding data bit. Reads to this field returns zero.Upper 4KB aligned Base Address as mapped in the PPGTT or in the GGTT for the render target. This base address must be the one that is either front buffer or the back-buffer (a flip target). It can be only programmed once per context. **Programming Notes** It must be programmed before any draw call binding that render target base address.

	25:22	**GT SUBSLICE DISABLE FUSE OVERRIDE** Access: R/W Lock _Custom_GTIReset: BUS SW GT SubSlice Disable Fuse Override Bits
	21:16	**GT SLICE ENABLE FUSE OVERRIDE** Default Value: 111111b Access: R/W Lock _Custom_GTIReset: BUS SW GT Slice Enable Fuse Override Bits
	15:5	**Reserved** Access: RO Format: MBZ
	4	**Reserved**
	3	**Reserved**

MFCR - Fence Control Register

	2	**Write/Read Port Block** Access: R/W _Custom_GTIReset: BUS 0 - Dont Block the R/W port when Query is started. 1 - Block the R/W port until the Memory Fence is completed. This is applicable for only Memory Fence.
	1	**LLC Query Enable** Access: R/W _Custom_GTIReset: BUS 0 - Query for 16 Ways. 1 - Query for 32 Ways. No Flexing.
	0	**Fence Controller GFDT Mode** Access: R/W _Custom_GTIReset: BUS Fence Controller GFDT Mode. 0 - Single bit GFDT mode. 1 - Two bit GFDT mode.

FF Performance

FF_PERF - FF Performance

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	06B1Ch
Name:	Render CS FF Performance
ShortName:	RCS_FF_PERF
Address:	17B1Ch
Name:	Position CS POSH Pipeline FF Performance
ShortName:	PCS_FF_PERF

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask _Custom_GTIReset: DEV Must be set to modify corresponding bit in Bits 15:0. (All implemented bits)
	15:11	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	10:8	**Throttle counter value** Access: R/W _Custom_GTIReset: DEV Counter value defining how many clocks the interface needs to be slowed down. Value: 0h — Name: **[Default]** — Description: Masked by default.
	7:3	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	2	**Enable throttling for SF-WM interface** Access: R/W _Custom_GTIReset: DEV

FF_PERF - FF Performance

Value	Name	Description
0h	Disable_2	No throttling
1h	Enable_2	Enable throttling in all SF-WM interfaces

Programming Notes
This field must not be programmed for SVGR unit.

1 **Enable throttling for SF-SBE interface**

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name	Description
0h	Disable_1	No throttling
1h	Enable_1	Enable throttling in all SF-SBE interfaces

Programming Notes
This field must not be programmed for SVGR unit.

0 **Enable throttling for CL-SF interface**

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name	Description
0h	Disable_0	No throttling
1h	Enable_0	Enable throttling in all CL-SF interfaces

Restriction
This bit must not be set. SW may choose to use SF-SBE throttle interface(bit 1) to achieve the same effect.

First MGSR read done

Address:	1F6DA4h-1F6DA7h
Name:	First MGSR read done
ShortName:	FIRST_MGSR_READ_DONE_VDENC_REG7
This register is used to enable wrap around cases in the current testbench. There is not good way to identify the delay that should be introduced in Primary.bfl file before the wrapped around value is written to MGSR register. RTL will write 1 to this register when the first value is read by ECP and reset at frame_flop_reset. This will indicate that the read has happened and the wrap around can happen. this is introduced, because in real life it should never happen that the tailptr value read by ECP is of the next frame before reading at least one tailptr value of this frame.	

DWord	Bit	Description

FIRST_MGSR_READ_DONE - First MGSR read done		
0	31:16	**mgsr_return_value_zero** Access: RO This field is cleared when a WL is submitted to VDENC and set if the tail pointer value received by VDENC is zero..
	15:8	**VDENC_End_of_frame_processed** Access: RO This field is cleared when a WL is submitted to VDENC and set after VDENC process entire frame.
	7:0	**First_MGSR_read_done** Access: RO This field is cleared when a WL is submitted to VDENC and set after reading first tail pointer from MGSR.

First VF Offset

FIRST_VF_OFFSET_0_2_0_PCI - First VF Offset		
Register Space: PCI: 0/2/0 Size (in bits): 16		
Address: 00334h		
Defines the offset of the function number from the PF to the first VF.		
DWord	**Bit**	**Description**
0	15:0	**FIRST VF OFFSET VALUE** Default Value: 0000000000000001b Access: RO _Custom_GTIReset: BUS Defines the routing ID offset of the first VF that is associated with the PF that contains this Capability structure. The first VFs 16-bit Routing ID is calculated by adding the contents of this field to the Routing ID of the PF containing this field ignoring any carry, using unsigned, 16-bit arithmetic. The value of this field is hardwired to 0001h.

DWord	Bit	Description
0	31	**PFET Control Lock** Access: R/W Lock _Custom_GTIReset: BUS 0 = Bits of Slice 0 PGFETCTL register are R/W 1 = All bits of Slice 0 PGFETCTL register are RO (including this lock bit) Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR.
	30:24	**Reserved** Access: RO Format: MBZ
	23	**Power Well Status** Access: RO _Custom_GTIReset: BUS 0 = Well is powered Down 1 = Well is powered up Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR.
	22	**Powergood timer error** Access: RO _Custom_GTIReset: BUS 0 = Well is powered Down 1 = Well is powered up Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR.
	21:19	**Delay from enabling secondary PFETs to power good.** Access: R/W Lock _Custom_GTIReset: BUS Delay from enabling secondary PFETs to power good 3'b000: 40ns 3'b001: 80ns 3'b010: 160ns

FIXSPCPFETCTL - FIX PGFET control register with lock

3'b011: 240ns
3'b100: 320ns
3'b101: 480ns
3'b110: 640ns
3'b111: 1280ns

Value	Name
101b	**[Default]**

18:16 **Strobe pulse period**

Default Value:	010b
Access:	R/W Lock
_Custom_GTIReset:	BUS

Time period b/w two adjacent strobes to the primary FETs
3'b000: 10ns (or 1 bclk)
3'b001: 20ns (or 2 bclk)
3'b010: 30ns (or 3 bclk)
3'b111: 80ns (or 8 bclk)

15:0 **PFET Ladder Step Sequence**

Default Value:	1111111111111111b
Access:	R/W Lock
_Custom_GTIReset:	BUS

PFET Ladder STEP sequence
The PFET ladder has 16 steps, each represented by its corresponding bit in pfetlddrstepseq[15:0]. If the bit location is set, it means we must step on that ladder stage before we go to the next stage.
The SPC controller will step through all the steps with asserted bits periodically with period equal to strbpulsprd[2:0]
Programming Rule: pfetldrstepseq[15] and pfetldrstepseq[0] must be '1; A '0 setting for these bits is illegal.
15'FFFFh: Ladder step (ladder_sel) goes 0, 1, 2, ?.15.
15'FFF1h: Ladder step goes 0, 4, 5, 6,?15; Steps 1, 2, 3 are skipped.
15'D555h: Ladder step goes 0, 2, 4, 6, 8, 10, 12, 14, 15; Steps 1, 3, 5, 7, 9, 11, 13 are skipped.
15'80001h: Ladder step goes 0, 15; Steps 1, 2, 3, 4, ?14 are skipped.

Fix Power Context Save request

FIXPGCTXREQ - Fix Power Context Save request

FIX Power on FSM control register with lock

FIXSPCPOWERUPFSMCTL - FIX Power on FSM control register with lock

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	2430Ch

DWord	Bit	Description
0	31	**power up control Lock** Access: R/W Lock _Custom_GTIReset: BUS 0 = Bits of Slice 0 POWERUPFSMCTL register are R/W 1 = All bits of Slice 0 POWERUPFSMCTL register are RO (including this lock bit) Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR.
	30:9	**Reserved** Access: RO Format: MBZ
	8:6	**Power UP state 3** Default Value: 010b Access: R/W Lock _Custom_GTIReset: BUS This will be the 3rd state after power is turned ON in the well Encodings: 000 = Clock Ungate 001 = Firewall OFF 010 = De-assert resets 1xx = Rsvd for future Default - De-assert resets 3'b000: 10ns (or 1 bclk)
	5:3	**Power UP state 2** Default Value: 001b Access: R/W Lock _Custom_GTIReset: BUS This will be the 2nd state after power is turned ON in the well Encodings: 000 = Clock Ungate 001 = Firewall OFF

FIXSPCPOWERUPFSMCTL - FIX Power on FSM control register with lock

		010 = De-assert resets 1xx = Rsvd for future Default - Firewall OFF
	2:0	**Power UP state 1** Default Value: 000b Access: R/W Lock _Custom_GTIReset: BUS This will be the 1st state after power is turned ON in the well Encodings: 000 = Clock Ungate 001 = Firewall OFF 010 = De-assert resets 1xx = Rsvd for future Default - Clock Ungate

These registers are privilege registers and are not allowed to be written from non-privilege batch buffer. These are global registers and power context save/restored.

Workaround

This register must be programmed as non-privileged to give PPGTT batch buffer access: 3DPRIM_XP0(0x2690), 3DPRIM_XP1(0x2694) and 3DPRIM_XP2(0x2698).

DWord	Bit	Description
0	31	**Virtual Function Privilege Control** Value / Name / Description 0 / **Default]** / MMIO offset programmed in Non Privileged Register Address field will be treated as a non-privilege register by the commands executed from a non-privilege batch buffer. This register provides programmability to add new entries to the User Mode Non-Privileged Registers table mentioned in User Mode Privileged Commands section. 1 / / MMIO offset programmed in Non Privileged Register Address field will be treated as a non-privilege register by the commands executed from a privilege batch buffer or ring buffer of an virtual function. Not that this will not make the register offset as non-privileged for the commands executed from non-privileged batch buffer.
	30	**Denylist Enable**

FORCE_TO_NONPRIV - FORCE_TO_NONPRIV

If this bit is set, then the command stream will not allow access for a PPGTT batch buffer to this register or range. This takes the highest precedence so in the case the register is allow listed in a separate FORCE_TO_NONPRIV register, it will still be deny listed.

Value	Name
0	Allowlist **[Default]**
1	Denylist

29:28 **Access Selection**

This field allows the selection of whether read or write access are impacted. This allows for any permutation to deny list or allow list any combination of reads/writes. For Example, if Deny list Enable is set and the Access if for Reads only, then only Read access will be disallowed based on the Address in this register.

Value	Name
0h	Impacts both Read and Write Access **[Default]**
1h	Impacts only Read Access
2h	Impacts only Write Access
3h	Reserved

27:26 **Reserved**

Access:	RO
Format:	MBZ

25:2 **Non Privilege Register Address**

Format:	MmioAddress[25:2]

This field contains the MMIO offset of a register. MMIO offset programmed in this field will be treated as a non-privilege register by render command streamer while processing register writes from a non-privilege batch buffer. This register provides programmability is to extend the non-privilege register table mentioned in MI_BATCH_BUFFER_START command in render command streamer.

Value	Name
3800h	**[Default]**

1:0 **Offset Range**

This field specifies the range of registers to either be deny listed or allow listed. Note the Non-Privilege Register Address value should be at the same granularity of the Offset Range. The lower bits of the address will be ignored in the comparison as the definition only support base 2 address for range comparison.

Value	Name	Description
0h	Single Register **[Default]**	Offset for allowlist or denylist compare will be 25:2.
1h	Four Registers	Offset for allowlist or denylist compare will be 25:4.
2h	Sixteen Registers	Offset for allowlist or denylist compare will be 25:6.
3h	Sixty Four Registers	Offset for allowlist or denylist compare will be 25:8.

FUSE_STATUS

FUSE_STATUS

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	42000h-42003h
Name:	Fuse Status
ShortName:	FUSE_STATUS
Reset:	global

This register is on the ungated clock and the chip reset, not the FLR.

DWord	Bit	Description
0	31	**Fuse Download Status** Access: RO This field indicates the status of fuse and strap download to the Display Engine. After fuse and strap download, fuses will be distributed within the Display Engine. Value: 0b – Not Done Value: 1b – Done

GAMMA_MODE

GAMMA_MODE

Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank

Address:	4A480h-4A483h
Name:	Pipe Gamma Mode
ShortName:	GAMMA_MODE_A
Reset:	soft

Address:	4AC80h-4AC83h
Name:	Pipe Gamma Mode
ShortName:	GAMMA_MODE_B
Reset:	soft

Address:	4B480h-4B483h
Name:	Pipe Gamma Mode
ShortName:	GAMMA_MODE_C
Reset:	soft

Address:	4BC80h-4BC83h
Name:	Pipe Gamma Mode
ShortName:	GAMMA_MODE_D
Reset:	soft

DWord	Bit	Description
0	31	**Pre CSC Gamma Enable** This bit enables the pipe pre color space conversion gamma. Restriction : This bit must not be set when any of the individual plane 'Pipe CSC Enable' bit is set in PLANE_COLOR_CTL register. Value / Name: 1b – Enable 0b – Disable
	30	**Post CSC Gamma Enable** This bit enables the pipe post color space conversion gamma. Restriction : This bit must not be set when any of the individual plane 'Pipe Gamma Enable' bit is set in PLANE_COLOR_CTL register.

GAMMA_MODE

Value	Name
1b	Enable
0b	Disable

29	**Allow Double Buffer Update Disable**
	Access: R/W
	This field controls whether double buffer updates are allowed to be disabled for the Gamma registers that are double buffered. The DOUBLE_BUFFER_CTL register can be configured to globally disable double buffer updates for those resources that allow them to be disabled.

Value	Name
0b	Not Allowed
1b	Allowed **[Default]**

28:25	**Reserved**
	Access: RO
	Format: MBZ
24:16	**Reserved**
	Access: RO
	Format: MBZ
15	**Reserved**
14:5	**Reserved**
	Access: RO
	Format: MBZ
4:3	**Reserved**
	Access: RO
	Format: MBZ
2	**Reserved**
	Access: RO
	Format: MBZ
1:0	**Gamma Mode**
	This field selects which mode the pipe palette/gamma correction logic works in. Other gamma units, such as in the planes, are unaffected by these bits.
	This field applies to post csc gamma. Pre csc gamma mode is fixed and not configurable.

Value	Name	Description
00b	8 bit	8-bit Legacy Palette Mode
01b	10 bit	10-bit Precision Palette Mode
10b	12 bit	12-bit Interpolated Gamma Mode
11b	12 bit Multi Segment	12-bit Multi-segmented Gamma Mode

Gang Timer Register

FF_MODE2 - Gang Timer Register	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	06604h-06607h
Name:	Ganged Timer Register
ShortName:	FF_MODE2_SVGUNIT
Address:	17604h-17607h
Name:	Ganged Timer Register
ShortName:	FF_MODE2_SVGRUNIT

This register is used to program the FF shader timers.

DWord	Bit	Description
0	31:24	**GS timer value** Format: U8 The GS timer value will be a multiple of 32 clocks. The GS timer value of 0 disables the GS timer. If the number of clocks between ganged threads reaches the GS timer value, the GS will dispatch however many threads it currently has ganged.
	23:16	**TDS timer value** Format: U8 The TDS timer value will be a multiple of 32 clocks. The TDS timer value of 0 disables the TDS timer. If the number of clocks between ganged threads reaches the TDS timer value, the TDS will dispatch however many threads it currently has ganged. **Programming Notes** For best performance, a value of 4 should be programmed.
	15:8	**HS timer value** Format: U8 The HS timer value will be a multiple of 32 clocks. The HS timer value of 0 disables the HS timer. If the number of clocks between ganged threads reaches the HS timer value, the HS will dispatch however many threads it currently has ganged.

FF_MODE2 - Gang Timer Register		
	7:0	**VS timer value** Format: U8 The VS timer value will be a multiple of 32 clocks. The VS timer value of 0 disables the VS timer. If the number of clocks between ganged threads reaches the VS timer value, the VS will dispatch however many threads it currently has ganged.

Gated Clock Counter for DFR Testability

SAMPLER_DFR_GATED_COUNT - Gated Clock Counter for DFR Testability

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0E14Ch

For testability of DFR feature

DWord	Bit	Description
0	31:0	**Counter Bits** Format: U32 Count of edge-skipped sampler clocks

General Purpose Register

CS_GPR - General Purpose Register	
Register Space:	MMIO: 0/2/0

GFX_FLSH_CNT

GFX_FLSH_CNT - GFX_FLSH_CNT

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	101008h

Used to flush Gunit TLB

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**GfxFlshCntl** Default Value: 0b Access: WO _Custom_GTIReset: BUS Access type of this register is WO. A write to this bit flushes the Gfx TLB in GUNIT. The data associated with the write is discarded and a read return all 0s.

GFX_VTDBAR_LSB

GFXVTDBAR_LSB_0_2_0_PCI - GFX_VTDBAR_LSB

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	000C8h

This is the base address for the Graphics VTD configuration space. There is no physical memory within this 4KB window that can be addressed. The 4KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. On reset, the GFX-VTD configuration space is disabled and must be enabled by writing a 1 to GFXVTDBAREN.
None of the bits in this register are writeable in Intel TXT mode. This enforcement is based on SAI policy registers.
BIOS programs this register, after which the register cannot be altered.

DWord	Bit	Description
0	31:12	**GFXVTDBAR** Default Value: 000000h Access: R/W _Custom_GTIReset: BUS This field corresponds to bits 31 to 12 of the base address GFX-VTD configuration space. BIOS will program this register resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the GFX-VTD register set. All the Bits in this register are included in an SAI policy group for Intel TXT mode purposes.
	11:2	**Reserved** Access: RO Format: MBZ
	1	**SPARE** Default Value: 000h Access: R/W _Custom_GTIReset: BUS This was a lock bit prior.
	0	**GFXVTDBAREN** Default Value: 0b Access: R/W _Custom_GTIReset: BUS 0: GFX-VTBAR is disabled and does not claim any memory. 1: GFX-VTBAR memory mapped accesses are claimed and decoded appropriately This bit will remain 0 if VTd capability is disabled.

GFXBDF

GFXBDF - GFXBDF

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	10107Ch

If the associated hardware strap is enabled, hardware will update this register based on the received IOSF P Bus / Device value from Type 0 configuration cycles (per PCIe spec). Also hardware will be updating this register, Punit needs the ability to save/restore the register contents for relevant PKGC state flows and/or S0i3 flows. Therefore, this register will be a RW-able by software and write-able by hardware.

DWord	Bit	Description
0	31:24	**BUS** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS This field specifies the PCI bus number of theGfx device.
	23:19	**DEVICE** Access: R/W _Custom_GTIReset: BUS This field specifies the PCI device number of theGfx device. Value: 00010b — Name: **[Default]**
	18:16	**FUNCTION** Default Value: 000b Access: RO _Custom_GTIReset: BUS This field specifies the PCI function number of theGfx device.
	15:1	**Reserved** Access: RO Format: MBZ
	0	**HWUPDATEDISABLE** Default Value: 0b Access: R/W _Custom_GTIReset: BUS 0 : Hardware updates Bus/Device value based on received Type 0 configuration cycles. 1 : Disable hardware updates based on received hardware cycles (even if strapped to allow updates).

GGTT Pinned Range Base Register

GGTT_PINNED_BASE - GGTT Pinned Range Base Register

Register Space: MMIO: 0/2/0

Size (in bits): 32

GGTT Pinned Range Base register

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ
	19:0	**Pinned Range Base** Default Value: 00000h Access: R/W _Custom_GTIReset: DEV GGTT Entry that represents the base of the Pinned Range. This corresponds to bits 31:12 of the Global Virtual address of the memory page that corresponds to that entry. This register is a shadow of the primary register in Gunit, and is updated automatically by Gunit HW via IOSF-SB.

GGTT Pinned Range Limit Register

GGTT_PINNED_LIMIT - GGTT Pinned Range Limit Register

Register Space: MMIO: 0/2/0

Size (in bits): 32

GGTT Pinned Range Limit register

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ
	19:0	**Pinned Range Limit** Default Value: 00000h Access: R/W _Custom_GTIReset: DEV GGTT Entry that represents the limit(last entry) of the Pinned Range. This corresponds to bits 31:12 of the Global Virtual address of the memory page that corresponds to that entry. This register is a shadow of the primary register in Gunit, and is updated automatically by Gunit HW via IOSF-SB.

Global MicroController Status

GUC_STATUS - Global MicroController Status

Register Space: MMIO: 0/2/0
Access: RO
Size (in bits): 32

Programming Notes
This register is saved in the power context.
Only write by MinuteIA is allowed to this register.
Host writes to this register have no effect (they are dropped).

DWord	Bit	Description
0	31:30	**Authentication Status** BootROM code shall write a 1 to bit 31, if the uOS was authenticated successfully. BootROM code shall write a 1 to bit 30, if the uOS authentication failed. **Value / Name / Description** 1h / Fail / The uOS authentication failed. 2h / Success / The uOS was authenticated successfully. **Programming Notes** Set Once Bits (Once written, they cannot be overwritten) If bit 30 is set, DMA HW will skip trying to load a uOS into the SRAM thereby preventing the MinuteIA from execution.
	29:24	**uApp Status** This field is software-defined.
	23:16	**Reserved**
	15:8	**uKernel/uOS Status** This field is software-defined.
	7:1	**Boot ROM Code Status** This field is software-defined.
	0	**MinIA Is In Reset** '1' indicates that MinIA is in reset.

Global System Interrupt Routine

EU_GLOBAL_SIP - Global System Interrupt Routine		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	DEV	
Address:	0E42Ch	

DWord	Bit	Description
0	31:3	**Global SIP** Format: GraphicsAddress[31:3] Specifies the base address for System Interrupt Routine that over-rides the SIP set by the state (STATE_SIP).
	2:1	**Reserved** Format: PBC
	0	**Global SIP Enable** The bit specifies if the System Routine starts from the Global SIP provided by the DW OR the SIP provided by the state (STATE_SIP) Value: 0 — SIP used is from STATE_EIP Value: 1 — SIP used is from MMIO register

GMCH Graphics Control

GGC - GMCH Graphics Control

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	108040h

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:8	**GMS** Default Value: 05h Access: R/W _Custom_GTIReset: BUS This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics device in VGA (non-linear) and Native (linear) modes. It corresponds to DSM (Data Stolen Memory region) region. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD (bit 1 of this register) is 0. BIOS Requirement: Given new sizes allow down to 8MB allocation, BIOS has to ensure there is sufficient space for WOPCM and basic GFX Stolen functions. 00h:0MB 01h:32MB 02h:64MB 03h:96MB 04h:128MB 05h:160MB 06h:192MB 07h:224MB 08h:256MB 09h:288MB 0Ah:320MB 0Bh:352MB 0Ch:384MB 0Dh:416MB 0Eh:448MB 0Fh:480MB 10h:512MB 11h - 1Fh: Reserved 20h:1024MB

Access:	RO
Format:	MBZ

2 **VAMEN**

Default Value:	0b
Access:	R/W
_Custom_GTIReset:	BUS

GGC - GMCH Graphics Control

	1	**IVD** Default Value: 0b Access: R/W _Custom_GTIReset: BUS 0: Enable. Device 2 (IGD) claims VGA memory and IO cycles, the Sub-Class Code within Device 2 Class Code register is 00. 1: Disable. Device 2 (IGD) does not claim VGA cycles (Mem and IO), and the Sub- Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field (bits 7:3 of this register) pre-allocates no memory.
	0	**SPARE** Default Value: 0b Access: R/W _Custom_GTIReset: BUS Note: This bit was maintained as a placeholder for compatibility. Prior, it locked the register.

GPGPU Dispatch Dimension X

GPGPU_DISPATCHDIMX - GPGPU Dispatch Dimension X

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	02500h-02503h
Name:	GPGPU Dispatch Dimension X
ShortName:	GPGPU_DISPATCHDIMX_RCSUNIT_BE_COMPUTE

Address:	1A500h-1A503h
Name:	GPGPU Dispatch Dimension X
ShortName:	GPGPU_DISPATCHDIMX_CCSUNIT_BE_COMPUTE0

DWord	Bit	Description
0	31:0	**Dispatch Dimension X** Format: U32 The number of thread groups to be dispatched in the X dimension (max x + 1). Value: 0, FFFFFFFFh; Name:

GPGPU Dispatch Dimension Y

GPGPU_DISPATCHDIMY - GPGPU Dispatch Dimension Y

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	02504h-02507h
Name:	GPGPU Dispatch Dimension Y
ShortName:	GPGPU_DISPATCHDIMY_RCSUNIT_BE_COMPUTE

Address:	1A504h-1A507h
Name:	GPGPU Dispatch Dimension Y
ShortName:	GPGPU_DISPATCHDIMY_CCSUNIT_BE_COMPUTE0

DWord	Bit	Description
0	31:0	**Dispatch Dimension Y** Format: U32 The number of thread groups to be dispatched in the Y dimension (max y + 1 Value: 0, FFFFFFFFh; Name:

GPGPU Dispatch Dimension Z

GPGPU_DISPATCHDIMZ - GPGPU Dispatch Dimension Z	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02508h-0250Bh
Name:	GPGPU Dispatch Dimension Z
ShortName:	GPGPU_DISPATCHDIMZ_RCSUNIT_BE_COMPUTE
Address:	1A508h-1A50Bh
Name:	GPGPU Dispatch Dimension Z
ShortName:	GPGPU_DISPATCHDIMZ_CCSUNIT_BE_COMPUTE0

DWord	Bit	Description
0	31:0	**Dispatch Dimension Z** Format: U32 The number of thread groups to be dispatched in the Zdimension (max Z + 1) Value: 0, FFFFFFFFh; Name:

GP Thread Time

GP_THREAD_TIME - GP Thread Time	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	053C4h

Reading this register returns the cumulative GP context execution time. This register uses the same clock frequency as CTX_TIMESTAMP, but differs from CTX_TIMESTAMP because it excludes the execution time during preemption save or restore. This register gets context save/restored on a context switch.
The granularity of this toggle is at the rate of the bit 3 in the "Reported Timestamp Count" register(0x2358). The toggle will be 8 times slower that "Reported Timestamp Count". The granularity of the time stamp base unit for "Reported Timestamp Count" is defined in the Timestamp Bases subsection in Power Management chapter.

DWord	Bit	Description
0	31:0	**Timestamp Value** Access: RO Number of clock ticks that the context has run.

Graphics Device Reset Control

GDRST - Graphics Device Reset Control

Graphics Device Reset Control Registers

DWord	Bit	Description
0	31:24	**Reserved**
	23:22	**Reserved**
	21	**Reserved**
	20	**Initiate Graphics SFC3 soft reset** Access: R/W Set _Custom_GTIReset: BUS Graphics SFC 3 Soft-Reset Control: '1' : Initiate a graphics SFC1 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP hardware can reset this bit. Note: This is a non-posted register.
	19	**Initiate Graphics SFC2 soft reset** Access: R/W Set _Custom_GTIReset: BUS Graphics SFC 1 Soft-Reset Control: '1' : Initiate a graphics SFC1 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP hardware can reset this bit. Note: This is a non-posted register.
	18	**Initiate Graphics SFC1 soft reset** Access: R/W Set _Custom_GTIReset: BUS Graphics SFC 1 Soft-Reset Control: '1' : Initiate a graphics SFC1 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP hardware can reset this bit. Note: This is a non-posted register.

GDRST - Graphics Device Reset Control

	17	**Initiate Graphics SFC0 soft reset** Access: R/W Set _Custom_GTIReset: BUS Graphics SFC 0 Soft-Reset Control: '1' : Initiate a graphics SFC0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP hardware can reset this bit. Note: This is a non-posted register.
	16	**Initiate Graphics Vebox3 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics VEbox Soft-Reset Control: '1' : Initiate a graphics Vebox domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	15	**Initiate Graphics Vebox2 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics VEbox Soft-Reset Control: '1' : Initiate a graphics Vebox domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	14	**Initiate Graphics Vebox1 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics VEbox Soft-Reset Control: '1' : Initiate a graphics Vebox domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	13	**Initiate Graphics Vebox0 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics VEbox Soft-Reset Control: '1' : Initiate a graphics Vebox domain reset. - Cleared by CP once the reset is complete

		'0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	12	**Initiate Graphics Media 7 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics Media Soft-Reset Control: '1' : Initiate a graphics media 0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	11	**Initiate Graphics Media 6 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics Media Soft-Reset Control: '1' : Initiate a graphics media 0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	10	**Initiate Graphics Media 5 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics Media Soft-Reset Control: '1' : Initiate a graphics media 0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	9	**Initiate Graphics Media 4 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics Media Soft-Reset Control: '1' : Initiate a graphics media 0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	8	**Initiate Graphics Media 3 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS

GDRST - Graphics Device Reset Control

		Graphics Media Soft-Reset Control: '1' : Initiate a graphics media 0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	7	**Initiate Graphics Media 2 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics Media Soft-Reset Control: '1' : Initiate a graphics media 0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	6	**Initiate Graphics Media 1 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics Media Soft-Reset Control: '1' : Initiate a graphics media 0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	5	**Initiate Graphics Media 0 Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics Media Soft-Reset Control: '1' : Initiate a graphics media 0 domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	4	**Reserved** Access: RO Format: MBZ
	3	**Initiate Graphics GUC soft reset** Access: R/W Set _Custom_GTIReset: BUS Graphics GUC Soft-Reset Control: '1' : Initiate a graphics GUC domain reset(cgucrst_b). - Cleared by CP once the reset is complete

GDRST - Graphics Device Reset Control

		'0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	2	**Initiate Graphics Blitter Soft Reset** Access: R/W Set _Custom_GTIReset: BUS **Description** Graphics Blitter Soft-Reset Control: '1' : Initiate a graphics blitter domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.
	1	**Initiate Graphics Render Soft Reset** Access: R/W Set _Custom_GTIReset: BUS **Description** Graphics Render Soft-Reset Control: '1' : Initiate a graphics render domain reset. - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register. Note that both RenderEngine (hedaed by RenderCS) and ComputeEngine (headed by ComputeCS) are in Graphics Render Reset domain.
	0	**Initiate Graphics Full Soft Reset** Access: R/W Set _Custom_GTIReset: BUS Graphics Full Soft-Reset Control: '1' : Initiate a full graphics reset (i.e., graphics render, media, and blitter reset). - Cleared by CP once the reset is complete '0' : N/A - Once set, clearing of this bit has no effect on CP. Only CP can reset this bit. Note: This is a non-posted register.

Graphics Memory Range Address

GMADR_0_2_0_PCI - Graphics Memory Range Address

Register Space:	PCI: 0/2/0
Size (in bits):	64
Address:	00018h

GMADR is the PCI aperture used by S/W to access tiled GFX surfaces in a linear fashion.

DWord	Bit	Description
0	63:32	**Memory Base Address** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS Set by the OS, these bits correspond to address signals [63:32].
	31	**4096 MB Address Mask** Default Value: 0b Access: R/W Lock _Custom_GTIReset: BUS This bit is either part of the Memory Base Address (R/W) or part of Address Mask (RO) depending on the value of MSAC.APSZ.RO and forced to 0 when MSAC.APSZ >= 4096MB. (i.e. MSAC.APSZ[4]=1)
	30	**2048 MB Address Mask** Default Value: 0b Access: R/W Lock _Custom_GTIReset: BUS This bit is either part of the Memory Base Address (R/W) or part of the Address Mask (RO) depending on the value of MSAC.APSZ.RO and forced to 0 when MSAC.APSZ >= 2048MB. (i.e. MSAC.APSZ[3]=1)
	29	**1024 MB Address Mask** Default Value: 0b Access: R/W Lock _Custom_GTIReset: BUS This bit is either part of the Memory Base Address (R/W) or part of the Address Mask (RO) depending on the value of MSAC.APSZ.RO and forced to 0 when MSAC.APSZ >= 1024MB. (i.e. MSAC.APSZ[2]=1)
	28	**512MB Address Mask** Default Value: 0b Access: R/W Lock _Custom_GTIReset: BUS This bit is either part of the Memory Base Address (R/W) or part of the Address Mask (RO) depending on the value of MSAC.APSZ.RO and forced to 0 when MSAC.APSZ >= 512MB. (i.e.

GMADR_0_2_0_PCI - Graphics Memory Range Address

		MSAC.APSZ[1]=1)
	27	**256 MB Address Mask** Default Value: 0b Access: R/W Lock _Custom_GTIReset: BUS This bit is either part of the Memory Base Address (R/W) or part of the Address Mask (RO) depending on the value of MSAC.APSZ.RO and forced to 0 when MSAC.APSZ >= 256MB. (i.e. MSAC.APSZ[0]=1)
	26:4	**Address Mask** Default Value: 00000000000000000000000b Access: RO _Custom_GTIReset: BUS Hardwired to 0s to indicate at least 128MB address range.
	3	**Prefetchable Memory** Default Value: 1b Access: RO _Custom_GTIReset: BUS Hardwired to 1 to enable prefetching.
	2:1	**Memory Type** Default Value: 10b Access: RO _Custom_GTIReset: BUS Hardwired to 2h to indicate 64 bit base address.
	0	**Memory/IO Space** Default Value: 0b Access: RO _Custom_GTIReset: BUS Hardwired to 0 to indicate memory space.

Graphics Mode Register

GFX_MODE - Graphics Mode Register	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0229Ch-0229Fh
Name:	Graphics Mode Register
ShortName:	GFX_MODE_RCSUNIT
Address:	1829Ch-1829Fh
Name:	Graphics Mode Register

GFX_MODE - Graphics Mode Register

Address:	1E429Ch-1E429Fh
Name:	Graphics Mode Register
ShortName:	GFX_MODE_VCSUNIT5

Address:	1E829Ch-1E829Fh
Name:	Graphics Mode Register
ShortName:	GFX_MODE_VECSUNIT2

Address:	1F029Ch-1F029Fh
Name:	Graphics Mode Register
ShortName:	GFX_MODE_VCSUNIT6

Address:	1F429Ch-1F429Fh
Name:	Graphics Mode Register
ShortName:	GFX_MODE_VCSUNIT7

Address:	1F829Ch-1F829Fh
Name:	Graphics Mode Register
ShortName:	GFX_MODE_VECSUNIT3

Address:	1A29Ch-1A29Fh
Name:	Graphics Mode Register
ShortName:	GFX_MODE_CCSUNIT0

This register contains a control bit for the new execlist and 2-level PPGTT functions.

Programming Notes

"Privilege Check Disable" are the only programmable bits in GFX_MODE register for PositionCS, functionality for the rest of the bits is not supported by Position command streamer.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask Must be set to modify corresponding bit in Bits 15:0. (All implemented bits)
	15	**Reserved** Format: PBC
	14	**Reserved** Format: PBC
	13	**Reserved** Format: PBC
	12	**Reserved**

12 **Reserved**

Source:	RenderCS, BlitterCS, ComputeCS
Format:	PBC

11 **Virtual Function MMIO Read Access Control**

This bit controls the disabling and enabling of MMIO read access of an virtual function context running on an engine.

Value	Name	Description
1		A VF context running on an engine can do MMIO read access to other engines. Ex: VF context running on RenderCS can do MMIO read access to VideoCS.
0	**Default]**	A VF context running on an engine cant do MMIO read access to other engines. Ex: VF context running on RenderCS can't do MMIO read access to VideoCS.

10 **Prefetch Disable**

This field allows software to enable or disable pre-fetch mechanism for command buffers in hardware.

Value	Name	Description
0	**[Default]**	When reset pre-fetch of command buffers is enabled in hardware. However software can enable/disable pre-fetch functionality locally from within a command sequence using MI_ARB_CHK command on per context basis.
1		When set pre-fetch of command buffers is disabled in hardware.

9 **Per-Process GTT Enable**

Per-Process GTT Enable

Value	Name	Description
0h	PPGTT Disable **[Default]**	When clear, the Global GTT will be used to translate memory access from designated commands and for commands that select the PPGTT as their translation space.
1h	PPGTT Enable	When set, the PPGTT will be used to translate memory access from designated commands and for commands that select the PPGTT as their translation space.

Programming Notes

This bit is used for enabling PPGTT access in Ring Buffer mode of scheduling. Privilege field in context descriptor states the same in Execlist Mode of scheduling. This field should be set before programming PDP0/1/2/3 registers in order to set the PPGTT translation of memory access.
Programming this bit doesn't enable or disable the PPGTT translation of memory access immediately; the change comes in to affect only when the Page Directory registers are programmed. Programming this bit must be followed by programming Page Directory Registers in order to enable or disable the PPGTT translation of memory access.

GFX_MODE - Graphics Mode Register

8 — Reserved

Source:	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS
Format:	PBC

8 — Reserved

7 — 64Bit Virtual Addressing Enable

64Bit Virtual Addressing Enable

Value	Name	Description
0h	64Bit Virtual Addressing Disable **[Default]**	When clear indicates GFX operating in 32bit Virtual Addressing for PPGTT based memory access.
1h	64Bit Virtual Addressing Enable	When Set indicates GFX operating in 64bit (48bit Canonical) Virtual Addressing for PPGTT based memory access.

Programming Notes

This bit is only valid when PPGTT is enabled in ring buffer mode of scheduling. Context Descriptor has a similar bit to control 64bit virtual addressing in execlist mode of scheduling. Whether this field is set or clear virtual addresses translated through GGTT are always 32Bit. This field should be programmed before enabling PPGTT access. When this field is not set or for GGTT virtual addresses, Graphics Address [47:32] field of any commands or register exercised by SW should be programmed to 0x0.

6:5 — Reserved

4 — Reserved

3 — Disable Legacy Mode

This bit must be set to disable Legacy behavior to support features added for the current project.

When set the size of the CSB status FIFO is 12 deep.

Value	Name	Description
0h	Enable Legacy **[Default]**	Any features using this bit will be compatible with legacy drivers.
1h	Disable Legacy	HW will not be compatible with legacy drivers.

Programming Notes

A graphics reset is required prior to changing the value of this bit.

2 — Reserved

Format:	PBC

1 — MMIO Read Privilege Check Disable

Format:	Enable

This field when set, disables MMIO Read Privilege Violation checks on non-privileged batch buffers. When set Privileged MMIO read requests are allowed to be executed from non-privileged batch buffers.

GFX_MODE - Graphics Mode Register		
	0	**Privilege Check Disable** This field when set, disables Privilege Violation checks on non-privileged batch buffers. When set Privileged commands are allowed to be executed from non-privileged batch buffers.

Graphics Primary Interrupt

GFX_MSTR_INTR - Graphics Primary Interrupt

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 190010h

Top level register that indicates interrupt from hardware.
Bits in this register are set interrupts are pending in the underlying PCU, display or GT interrupts

DWord	Bit	Description
0	31	**Primary Interrupt** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This is the primary control for graphics interrupts. This must be enabled for any of these interrupts to propagate to PCI device interrupt .
	30	**PCU** Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS
	29	**GU_MISC** Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS
	28:26	**Reserved** Access: RO Format: MBZ
	25:17	**Reserved** Access: RO Format: MBZ
	16	**Display** Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS
	15:2	**Reserved** Access: RO Format: MBZ

GFX_MSTR_INTR - Graphics Primary Interrupt

	1	**GT DW1**
		Default Value: 0b
		Access: RO Variant
		_Custom_GTIReset: BUS
	0	**GT DW0**
		Default Value: 0b
		Access: RO Variant
		_Custom_GTIReset: BUS

Graphics System Event

GSE_0_2_0_PCI - Graphics System Event		
Register Space:	PCI: 0/2/0	
Size (in bits):	32	
Address:	000E4h	
This register can be accessed by either Byte, Word, or Dword PCI config cycles. A write to this register will cause the Graphics System Event display interrupt if it is enabled and unmasked in the display interrupt registers.		
DWord	**Bit**	**Description**
0	31:24	**GSE Scratch Trigger 3** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS
	23:16	**GSE Scratch Trigger 2** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS
	15:8	**GSE Scratch Trigger 1** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS
	7:0	**GSE Scratch Trigger 0** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS

Graphics Translation Table Memory Mapped Range Address

GTTMMADR_0_2_0_PCI - Graphics Translation Table Memory Mapped Range Address

Register Space:	PCI: 0/2/0
Size (in bits):	64
Address:	00010h

This register requests allocation for the combined Graphics Translation Table Modification Range and Memory Mapped Range. The range requires 16 MB combined for MMIO and Global GTT aperture, with 2MB of that used by MMIO, 6MB reserved, and 8MB used by GTT. GTTADR will begin at (GTTMMADR + 8 MB) while the MMIO base address will be the same as GTTMMADR. The region between (GTTMMADR + 2MB) - (GTTMMADR + 8MB) is reserved. For the Global GTT, this range is defined as a memory BAR in graphics device config space. It is an alias into which software is required to write Page Table Entry values (PTEs). Software may read PTE values from the global Graphics Translation Table (GTT). PTEs cannot be written directly into the global GTT memory area. The device snoops writes to this region in order to invalidate any cached translations within the various TLB's implemented on-chip. The allocation is for 16MB and the base address is defined by bits [38:24].

DWord	Bit	Description
0	63:24	**Memory Base Address** Default Value: 0000000000h Access: R/W _Custom_GTIReset: BUS Set by the OS, these bits correspond to address signals [63:24].
	23:4	**Address Mask** Default Value: 00000000000000000000b Access: RO _Custom_GTIReset: BUS Hardwired to 0s to indicate at least 16MB address range.
	3	**Prefetchable Memory** Default Value: 0b Access: RO _Custom_GTIReset: BUS Hardwired to 0 to prevent prefetching.
	2:1	**Memory Type** Default Value: 10b Access: RO _Custom_GTIReset: BUS Hardwired to 2h to indicate 64 bit base address.

GTTMMADR_0_2_0_PCI - Graphics Translation Table Memory Mapped Range Address

	0	**Memory/IO Space** Default Value: 0b Access: RO _Custom_GTIReset: BUS Hardwired to 0 to indicate memory space.

Graphics Virtual Primary Interrupt

GFX_VIRT_MSTR_INTR - Graphics Virtual Primary Interrupt

Register Space:	MMIO: 0/2/0
Size (in bits):	32

Address:	191010h
Name:	VF1_GFX_MSTR_INTR
ShortName:	VF1_GFX_MSTR_INTR

Address:	192010h
Name:	VF2_GFX_MSTR_INTR
ShortName:	VF2_GFX_MSTR_INTR

Address:	193010h
Name:	VF3_GFX_MSTR_INTR
ShortName:	VF3_GFX_MSTR_INTR

Address:	194010h
Name:	VF4_GFX_MSTR_INTR
ShortName:	VF4_GFX_MSTR_INTR

Address:	195010h
Name:	VF5_GFX_MSTR_INTR
ShortName:	VF5_GFX_MSTR_INTR

Address:	196010h
Name:	VF6_GFX_MSTR_INTR
ShortName:	VF6_GFX_MSTR_INTR

Address:	197010h
Name:	VF7_GFX_MSTR_INTR
ShortName:	VF7_GFX_MSTR_INTR

Top level register that indicates interrupt from hardware.
Bits in this register are set interrupts are pending in the underlying PCU, display or GT interrupts

DWord	Bit	Description
0	31	**Primary Interrupt** Access: R/W
	30	**PCU** Access: RO

GSCPowerGoodDelay

GSC_PG_DLY - GSCPowerGoodDelay		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
IA/Context savable by MGSR/punit		
DWord	**Bit**	**Description**
0	31:16	**Power Good Delay** Default Value: 00C8h PWRGOOD_DLY Value
	15:0	**RAMP Delay** Default Value: 00C8h RAMP_DLY Value

GS Invocation Counter

GS_INVOCATION_COUNT - GS Invocation Counter	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02328h
Name:	GS Invocation Counter
ShortName:	GS_INVOCATION_COUNT

This register stores the number of objects that are part of geometry shader threads. This register is part of the context save and restore.

DWord	Bit	Description
0	63:32	**GS Invocation Count UDW** Number of objects that are dispatched as a geometry shader threads invoked by the GS stage. Updated only when **Statistics Enable** is set in GS_STATE (see the Geometry Shader Chapter in the 3D Volume.)
	31:0	**GS Invocation Count LDW** Number of objects that are dispatched as a geometry shader threads invoked by the GS stage. Updated only when **Statistics Enable** is set in GS_STATE (see the Geometry Shader Chapter in the 3D Volume.)

GSI Power Good Delay

GSI_PG_DLY - GSI Power Good Delay		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
IA/Context savable by MGSR/punit		
DWord	**Bit**	**Description**
0	31:16	**Power Good Delay** Default Value: 00C8h PWRGOOD_DLY Value
	15:0	**RAMP Delay** Default Value: 00C8h RAMP_DLY Value

GSMBASE

GSMBASE - GSMBASE

Register Space:	MMIO: 0/2/0
Size (in bits):	64
SOC_Consumer:	BIOS
Address:	108100h

This register contains the base address of stolen DRAM memory for the GTT. BIOS determines the base of GTT stolen memory. BIOS is now able to allocate Gfx Stolen Memory above the 4GB.

DWord	Bit	Description
0..1	63:32	**BGSM_MSB** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS This BitField contains bits 63 to 32 of the base address of stolen DRAM memory.
	31:20	**BGSM_LSB** Default Value: 001h Access: R/W _Custom_GTIReset: BUS This BitField contains bits 31 to 20 of the base address of stolen DRAM memory.
	19:1	**Reserved** Access: RO Format: MBZ
	0	**SPARE** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This was a lock bit prior.

GS Primitives Counter

GS_PRIMITIVES_COUNT - GS Primitives Counter	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02330h
Name:	GS Primitives Counter
ShortName:	GS_PRIMITIVES_COUNT

This register reflects the total number of primitives that have been output by the Geometry Shader stage. This register is part of the context save and restore.

DWord	Bit	Description
0	63:32	**GS Primitives Count UDW** Total number of primitives output by the geometry stage. Updated only when Statistics Enable is set in GS_STATE (see the Geometry Shader Chapter in the 3D Volume.)
	31:0	**GS Primitives Count LDW** Total number of primitives output by the geometry stage. Updated only when Statistics Enable is set in GS_STATE (see the Geometry Shader Chapter in the 3D Volume.)

GT_FLUSH_BCLD_ACK

GT_FLUSH_BCLD_ACK - GT_FLUSH_BCLD_ACK

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	030C0h

GT writes a '1 to this bit to acknowledge PRMRR range registers are loaded into GT.
This register is a LOCAL CR register and not an MMIO register

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**ACK** Default Value: 0b Access: R/W _Custom_GTIReset: BUS GT Boot Context Load Ack

GT_RELOAD_FLUSH

GT_RELOAD_FLUSH - GT_RELOAD_FLUSH

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	030B0h

Ucode writes a '1 to bits 0 which triggers GT to flush and re-load PRMRR range registers.
This register is a LOCAL CR register and not an MMIO register

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**BCLD_REQ** Default Value: 0b Access: R/W _Custom_GTIReset: BUS GT Boot Context Load Request. Write to this bit will initiate Mcheck Complete Routine (PPPE flow).

GTACK

GTACK - GTACK

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	120004h

This register is written to by GT for various device 2 sequencer flows.

DWord	Bit	Description
0	31:5	**Reserved** Access: RO Format: MBZ
	4	**RTPACK** Default Value: 0h Access: R/W _Custom_GTIReset: BUS GT indicates that the set root table pointer flow is complete from its point of view by writing a 1b to this field. Once SW is notified with the appropriate status bit, this bit is cleared by the HW.
	3	**DESCRACK** Default Value: 0h Access: R/W _Custom_GTIReset: BUS GT indicates that the generic descriptor flow is complete from its point of view by writing a 1b to this field Once SW is notified with the appropriate status bit, this bit is cleared by the HW.
	2	**VTDACK** Default Value: 0h Access: R/W _Custom_GTIReset: BUS GT indicates that the Translation Enable/Disable or IOTLB Invalidation flow is complete from its point of view by writing a 1b to this field. Once SW is notified with the appropriate status bit, this bit is cleared by the HW.
	1	**DPRACK** Default Value: 0h Access: R/W _Custom_GTIReset: BUS GT indicates that DPR Update flow is complete from its point of view by writing a 1b to this field. Once SW is notified with the appropriate status bit, this bit is cleared by the HW.

GTACK - GTACK

	0	**PMRACK** Default Value: 0h Access: R/W _Custom_GTIReset: BUS GT indicates that PMR Enable/Disable flow is complete from its point of view by writing a 1b to this field. Once SW is notified with the appropriate status bit, this bit is cleared by the HW.

GTC_CTL

GTC_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	67000h-67003h
Name:	Global Time Code Control
ShortName:	GTC_CTL
Reset:	soft

DWord	Bit	Description
0	31	**GTC Function Enable** This bit enables the GTC counter. Value: 0b = Disable; 1b = Enable Restriction: Enable this bit before enabling GTC controller operation on a port with a GTC capable device.
	30:29	**Reserved** Access: RO Format: MBZ
	28:13	**Reserved**
	12:1	**Reserved** Access: RO Format: MBZ
	0	**Reserved**

GTC_DDA_M

GTC_DDA_M		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	67010h-67013h	
Name:	Global Time Code DDA M	
ShortName:	GTC_DDA_M	
Reset:	soft	
DWord	**Bit**	**Description**
0	31:24	**Reserved**
	23:0	**GTC DDA M** This field is used to program the M value of the GTC DDA. The ratio of M to N programmed depends on the GTC reference clock. The DDA programmed values are related by the following formula: 1/(accumulator increment) = Reference Clock * DDA_M / DDA_N

GTC_DDA_N

GTC_DDA_N		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	67014h-67017h	
Name:	Global Time Code DDA N	
ShortName:	GTC_DDA_N	
Reset:	soft	
DWord	**Bit**	**Description**
0	31:24	**GTC Accum Inc** Format: U7.1 This field is the GTC accumulator increment value in nanoseconds each time the DDA trips. It is programmed in 7.1 fixed point binary format where the LSB represents 0.5ns increment.
	23:0	**GTC DDA N** This field is used to program the N value of the GTC DDA. The ratio of M to N programmed depends on the GTC reference clock and should not result in any accumulation error in any 10ms interval period. The DDA programmed values are related by the following formula: 1/(accumulator increment) = Reference Clock * DDA_M / DDA_N

GTC_IIR

GTC_IIR	
Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32
Address:	67058h-6705Bh
Name:	Global Time Code Interrupt Identity
ShortName:	GTC_IIR
Reset:	soft

See the GTC interrupt bit definition to find the source event for each interrupt bit.

DWord	Bit	Description
0	31:0	**Interrupt Identity Bits** This field holds the persistent values of the GTC interrupt bits which are unmasked by the GTC_IMR.Bits set in this register will propagate to the GTC interrupt in the Display Engine Miscellaneous Interrupts. Bits set in this register will remain set (persist) until the interrupt condition is cleared by writing a '1' to the appropriate bits.

Value	Name
0b	Condition Not Detected
1b	Condition Detected

GTC_IMR

GTC_IMR	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	67054h-67057h
Name:	Global Time Code Interrupt Mask
ShortName:	GTC_IMR
Reset:	soft

See the GTC interrupt bit definition to find the source event for each interrupt bit.

DWord	Bit	Description
0	31:0	**Interrupt Mask Bits** This field contains a bit mask which selects which GTC events are reported int the GTC IIR.

Value	Name
0b	Not Masked
1b	Masked
FFFFFFFFh	All interrupts masked **[Default]**

GTC_LIVE

GTC_LIVE		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	67020h-67023h	
Name:	Global Time Code Live	
ShortName:	GTC_LIVE	
Reset:	soft	
DWord	**Bit**	**Description**
0	31:0	**GTC Live Value** This field contains the live current value of the GTC. It is inactive when the GTC controller function is disabled. This register also samples and holds the live GTC value following a Audio Time Capture (ATC) event until software reads this register. A subsequent read of this register will reflect the live value.

GTC_PORT_CTL

GTC_PORT_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	64370h-64373h
Name:	DDI GTC Port Control
ShortName:	GTC_PORT_CTL_USBC1
Reset:	soft
Address:	64470h-64473h

GTC_PORT_CTL

Reset: soft

Address: 64270h-64273h
Name: DDI GTC Port Control
ShortName: GTC_PORT_CTL_C
Reset: soft

DWord	Bit	Description
0	31	**Port Global Time Code Enable** This bit enables the GTC controller to start lock acquisition phase with remote GTC sink connected to this port. This bit has no effect if the GTC controller is disabled. **Value** / **Name** 0b – Disable 1b – Enable **Restriction** The Maintenance Phase Enable bit must be initially written as '0' when this bit is set.
	30:25	**Reserved**
	24	**Maintenance Phase Enable** This bit is used by software to transition from lock acquisition to lock maintenance phase. The GTC controller generates an interrupt at the end of the lock phase as determined by lock acquisition duration field. Software shall read the sink device GTC lock done bit. If set, software shall set this bit to '1' after first writing the GTC skew value to the RX GTC skew DPCD offset with GTC skew enable bit set to '1'. **Value** / **Name** / **Description** 0b – Lock – Lock acquisition phase. The controller writes or reads GTC every 1ms. 1b – Maintain – Lock maintenance phase. The controller writes or reads GTC every 10ms.
	23:1	**Reserved**
	0	**Port RX Lock Done** This bit indicates the remote GTC sink has achieved lock. This bit shall be written by software after reading remote GTC sink DPCD register. This bit shall be cleared by software when GTC controller is reset from lock maintenance mode to lock acquisition mode or when the controller is disabled. **Value** / **Name** 0b – Not Locked 1b – Locked

GTC_PORT_MISC

GTC_PORT_MISC	
Register Space:	MMIO: 0/2/0

ShortName:	GTC_PORT_MISC_C
Reset:	soft

DWord	Bit	Description
0	31:22	**Reserved** Access: RO Format: MBZ
	21:12	**GTC Update Message Delay** Default Value: 00110100b 52 nanoseconds This field programs the absolute delay in nanoseconds between the GTC at the aux sync point event and the corresponding GTC value at the capture point. It represents the delay between the GTC values at the aux sync point and capture point introduced due to synchronization and glitch suppression.
	11:8	**Min Lock Duration** Default Value: 1010b 10ms This field determines the minimum duration in milliseconds of lock acquisition and maintenance phase after which software is notified through interrupt. The GTC interrupt enable and mask register must be enabled beforehand. Software may also poll the interrupt identity bit in IIR.
	7:0	**Reserved** Access: RO Format: MBZ

GTC_PORT_TX_CURR

GTC_PORT_TX_CURR

GT Correctable Err Status Register

ERR_STAT_FUSA_GT_COR - GT Correctable Err Status Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100160h

This register captures GT Correctable Errors for FuSa functionality.

DWord	Bit	Description
0	31:16	**Error Mask** Default Value: ffffh Access: R/W _Custom_GTIReset: BUS Bits for masking errors defined on bits 15:0 of ERR_STAT_FUSA_GT_COR. These bits are independent of the lower 16 bits -i.e a write to one of these bits is not required to set/clear the lower 16.
	15:1	**Reserved**
	0	**L3 Single Error Corrected** Default Value: 0b Access: R/WC _Custom_GTIReset: BUS L3 single error corrected

GTDRIVER_MAILBOX_DATA1

GTDRIVER_MAILBOX_DATA1 - GTDRIVER_MAILBOX_DATA1		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	13812Ch	
Data register for the GFX-DRIVER-to-PCODE mailbox. This mailbox is implemented as a means for tuning parameters for specific GFX workloads. This register is used in conjunction with GTDRIVER_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU I/O SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES.		
DWord	**Bit**	**Description**
0	31:0	**Considerations**

GTDRIVER_MAILBOX_INTERFACE

GTDRIVER_MAILBOX_INTERFACE - GTDRIVER_MAILBOX_INTERFACE	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	138124h

Control and Status register for the GFX-DRIVER-to-PCODE mailbox. This mailbox is implemented as a means for tuning parameters for specific GFX workloads. This register is used in conjunction with GTDRIVER_MAILBOX_DATA. THIS REGISTER IS DUPLICATED IN THE PCU.

DWord	Bit	Description
0	31:0	**Considerations**

GTDRIVER_P2G_EVENTS

GTDRIVER_P2G_EVENTS - GTDRIVER_P2G_EVENTS	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	138160h

This extended capability allows PCODE to send an interrupt notification upon completion of a mailbox command. It is enabled via the GFX Driver Mailbox. PCODE will set the appropriate bit in this register to 1b, and will then write to 0.2.0.GTTMMADR.PIM[PCU_MBOXE]. The GFX Driver will clear the appropriate bit in this register by writing a 1 to the bit. THIS REGISTER IS DUPLICATED IN THE PCU I/O SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES.

DWord	Bit	Description
0	31:0	**Considerations**

GT Engine Interrupt Enable

GT_ENG_INTR_ENABLE - GT Engine Interrupt Enable

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	190030h
ShortName:	RENDER_COPY_INTR_ENABLE
Address:	190034h
ShortName:	VIDEODECODE_VIDEOENHANCE_INTR_ENABLE
Address:	190038h
ShortName:	GUC_SCATTERGATHER_INTR_ENABLE

DWord	**Bit**	**Description**	
0	31:16	**Engine1 Interrupt Mask**	
		Default Value:	0000h
		Access:	R/W
		_Custom_GTIReset:	BUS

GT_ENG_INTR_MASK - GT Engine Interrupt Mask		
	15:0	**Engine0 Interrupt Mask** Default Value: 0000h Access: R/W _Custom_GTIReset: BUS

GT Fatal Err Status Register

ERR_STAT_FUSA_GT_FATAL - GT Fatal Err Status Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100168h

This register captures GT Fatal Errors for FuSa functionality.

DWord	Bit	Description
0	31:16	**Error Mask** Default Value: ffffh Access: R/W _Custom_GTIReset: BUS Bits for masking errors defined on bits 15:0 of ERR_STAT_FUSA_GT_FATAL. These bits are independent of the lower 16 bits -i.e a write to one of these bits is not required to set/clear the lower 16.
	15:9	**Reserved**
	8	**IDI Parity Error** Default Value: 0b Access: R/WC _Custom_GTIReset: BUS IDI Parity Error
	7:6	**Reserved HW Error2** Access: R/WC _Custom_GTIReset: BUS
	5	**L3 ECC Checker Error** Default Value: 0b Access: R/WC _Custom_GTIReset: BUS L3 ECC Checker Error
	4	**L3 Double Error** Default Value: 0b Access: R/WC _Custom_GTIReset: BUS L3 double error
	3:2	**Reserved HW Error1** Access: R/WC _Custom_GTIReset: BUS

ERR_STAT_FUSA_GT_FATAL - GT Fatal Err Status Register

	1	**Array Bist Error** Default Value: 0b Access: R/WC _Custom_GTIReset: BUS Array BIST Error
	0	**Reserved HW Error0** Access: R/WC _Custom_GTIReset: BUS

GT Function Level Reset Control Message

FLRCTLMSG - GT Function Level Reset Control Message

Register Space:	MMIO: 0/2/0
Size (in bits):	32
CrashLogSaved:	true
CrashLogVisibility:	cspec
Address:	08100h

GT Reset Control Register

DWord	Bit	Description
0	31:16	**Message Mask** Access: RO _Custom_GTIReset: BUS Message Mask In order to write to bits 15:0, the corresponding message mask bits must be written. For example, for bit 14 to be set, bit 30 needs to be 1 : 40004000
	15:2	**Reserved** Access: RO Format: MBZ
	1	**Reserved** Access: RO Format: MBZ
	0	**Initiate GT Function Level Reset Message** Access: R/W Set _Custom_GTIReset: BUS GT Function Level Reset (FLR) 1: Initiate GT FLR - This is a Non-Posted message to reset Render, Media, Blitter and GTI-Device domains. - This bit is cleared by the CPunit upon completion of the reset.

GTICP BONUS1 Reg

GTICPBONUS1 - GTICP BONUS1 Reg

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 24014h

Clock Gating Messages Register

DWord	Bit	Description
0	31:16	**Message Mask** Access: RO _Custom_GTIReset: BUS Message Mask In order to write to bits 15:0, the corresponding message mask bits must be written. For example, for bit 14 to be set, bit 30 needs to be 1 : 40004000
	15:8	**Reserved** Access: RO Format: MBZ
	7	**BONUS BIT 7** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	6	**BONUS BIT 6** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	5	**BONUS BIT 5** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	4	**BONUS BIT 4** Access: R/W _Custom_GTIReset: BUS SLice 0 power well request: '0' : Initiate Power Down request

GTICPBONUS1 - GTICP BONUS1 Reg

		'1' : Initiate Power UP req
	3	**BONUS BIT 3** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	2	**BONUS BIT 2** Access: R/W _Custom_GTIReset: BUS SLice 0 power well request: '0' : Initiate Power Down request '1' : Initiate Power UP req
	1	**BONUS BIT 1** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	0	**BONUS BIT 0** Access: R/W _Custom_GTIReset: BUS SLice 0 power well request: '0' : Initiate Power Down request '1' : Initiate Power UP req

GTICP BONUS2 Reg

GTICPBONUS2 - GTICP BONUS2 Reg

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	24018h

Clock Gating Messages Register

DWord	Bit	Description
0	31:16	**Message Mask** Access: RO _Custom_GTIReset: BUS Message Mask In order to write to bits 15:0, the corresponding message mask bits must be written. For example, for bit 14 to be set, bit 30 needs to be 1 : 40004000
	15:8	**Reserved** Access: RO Format: MBZ
	7	**BONUS BIT 7** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	6	**BONUS BIT 6** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	5	**BONUS BIT 5** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)

GTICPBONUS2 - GTICP BONUS2 Reg

	4	**BONUS BIT 4** Access: R/W _Custom_GTIReset: BUS SLice 0 power well request: '0' : Initiate Power Down request '1' : Initiate Power UP req
	3	**BONUS BIT 3** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	2	**BONUS BIT 2** Access: R/W _Custom_GTIReset: BUS SLice 0 power well request: '0' : Initiate Power Down request '1' : Initiate Power UP req
	1	**BONUS BIT 1** Access: R/W _Custom_GTIReset: BUS SLICE 0 BONUS BIT: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	0	**BONUS BIT 0** Access: R/W _Custom_GTIReset: BUS SLice 0 power well request: '0' : Initiate Power Down request '1' : Initiate Power UP req

GT Interrupt DW0

GT_INTR_DW0 - GT Interrupt DW0

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 190018h

Engine bits in this register are set if any of the unmasked bits in the underlying engine 16b interrupt vector is non-zero

DWord	Bit	Description
0	31	**CSME** Access: R/W One Clear
	30	**Reserved** Access: RO Format: MBZ
	29	**Reserved** Access: RO Format: MBZ
	28	**GUNIT** Access: R/W One Clear
	27:26	**Reserved** Access: RO Format: MBZ
	25	**GUC** Access: R/W One Clear
	24	**Reserved** Access: RO Format: MBZ
	23	**SCTRGTHR** Access: R/W One Clear
	22	**Reserved** Access: RO Format: MBZ
	21	**Reserved** Access: RO Format: MBZ

GT_INTR_DW0 - GT Interrupt DW0

	20	**WDPERF** Access: R/W One Clear
	19	**KCR** Access: R/W One Clear
	18	**Reserved** Access: RO Format: MBZ
	17	**Reserved** Access: RO Format: MBZ
	16	**GTPM** Access: R/W One Clear
	15	**BCS** Access: R/W One Clear
	14:10	**Reserved**
	9:8	**Reserved** Access: RO Format: MBZ
	7	**CCS3** Access: R/W One Clear
	6	**CCS2** Access: R/W One Clear
	5	**CCS1** Access: R/W One Clear
	4	**CCS0** Access: R/W One Clear
	3:1	**Reserved** Access: RO Format: MBZ
	0	**RCS0** Access: R/W One Clear

GT Interrupt DW1

GT_INTR_DW1 - GT Interrupt DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	19001Ch	
Interrupt bits indicating one of theunderlying engine interrupts is non-zero		
DWord	**Bit**	**Description**
0	31	**VECS0** Access: R/W One Clear
	30	**VECS1** Access: R/W One Clear
	29	**VECS2** Access: R/W One Clear
	28	**VECS3** Access: R/W One Clear
	27:8	**Reserved** Access: RO Format: MBZ
	7	**VCS7** Access: R/W One Clear
	6	**VCS6** Access: R/W One Clear
	5	**VCS5** Access: R/W One Clear
	4	**VCS4** Access: R/W One Clear
	3	**VCS3** Access: R/W One Clear
	2	**VCS2** Access: R/W One Clear
	1	**VCS1** Access: R/W One Clear
	0	**VCS0** Access: R/W One Clear

GT Interrupt Identity

GT_INTR_IDENTITY - GT Interrupt Identity

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	190060h
ShortName:	INTR_IDENTITY_REG0
Address:	190064h
Name:	INTR_IDENTITY_REG1
ShortName:	INTR_IDENTITY_REG1

HW displays the interrupt bits for engine chosen using Selector.
Only unmasked interrupts are displayed. Masked interrupts continue to accumulate behind the mask.
After processing, SW shall write 1's to clear. (Bit 31 must be cleared by SW)
Write to Clear indicates to HW that processing is complete (for displayed interrupts).

DWord	Bit	Description
0	31	**Data Valid** Access: R/W
	30:26	**Reserved** Access: RO Format: MBZ
	25:20	**Engine Instance ID** Engine Instance ID format is defined in structure "Engine ID Definition"
	19	**Reserved** Access: RO Format: MBZ
	18:16	**Engine Class ID** Engine class is defined in structure "Engine ID Definition"
	15:0	**Engine Interrupt** Access: R/W Format is specific to the engine that is sending the interrupt. Format is defined in structure "EngineInterrupt Vector" (where engine isBlitter/G-Unit/GTPM/GuC/Render Engine/Video Decoder/VideoEnhancement).

GT Interrupt IIR Selector

GT_INTR_IIR_SELECTOR - GT Interrupt IIR Selector

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	190070h
ShortName:	IIR_REG0_SELECTOR
Address:	190074h
ShortName:	IIR_REG1_SELECTOR

This is a basic register template

DWord	Bit	Description
0	31:0	**Engine ID** Access: R/W SW/FW shall program the appropriate Engine ID to view the interrupts from an engine Engine_ID is a one-hot encoding that follows the bit definition of GuC GT Interrupt DW register. Register: IIR_REG0_SELECTOR — Bit Definiition: Format: GT Interrupt DW0 Register: IIR_REG1_SELECTOR — Bit Definiition: Format: GT Interrupt DW1

GTI PGFET control register with lock

GTIPFETCTL - GTI PGFET control register with lock

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 24008h

DWord	Bit	Description
0	31	**PFET Control Lock** Access: R/W Lock _Custom_GTIReset: BUS 0 = Bits of MEDIA1 PGFETCTL register are R/W 1 = All bits of MEDIA1 PGFETCTL register are RO (including this lock bit) Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR.
	30:26	**Reserved** Access: RO Format: MBZ
	25	**Leave firewall disabled** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not firewall the gated domain for a power down flow. But it will pretend to complete the flow with PM Encodings: 0 = Default mode, i.e firewall gated domain to ungated domain crossing during power down flows 1 = Leave firewall disabled, i.e dont firewall the gated domain, but complete logical flow
	24	**Leave FET On** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not turn off the PFET eventhough it will complete the flow with PM Encodings: 0 = Default mode, i.e power off fets during power down flows 1 = Leave ON mode, i.e dont power off pfet, but complete logical flow
	23	**Power Well Status** Access: RO _Custom_GTIReset: BUS 0 = Well is powered Down 1 = Well is powered up

GTIPFETCTL - GTI PGFET control register with lock

	Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR.
22	**Reserved** Access: RO Format: MBZ
21:19	**Delay from enabling secondary PFETs to power good.** Default Value: 110b Access: R/W Lock _Custom_GTIReset: BUS Delay from enabling secondary PFETs to power good 3'b000: 40ns 3'b001: 80ns 3'b010: 160ns 3'b011: 240ns 3'b100: 320ns 3'b101: 480ns 3'b110: 640ns 3'b111: 1280ns
18:16	**Strobe pulse period** Access: R/W Lock _Custom_GTIReset: BUS Time period b/w two adjacent strobes to the primary FETs 3'b000: 10ns (or 1 bclk) 3'b001: 20ns (or 2 bclk) 3'b010: 30ns (or 3 bclk) 3'b111: 80ns (or 8 bclk) Value: 001b — Name: **[Default]**
15:0	**PFET Ladder Step Sequence** Access: R/W Lock _Custom_GTIReset: BUS PFET Ladder STEP sequence The PFET ladder has 16 steps, each represented by its corresponding bit in pfetlddrstepseq[15:0]. If the bit location is set, it means we must step on that ladder stage before we go to the next stage. The SPC controller will step through all the steps with asserted bits periodically with period equal to strbpulsprd[2:0] Programming Rule: pfetldrstepseq[15] and pfetldrstepseq[0] must be '1; A '0 setting for these bits is illegal. 15'FFFFh: Ladder step (ladder_sel) goes 0, 1, 2, ?.15.

GTIPFETCTL - GTI PGFET control register with lock

15'FFF1h: Ladder step goes 0, 4, 5, 6,?15; Steps 1, 2, 3 are skipped.
15'D555h: Ladder step goes 0, 2, 4, 6, 8, 10, 12, 14, 15; Steps 1, 3, 5, 7, 9, 11, 13 are skipped.
15'80001h: Ladder step goes 0, 15; Steps 1, 2, 3, 4, ?14 are skipped.

Value	Name
1000011111111001b	**[Default]**

GTI Power Gate Control Request

GTIPGCTLREQ - GTI Power Gate Control Request

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	24000h

Clock Gating Messages Register

DWord	Bit	Description
0	31:16	**Message Mask** Access: RO _Custom_GTIReset: BUS Message Mask In order to write to bits 15:0, the corresponding message mask bits must be written. For example, for bit 14 to be set, bit 30 needs to be 1 : 40004000
	15:1	**Reserved** Access: RO Format: MBZ
	0	**Power Gate Request** Access: R/W _Custom_GTIReset: BUS Media1 power well request: '0' : Initiate Power Down request '1' : Initiate Power UP req

GT Mode Register

GT_MODE - GT Mode Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	07008h
Name:	GT Mode Register
ShortName:	GT_MODE

This Register is used to control the 6EU and 12EU configuration for GT. Writing 0x01FF01FF to this register enables the 6EU mode.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask _Custom_GTIReset: DEV Must be set to modify corresponding bit in Bits 15:0. (All implemented bits)
	15	**EU Local Thread Checking Enable** Access: R/W _Custom_GTIReset: DEV This field configures the EU local thread checking. If enable the stateless access will be checked against the local thread's scratch space size and start address. Value / Name / Description: 0h / Disable **[Default]** / EU local thread checking is disabled. 1h / Enable / EU local thread checking is enabled.
	14:13	**SFR mode** Access: R/W Format: U2 _Custom_GTIReset: DEV This field must be zero when not in GT4(SFR) configuration i.e GTB_rendermode fuse set to SFR.
	12:11	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV

GT_MODE - GT Mode Register

10 HW Binding Table Alignment

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

This bit changes the format of the binding table pointer.

When this bit is set, the format of the binding table is SW binding table format whether Binding Table Pool is enabled or disabled.

Value	Name	Description
0h	Legacy **[Default]**	Binding table pointer 15:5 Maps to 15:5 for INTERFACE_DESCRIPTOR DATA. Binding table pointer 15:5 Maps to 15:5 for 3DSTATE_BINDING_TABLE_POINTER_* if Binding Table Pool is disabled. Binding table pointer 15:5 Maps to 16:6 for 3DSTATE_BINDING_TABLE_POINTER_* if Binding Table Pool is enabled.
1h	Enable 512KB Binding Table size	Binding table pointer maps to 18:8 for both 3DSTATE_BINDING_TABLE_POINTER_* and INTERFACE_DESCRIPTOR DATA.

GT_MODE - GT Mode Register

5:4 **Slice2 IZ Hashing: 7 EU subslice encoding**

Access:	R/W
_Custom_GTIReset:	DEV

These bits control 3-way sub-slice hashing by conveying which sub-slice has 7 EUs.

Value	Name	Description
0h	**[Default]**	All subslices have equal number of EUs.
1h		Subslice 2 has 7 EUs.
2h		Subslice 1 has 7 EU.
3h		Subslice 0 has 7 EUs.

Programming Notes
SW must program these bits based on EU Disable Fuses in Slice 2.

3:2 **Slice1 IZ Hashing: 7 EU subslice encoding**

Access:	R/W
_Custom_GTIReset:	DEV

These bits control 3-way sub-slice hashing by conveying which sub-slice has 7 EUs.

Value	Name	Description
0h	**[Default]**	All subslices have equal number of EUs.
1h		Subslice 2 has 7 EUs.
2h		Subslice 1 has 7 EUs.
3h		Subslice 0 has 7 EUs.

Programming Notes
SW must program these bits based on EU Disable Fuses in Slice 1.

1:0 **Slice 0 IZ Hashing: 7 EU subslice encoding**

Access:	R/W
_Custom_GTIReset:	DEV

These bits control 3-way sub-slice hashing by conveying which sub-slice has 7 EUs.

Value	Name	Description
0h	**[Default]**	All subslices have equal number of EUs.
1h		Subslice 2 has 7 EUs.
2h		Subslice 1 has 7 EUs.
3h		Subslice0 has 7 EUs.

Programming Notes
SW must program these bits based on EU Disable Fuses in Slice 0.

GT Non Fatal Err Status Register

ERR_STAT_FUSA_GT_NONFATAL - GT Non Fatal Err Status Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100164h

This register captures GT Non-Fatal errors for FuSa functionality

DWord	Bit	Description
0	31:16	**Error Mask** Default Value: ffffh Access: R/W _Custom_GTIReset: BUS bits for masking errors defined on bit 15:0 of ERR_STAT_FUSA_DISP_NONFATAL. These bits are independent of the lower 16 bits -i.e a write to one of these bits is not required to set/clear the lower 16.
	15:0	**Reserved**

GTPO Triggering Block 1 Mask A

GTPO_TRIGGERING_BLOCK_1_MASK_A - GTPO Triggering Block 1 Mask A

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	0D214h-0D21Bh

Primary 64bit Mask Value for GTPO Triggering Block 1

DWord	Bit	Description
0..1	63:32	**GTPO TRIGGERING MASK A UPPER** Access: R/W _Custom_GTIReset: BUS Lower 32bit Mask Value for the value programmed in the corresponding match register
	31:0	**GTPO TRIGGERING MASK A LOWER** Access: R/W _Custom_GTIReset: BUS Lower 32bit Mask Value for the value programmed in the corresponding match register

GTPO Triggering Block 1 Mask B

GTPO_TRIGGERING_BLOCK_1_MASK_B - GTPO Triggering Block 1 Mask B	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	0D21Ch-0D223h
Secondary 64bit Mask Value for GTPO Triggering Block 1	

DWord	Bit	Description
0..1	63:32	**GTPO TRIGGERING Mask B Upper** Access: R/W _Custom_GTIReset: BUS Upper 32bit Mask Value for the value programmed in the corresponding match register
	31:0	**GTPO TRIGGERING Mask B Lower** Access: R/W _Custom_GTIReset: BUS Lower 32bit Mask Value for the value programmed in the corresponding match register

GTPO Triggering Block 1 Match A

GTPO_TRIGGERING_BLOCK1_MATCHA - GTPO Triggering Block 1 Match A

Register Space:	MMIO: 0/2/0
Size (in bits):	64
Address:	0D224h-0D22Bh

Primary 64bit Match Value for GTPO Triggering Block 1

DWord	Bit	Description
0..1	63:32	**Match A Upper** Access: R/W _Custom_GTIReset: BUS Upper 32bit match value for use by GTPO triggering block
	31:0	**Macth A Lower** _Custom_GTIReset: BUS Lower 32bit match value for use by GTPO triggering block

GTPO Triggering Block 1 Match B

GTPO_TRIGGERING_BLOCK_1_MATCH_B - GTPO Triggering Block 1 Match B

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	0D22Ch-0D233h

Secondary 64bit Match Value for GTPO Triggering Block 1

DWord	Bit	Description
0..1	63:32	**GTPO TRIGGERING Match B Upper** Access: R/W _Custom_GTIReset: BUS Upper 32bit match value for use by GTPO triggering block
	31:0	**GTPO Triggering Match B Lower** Access: R/W _Custom_GTIReset: BUS Lower 32bit match value for use by GTPO triggering block

GTPO Triggering Block Mode Enable

GTPO_TRIGGERING_BLOCK_MODE - GTPO Triggering Block Mode Enable

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0D234h

Register to enable and set the mode for 4 GTPO triggering blocks

DWord	Bit	Description
0	31:3	**GTPO BLOCK MODE ENABLE RSVD** Access: R/W _Custom_GTIReset: BUS
	2:1	**GTPO Triggering Block 1 Mode** Default Value: 00b Access: R/W _Custom_GTIReset: BUS 01 - Match; 10 - Match Secondary; 11 - Match Content;
	0	**GTPO Triggering Block 1 Enable** Default Value: 0b _Custom_GTIReset: BUS

GTSCRATCH

GTSCRATCH	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	4F100h-4F11Fh
Name:	GT SCRATCH
ShortName:	GTSCRATCH_*

There are 8 instances of this register format.

Restriction
These registers are used by hardware and must not be used by software.

DWord	Bit	Description
0	31:0	**GT Sratchpad** Default Value: 00000000000000000000000000000000b Access: R/W _Custom_GTIReset: BUS GT Scratchpad

GTSP

GTSP	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	130040h-13005Fh
Name:	GT SCRATCHPAD
ShortName:	GTSP_*

There are 8 instances of this register format.

DWord	Bit	Description
0	31:0	**GT Scratchpad** Default Value: 00000000000000000000000000000000b Access: R/W _Custom_GTIReset: BUS GT Scratchpad

GT Virtual Function Engine Interrupt Enable

GT_ENG_INTR_ENABLE - GT Virtual Function Engine Interrupt Enable	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	191030h
ShortName:	VF1_RENDER_COPY_INTR_ENABLE
Address:	192030h

ShortName:	VF7_INTR_IDENTITY_REG1
HW displays the interrupt bits for engine chosen using Selector. Only unmasked interrupts are displayed. Masked interrupts continue to accumulate behind the mask.	

GT_VF_INTR_IDENTITY - GT Virtual Function Interrupt Identity

After processing, SW shall write 1's to clear. (Bit 31 must be cleared by SW)
Write to Clear indicates to HW that processing is complete (for displayed interrupts).

DWord	Bit	Description

GUC_HOST_INTR_IIR

GUC_HOST_INTR_IIR - GUC_HOST_INTR_IIR

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	1901F0h

This register provides a capability for a Host SW to communicate with GuC FW. The Host SW, whether Host OS/VMM or a Guest VM, writes to this register at MMIO offset 1901F0h with a 32-bit payload, which results in the Gunit sending an interrupt to GuC, which can then retrieve the payload from this register using the appropriate Gunit unique address.

DWord	Bit	Description
0	31:0	**Data** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS Data

GuC DMA Interrupt Input

GUC_DMA_IIR - GuC DMA Interrupt Input

Register Space: MMIO: 0/2/0
Access: R/W
Size (in bits): 32

DWord	Bit	Description
0	31:2	**Reserved** Access: RO Format: MBZ
	1	**DMA Service Interrupt Routing** 0h – Host **[Default]** – Interrupts will be routed to the host CPU. 1h – Reserved – Reserved
	0	**DMA Interrupt** There can only be one DMA workload outstanding at any time. Set by DMA hardware. Cleared by Host. 0h – No DMA Interrupt Pending **[Default]** 1h – DMA Interrupt Pending

GuC Doorbell Group 0 Interrupt Status

GUC_DB_ISR_0 - GuC Doorbell Group 0 Interrupt Status	
Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32
This is a "shadow" of registers in GTI. The GuC takes a snapshot when it services them. Access: copy-write by the GuC hardware, read and cleared by the uKernel and host CPU.	

DWord	Bit	Description
0	31:0	**Interrupt Status** GuC shadow copy of the interrupt status mask for doorbells 0 through 31.

GuC Doorbell Group 1 Interrupt Status

GUC_DB_ISR_1 - GuC Doorbell Group 1 Interrupt Status	
Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32

Interrupt status shadow copy. Access: copy-write by the GuC hardware, read and cleared by the uKernel and host CPU.

DWord	Bit	Description
0	31:0	**Interrupt Status** GuC shadow copy of the interrupt status mask for doorbells 32 through 63.

GuC Doorbell Group 2 Interrupt Status

GUC_DB_ISR_2 - GuC Doorbell Group 2 Interrupt Status		
Register Space:	MMIO: 0/2/0	
Access:	R/WC	
Size (in bits):	32	
Interrupt status shadow copy. Access: copy-write by the GuC hardware, read and cleared by the uKernel and host CPU.		
DWord	**Bit**	**Description**
0	31:0	**Interrupt Status** GuC shadow copy of the interrupt status mask for doorbells 64 through 95.

GuC Doorbell Group 3 Interrupt Status

GUC_DB_ISR_3 - GuC Doorbell Group 3 Interrupt Status	
Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32

Interrupt status shadow copy. Access: copy-write by the GuC hardware, read and cleared by the uKernel and host CPU.

DWord	Bit	Description
0	31:0	**Interrupt Status** GuC shadow copy of the interrupt status mask for doorbells 96 through 127.

GuC Doorbell Group 4 Interrupt Status

GUC_DB_ISR_4 - GuC Doorbell Group 4 Interrupt Status		
Register Space:	MMIO: 0/2/0	
Access:	R/WC	
Size (in bits):	32	
Interrupt status shadow copy. Access: copy-write by the GuC hardware, read and cleared by the uKernel and host CPU.		
DWord	**Bit**	**Description**
0	31:0	**Interrupt Status** GuC shadow copy of the interrupt status mask for doorbells 128 through 159.

GuC Doorbell Group 5 Interrupt Status

GUC_DB_ISR_5 - GuC Doorbell Group 5 Interrupt Status	
Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32

Interrupt status shadow copy. Access: copy-write by the GuC hardware, read and cleared by the uKernel and host CPU.

DWord	Bit	Description
0	31:0	**Interrupt Status** GuC shadow copy of the interrupt status mask for doorbells 160 through 191.

GuC Doorbell Group 6 Interrupt Status

GUC_DB_ISR_6 - GuC Doorbell Group 6 Interrupt Status		
Register Space:	MMIO: 0/2/0	
Access:	R/WC	
Size (in bits):	32	
Interrupt status shadow copy. Access: copy-write by the GuC hardware, read and cleared by the uKernel and host CPU.		
DWord	**Bit**	**Description**
0	31:0	**Interrupt Status** GuC shadow copy of the interrupt status mask for doorbells 192 through 223.

GuC Doorbell Group 7 Interrupt Status

GUC_DB_ISR_7 - GuC Doorbell Group 7 Interrupt Status	
Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32

Interrupt status shadow copy. Access: copy-write by the GuC hardware, read and cleared by the uKernel and host CPU.

DWord	Bit	Description
0	31:0	**Interrupt Status** GuC shadow copy of the interrupt status mask for doorbells 224 through 255.

GuC Engine Interrupt Mask

GUC_ENG_INTR_MASK - GuC Engine Interrupt Mask		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
DWord	**Bit**	**Description**
0	31:16	**Engine1 Interrupt Mask** Access: R/W
	15:0	**Engine0 Interrupt Mask** Access: R/W

Guc GT Interrupt DW1

GUC_GT_INTR_DW1 - Guc GT Interrupt DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
This is a basic register template		
DWord	**Bit**	**Description**
0	31	**VECS0** Access: R/W
	30	**VECS1** Access: R/W
	29	**VECS2** Access: R/W

	1	**VCS1** Access: R/W
	0	**VCS0** Access: R/W

GuC Host Interrupt Interrupt Input 0

GUC_HOST_INTR_IIR_0 - GuC Host Interrupt Interrupt Input 0		
Register Space:	MMIO: 0/2/0	
Access:	R/WC	
Size (in bits):	32	
The format of this register is defined by software. The host CPU is expected to write this register and the uKernel to read it.		
DWord	**Bit**	**Description**
0	31:0	**Scratch**

GuC Host Interrupt Mask 0

GUC_HOST_INTR_MASK_0 - GuC Host Interrupt Mask 0		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Interrupt Masks for the host KMD that can generate interrupts. When virtualization is enabled, bits 1 through 31 may indicated interrupts		
DWord	**Bit**	**Description**
0	31:8	**VF N Intr Mask**
	7	**VF7 Intr Mask**
	6	**VF6 Intr Mask**
	5	**VF5 Intr Mask**
	4	**VF4 Intr Mask**

GuC Interupt IIR Selector

INTR_IIR_SELECTOR - GuC Interupt IIR Selector		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
DWord	**Bit**	**Description**
0	31:0	**Engine ID** Access: R/W SW/FW shall program the appropriate Engine ID to view the interrupts from an engine. Engine_ID is a one-hot encoding that follows the bit definition of GuC GT Interrupt DW register. GUC_IIR_REG0_SELECTOR uses GuC GT Interrupt DW0. GUC_IIR_REG1_SELECTOR uses GuC GT Interrupt DW1. **Programming Notes** A write to the selector is dropped if there are no interrupts to be serviced - because the State Machine is not in the correct state to accept the selector write

Guc Peek Register 0

DRB0PEEK - Guc Peek Register 0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	01920h	

DWord	Bit	Description
0	31	**Doorbell #(0*32+31) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+31) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	30	**Doorbell #(0*32+30) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+30) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	29	**Doorbell #(0*32+29) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+29) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	28	**Doorbell #(0*32+28) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+28) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	27	**Doorbell #(0*32+27) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+27) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB0PEEK - Guc Peek Register 0

26	**Doorbell #(0*32+26) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+26) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
25	**Doorbell #(0*32+25) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+25) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
24	**Doorbell #(0*32+24) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+24) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
23	**Doorbell #(0*32+23) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+23) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
22	**Doorbell #(0*32+22) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+22) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
21	**Doorbell #(0*32+21) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+21) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB0PEEK - Guc Peek Register 0

	20	**Doorbell #(0*32+20) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+20) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	19	**Doorbell #(0*32+19) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+19) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	18	**Doorbell #(0*32+18) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+18) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	17	**Doorbell #(0*32+17) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+17) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	16	**Doorbell #(0*32+16) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+16) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	15	**Doorbell #(0*32+15) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+15) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB0PEEK - Guc Peek Register 0

14 Doorbell #(0*32+14) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(0*32+14) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

13 Doorbell #(0*32+13) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(0*32+13) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

12 Doorbell #(0*32+12) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(0*32+12) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

11 Doorbell #(0*32+11) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(0*32+11) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

10 Doorbell #(0*32+10) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(0*32+10) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

9 Doorbell #(0*32+9) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(0*32+9) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB0PEEK - Guc Peek Register 0

	8	**Doorbell #(0*32+8) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+8) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	7	**Doorbell #(0*32+7) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+7) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	6	**Doorbell #(0*32+6) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+6) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	5	**Doorbell #(0*32+5) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+5) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	4	**Doorbell #(0*32+4) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+4) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	3	**Doorbell #(0*32+3) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+3) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB0PEEK - Guc Peek Register 0

	2	**Doorbell #(0*32+2) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+2) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	1	**Doorbell #(0*32+1) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+1) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	0	**Doorbell #(0*32+0) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(0*32+0) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

Guc Peek Register 1

DRB1PEEK - Guc Peek Register 1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	01924h	

DWord	Bit	Description
0	31	**Doorbell #(1*32+31) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+31) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	30	**Doorbell #(1*32+30) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+30) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	29	**Doorbell #(1*32+29) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+29) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	28	**Doorbell #(1*32+28) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+28) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	27	**Doorbell #(1*32+27) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+27) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB1PEEK - Guc Peek Register 1

26	**Doorbell #(1*32+26) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+26) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
25	**Doorbell #(1*32+25) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+25) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
24	**Doorbell #(1*32+24) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+24) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
23	**Doorbell #(1*32+23) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+23) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
22	**Doorbell #(1*32+22) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+22) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
21	**Doorbell #(1*32+21) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+21) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB1PEEK - Guc Peek Register 1

	20	**Doorbell #(1*32+20) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+20) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	19	**Doorbell #(1*32+19) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+19) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	18	**Doorbell #(1*32+18) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+18) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	17	**Doorbell #(1*32+17) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+17) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	16	**Doorbell #(1*32+16) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+16) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	15	**Doorbell #(1*32+15) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+15) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB1PEEK - Guc Peek Register 1

14	**Doorbell #(1*32+14) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+14) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
13	**Doorbell #(1*32+13) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+13) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
12	**Doorbell #(1*32+12) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+12) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
11	**Doorbell #(1*32+11) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+11) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
10	**Doorbell #(1*32+10) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+10) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
9	**Doorbell #(1*32+9) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+9) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB1PEEK - Guc Peek Register 1

	8	**Doorbell #(1*32+8) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+8) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	7	**Doorbell #(1*32+7) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+7) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	6	**Doorbell #(1*32+6) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+6) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	5	**Doorbell #(1*32+5) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+5) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	4	**Doorbell #(1*32+4) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+4) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	3	**Doorbell #(1*32+3) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+3) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB1PEEK - Guc Peek Register 1

	2	**Doorbell #(1*32+2) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+2) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	1	**Doorbell #(1*32+1) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+1) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	0	**Doorbell #(1*32+0) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(1*32+0) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

Guc Peek Register 2

DRB2PEEK - Guc Peek Register 2		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	01928h	

DWord	Bit	Description
0	31	**Doorbell #(2*32+31) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+31) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	30	**Doorbell #(2*32+30) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+30) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	29	**Doorbell #(2*32+29) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+29) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	28	**Doorbell #(2*32+28) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+28) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	27	**Doorbell #(2*32+27) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+27) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB2PEEK - Guc Peek Register 2

26 Doorbell #(2*32+26) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(2*32+26) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

25 Doorbell #(2*32+25) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(2*32+25) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

24 Doorbell #(2*32+24) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(2*32+24) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

23 Doorbell #(2*32+23) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(2*32+23) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

22 Doorbell #(2*32+22) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(2*32+22) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

21 Doorbell #(2*32+21) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(2*32+21) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB2PEEK - Guc Peek Register 2

20	**Doorbell #(2*32+20) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+20) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
19	**Doorbell #(2*32+19) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+19) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
18	**Doorbell #(2*32+18) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+18) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
17	**Doorbell #(2*32+17) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+17) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
16	**Doorbell #(2*32+16) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+16) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
15	**Doorbell #(2*32+15) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+15) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB2PEEK - Guc Peek Register 2

	14	**Doorbell #(2*32+14) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+14) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	13	**Doorbell #(2*32+13) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+13) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	12	**Doorbell #(2*32+12) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+12) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	11	**Doorbell #(2*32+11) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+11) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	10	**Doorbell #(2*32+10) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+10) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	9	**Doorbell #(2*32+9) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+9) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB2PEEK - Guc Peek Register 2

	8	**Doorbell #(2*32+8) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+8) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	7	**Doorbell #(2*32+7) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+7) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	6	**Doorbell #(2*32+6) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+6) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	5	**Doorbell #(2*32+5) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+5) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	4	**Doorbell #(2*32+4) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+4) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	3	**Doorbell #(2*32+3) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+3) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB2PEEK - Guc Peek Register 2

	2	**Doorbell #(2*32+2) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+2) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	1	**Doorbell #(2*32+1) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+1) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	0	**Doorbell #(2*32+0) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(2*32+0) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

	28	**Doorbell #(3*32+28) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+28) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	27	**Doorbell #(3*32+27) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+27) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB3PEEK - Guc Peek Register 3

26 Doorbell #(3*32+26) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(3*32+26) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

25 Doorbell #(3*32+25) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(3*32+25) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

24 Doorbell #(3*32+24) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(3*32+24) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

23 Doorbell #(3*32+23) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(3*32+23) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

22 Doorbell #(3*32+22) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(3*32+22) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

21 Doorbell #(3*32+21) Guc Peek

Access:	RO
_Custom_GTIReset:	BUS

Doorbell #(3*32+21) has been rung.
Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB3PEEK - Guc Peek Register 3

	20	**Doorbell #(3*32+20) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+20) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	19	**Doorbell #(3*32+19) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+19) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	18	**Doorbell #(3*32+18) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+18) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	17	**Doorbell #(3*32+17) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+17) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	16	**Doorbell #(3*32+16) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+16) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	15	**Doorbell #(3*32+15) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+15) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB3PEEK - Guc Peek Register 3

	14	**Doorbell #(3*32+14) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+14) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	13	**Doorbell #(3*32+13) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+13) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	12	**Doorbell #(3*32+12) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+12) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	11	**Doorbell #(3*32+11) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+11) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	10	**Doorbell #(3*32+10) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+10) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	9	**Doorbell #(3*32+9) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+9) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB3PEEK - Guc Peek Register 3

8	**Doorbell #(3*32+8) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+8) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
7	**Doorbell #(3*32+7) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+7) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
6	**Doorbell #(3*32+6) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+6) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
5	**Doorbell #(3*32+5) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+5) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
4	**Doorbell #(3*32+4) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+4) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
3	**Doorbell #(3*32+3) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+3) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB3PEEK - Guc Peek Register 3

	2	**Doorbell #(3*32+2) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+2) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	1	**Doorbell #(3*32+1) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+1) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	0	**Doorbell #(3*32+0) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(3*32+0) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

Guc Peek Register 4

DRB6PEEK - Guc Peek Register 6

	20	**Doorbell #(6*32+20) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+20) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	19	**Doorbell #(6*32+19) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+19) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	18	**Doorbell #(6*32+18) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+18) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	17	**Doorbell #(6*32+17) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+17) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	16	**Doorbell #(6*32+16) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+16) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	15	**Doorbell #(6*32+15) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+15) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB6PEEK - Guc Peek Register 6

14	**Doorbell #(6*32+14) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+14) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
13	**Doorbell #(6*32+13) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+13) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
12	**Doorbell #(6*32+12) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+12) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
11	**Doorbell #(6*32+11) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+11) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
10	**Doorbell #(6*32+10) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+10) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
9	**Doorbell #(6*32+9) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+9) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB6PEEK - Guc Peek Register 6

	8	**Doorbell #(6*32+8) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+8) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	7	**Doorbell #(6*32+7) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+7) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	6	**Doorbell #(6*32+6) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+6) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	5	**Doorbell #(6*32+5) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+5) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	4	**Doorbell #(6*32+4) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+4) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	3	**Doorbell #(6*32+3) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+3) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB6PEEK - Guc Peek Register 6

	2	**Doorbell #(6*32+2) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+2) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	1	**Doorbell #(6*32+1) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+1) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	0	**Doorbell #(6*32+0) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(6*32+0) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

Guc Peek Register 7

DRB7PEEK - Guc Peek Register 7		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	0193Ch	

DWord	Bit	Description
0	31	**Doorbell #(7*32+31) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+31) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	30	**Doorbell #(7*32+30) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+30) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	29	**Doorbell #(7*32+29) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+29) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	28	**Doorbell #(7*32+28) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+28) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	27	**Doorbell #(7*32+27) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+27) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB7PEEK - Guc Peek Register 7

	26	**Doorbell #(7*32+26) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+26) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	25	**Doorbell #(7*32+25) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+25) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	24	**Doorbell #(7*32+24) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+24) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	23	**Doorbell #(7*32+23) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+23) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	22	**Doorbell #(7*32+22) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+22) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	21	**Doorbell #(7*32+21) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+21) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB7PEEK - Guc Peek Register 7

	20	**Doorbell #(7*32+20) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+20) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	19	**Doorbell #(7*32+19) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+19) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	18	**Doorbell #(7*32+18) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+18) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	17	**Doorbell #(7*32+17) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+17) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	16	**Doorbell #(7*32+16) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+16) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	15	**Doorbell #(7*32+15) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+15) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB7PEEK - Guc Peek Register 7

	14	**Doorbell #(7*32+14) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+14) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	13	**Doorbell #(7*32+13) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+13) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	12	**Doorbell #(7*32+12) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+12) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	11	**Doorbell #(7*32+11) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+11) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	10	**Doorbell #(7*32+10) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+10) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	9	**Doorbell #(7*32+9) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+9) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB7PEEK - Guc Peek Register 7

	8	**Doorbell #(7*32+8) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+8) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	7	**Doorbell #(7*32+7) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+7) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	6	**Doorbell #(7*32+6) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+6) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	5	**Doorbell #(7*32+5) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+5) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	4	**Doorbell #(7*32+4) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+4) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	3	**Doorbell #(7*32+3) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+3) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

DRB7PEEK - Guc Peek Register 7

	2	**Doorbell #(7*32+2) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+2) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	1	**Doorbell #(7*32+1) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+1) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.
	0	**Doorbell #(7*32+0) Guc Peek** Access: RO _Custom_GTIReset: BUS Doorbell #(7*32+0) has been rung. Shadow copy of matching register in DRB*ACT, which is not cleared after a read and only echoes the register value.

GuC PM Time Stamp Counter 0

GUC_PM_TSCVALUE0 - GuC PM Time Stamp Counter 0	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

This register value shadows the GPM time stamp counter value.

Programming Notes
This value is provided locally in the GuC Shim to avoid overhead of retrieving a time stamp value from GPM unit (for e.g: latency incurred for reading the timestamp value makes the value stale).
This register is saved in the power context.

DWord	Bit	Description
0	31:0	**Time Stamp Value** Holds the lower 32 bits of the incoming time stamp counter value.

GuC PM Time Stamp Counter 1

GUC_PM_TSCVALUE1 - GuC PM Time Stamp Counter 1

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

This register value shadows the GPM time stamp counter value.

Programming Notes
This value is provided locally in the GuC Shim to avoid overhead of retrieving a time stamp value from GPM unit (for e.g: latency incurred for reading the timestamp value makes the value stale).
This register is saved in the power context.

DWord	Bit	Description
0	31:4	**Reserved** Access: RO Format: MBZ
	3:0	**Time Stamp Value** Holds the upper 4 bits of the incoming time stamp counter value.

GU Misc Interrupt Definition

GU Misc Interrupt Definition

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS

Address:	444F0h-444FFh
Name:	Gunit Miscellaneous Interrupts
ShortName:	GU_MISC_INTERRUPT

This table indicates which events are mapped to each bit of the Gunit Miscellaneous Interrupt registers.
0x444F0 = ISR
0x444F4 = IMR
0x444F8 = IIR
0x444FC = IER

DWord	Bit	Description
0	31	**Spare_31** _Custom_GTIReset: BUS Spare bit
	30	**Spare_30** _Custom_GTIReset: BUS Spare bit
	29	**Invalid GTT page table entry** _Custom_GTIReset: BUS The ISR is an active high pulse on receiving the iMPH invalid GTT page table entry indication.
	28	**Spare_28** _Custom_GTIReset: BUS Spare bit
	27	**GSE** _Custom_GTIReset: BUS The ISR is an active high pulse on the GSE system level event.

Name:	Hardware Status Mask Register
ShortName:	HWSTAM_VECSUNIT3
Address:	1A098h-1A09Bh
Name:	Hardware Status Mask Register
ShortName:	HWSTAM_CCSUNIT0

The HWSTAM register has the same format as the Interrupt Control Registers. The bits in this register are mask bits that prevent the corresponding bits in the Interrupt Status Register from generating a Hardware Status Write (PCI write cycle). Any unmasked interrupt bit (HWSTAM bit set to 0) will allow the Interrupt Status Register to be written to the ISR location (within the memory page specified by the Hardware Status Page Address Register) when that Interrupt Status Register bit changes state.

Programming Notes

- To write the interrupt to the HWSP, the corresponding IMR bit must also be clear (enabled).
- At most 1 bit can be unmasked at any given time.

DWord	Bit	Description
0	31:0	**Hardware Status Mask** Default Value: 00000000h Refer to the Interrupt Control Register section for bit definitions. Reserved bits are RO.

Hardware Status Page Address Register

HWS_PGA - Hardware Status Page Address Register

ShortName:	HWS_PGA_VECSUNIT3
Address:	1A080h-1A083h
Name:	Hardware Status Page Address Register
ShortName:	HWS_PGA_CCSUNIT0

This register is used to program the 4 KB-aligned System Memory address of the Hardware Status Page used to report hardware status into (typically cacheable) System Memory.

DWord	Bit	Description
0	31:12	**Address** Format: GraphicsAddress[31:12] This field is used by SW to specify Bits 31:12 of the 4 KB-aligned System Memory address of the 4 KB page known as the Hardware Status Page. The Global GTT is used to map this page from the graphics virtual address to physical address. **Programming Notes** If the Per-Process Virtual Address Space and Exec List Enable bit is set, HW requires that the status page is programmed to allow for the context switch status to be reported.
	11:0	**Reserved** Access: RO Format: MBZ

HCP Bitstream Output Minimal Size Padding Count Report Register

HCP_MINSIZE_PADDING_COUNT - HCP Bitstream Output Minimal Size Padding Count Report Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1E9B4h

This register stores the count in bytes of **minimal size padding insertion. It is primarily provided forstatistical data gathering.** This register is part of the context save and restore.

DWord	Bit	Description
0	31:0	**HCP MinSize Padding Count** Format: U32 Total number of bytes in the bitstream output contributing to minimal size padding operation. Thiscount is updated each time when the padding count is incremented.

HCP CABAC Status

HCP_CABAC_STATUS - HCP CABAC Status	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	1C2804h

HCP CABAC status or VP9 Decode status	

DWord	Bit	Description
0	31:18	**Reserved** Access: RO Format: MBZ

HCP_CABAC_STATUS - HCP CABAC Status

	17:0	**VP9 SuperBlock Concealment Counter** Exists If: // VP9 decode = 1 Format: U18 Indicate the number of Superblock (SB) concealed by VP9 decoder (not decoded from bitstream due to error)
	11	**Temporal Direction Motion Vector Out-of-Bound Error** Default Value: 0 Access: RO Exists If: // HEVC decode = 1 Format: U1 This flag indicates motion vectors calculated from the Temporal Direct Motion vector is larger than the allowed range for HEVC decode.
	6	**Motion Vector Delta SE** Default Value: 0 Access: RO Exists If: // HEVC decode = 1 Format: U1 This flag indicates out-of-bound motion vector delta SEs coded in the bit-stream for HEVC decode.
	5	**Delta QP SE** Default Value: 0 Access: RO Exists If: // HEVC decode = 1 Format: U1 This flag indicates leading-one overflow during CABAC decode of cu_qp_delta_abs for HEVC decode.
	4	**Residual Error** Default Value: 0 Access: RO Exists If: // HEVC decode = 1 Format: U1 This flag indicates out-of-bound absolute coefficient level SEs coded in the bit-streamfor HEVC decode.

HCP_CABAC_STATUS - HCP CABAC Status

	3	**Slice and Error** Default Value: 0 Access: RO Exists If: // HEVC decode = 1 Format: U1 This flag indicates a pre-mature end to the slice or an inconsistent end of slice on the last Ctb of a slice for HEVC decode.
	0	**HEVC Ctb Concealment Flag** Default Value: 0 Access: RO Exists If: // HEVC decode = 1 Format: U1 Each pulse from this flag indicates one Ctb is concealed by the HEVC decode.

HCP Decode Status

HCP_DEC_STATUS - HCP Decode Status

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

Address:	1C2800h
ShortName:	HCP_DEC_STATUS_VCS0
Description:	For VDBox0

Address:	1C6800h
ShortName:	HCP_DEC_STATUS_VCS1
Description:	For VDBox1

Address:	1D2800h
ShortName:	HCP_DEC_STATUS_VCS2
Description:	For VDBox2

Address:	1D6800h
ShortName:	HCP_DEC_STATUS_VCS3
Description:	For VDBox3

Address:	1E2800h
ShortName:	HCP_DEC_STATUS_VCS4
Description:	For VDBox4

Address:	1E6800h
ShortName:	HCP_DEC_STATUS_VCS5
Description:	For VDBox5

Address:	1F2800h
ShortName:	HCP_DEC_STATUS_VCS6
Description:	For VDBox6

Address:	1F6800h
ShortName:	HCP_DEC_STATUS_VCS7
Description:	For VDBox7

HCP Decode status.

DWord	Bit	Description
0	31:18	**Number of Ctbs Concealed** Default Value: 0 Format: U14 This 14-bit field indicates the number of Ctbs concealed during the decoding of the current frame. This field is cleared with the HCP_PIPE_MODE_SELECT command.

HCP_DEC_STATUS - HCP Decode Status

	17	**Frame Dec Active** Default Value: 0 Format: U1 This flag indicates that the decoder hardware is actively decoding a picture.
	16	**Indirect Bitstream ObjectAccess Upper Bound Error** Default Value: 0 Format: U1 This flag indicates that the upper bound bit-stream address was reached.
	15:0	**Bit-stream Error Flags** Default Value: 0 Format: U16 This 16-bit field indicates the number of bit stream errors detected for each bit fieldindicated in the CABAC Status register.

HCP Frame BitStream BIN Count

HCP_BIN_CT - HCP Frame BitStream BIN Count

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1E980h

This register stores the number of BINs decoded in a frame. This register is not part of hardware context save and restore.

DWord	Bit	Description
0	31:0	**HCP Frame Bit-stream BIN Count** Default Value: 723ba5c0h Format: U32 Total number of BINs decoded/ in current frame. This number is used with frame performance count to derive Bin/clk.

HCP Image Status Control

HCP_IMAGE_STATUS_CONTROL - HCP Image Status Control

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	1C28BCh

DWord	Bit	Description
0	31:24	**Cumulative Frame Delta QP/QIndex** Format: S7 Used for Frame Level Multi-pass Rate Control.HEVC: cu_qp = input (first pass) cu_qp + Cumulative Frame Delta Qp. Pak does clamping to max value based on bitdepth. Bit31 is the sign bit. VP9: cu_qindex = input (first pass) cu_qindex + Cumulative Frame Delta Qindex. Pak does clamping to -127..127 after adding. Bit31 is the sign bit. VDENC: In VDenc mode this value is added even in first pass (always)so the recommendation is to set this value to zero in first pass
	23	**Reserved** Access: RO Format: MBZ
	22:16	**Cumulative Frame Delta LF** Access: RO Format: S6 Used for Frame Level Multi-pass Rate Control. LF_level = input (first pass) LF_level + Cumulative Frame Delta LF level. Pak does clamping to -63..63 after adding.
	15:12	**Reserved** Access: RO Format: MBZ
	11:8	**Total Num-Pass** Format: U4
	7:3	**Reserved** Access: RO Format: MBZ
	2	**Frame Bit Count Violate - under run** Access: RO Format: U1 This can trigger Frame Level Multi-pass Rate Control.Set to 1 if frame bit count is less than or equal to FrameBitRateMin

HCP_IMAGE_STATUS_CONTROL - HCP Image Status Control		
	1	**Frame Bit Count Violate - over run** Access: RO Format: U1 This can trigger Frame Level Multi-pass Rate Control.Set to 1 if frame bit count is less than or equal to FrameBitRateMax
	0	**LCU Bit Count Violate- overrun**

HCP Image Status Mask

HCP_IMAGE_STATUS_MASK - HCP Image Status Mask		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	1E9B8h	
This register stores the image status(flags).		

DWord	Bit	Description
0	31:3	**Reserved** Access: RO Format: MBZ
	2	**FrameBitRateMinReportMask** Same as **FrameSzUnderStatusEn** in HCP_PIC_STATE.
	1	**FrameBitRateMaxReportMask** Same as **FrameSzOverStatusEn** in HCP_PIC_STATE.
	0	**FrameLcuMaxReportMask**

HCP Last Position

HCP_LAST_POSITION - HCP Last Position

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	1C2808h
ShortName:	HCP_LAST_POSITION_VCS0
Description:	For VDBox0
Address:	1C6808h
ShortName:	HCP_LAST_POSITION_VCS1
Description:	For VDBox1
Address:	1D2808h
ShortName:	HCP_LAST_POSITION_VCS2
Description:	For VDBox2
Address:	1D6808h
ShortName:	HCP_LAST_POSITION_VCS3
Description:	For VDBox3
Address:	1E2808h
ShortName:	HCP_LAST_POSITION_VCS4
Description:	For VDBox4
Address:	1E6808h
ShortName:	HCP_LAST_POSITION_VCS5
Description:	For VDBox5
Address:	1F2808h
ShortName:	HCP_LAST_POSITION_VCS6
Description:	For VDBox6
Address:	1F6808h
ShortName:	HCP_LAST_POSITION_VCS7
Description:	For VDBox7

Last row and column position of the decoder.

- The HCP Last Position register reports the position of the last Ctb to be decoded by the HCP hardware.
- It can be reset to 0H with the HCP_PIPE_MODE_SELECT command.

DWord	Bit	Description
0	31:25	**Reserved** Access: RO

HCP_LAST_POSITION - HCP Last Position

		Format: MBZ
	24:16	**Last Row Position in Ctbs** Default Value: 0 Access: RO Format: U9
	15:9	**Reserved** Access: RO Format: MBZ
	8:0	**Last Column Position in Ctbs** Default Value: 0 Access: RO Format: U9

HCP Picture Checksum cIdx0

HCP_PICTURE_CHECKSUM_CIDX0 - HCP Picture Checksum cIdx0	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1C281Ch
ShortName:	HCP_PICTURE_CHECKSUM_CIDX0_VCS0
Description:	For VDBox0
Address:	1C681Ch
ShortName:	HCP_PICTURE_CHECKSUM_CIDX0_VCS1
Description:	For VDBox1
Address:	1D281Ch

0	Non-Active **[Default]**

HCP Power Context Save request

HCPPGCTXREQ - HCP Power Context Save request

Register Space: MMIO: 0/2/0

Size (in bits): 32

DWord	Bit	Description
0	31:16	**Reserved**
	15:10	**Reserved** Access: RO Format: MBZ
	9	**Power context save request** Access: R/W Set _Custom_GTIReset: BUS Power Context Save Request 1'b0 : Power context save is not being requested 1'b1 : Power context save is being requested CPUnit self-clears this bit upon sampling.
	8:0	**Power Context Save request crdit count** Access: R/W _Custom_GTIReset: BUS QWord Credits for Power Context Save Request Minimum Credits = 1 : Unit may send 1 QWord pair (enough for first LRI at least) Maximum Credits = 511 : Unit may send 511 QWord pairs A QWord pair is defined as a 32-bit register address and the corresponding 32-bits of register data. Note that the LRI header and END commands are 64-bits each (32-bit command followed by 32-bit NOOP) and will consume one QWord credit. Only valid with PWRCTX_SAVE_REQ (Bit9).

HCP Power Down FSM control register with lock

HCPSPCPOWERDNFSMCTL - HCP Power Down FSM control register with lock

Register Space: MMIO: 0/2/0

Size (in bits): 32

DWord	Bit	Description
0	31	**Reserved**
	30:13	**Reserved** Access: RO Format: MBZ
	12	**Leave firewall disabled** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not firewall the gated domain for a power down flow. But it will pretend to complete the flow with PM Encodings: 0 = Default mode, i.e firewall gated domain to ungated domain crossing during power down flows 1 = Leave firewall disabled, i.e don't firewall the gated domain, but complete logical flow
	11	**Leave reset de-asserted** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not assert reset for power off flow. But it will pretend to complete the flow with PM Encodings: 0 = Default mode, i.e assert resets during power down flows 1 = Leave reset de-asserted mode, i.e don't assert reset, but complete logical flow
	10	**Leave CLKs ON** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not gate clks for power off flow. But it will pretend to complete the flow with PM Encodings: 0 = Default mode, i.e gate clocks during power down flows 1 = Leave CLKS ON mode, i.e don't clock gate, but complete logical flow

HCPSPCPOWERDNFSMCTL - HCP Power Down FSM control register with lock

	9	**Leave FET On** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not turn off the PFET even though it will complete the flow with PM Encodings: 0 = Default mode, i.e power off fets during power down flows 1 = Leave ON mode, i.e don't power off pfet, but complete logical flow
	8:0	**Reserved** Access: RO Format: MBZ

HCP Power Gate Control Request

HCPPGCTLREQ - HCP Power Gate Control Request

Register Space: MMIO: 0/2/0

Size (in bits): 32

Clock Gating Messages Register

DWord	Bit	Description
0	31:16	**Reserved**
	15:2	**Reserved** Access: RO Format: MBZ
	1	**CLK RST FWE Request** Access: R/W _Custom_GTIReset: BUS HCP CLK RST FWE request: '0' : Initiate power down sequence (clk/rst/fwe) '1' : Initiate power up sequence (clk/rst/fwe)
	0	**Power Gate Request** Access: R/W _Custom_GTIReset: BUS HCP power well request: '0' : Initiate Power Down request '1' : Initiate Power UP req

HCP Qp Status Count

HCP_QP_STATUS_COUNT - HCP Qp Status Count		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	64	
Address:	1E9C0h	

DWord	Bit	Description
0	31:24	**Reserved** Access: RO Format: MBZ
	23:0	**Cumulative QP** Format: U24 Cumulative QP for all LCU of a Frame (Can be used for computing average QP).
1	31:15	**Reserved** Access: RO Format: MBZ
	14:8	**Frame Max CU QP** Format: U7 Valid Range: 0-51 for 8bit, 0-63 for 10bit and 0-75 for 12bit
	7	**Reserved** Access: RO Format: MBZ
	6:0	**Frame Min CU QP** Format: U7 Valid Range: 0-51 for 8bit and 0-63 for 10bit range 0-75 for 12bit

HCP Reported Bitstream Output Byte Count with header per Frame Register

HCP_BITSTREAM_BYTECOUNT_FRAME_WITH_HEADER - HCP Reported Bitstream Output Byte Count with header per Frame Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1E9A0h

DWord	Bit	Description
0	31:0	**HCP Bitstream Byte Count per Frame With header** Format: U32 Total number of bytes in the bitstream output per frame from the encoder. This includes header, optional tail, byte alignment, data bytes, EMU (emulation) bytes, capac-zero word insertion, and padding insertion. The optional header/optional tail includes all bits accumulated for PAK_INSERT_COMMAND when HeaderLenghtExcludeFrmSize is set to 0 and it does NOT include all bits generated by PAK_INSERT_COMMAND when HeaderLenghtExcludeFrmSize is set to 1. This count is updated for every time the internal bitstream counter is incremented and its reset at image start.

HCP Reported Bitstream Output Byte Count without header per Frame Register

HCP_BITSTREAM_BYTECOUNT_FRAME_NO_HEADER - HCP Reported Bitstream Output Byte Count without header per Frame Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1E9A4h

DWord	Bit	Description
0	31:0	**HCP Bitstream Byte Count per Frame Without header** Format: U32 Total number of bytes in the bitstream output per frame from the encoder. This includes optional header, optional tail, byte alignment, data bytes, EMU (emulation) bytes, capac-zero word insertion, and padding insertion. The optional header/optional tail includes all bits accumulated for PAK_INSERT_COMMAND when HeaderLenghtExcludeFrmSize is set to 0 and it does NOT include all bits generated by PAK_INSERT_COMMAND when HeaderLenghtExcludeFrmSize is set to 1. This count is updated for every time the internal bitstream counter is incremented and its reset at image start.

HCP Reported Bitstream Output CABAC Bin Count Register

HCP_CABAC_BIN_COUNT_FRAME - HCP Reported Bitstream Output CABAC Bin Count Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1E9ACh

This register stores the count of number of bins per frame.

DWord	Bit	Description
0	31:0	**HCP Cabac Bin Count** Default Value: 0 Format: U32 Total number of BINs in the bitstream output per frame from the encoder. This count is updated for every time the bin counter is incremented and its reset at image start.

HCP SLICE COUNT

HCP_SLICE_COUNT - HCP SLICE COUNT

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1E9C8h

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ
	19:0	**Slice Count** Format: U20 Indicates Number of Slices in a Frame.

HCP Unit Done

HCP_UNIT_DONE - HCP Unit Done

Header Type

HDR2_0_2_0_PCI - Header Type		
Register Space: PCI: 0/2/0 Size (in bits): 8		
Address: 0000Eh		
This register contains the Header Type of the IGD.		
DWord	**Bit**	**Description**
0	7	**Multi Function Status** Default Value: 0b Access: RO _Custom_GTIReset: BUS Indicates if the device is a Multi-Function Device. The Value of this register is hardwired to 0, internal graphics is a single function.
	6:0	**Header Code** Default Value: 0000000b Access: RO _Custom_GTIReset: BUS This is a 7-bit value that indicates the Header Code for the IGD. This code is hardwired to the value 00h, indicating a type 0 configuration space format.

Head pointer update

HEAD_PTR_UPDATE - Head pointer update	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	1C2D90h-1C2D93h
Name:	Head pointer Update

Name:	Head pointer Update
ShortName:	HEAD_PTR_UPDATE_VDENC_REG7

A write to this register with a value of 1 would result in head pointer update to Display.

DWord	Bit	Description
0	31:1	**Head pointer value** Access: R/W Hardware Clear The head pointer value is read only value. It is updated by HW.

HEAD_PTR_UPDATE - Head pointer update

	0	**Head pointer update enable** Access: R/W Hardware Clear This bit can be written with a value of 0 or 1. A write with 0 is ignored. A write with 1 would result in head pointer update to display if VDEnc is in WiDi session. While reading this bit always results zero. Head pointer update is achieved by performing config write to address 2005_0500 for widi session 0 when Capture Mode = 0, VDENC_PIPE_MODE_SELECT, DW 5. Head pointer update is achieved by performing config write to address 2005_0600 for widi session 1 when Capture Mode = 0, VDENC_PIPE_MODE_SELECT, DW 5. Head pointer update is achieved by performing config write to address 2024_2000 for widi session 0 when Capture Mode = 1, VDENC_PIPE_MODE_SELECT, DW 5. Head pointer update is achieved by performing config write to address 2024_2004 for widi session 1 when Capture Mode = 1, VDENC_PIPE_MODE_SELECT, DW 5. Head pointer update is achieved by performing config write to address 2024_2008 for widi session 2 when Capture Mode = 1, VDENC_PIPE_MODE_SELECT, DW 5. Head pointer update is achieved by performing config write to address 2024_200C for widi session 3 when Capture Mode = 1, VDENC_PIPE_MODE_SELECT, DW 5. Data format: 31:28 Zeros. 27:20 Tile number 19:16 Frame number (only bit 0 is used by HW) 15:0 Tail pointer pointing to pixel row.

HEVC Local APIC Retry Vector

HEVC_LAPIC_RETRY_VECT - HEVC Local APIC Retry Vector

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	0D594h

Holds the 4 last retry interrupt vectors. The retry vector register holds the last 4 values acknowledged as an interrupt retry. Retries are errors in hardware and are not expected. HUCINT handles retries by logging the interrupt vector in this register. No interrupt is actually retried, and the interrupt stimulus will be lost if a retry occurs. The system will hang eventually. A 2-bit counter (starting at reset value of 0) is used to point to the slot/byte location from which to load the next retry vector (into the 4 available slots) in sequence. This means if a 5th retry vector shows up, it will be loaded into slot 0 again (as the counter wraps around), over-writing the retry vector which existed there in slot_0.

DWord	Bit	Description
0	31:24	**Vector Slot 3** Format: U8
	23:16	**Vector Slot 2** Format: U8
	15:8	**Vector Slot 1** Format: U8

HS Invocation Counter

HS_INVOCATION_COUNT - HS Invocation Counter	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02300h
Name:	HS Invocation Counter
ShortName:	HS_INVOCATION_COUNT

This register stores the number of patch objects processed by the HS unit. E.g., A PATCHLIST_2 topology with 6 vertices would cause this counter to increment by 3 (there are 3 2-vertex patch objects in that topology).This register is part of the context save and restore.

DWord	Bit	Description
0	63:32	**HS Invocation Count UDW** Number of patch objects processed by the HS stage. Updated only when HS Enable and HS Statistics Enable are set in 3DSTATE_HS
	31:0	**HS Invocation Count LDW** Number of patch objects processed by the HS stage. Updated only when HS Enable and HS Statistics Enable are set in 3DSTATE_HS

IA Vertices Count

IA_VERTICES_COUNT - IA Vertices Count	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02310h-02317h
Name:	IA Vertices Count
ShortName:	IA_VERTICES_COUNT_RCSUNIT_BE_GEOMETRY
Address:	18310h-18317h
Name:	IA Vertices Count
ShortName:	IA_VERTICES_COUNT_POCSUNIT_BE_GEOMETRY

This register stores the count of vertices processed by VF. This register is part of the context save and restore.

DWord	Bit	Description
0	63:32	**IA Vertices Count Report UDW** Total number of vertices fetched by the VF stage. This count is updated for every input vertex as long as Statistics Enable is set in VF_STATE (see the Vertex Fetch Chapter in the 3D Volume.)
	31:0	**IA Vertices Count Report LDW** Total number of vertices fetched by the VF stage. This count is updated for every input vertex as long as Statistics Enable is set in VF_STATE (see the Vertex Fetch Chapter in the 3D Volume.)

Idle Switch Delay

ShortName:	IDLEDLY_VECSUNIT3
Address:	1A23Ch-1A23Fh
Name:	Idle Switch Delay
ShortName:	IDLEDLY_CCSUNIT0

The IDLEDLY register contains an Idle Delay field which specifies eight times the time stamp base units allowed for command streamer to wait before a context is switched out leading to IDLE state in Execlist mode, i.e following this context switch there is no active element available in HW to execute. Refer Time Stamp Bases subsection in Power Management chapter for time stamp base unit granularity. Example: An IDLE Delay count of 2 with Time stamp base unit value of 80ns would mean an idle delay wait of 1280ns (2*8*80). A default value of 0, means that by default, there is no restriction to wait on a context switch leading to IDLE. This register has no significance when Execlists are not enabled.

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20:0	**IDLE Delay** Format: U21 Eight times the time stamp base units allowed. Refer Time Stamp Bases subsection in Power Management chapter for time stamp base unit granularity. Example: An IDLE Delay count of 2 with Time stamp base unit value of 80ns would mean an idle delay wait of 1280ns (2*8*80).

This register is used to program the offset where commands RCS_INDIRECT_CTX points to will be executed as part of engine context restore.

Programming Notes

- BlitterCS/VideoCS/VideoCS2/VideoEnhancementCS/PositionCS: This register functionality is not supported and must not be programmed for these command streamers.
- Offset of Indirect CS context must be always programmed to a command boundary and cacheline boundary inside the context image.
- Indirect context pointer itself is restored during context restore and hence Indirect Context Offset must not be programmed with value less than 0x5.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:6	**Offset of Indirect CS Context** Format: U10 This is the cache line offset for the Indirect CS context. This defaults to execute between CS and SVG context. It is not valid to program this to a value that is greater or equal to the starting offset for RS context. If context must be programmed at the end of engine context then program

INDIRECT_CTX_OFFSET - Indirect Context Offset Pointer

		then use BB_PER_CTX_PTR. **Value** / **Name** 0Dh / **[Default]**
	5:0	**Reserved** Access: RO Format: MBZ

ShortName:	INDIRECT_CTX_CCSUNIT0

This register is used to program the indirect address to be executed between CS and SVG engine context if enabled. This will only get executed due to regular context save/restore and not during power restore. This register is part of the execution list context and will be executed per context. Only supported if execution list is enabled. There is no preempting workloads within this context.

Programming Notes

BlitterCS/VideoCS/VideoCS2/VideoEnhancementCS/PositionCS: This register functionality is not supported and must not be programmed for these command streamers.

The following commands are not supported within Render CS indirect context:

Command Name
MI_WAIT_FOR_EVENT
MI_ARB_CHECK
MI_REPORT_HEAD
MI_TOPOLOGY_FILTER
MI_SET_CONTEXT
MI_SEMAPHORE_WAIT in Memory Poll Mode is not supported. MI_SEMAPHORE_WAIT in register poll mode is supported.
MI_BATCH_BUFFER_START
MI_CONDITIONAL_BATCH_BUFFER_END

INDIRECT_CTX - Indirect Context Pointer

GPGPU_WALKER
3DPRIMITIVE
MI_BATCH_BUFFER_END

DWord	Bit	Description
0	31:6	**Indirect CS Context Address** Format: GraphicsAddress[31:6] Pointer to the Context in memory to be executed as a batch.
	5:0	**Size of Indirect CS Context** Format: U6 This is the size of the Indirect Context for CS. This size supports up to 63 cache lines worth of commands where a cache line is 64B. If programmed to zero then the indirect fetch of the CS context is disabled. Value: [0,63] Name:

Name:	Instruction Parser Mode Register
ShortName:	INSTPM_CCSUNIT0

The INSTPM register is used to control the operation of the Instruction Parser. Certain classes of instructions can be disabled (ignored) - often useful for detecting performance bottlenecks. Also, Synchronizing Flush operations can be initiated - useful for ensuring the completion (vs. only parsing) of rendering instructions.

Programming Notes

- If an instruction type is disabled, the parser will read those instructions but not process them.
- Error checking will be performed even if the instruction is ignored.
- All Reserved bits are implemented.
- This Register is saved and restored as part of Context.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask Masks: These bits serve as write enables for bits 15:0. If this register is written with any of these bits clear the corresponding bit in the field 15:0 will not be modified. Reading these bits always returns 0s.

INSTPM - Instruction Parser Mode Register

15 — Register Poll Mode Semaphore Wait Event IDLE message Disable

This bit controls the DOP CG behavior of CS while waiting for pending semaphore wait for event to be satisfied in register poll mode of operation.

Value	Name	Description
0	**[Default]**	When Rest, CS trigger DOP CG on an unsuccessful semaphore wait in register poll mode of operation.
1		When Set, CS doesn't trigger DOP CG on an unsuccessful semaphore wait in register poll mode of operation.

14 — Ignore Posh Start and Posh Enable fields in Batch Start command

Source:	RenderCS, PositionCS

This bit controls the execution of ring buffers and batch buffer by PositionCS and RenderCS.

Value	Name	Description
0	**[Default]**	PositonCS and RenderCS consider the Posh Start and Posh Enable fields programmed in the MI_BATCH_BUFFER_START command and execute accordingly. PositionCS parses (doesnt execute) the commands programmed in the ring buffer.
1		PositonCS and RenderCS ignores the Posh Start and Posh Enable fields programmed in the MI_BATCH_BUFFER_START command. PositionCS executes all the commands programmed in the ring buffer and the batch buffers.

13 — Enable Semaphore Register Poll Mask

This bit enables masking of the register data red prior to semaphore comparison on a register poll mode.

Value	Name	Description
1		In register poll mode of operation Semaphore Address Upper Dword will be used as mask and applied to the data red form the register prior to comparison. Mask Bit Set to 0 indicate the corresponding bit red from the register is considered as it is unmodified for comparison. Mask Bit Set to 1 indicate the corresponding bit red from the register is forced to 0 for comparison.
0	**[Default]**	Regular comparison with no mask applied.

12 — PreFetch Disable Status

This bit gets programmed on executing MI_ARB_CHK command with mask bit set for Pre-Fetch Disable. This bit is used to context save/restore the Pre-Fetch Disable status on a context switch. This bit must not be directly written by software.

11 — CLFLUSH Toggle

Source:	RenderCS, PositionCS
Access:	RO
Format:	U1

INSTPM - Instruction Parser Mode Register		
		This bit changes polarity each time the MI_CLFLUSH command completes. This bit is Read Only.
	10	**Reserved**
	9:0	**Reserved** Access: RO Format: MBZ

Interrupt Group 0

INTR_GROUP_0 - Interrupt Group 0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

The two Interrupt Group Registers (0 and 1) use their total 64 bits to map 16 groups to 16 base values (14 of which are currently used, 13 used prior) within the 256-bit interrupt vector. Each group (8 per register) is assigned a 4-bit value that specifies its position in the 256 vector.
The position of an interrupt within a group of 16 interrupts (as assigned by the group value) is HW determined. Groups with a single interrupt use the highest possible encoding (0XF), groups with multiple interrupts use a HW encoding as specified. Since Doorbell interrupts may use the same group value for more than one group of interrupts, each doorbell interrupt is assigned (by HW) a unique position in each group of 16. In other words, even though Doorbell groups have a single interrupt each, these do not all use the highest possible encoding, the encoding is as specified.
A value of 0 turns off that entire group of interrupts.

Programming Notes
When programmed to send doorbell interrupts to Host, only one group of 32 doorbells may be enabled. All other (seven) doorbell groups MUST be disabled by making their group value 0.
This register is saved in the power context

DWord	Bit	Description
0	31:28	**Doorbell Group 7** Interrupt vector group (dword index) for doorbell group 7, which covers input doorbells 224 through 255 Encoding: 0XF
	27:24	**Doorbell Group 6** Interrupt vector group (dword index) for doorbell group 6, which covers input doorbells 192 through 223 Encoding: 0XE
	23:20	**Doorbell Group 5** Interrupt vector group (dword index) for doorbell group 5, which covers input doorbells 160 through 191 Encoding: 0XD
	19:16	**Doorbell Group 4** Interrupt vector group (dword index) for doorbell group 4, which covers input doorbells 128 through 159 Encoding: 0XC
	15:12	**Doorbell Group 3** Interrupt vector group (dword index) for doorbell group 3, which covers input doorbells 96 through 127 Encoding: 0XB

INTR_GROUP_0 - Interrupt Group 0		
	11:8	**Doorbell Group 2** Interrupt vector group (dword index) for doorbell group 2, which covers input doorbells 64 through 95 Encoding: 0XA
	7:4	**Doorbell Group 1** Interrupt vector group (dword index) for doorbell group 1, which covers input doorbells 32 through 63 Encoding: 0X9
	3:0	**Doorbell Group 0** Interrupt vector group (dword index) for doorbell group 0, which covers input doorbells 0 through 31 Encoding: 0X8

Interrupt Group 1

INTR_GROUP_1 - Interrupt Group 1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

The two Interrupt Group Registers (0 and 1) use their total 64 bits to map 16 groups to 16 base values (14 of which are currently used, 13 used prior) within the 256-bit interrupt vector. Each group (8 per register) is assigned a 4-bit value that specifies its position in the 256 vector.
The position of an interrupt within a group of 16 interrupts (as assigned by the group value) is HW determined. Groups with a single interrupt use the highest possible encoding (0XF), groups with multiple interrupts use a HW encoding as specified.
Since Doorbell interrupts may use the same group value for more than one group of interrupts, each doorbell interrupt is assigned (by HW) a unique position in each group of 16. In other words, even though Doorbell groups have a single interrupt each, these do not all use the highest possible encoding, the encoding is as specified.
A value of 0 turns off that entire group of interrupts.

Programming Notes
This register is saved in the power context

DWord	Bit	Description
0	31:24	**Reserved** Access: RO Format: MBZ
	23:20	**Host Group** Interrupt vector group for Host. Encoding (see description above) used: 0xF
	19:16	**DMA/Timer/FLR Group** Interrupt vector group (dword index) for the DMA, Timer, FLR group. Encoding (see description above): FLR= 0XD, Timer = 0xE, DMA = 0xF
	15:12	**Display Events Group** Interrupt vector group (dword index) for display events Encoding (see description above): Solicited = 0XF Unsolicited = 0XE
	11:8	**IOMMU Interrupts Group** Interrupt vector group (dword index) for IOMMU interrupts Encoding (see description above): GuC Catastrophic Error = 0xF, Non GuC Catastrophic errors = 0XC, Page Faults = 0XB, Page Response = 0XA
	7:4	**Semaphore Group** Description Interrupt vector group (dword index) for semaphores Encoding of interrupts: VF0 = 0xF, VF1 = 0xE, VF2 = 0xD, VF3 = 0xC, VF4 = 0xB, VF5 = 0xA, VF6 = 0x9, VF7 = 0x8

INTR_GROUP_1 - Interrupt Group 1		
	3:0	**Engine Interrupts Group** Interrupt vector group (dword index) for engine interrupts Encoding: INTDW0 = 0XF, INTDW1 = 0XE

Interrupt Line

INTRLINE_0_2_0_PCI - Interrupt Line		
Register Space:	PCI: 0/2/0	
Size (in bits):	8	
Address:	0003Ch	
This register is used to communicate interrupt line routing information. The device itself does not use this value, rather it is used by device drivers and operating systems to determine priority and vector information.		
DWord	**Bit**	**Description**
0	7:0	**Interrupt Connection** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS Used to communicate interrupt line routing information. POST software writes the routing information into this register as it initializes and configures the system. The value in this register indicates to which input of the system interrupt controller the device's interrupt pin is connected.

Interrupt Pin

INTRPIN_0_2_0_PCI - Interrupt Pin		
Register Space:	PCI: 0/2/0	
Size (in bits):	8	
Address:	0003Dh	
This register tells which interrupt pin the device uses.		
DWord	**Bit**	**Description**
0	7:0	**Interrupt Pin Value** Default Value: 00000001b Access: RO _Custom_GTIReset: BUS As a single function device, the IGD specifies INTA# as its interrupt pin. Hardwired to 01h = INTA#.

I/O Base Address

IOBAR_0_2_0_PCI - I/O Base Address

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00020h

This register provides the Base offset of the I/O registers within Device #2. Bits 15:6 are programmable allowing the I/O Base to be located anywhere in 16bit I/O Address Space. Bits 2:1 are fixed and return zero; bit 0 is hardwired to a one indicating that 8 bytes of I/O space are decoded. Access to the 8Bs of IO space is allowed in PM state D0 when IO Enable (PCICMD bit 0) set. Access is disallowed in PM states D1-D3 or if IO Enable is clear or if Device #2 is turned off or if Internal graphics is disabled through the fuse or fuse override mechanisms.Note that access to this IO BAR is independent of VGA functionality within Device #2. If accesses to this IO bar is allowed then all 8, 16 or 32 bit IO cycles from IA cores that falls within the 8B are claimed.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:6	**IO Base Address** Default Value: 0000000000b Access: R/W _Custom_GTIReset: BUS Set by the OS, these bits correspond to address signals [15:6].
	5:3	**Reserved** Access: RO Format: MBZ
	2:1	**Memory Type** Default Value: 00b Access: RO _Custom_GTIReset: BUS Hardwired to 0s to indicate 32-bit address.
	0	**Memory/IO Space** Default Value: 1b Access: RO _Custom_GTIReset: BUS Hardwired to "1" to indicate IO space.

Jump Location

JMP_DEST - Jump Location

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

The Jump Location used by HW shall be in DW1 of the last Cacheline. The 32 bits are split up into two fields: one to specify the uOS load location, another to specify where in the uOS image to jump to. BootROMs shall use the 2 fields to compute uOS jump point.

Programming Notes

This register is saved in the power context

DWord	Bit	Description
0	31:18	**uOS Intended Base** Default Value: 0h Indicate the location at which uOS shall be loaded. BootROM shall verify that the ukernel was loaded at this intended location (by inspecting DMA_OUS_BASE register) before transferring control to the uOS. These 14 bits represent a cacheline aligned address [19:6] for the uOS location, allowing a uOS to be loaded at an address of upto 1MB in the MinuteIA address space.
	17:0	**uOS Offset** Default Value: 4000h Indicate the byte Offset (from the start of the uOS image) of the first executable instruction within the uOS image. This field allows the BootROM to determine where in the uOS image to transfer control to.

KVMR_SPR_COLOR_CTL

KVMR_SPR_COLOR_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	45030h-45033h
Name:	Kvmr Sprite Color Control
ShortName:	KVMR_SPR_COLOR_CTL
Reset:	soft

DWord	Bit	Description
0	31	**Enable Color Processing** This field enables the sRGB de-gamma, color space conversion to BT2020 and tone mapping with the programmed tone mapping factor. Value: 1b — Name: Enable Value: 0b — Name: Disable
	30:10	**Reserved** Access: RO Format: MBZ
	9:0	**Tone Mapping Factor** This field specifies the tone mapping factor. Each color component gets corrected with this programmed 10 bit fractional value.

L3 Allocation Control Register

L3ALLOCREG - L3 Allocation Control Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B134h
Name:	L3 Allocation Control Register
ShortName:	L3ALLOCREG
Address:	0B234h
ShortName:	L3ALLOCREG_CCS0

This register controls the allocation of various sections of the L3 cache

DWord	Bit	Description
0 L3CacheLayout: 2x2 array	31:25	**All L3 Client Pool** Access: R/W Number of ways allocated for the all client pool. This is a combined pool for all clients. Value: 68h — Name: default **[Default]** Value: [0h,68h] — Name: **Programming Notes** When this field is non-zero, **DC Way Assignment** and **Read Only Client Pool** should be 0KB.
	24:18	**DC Way Assignment** Access: R/W Number of ways allocated for HDC. Value: 0h — Name: **[Default]** Value: [0h,68h] — Name: **Programming Notes** Note: This field must be 0KB if All L3 Client Pool is non-zero.
	17:11	**Read Only Client Pool** Access: R/W Number of ways allocated for Read Only L3 clients. This is a combined pool for all Read Only clients.

L3ALLOCREG - L3 Allocation Control Register

Value	Name
0h	**[Default]**
[0h,68h]	

Programming Notes
Note: This field must be 0KB if All L3 Client Pool is non-zero.

10 **Reserved**

Access:	RO
Format:	MBZ

9 **Reserved**

Access:	RO
Format:	MBZ

8 **Reserved**

Access:	RO
Format:	MBZ

7:1 **URB Allocation**

Access:	R/W

Number of ways allocated for URB

Value	Name
10h	**[Default]**
20h	

0 **Allocation Error status**

Access:	RO

This bit indicates a programming error in L3 allocation registers (L3ALLOCREG and L3TCCNTRLREG).
0 : Indicates no error in programming
1 : Indicates that the L3 allocation programming is incorrect.L3 will use the most recent valid allocation OR default programming.

L3 Cache Runtime ECC capture Register

L3_ECC_CAPTURE_REG - L3 Cache Runtime ECC capture Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B144h

This register shows the captured value of the ECC calculated by the internal logic for L3 writes.

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ
	19:0	**L3 Cache Latched ECC Value** Access: RO This field holds the value of the ECC generated by the L3 cache pipeline for the preceding write cycle.

L3 Cache Runtime ECC Test Control Register

L3_ECC_TEST_CTL - L3 Cache Runtime ECC Test Control Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B13Ch

This register is used to control the run time testing of the ECC logic in the L3 cache.

DWord	Bit	Description
0	31:22	**Reserved** Access: RO Format: MBZ
	21	**L3 ECC Latch Enable** Access: R/W This bit enables the latching of the ECC value generated for any write access made to the L3. The latched value of the ECC can be read from the "L3 Cache Runtime ECC capture Register". 0 – **[Default]** – Disable latching. 1 – Enable the latching
	20	**L3 ECC Override Enable** Access: R/W This bit enables the overriding of the ECC value generated for any write access made to the L3. The value in the field below will be used to override the ECC internally generated. 0 – **[Default]** – Disable override of the ECC value 1 – Enable the override of the ECC value
	19:0	**L3 ECC Override Value** Default Value: 00h Access: R/W This is the value to be used as the override for the ECC when enabled in the bit field above.

L3 Control Register

L3CNTLREG - L3 Control Register		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	07034h	
Name:	L3 Control Register	
ShortName:	L3CNTLREG	

DWord	Bit	Description
0	31:0	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV

L3 Multi Context Reserved1

L3RCS0RSVD1 - L3 Multi Context Reserved1		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	DEV	
Address:	0B168h	
ShortName:	L3RCS0RSVD1	
Address:	0B268h	
ShortName:	L3CCS0RSVD1	

DWord	Bit	Description
0	31:0	**SCRATCH** Access: R/W

L3 Multi Context Reserved2

L3 Multi Context Reserved2

	0	**IDLE_LNE**	

L3 Parameter Information Register

L3PARAMINFO - L3 Parameter Information Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B164h

Programming Notes

GT_L3_NUM_WAYS_NOTAG + GT_L3_NUM_WAYS gives total number of ways for one L3 bank. Storage per way can be calculated as Total Storage per L3 bank / (GT_L3_NUM_WAYS_NOTAG + GT_L3_NUM_WAYS). L3ALLOCREG and L3TCCNTLREG can be programmed appropriately using storage/way information.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:8	**GT_L3_NUM_WAYS_NOTAG** This field indicates number of ways in L3 bank without tag storage. These number of ways must be allocated for URB.
	7:0	**GT_L3_NUM_WAYS** This field indicates number of tagged ways in L3 bank which is maximum number of ways that can be allocated for cachable data.

L3 SQC register 4

L3SQCREG4 - L3 SQC register 4

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B118h
Address:	0B218h
ShortName:	L3SQCREG4_CCS0

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20:15	**Reserved** Access: RO Format: MBZ
	14:11	**Clean Evict Regulation Window** Access: R/W This field determines the time of the clean-eviction evaluation window. Value: 0000b — Name: **[Default]** **Programming Notes** The value provided in this window is multiplied by 16 in hardware. This allows for a range of 0 to 240 clocks for the evaluation window.
	10:7	**Clean Evict Regulation Count** Access: R/W Within the evaluation window, this field defines the number of allowable clean evictions to be sent by the L3BANK. If the limit is reached in a given window, L3BANK will downgrade any further clean evictions (within that window) to silent evictions. This evaluation mechanism is only applicable if clean-evicts are enabled. Value: 0000b — Name: lp_default **[Default]** **Programming Notes** The value programmed in to this register is multiplied by 2 in hardware. This allows for a limit of 0 to 30 clean evictions within the programmable window.

L3SQCREG4 - L3 SQC register 4

	6	**Clean Evict Disable** Access: R/W Clean evicts are disabled when set Value: 1 — Name: **[Default]**
	5:0	**Reserved** Access: RO Format: MBZ

L3 SQC register 5

L3SQCREG5 - L3 SQC register 5		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	DEV	
Address:	0B158h	
Address:	0B258h	
ShortName:	L3SQCREG5_CCS0	

DWord	Bit	Description
0	31:24	**Reserved** Access: RO Format: MBZ
	23	**Reserved** Access: RO Format: MBZ
	22	**Coherent Partial Write Merge Enable** Default Value: 1 Access: R/W Format: Enable _Custom_GTIReset: DEV Enables partial write merge optimization for coherent surfaces.
	21	**Compressible Partial Write Merge Enable** Default Value: 1 Access: R/W Format: Enable _Custom_GTIReset: DEV Enables partial write merge optimization for compressible surfaces.
	20	**LRU update control for detecting oldest partial writes** Default Value: 0 Access: R/W '0' : (default) - Update LRU bit for parent and also for the child merge event '1' : Update LRU bit only for the parent

L3SQCREG5 - L3 SQC register 5

	19:10	**Reserved** Access: RO Format: MBZ
	9:0	**L3 cache partial Write merge timer initial value** Default Value: 1FFh Default Access: R/W If partial write merging is enabled, this timer controls the window to allow partial writes to merge together. The value is first loaded when an eligible request arrives, and is reloaded every time another partial write is collapsed in to the parent **Programming Notes** The value of this register must be nonzero if any partial write merging is enabled, consisting of the CZ + L3 Partial Write Merge Enables in TCCNTLREG*, and the Coherent + Compressible Partial Write Merge Enables in LSCREG5*

L3 SQC register 6

L3SQCREG6 - L3 SQC register 6		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	DEV	
Address:	0B15Ch	
Address:	0B25Ch	
ShortName:	L3SQCREG6_CCS0	

DWord	Bit	Description
0	31:14	**Reserved** Access: RO Format: MBZ
	13:7	**Maximum number of partial write chains** Access: R/W Value / Name / Description: 10h **[Default]** 4-64 Upper bound is limited by the number of L3 SuperQueue slots
	6:0	**Maximum number of slots that can wait for timer to expire** Access: R/W Value / Name / Description: 20h **[Default]** 4-64 Upper bound is limited by the number of L3 SuperQueue slots

L3 SQC registers 1

L3SQCREG1 - L3 SQC registers 1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B100h
Address:	0B200h
ShortName:	L3SQCREG1_CCS0

Programming Notes

Workaround Credits between LNI/LSQC are not updated in case of Render DOP gating condition- DOP Render clock ungating needs to happen before L3SQCREG1 is programmed and it should happen through the driver.

DWord	Bit	Description
0	31:30	**Lookup Fifo2or3 over Fifo1 counter** Default Value: 10b Access: R/W Fifo2 or Fifo3 will be selected as winner as many times as described by this counter before fifo1 that is also available can be selected as winner. Valid values are as follows: ^M 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt (Default). 3 = 8 cnt. lbcf_csr_lsqc_lookup_f2_f3_cnt[1:0]
	29:28	**Lookup Fifo1 over Fifo2or3 counter** Default Value: 11b Access: R/W Fifo1 will be selected as winner as many times as described by this counter before some other fifo (any between Fifo2/Fifo3) that is also available can be selected as winner. Valid values are as follows: ^M 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt 3 = 8 cnt (Default). lbcf_csr_lsqc_lookup_f1_cnt[1:0]

L3SQCREG1 - L3 SQC registers 1

27:26 **Lookup fifo3 counter**

Default Value:	00b
Access:	R/W

Fifo3 will be selected as winner as many times as described by this counter before Fifo2 that is also available can be selected as winner.
Valid values are as follows:
^M
0 = 1 cnt (Default).
1 = 2 cnt.
2 = 4 cnt
3 = 8 cnt.
lbcf_csr_lsqc_lookup_f3_cnt[1:0]

25:24 **Lookup fifo2 counter**

Default Value:	11b
Access:	R/W

Fifo2 will be selected as winner as many times as described by this counter before Fifo3 that is also available can be selected as winner.
Valid values are as follows:
^M
0 = 1 cnt.
1 = 2 cnt.
2 = 4 cnt
3 = 8 cnt (Default).
lbcf_csr_lsqc_lookup_f2_cnt[1:0]

23:17 **L3SQ General Priority Credit Initialization**

Access:	R/W

Description
Number of general priority credits that SQ presents to L3 Arbiter blocks. This inherently also determines the depth of the SQ; reduce the number of credits and SQ uses fewer slots. The number of general priority credits is always greater than that of high priority credits. Total number of general and high priority credits should be less than or equal to 64. This implies that the sum of the programmed general priority and high priority values should be less than or equal to 32 The number of general priority credits is equal to double the value written in this register. Example: [00001b = 2 credits; 00100b = 8 credits] Valid values for general priority credits can range from: [1 to 32]. Other values are reserved Signal name: lbcf_csr_lsqc_gen_credit_init

Value	Name
0100000b	**[Default]**

L3SQCREG1 - L3 SQC registers 1

		[2h,20h]

Programming Notes

The number of general priority credits is always greater than that of high priority credits. Total number of general and high priority credits should be less than or equal to 64. This implies that the sum of the programmed general priority and high priority values should be less than or equal to 32 lbcf_csr_lsqc_gen_credit_init + lbcf_csr_lsqc_hp_credit_init less than or equal to 32

16:11 **L3SQ High Priority Credit Initialization**

Access:	R/W

Number of high priority credits that SQ presents to L3 Arbiter blocks. This inherently also determines the depth of the SQ; reduce the number of credits and SQ uses fewer slots.
The number of high priority credits is always lesser than that of general priority credits. Total number of general and high priority credits should be less than or equal to 64. This implies that the sum of the programmed general priority and high priority values should be less than or equal to 32
The number of high priority credits is equal to double the value written in this register. Example: [00001b = 2 credits; 00100b = 8 credits]
Valid values for high priority credits can range from: [0 to 15]. Other values are reserved
Signal name: lbcf_csr_lsqc_gen_credit_init

Value	Name
000000b	**[Default]**

Programming Notes

The number of high priority credits is always lesser than that of general priority credits. Total number of general and high priority credits should be less than or equal to 64. This implies that the sum of the programmed general priority and high priority values should be less than or equal to 32 lbcf_csr_lsqc_gen_credit_init + lbcf_csr_lsqc_hp_credit_init less than or equal to 32

10 **Reserved**

Access:	RO
Format:	MBZ

9 **L3SQ Read Once Enable for Sampler Client**

Access:	R/W

L3SQ Read Once Enable for Sampler Client (SQROE):
Enables Read Once indications to L3 Cache from SQ. Once enabled, any reads from Sampler client (MT) are sent as Read Once.
0 = (default) Reads from Sampler clients issue Read to L3 Cache.
1 = Reads from Sampler clients issue Read Once to L3 Cache.
lbcf_csr_sampler_readonce_en.

L3SQCREG1 - L3 SQC registers 1

8 — Error Detection Behavior Control

Access:	R/W

The L3 error detection can be enabled to hang the GPU on a non-recoverable error due to SER type events. Such option will be used when corresponding context has data consistency requirements. Once error detection is enabled, s/w has to initialize URB or SLM to all 0's (based on usage model) prior to execution of the workload. Initialization is required to clean up the error detection logic and syndrome tracking.

Value	Name	Description
0	**[Default]**	RTL does not hang on parity errors or double bit error
1		RTL enforces a hang on parity errors or double bit error

7 — GPGPU L3 Credit Mode Enable

Default Value:	0
Access:	R/W

This bit is required to be enabled under GPGPU workloads to provide the MAX latency coverage form L3 cache. It will override the registers 0xB100[18:14] and 0xB100[23:19], to 0 and the maximum value respectively.

6 — Reserved

Access:	RO
Format:	MBZ

5 — Flush all non coherent lines

The L3 will support destination based flushing for the unified sections of the cache. i.e., if we get a DC flush, even if we have a unified cache, only the lines brought in by DC will be flushed. Similarly, tile cache flushes only clean out lines brought in by the C/Z clients into the unified section.

When a pipeline flush or a tile cache flush is received and if this bit is set, then all the modified non-coherent lines irrespective of DC/C/Z in the unified cache section will be flushed. Also, all the Shared lines in the unified cache section will be downgraded to invalid for all Non- Coherent lines.

This bit will have no impact when DC and tile cache are in separate sections. Also note that this bit will not initiate the invalidation of RO lines in the cache. That is only controlled by the RO invalidation commands sent to the L3 on a per context basis.

Value	Name	Description
0	**[Default]**	By default, the full flush mode will be disabled.

4:0 — Reserved

Access:	RO
Format:	MBZ

L3 Unslice IDLE Status Register

L3_UNSL_IDLE - L3 Unslice IDLE Status Register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32

Format:	MBZ

5:4 Lower MOCS Index - L3 Cacheability Control

Access:	R/W Lock

Memory type information used in L3. This field is combined with the additional two bits that are sent by HDC based on binding table index.
For all other L3 requesters, this field is the primary source of L3 cache controls

Value	Name	Description
0h	LOWER_DIRECT	Use binding table index for direct EU accesses - for the rest it is reserved.
1h	LOWER_UC **[Default]**	Uncacheable
2h	LOWER_RESERVED	Reserved
3h	LOWER_WB	Writeback

LNCFCMOCS6 - LNCF MOCS Register 6

3:1 Lower MOCS Index - Skip Caching Control

Default Value:	7h
Access:	R/W Lock

Defines the bit values to enable caching. Outcome overrides the L3/LLC caching for the surface.

Programming Notes

If a given bit is programmed to 0, then the corresponding address bit value is treated as a don't care.
If a given bit is programmed to 1, then the corresponding address bit must be 0 to cache in the target.

Bit Offset	Corresponding Address Bit
0	9
1	10
2	11

0 Lower MOCS Index - Enable Skip Caching

Access:	R/W Lock

Enable the skip cache mechanism

Value	Name
0h	LOWER_ESC_DISABLE
1h	LOWER_ESC_ENABLE **[Default]**

1h	LOWER_UC **[Default]**	Uncacheable
2h	LOWER_RESERVED	Reserved
3h	LOWER_WB	Writeback

LNCFCMOCS30 - LNCF MOCS Register 30

	3:1	**Lower MOCS Index - Skip Caching Control** Default Value: 7h Access: R/W Lock Defines the bit values to enable caching. Outcome overrides the L3/LLC caching for the surface. **Programming Notes** If a given bit is programmed to 0, then the corresponding address bit value is treated as a don't care. If a given bit is programmed to 1, then the corresponding address bit must be 0 to cache in the target. **Bit Offset** / **Corresponding Address Bit** 0 / 9 1 / 10 2 / 11
	0	**Lower MOCS Index - Enable Skip Caching** Access: R/W Lock Enable the skip cache mechanism **Value** / **Name** 0h / LOWER_ESC_DISABLE 1h / LOWER_ESC_ENABLE **[Default]**

LNCF MOCS Register 31

LNCFCMOCS31 - LNCF MOCS Register 31

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B09Ch

Programming Notes

WAReprogramMOCS: Upon render reset the driver needs to reprogram the LNCF MOCS Register.

DWord	Bit	Description
0	31	**Upper MOCS Index Mask Bit** Access: WO In order to prevent overwriting the upper MOCS index of this register, this bit must be set as part of the write.
	30:24	**Reserved** Access: RO Format: MBZ
	23:22	**Reserved** Access: RO Format: MBZ
	21:20	**Upper MOCS Index - L3 Cacheability Control** Access: R/W Lock Memory type information used in L3. This field is combined with the additional two bits that are sent by HDC based on binding table index. For all other L3 requesters, this field is the primary source of L3 cache controls

Value	Name	Description
0h	UPPER_DIRECT **[Default]**	Use binding table index for direct EU accesses - for the rest it is reserved.
1h	UPPER_UC	Uncacheable
2h	UPPER_RESERVED	Reserved
3h	UPPER_WB	Writeback

DWord	Bit	Description
	19:17	**Upper MOCS Index - Skip Caching Control** Default Value: 0h Access: R/W Lock Defines the bit values to enable caching. Outcome overrides the L3/LLC caching for the surface.

LNCFCMOCS31 - LNCF MOCS Register 31

Programming Notes

If a given bit is programmed to 0, then the corresponding address bit value is treated as a don't care.
If a given bit is programmed to 1, then the corresponding address bit must be 0 to cache in the target.

Bit Offset	Corresponding Address Bit
0	9
1	10
2	11

16 Upper MOCS Index - Enable Skip Caching

Access:	R/W Lock

Enable the skip cache mechanism

Value	Name
0h	UPPER_ESC_DISABLE **[Default]**
1h	UPPER_ESC_ENABLE

15 Lower MOCS Index Mask Bit

Access:	WO

In order to prevent overwriting the lower MOCS index of this register, this bit must be set as part of the write.

14:8 Reserved

Access:	RO
Format:	MBZ

7:6 Reserved

Access:	RO
Format:	MBZ

5:4 Lower MOCS Index - L3 Cacheability Control

Access:	R/W Lock

Memory type information used in L3. This field is combined with the additional two bits that are sent by HDC based on binding table index.
For all other L3 requesters, this field is the primary source of L3 cache controls

Value	Name	Description
0h	LOWER_DIRECT **[Default]**	Use binding table index for direct EU accesses - for the rest it is reserved.
1h	LOWER_UC	Uncacheable
2h	LOWER_RESERVED	Reserved
3h	LOWER_WB	Writeback

LNCFCMOCS31 - LNCF MOCS Register 31

	3:1	**Lower MOCS Index - Skip Caching Control** Default Value: 0h Access: R/W Lock Defines the bit values to enable caching. Outcome overrides the L3/LLC caching for the surface. **Programming Notes** If a given bit is programmed to 0, then the corresponding address bit value is treated as a don't care. If a given bit is programmed to 1, then the corresponding address bit must be 0 to cache in the target.

Bit Offset	Corresponding Address Bit
0	9
1	10
2	11

	0	**Lower MOCS Index - Enable Skip Caching** Access: R/W Lock Enable the skip cache mechanism

Value	Name
0h	LOWER_ESC_DISABLE **[Default]**
1h	LOWER_ESC_ENABLE

Load Indirect Base Vertex

3DPRIM_BASE_VERTEX - Load Indirect Base Vertex	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02440h-02443h
Name:	Load Indirect Base Vertex
ShortName:	3DPRIM_BASE_VERTEX_RCSUNIT_BE_GEOMETRY
Address:	18440h-18443h
Name:	Load Indirect Base Vertex
ShortName:	3DPRIM_BASE_VERTEX_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**Base Vertex** Format: S31 This register is used to store the Base Vertex of the 3D_PRIMITIVE command when Load Indirect Enable is set.

Load Indirect Extended Parameter 0

3DPRIM_XP0 - Load Indirect Extended Parameter 0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02690h-02693h
Name:	Load Indirect Extended Parameter 0
ShortName:	3DPRIM_XP0_RCSUNIT_BE_GEOMETRY
Address:	18690h-18693h
Name:	Load Indirect Extended Parameter 0
ShortName:	3DPRIM_XP0_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**Extended Parameter 0** Format: U32 **Description** This register is used to store the Extended Parameter 0 of the 3D_PRIMITIVE command when Load Indirect Enable is set.

Load Indirect Extended Parameter 1

3DPRIM_XP1 - Load Indirect Extended Parameter 1	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02694h-02697h
Name:	Load Indirect Extended Parameter 1
ShortName:	3DPRIM_XP1_RCSUNIT_BE_GEOMETRY
Address:	18694h-18697h
Name:	Load Indirect Extended Parameter 1
ShortName:	3DPRIM_XP1_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**Extended Parameter 1** Format: U32 **Description** This register is used to store the Extended Parameter 1 of the 3D_PRIMITIVE command when Load Indirect Enable is set.

Load Indirect Extended Parameter 2

3DPRIM_XP2 - Load Indirect Extended Parameter 2	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02698h-0269Bh
Name:	Load Indirect Extended Parameter 2
ShortName:	3DPRIM_XP2_RCSUNIT_BE_GEOMETRY
Address:	18698h-1869Bh
Name:	Load Indirect Extended Parameter 2
ShortName:	3DPRIM_XP2_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**Extended Parameter 2** Format: U32 **Description** This register is used to store the Extended Parameter 2 of the 3D_PRIMITIVE command when Load Indirect Enable is set.

Load Indirect Instance Count

3DPRIM_INSTANCE_COUNT - Load Indirect Instance Count	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02438h-0243Bh
Name:	Load Indirect Instance Count
ShortName:	3DPRIM_INSTANCE_COUNT_RCSUNIT_BE_GEOMETRY
Address:	18438h-1843Bh
Name:	Load Indirect Instance Count
ShortName:	3DPRIM_INSTANCE_COUNT_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**Instance Count** This register is used to store the Instance Count of the 3D_PRIMITIVE command when Load Indirect Enable is set.

Load Indirect Start Instance

3DPRIM_START_INSTANCE - Load Indirect Start Instance	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0243Ch-0243Fh
Name:	Load Indirect Start Instance
ShortName:	3DPRIM_START_INSTANCE_RCSUNIT_BE_GEOMETRY
Address:	1843Ch-1843Fh
Name:	Load Indirect Start Instance
ShortName:	3DPRIM_START_INSTANCE_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**Start Vertex** Format: U32 This register is used to store the Start Instance of the 3D_PRIMITIVE command when Load Indirect Enable is set.

Load Indirect Start Vertex

3DPRIM_START_VERTEX - Load Indirect Start Vertex	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02430h-02433h
Name:	Load Indirect Start Vertex
ShortName:	3DPRIM_START_VERTEX_RCSUNIT_BE_GEOMETRY
Address:	18430h-18433h
Name:	Load Indirect Start Vertex
ShortName:	3DPRIM_START_VERTEX_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**Start Vertex** Format: U32 This register is used to store the Start Vertex of the 3D_PRIMITIVE command when Load Indirect Enable is set.

Load Indirect Vertex Count

3DPRIM_VERTEX_COUNT - Load Indirect Vertex Count	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02434h-02437h
Name:	Load Indirect Vertex Count
ShortName:	3DPRIM_VERTEX_COUNT_RCSUNIT_BE_GEOMETRY
Address:	18434h-18437h
Name:	Load Indirect Vertex Count
ShortName:	3DPRIM_VERTEX_COUNT_POCSUNIT_BE_GEOMETRY

DWord	Bit	Description
0	31:0	**Vertex Count** Format: U32 This register is used to store the Vertex Count of the 3D_PRIMITIVE command when Load Indirect Enable is set.

Lock register for Bank

L3BANKLOCK - Lock register for Bank

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B160h

This is a basic register template

DWord	Bit	Description
0	31	**Lockdown L3BANKLOCK for writes** Default Value: 0h Access: R/W 0 : (default) All bits of L3BANKLOCK (offset 0xB160) register are R/W 1 : All bits of L3BANKLOCK (offset 0xB160) register are RO Once written to 1, the lock is set for all of 0B160 and cannot be cleared (i.e., writing a 0 will not clear the lock). Lock Control is 0B160h bit 31
	30:17	**Reserved** Access: RO Format: MBZ
	16:14	**Reserved** Access: RO Format: MBZ
	13	**Lockdown L3_ECC_TEST_CTL for writes** Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). Value / Name / Description: 0 / **[Default]** / 1 / / All bits of L3_ECC_TEST_CTL (offset 0xB13C) and URB_ECC_TEST_CTL (offset 0xB148) registers are RO.
	12	**Lockdown L3SQCREG3 for writes** Access: R/W Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). Value / Name / Description: 0 / default **[Default]** / 1 / / All bits of L3SQCREG3 (offset 0xB108) register are RO.

L3BANKLOCK - Lock register for Bank

11 — Lockdown LBSREG for writes

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0	default **[Default]**	
1		All bits of LBSREG (offset 0xB124) register are RO.

10 — Lockdown LSQCFIFOARB for writes

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0	default **[Default]**	
1		All bits of LSQCFIFOARB (offset 0xB150) register are RO.

9 — Lockdown SCRATCH1 for writes

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0	default **[Default]**	
1		All bits of SCRATCH1 (offset 0xB11C) register are RO.

8 — Lockdown LTCDREG2 for writes

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0	default **[Default]**	
1		All bits of LTCDREG2 (offset 0xB110) register are RO.

7 — Lockdown L3SQCREG2 for writes

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0	default **[Default]**	
1		All bits of L3SQCREG2 (offset 0xB104) register are RO.

6 — Lockdown L3SCRATCH3 for writes

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

L3BANKLOCK - Lock register for Bank

Value	Name	Description
0	default **[Default]**	All bits of L3SCRATCH3 (offset 0xB154) register are R/W
1		Bits [10:4] of L3SCRATCH3 (offset 0xB154) register are RO.

5 **Lockdown L3SCRATCH2 for writes**

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0h	**[Default]**	(default) All bits of L3SCRATCH2;(offset 0xB140) register are R/W
1		All bits of L3SCRATCH2 offset 0xB140) register are RO

4 **Lockdown L3SQCREG1 for writes**

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0h	Default **[Default]**	All valid bits of L3SQREG1 (offset 0xB100) register are R/W
1		All valid bits of L3SQREG1 (offset 0xB100) register are R/W (no locking effect)

3 **Lockdown LTCDREG for writes**

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0h	**[Default]**	(default) All bits of LTCDREG (offset 0xB120) register are R/W
1		All bits of LTCDREG (offset 0xB120) register are RO

2 **Lockdown L3SQCREG4 for writes**

Access:	R/W

Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Value	Name	Description
0h	**[Default]**	(default) All bits of L3SQREG4 (offset 0xB118) register are R/W
1		All bits of L3SQREG4 (offset 0xB118) register are R/W (no locking effect)

L3BANKLOCK - Lock register for Bank

	1	**Lockdown L3CHMD for writes** Access: R/W Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). **Value** / **Name** / **Description** 0h / **[Default]** / (default) All bits of L3CHMD (offset 0xB114) register are R/W 1 / / All bits of L3CHMD (offset 0xB114) register are RO
	0	**Lockdown L3CNTLREG1 for writes** Access: R/W Once Lock Control 0xB160h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). **Value** / **Name** / **Description** 0h / **[Default]** / (default) - All bits of L3CNTLREG1 (offset 0xB10C) register are R/W 1 / / All bits of L3CNTLREG1 (offset 0xB10C) register are RO

Lock register for LPFC

L3LPFCLOCK - Lock register for LPFC

Register Space: MMIO: 0/2/0
Size (in bits): 32
_Custom_GTIReset: DEV

Address: 0B460h

This is a basic register template

DWord	Bit	Description
0	31	**Lockdown L3LPFCLOCK** Default Value: 0h Access: R/W 0 : (default) All bits of L3LPFCLOCK (offset 0xB460) register are R/W 1 : All bits of L3LPFCLOCK (offset 0xB460) register are RO Once written to 1, the lock is set for all of 0xB460 and cannot be cleared (i.e., writing a 0 will not clear the lock). Lock Control is B460h bit 31
	30:3	**Reserved** Access: RO Format: MBZ
	2	**Reserved**
	1	**Lockdown LSN Unslice Client Virtual Channel Assignment** Default Value: 0h Access: R/W 0 : (default) bits is R/W 1 : bit is RO Once Lock Control B460h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).
	0	**Lockdown LPFC hashing disable** Default Value: 0h Access: R/W 0 : (default) bit is R/W 1 : bit is RO Once Lock Control B460h bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

Lock register for Node

L3NODELOCK - Lock register for Node

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B0ACh

This is a basic register template

DWord	Bit	Description
0	31	**Lockdown L3NODELOCK** Default Value: 0h Access: R/W 0 : (default) All bits of L3NODELOCK (offset 0xB0AC) register are R/W 1 : All bits of L3NODELOCK (offset 0xB0AC) register are RO Once written to 1, the lock is set for all of 0xB0AC and cannot be cleared (i.e., writing a 0 will not clear the lock). Lock Control is 0B0ACh bit 31
	30:4	**Reserved** Access: RO Format: MBZ
	3	**Lockdown Color client arb pri, Z client Arb pri** Default Value: 0h Access: R/W 0 : (default) bits is R/W 1 : bit is RO Once Lock Control 0B0ACh bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).
	2	**Lockdown slow client fix dis** Default Value: 0h Access: R/W 0 : (default) bits is R/W 1 : bit is RO Once Lock Control 0B0ACh bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

L3NODELOCK - Lock register for Node

	1	**Lockdown TC/vc sel, LSN arb pri sel** Default Value: 0h Access: R/W 0 : (default) bits is R/W 1 : bit is RO Once Lock Control 0B0ACh bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).
	0	**Lockdown Hashing disable, mod5 hash dis, Non coh completion from node enable** Default Value: 0h Access: R/W 0 : (default) bit is R/W 1 : bit is RO Once Lock Control 0xB0ACh bit 31 is written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock).

LPFC FUSA Register

LPFC_FUSA - LPFC FUSA Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B480h

Functional Safety Register. LPFC collects updates of single and double bit errors from all LBCF in ECC Checker Mode.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**Double bit error indication from Bank 7** Access: R/W Double Error detection indication from Bank7.
	14	**Single bit error indication from Bank 7** Access: R/W Single Error detection indication from Bank7.
	13	**Double bit error indication from Bank 6** Access: R/W Double Error detection indication from Bank6.
	12	**Single bit error indication from Bank 6** Access: R/W Single Error detection indication from Bank6.
	11	**Double bit error indication from Bank 5** Access: R/W Double Error detection indication from Bank5.
	10	**Single bit error indication from Bank 5** Access: R/W Single Error detection indication from Bank5.

LPFC_FUSA - LPFC FUSA Register

	9	**Double bit error indication from Bank 4** Access: R/W Double Error detection indication from Bank4.
	8	**Single bit error indication from Bank 4** Access: R/W Single Error detection indication from Bank4.
	7	**Double bit error indication from Bank 3** Access: R/W Double Error detection indication from Bank3.
	6	**Single bit error indication from Bank 3** Access: R/W Single Error detection indication from Bank3.
	5	**Double bit error indication from Bank 2** Access: R/W Double Error detection indication from Bank2.
	4	**Single bit error indication from Bank 2** Access: R/W Single Error detection indication from Bank2.
	3	**Double bit error indication from Bank 1** Access: R/W Double Error detection indication from Bank1.
	2	**Single bit error indication from Bank 1** Access: R/W Single Error detection indication from Bank1.
	1	**Double bit error indication from Bank 0** Access: R/W Double Error detection indication from Bank0.
	0	**Single bit error indication from Bank 0** Access: R/W Single Error detection indication from Bank0.

LSN Arbitration Priority Register 0

LSN_ARBPRI0 - LSN Arbitration Priority Register 0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	0B0D0h

DWord	Bit	Description
0	31:28	**GAPS Local-Slice Arbitration Priority** This value is 'n' in the m:n priority scheme for L3 vs. GAPS local-slice traffic. Value: 1 — **[Default]** Value: [1,15]
	27:24	**L3 Local-Slice Arbitration Priority** This value is 'm' in the m:n priority scheme for L3 vs. GAPS local-slice traffic. Value: 4 — **[Default]** Value: [1,15]
	23:20	**LNE Traffic Class Channel 1 Priority Value** This value is 'm' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on LNE cycles. Value: 4 — **[Default]** Value: [1,15]
	19:16	**LNE Traffic Class Channel 0 Priority Value** This value is 'n' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on LNE cycles. Value: 1 — **[Default]** Value: [1,15]
	15:12	**LSN Virtual Channel 1 Traffic Class Channel 1 Priority Value** This value is 'm' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on LSN Virtual Channel 1 cycles. Value: 4 — **[Default]** Value: [1,15]

LSN_ARBPRI0 - LSN Arbitration Priority Register 0

	11:8	**LSN Virtual Channel 1 Traffic Class Channel 0 Priority Value** This value is 'n' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on LSN Virtual Channel 1 cycles. **Value** / **Name** 1 / **[Default]** [1,15] /
	7:4	**LSN Virtual Channel 0 Traffic Class Channel 1 Priority Value** This value is 'm' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on LSN Virtual Channel 0 cycles. **Value** / **Name** 4 / **[Default]** [1,15] /
	3:0	**LSN Virtual Channel 0 Traffic Class Channel 0 Priority Value** This value is 'n' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on LSN Virtual Channel 0 cycles. **Value** / **Name** 1 / **[Default]** [1,15] /

LSN Arbitration Priority Register 1

LSN_ARBPRI1 - LSN Arbitration Priority Register 1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	0B0D4h

DWord	Bit	Description
0	31:25	**Reserved** Access: RO Format: MBZ
	24	**LSN Opporunistic Arbitration Disable** Default Value: 0 _Custom_GTIReset: DEV 0 (default) - Opportunistic Arbitration mechanism of LSN Cross-Slice, LSN-LNI and LSN-LNE arbiters is enabled. 1- Opportunistic Arbitration mechanism of LSN Cross-Slice, LSN-LNI and LSN-LNE arbiters is disabled. Signal name - lncf_csr_lsn_opprtnstc_arb_dis
	23:20	**LNI Egress Traffic Class Channel 1 Priority Value** This value is 'm' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on completions to LNI's egress port. Value: 4 **[Default]** Value: [1,15]
	19:16	**LNI Egress Traffic Class Channel 0 Priority Value** This value is 'n' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on completions to LNI's egress port. Value: 1 **[Default]** Value: [1,15]
	15:12	**LNI Ingress Traffic Class Channel 1 Priority Value** This value is 'm' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on completions to LNI's ingress port. Value: 4 **[Default]** Value: [1,15]

LSN_ARBPRI1 - LSN Arbitration Priority Register 1

	11:8	**LNI Ingress Traffic Class Channel 0 Priority Value** This value is 'n' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on completions to LNI's ingress port. **Value** / **Name** 1 / **[Default]** [1,15] /
	7:4	**Cross-Slice Completion Traffic Class Channel 1 Priority Value** This value is 'm' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on cross-slice completions. **Value** / **Name** 4 / **[Default]** [1,15] /
	3:0	**Cross-Slice Completion Traffic Class Channel 0 Priority Value** This value is 'n' in the n:m priority scheme for TCC0 vs. TCC1 arbitration on cross-slice completions. **Value** / **Name** 1 / **[Default]** [1,15] /

LSN Miscellaneous Configuration

LSN_MISC - LSN Miscellaneous Configuration

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	0B0CCh

DWord	Bit	Description
0	31:6	**Reserved** Access: RO Format: MBZ
	5	**L3 Smart Repeater Bypass Enable** When set, L3 smart repeaters in unslice will bypass all FIFOs for requests. The simple flop bypass path will be used.
	4	**LSN Egress Pipeline Clock Gating Enable** Value / Name / Description: 1 / **[Default]** / Enable fub-level clock gating of the LSN egress pipeline. 0 / / Disable fub-level clock gating of the LSN egress pipeline.
	3	**LSN Smart Gating for Slice-Bound Memory Fill Repeaters Disable** Value / Name / Description: 1 / **[Default]** / Disable the smart gating of slice-bound memory fill repeaters. 0 / / Allow smart-gating for slice-bound memory fill repeaters.
	2	**LSN Conservative Arbitration Control** Controls whether LSN uses a more conservative form of arbitration by removing assumptions about packet arrival Value / Name / Description: 1 / / Cycles are only eligible for arbitration in the pipeline after arrival of all packets of the cycle. 0 / **[Default]** / Cycles are eligible for arbitration after the arrival of the first packet of the cycle.
	1	**GAFS Return Simple Arbitration Control** Enables simple arbitration between upstream LSN busses when returning GAFS-bound read returns. This arbitration uses a continuously running counter to select two busses for GAFS-bound read returns.

LSN_MISC - LSN Miscellaneous Configuration

Value	Name	Description
1	SIMPLE	Enable simple (always running) arbitration
0	PRIORITY **[Default]**	Enable priority-based arbitration

0 **LSN Cross-Slice Virtual Channel Arbitration Control**

Controls whether to use round-robin or fixed priority arbitration between cross-slice virtual channels

Value	Name	Description
1	RR_PRI	Enable round-robin priority between VC1 and VC0
0	FIXED_PRI **[Default]**	Enable fixed priority between VC1 and VC0. VC1 will always take higher priority

LSN Slice Client Virtual Channel Assignment

LSN_SLCVC - LSN Slice Client Virtual Channel Assignment

Register Space:	MMIO: 0/2/0
Access:	R/W

LSQC FIFO Arbitration

LSQCFIFOARB - LSQC FIFO Arbitration

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0B150h

LSQC FIFO Arbitration register enables programmable arbitration used for selecting a winner amongst multiple FIFO's in LSQC

DWord	Bit	Description
0	31:24	**Reserved** Access: RO Format: MBZ
	23:22	**Memory read over memory write** Access: R/W _Custom_GTIReset: DEV This count will determine for how many clocks the memory reads will be selected as winner before allowing memory writes. Needed as Cmd port from lsqc to gapl3 is just 1. Valid values are as follows: 0 = 1 cnt (Default). 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt. lbcf_csr_lsqc_memrd_over_memwr_cnt[1:0] Value: 1 — Name: **[Default]**
	21:20	**Memory write over Memory Read** Access: R/W _Custom_GTIReset: DEV This count will determine for how many clocks the memory writes will be selected as winner before allowing memory reads. Needed as Cmd port from lsqc to gapl3 is just 1. Valid values are as follows: 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt (Default). lbcf_csr_lsqc_memwr_over_memrd_cnt[1:0] Value: 0 — Name: def **[Default]**

LSQCFIFOARB - LSQC FIFO Arbitration

	19:18	**Memory read Fifo2 counter** Default Value: 00b Access: R/W _Custom_GTIReset: DEV This count will determine for how many clocks the memory reads fifo2 will be selected as winner before allowing memory read Fifo1. Valid values are as follows: 0 = 1 cnt (Default). 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt. lbcf_csr_lsqc_memrd_f2_cnt[1:0]
	17:16	**Memory read Fifo1 counter** Default Value: 11b Access: R/W _Custom_GTIReset: DEV This count will determine for how many clocks the memory reads fifo1 will be selected as winner before allowing memory read Fifo2. Valid values are as follows: 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt (Default). lbcf_csr_lsqc_memrd_f1_cnt[1:0]
	15:14	**Memory write Fifo2 counter** Default Value: 00b Access: R/W _Custom_GTIReset: DEV This count will determine for how many clocks the memory writes fifo2 will be selected as winner before allowing read returns. Valid values are as follows: 0 = 1 cnt (Default). 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt. lbcf_csr_lsqc_memwr_f2_cnt[1:0]

LSQCFIFOARB - LSQC FIFO Arbitration

	13:12	**Memory write Fifo1 counter** Default Value: 11b Access: R/W _Custom_GTIReset: DEV This count will determine for how many clocks the memory writes fifo1 will be selected as winner before allowing read returns. Valid values are as follows: 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt (Default). lbcf_csr_lsqc_memwr_f1_cnt[1:0]
	11:10	**Read Return Fifo3 counter** Default Value: 00b Access: R/W _Custom_GTIReset: DEV Fifo3 will be selected as winner as many times as described by this counter before some other fifo that is also available can be selected as winner. Valid values are as follows: 0 = 1 cnt (Default). 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt. lbcf_csr_lsqc_rdret_f3_cnt[1:0]
	9:8	**Read Return Fifo2 counter** Default Value: 10b Access: R/W _Custom_GTIReset: DEV Fifo2 will be selected as winner as many times as described by this counter before some other fifo that is also available can be selected as winner. Valid values are as follows: 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt (Default). 3 = 8 cnt. lbcf_csr_lsqc_rdret_f2_cnt[1:0]

LSQCFIFOARB - LSQC FIFO Arbitration

	7:6	**Read Return Fifo1 counter** Default Value: 11b Access: R/W _Custom_GTIReset: DEV Fifo1 will be selected as winner as many times as described by this counter before some other fifo that is also available can be selected as winner. Valid values are as follows: 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt (Default). lbcf_csr_lsqc_rdret_f1_cnt[1:0]
	5:4	**Fill Fifo3 counter** Default Value: 00b Access: R/W _Custom_GTIReset: DEV Fifo3 will be selected as winner as many times as described by this counter before some other fifo that is also available can be selected as winner. Valid values are as follows: 0 = 1 cnt (Default). 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt. lbcf_csr_lsqc_fill_f3_cnt[1:0]
	3:2	**Fill Fifo2 counter** Default Value: 10b Access: R/W _Custom_GTIReset: DEV Fifo2 will be selected as winner as many times as described by this counter before some other fifo that is also available can be selected as winner. Valid values are as follows: 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt (Default). 3 = 8 cnt. lbcf_csr_lsqc_fill_f2_cnt[1:0]

LSQCFIFOARB - LSQC FIFO Arbitration

	1:0	**Fill Fifo1 counter** Default Value: 11b Access: R/W _Custom_GTIReset: DEV Fifo1 will be selected as winner as many times as described by this counter before some other fifo that is also available can be selected as winner. Valid values are as follows: 0 = 1 cnt. 1 = 2 cnt. 2 = 4 cnt. 3 = 8 cnt (Default). lbcf_csr_lsqc_fill_f1_cnt[1:0]

LUT_3D_CTL

LUT_3D_CTL

Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank or pipe not enabled

Address:	490A4h-490A7h
Name:	Pipe A 3D LUT Control
ShortName:	LUT_3D_CTL_A
Reset:	soft

Address:	491A4h-491A7h
Name:	Pipe B 3D LUT Control
ShortName:	LUT_3D_CTL_B
Reset:	soft

<table>
<tr><th>DWord</th><th>Bit</th><th>Description</th></tr>
<tr><td rowspan="2">0</td><td>31</td><td>LUT 3D Enable
This field enables the 3D LUT.
<table>
<tr><th>Value</th><th>Name</th></tr>
<tr><td>0b</td><td>Disable</td></tr>
<tr><td>1b</td><td>Enable</td></tr>
</table>
<table>
<tr><th>Programming Notes</th></tr>
<tr><td>3D LUT can be enabled/disabled at any time irrespective of when the pipe is enabled/disabled. Program the Bit 10 of register 420b0h to 1b to ensure that the 3D LUT functionality gets enabled on the first frame after the pipe turns on.</td></tr>
</table></td></tr>
<tr><td>30</td><td>New LUT Ready
<table>
<tr><td>Access:</td><td>R/W Set</td></tr>
</table>
This bit must be set to '1' after all the 3D LUT entries are programmed. This bit will get cleared by hardware after the LUT buffer is loaded in to the internal working RAM.
<table>
<tr><th>Value</th><th>Name</th><th>Description</th></tr>
<tr><td>0b</td><td>New LUT not ready</td><td>New LUT is not yet ready/hardware finished loading the LUT buffer in to internal working RAM.</td></tr>
<tr><td>1b</td><td>New LUT Ready</td><td>New LUT is ready.</td></tr>
</table>
<table>
<tr><th>Restriction</th></tr>
<tr><td>Once set, only hardware is allowed to clear this bit. Software cannot clear this bit.</td></tr>
</table></td></tr>
</table>

LUT_3D_CTL

	29	**Allow Double Buffer Update Disable** Access: R/W This field controls whether double buffer updates are allowed to be disabled for the 3D LUT registers that are double buffered. The DOUBLE_BUFFER_CTL register can be configured to globally disable double buffer updates for those resources that allow them to be disabled. Updates to the LUT entries, triggered by New LUT Ready, do not have double buffer updating disabled. **Value** / **Name** 0b: Not Allowed 1b: Allowed **[Default]**
	28:0	**Reserved** Access: RO Format: MBZ

LUT_3D_DATA

LUT_3D_DATA	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	490ACh-490AFh
Name:	Pipe A 3D LUT Data
ShortName:	LUT_3D_DATA_A
Reset:	soft
Address:	491ACh-491AFh
Name:	Pipe B 3D LUT Data
ShortName:	LUT_3D_DATA_B
Reset:	soft

These are the 3D LUT entries. The 3D LUT Index Value indicates the 3D LUT location to be accessed through this register.
Even though this specific register is not double buffered, the 3D LUT table that this register accesses is (i.e. this register updates the table's back buffer). The double buffering point for the table (after DB'ing is armed) is the start of V. Blank or the Pipe is disabled

Restriction
This register must be written only as a full 32 bit dword. Byte or word writes are not supported.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:0	**LUT 3D Entry** 3D LUT entry value programmed as R10G10B10.

LUT_3D_INDEX

LUT_3D_INDEX

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Address:	490A8h-490ABh
Name:	Pipe A 3D LUT Index
ShortName:	LUT_3D_INDEX_A
Reset:	soft

Address:	491A8h-491ABh
Name:	Pipe B 3D LUT Index
ShortName:	LUT_3D_INDEX_B
Reset:	soft

This index controls access to the pre-double buffered array of 3D LUT entries.
Even though this specific register is not double buffered, the 3D LUT table that this register accesses is (i.e. this register updates the table's back buffer). The double buffering point for the table (after DB'ing is armed) is the start of V. Blank or the Pipe is disabled

DWord	Bit	Description
0	31:14	**Reserved** Access: RO Format: MBZ
	13	**Index Auto Increment** This field enables the index value to auto increment on each read or write to the data register. 0b – No Increment 1b – Auto Increment
	12:0	**Index Value** This field indicates the data location to be accessed through the data register. This value can be automatically incremented by a read or a write to the data register if the index auto increment bit is set. When automatically incrementing, the current automatically calculated index value can be read here, and the index will roll over to 0 after reaching the end of the allowed range. [0,4912]

MAILBOX0

MAILBOX0 - MAILBOX0

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	120800h

This register contains bits 31:0 of the generic descriptor, fetched from the invalidate queue for GT.

DWord	Bit	Description
0	31:0	**DATA** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS This field contains bits 31:0 of the generic descriptor, fetched from the invalidate queue for GT.

MAILBOX1

MAILBOX1 - MAILBOX1

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	120804h

This register contains bits 63:32 of the generic descriptor, fetched from the invalidate queue for GT.

DWord	Bit	Description
0	31:0	**DATA** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS This field contains bits 63:32 of the generic descriptor, fetched from the invalidate queue for GT.

MAILBOX2

MAILBOX2 - MAILBOX2		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	120808h	
This register contains bits 95:64 of the generic descriptor, fetched from the invalidate queue for GT.		

DWord	Bit	Description
0	31:0	**DATA** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS This field contains bits 95:64 of the generic descriptor, fetched from the invalidate queue for GT.

MAILBOX3

MAILBOX3 - MAILBOX3

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	12080Ch

This register contains bits 127:96 of the generic descriptor, fetched from the invalidate queue for GT.

DWord	Bit	Description
0	31:0	**DATA** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS This field contains bits 127:96 of the generic descriptor, fetched from the invalidate queue for GT.

Maximum Latency

MAXLAT_0_2_0_PCI - Maximum Latency		
Register Space:	PCI: 0/2/0	
Size (in bits):	8	
Address:	0003Fh	
The Integrated Graphics Device has no requirement for the settings of Latency Timers.		
DWord	**Bit**	**Description**
0	7:0	**Maximum Latency Value** Default Value: 00000000b Access: RO _Custom_GTIReset: BUS Hardwired to 0s because the IGD has no specific requirements for how often it needs to access the PCI bus.

MBC Control Register

MBCTL - MBC Control Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0907Ch

MBC Control Register

DWord	Bit	Description
0	31:18	**ECORSVD** Access: R/W _Custom_GTIReset: BUS ECO purposes Reserved
	17	**U2C Global PMON Enable Override** Default Value: 1b Access: R/W _Custom_GTIReset: BUS U2C Performance Monitor Global Enable Override 0 - U2C Global PMON needs to be enabled for performance monitors to be enabled (default) 1 - Overrride U2C Global PMON Enable is ignored ine baled performance monitor counters
	16	**VCR Fuse Writes as Posted** Access: R/W _Custom_GTIReset: BUS Non-posted fuse fetching is NOT supported. Only posted is allowed (the default). 0 - MBCunit sends VCR Fuse Writes as Non-posted. 1 - MBCunit sends VCR Fuse Writes as posted.
	15:8	**Reserved** Access: RO Format: MBZ
	7	**Disable Wait for SQemtpy in MAE** Access: R/W _Custom_GTIReset: BUS 0 - Wait for SQempty for MAE update Flow. 1 - MBC MAE update FSM does not wait for the SQempty to complete the FSM.
	6	**Reserved**

MBCTL - MBC Control Register

	5:4	**Reserved** Access: RO Format: MBZ
	3	**Context Fetch Needed** Access: R/W _Custom_GTIReset: BUS Context Fetch Needed for Power Exits. 0 - Context Fetch Not Needed. 1 - Context Fetch Needed for Power Exits (CPD Entry).
	2:0	**Reserved** Access: RO Format: MBZ

MBUS_ABOX_CTL

MBUS_ABOX_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Address:	45038h-4503Bh
Name:	MBus ABox Control
ShortName:	MBUS_ABOX_CTL
Reset:	soft

Address:	45048h-4504Bh
Name:	MBus ABox 1 Control
ShortName:	MBUS_ABOX1_CTL
Reset:	soft

Address:	4504Ch-4504Fh
Name:	MBus ABox 2 Control
ShortName:	MBUS_ABOX2_CTL
Reset:	soft

DWord	Bit	Description
0	31	**Status** Access: RO This field indicates if the box is enabled. 0b: Disabled 1b: Enabled
	30:27	**Ring Stop Address** Access: RO This field indicates the address of the box in the ring.
	26:22	**B2B Transactions Max** This fields indicates the number of back to back transactions that can be added to either to top or bottom of the ring when 'Regulate Transactions' bit is 1b. 10: **[Default]** [1-31]
	21:20	**BW Credits** Default Value: 1h BW credits are used by the Arbiter to initiate write cycles when performing VRH read-modified-writes to the display buffer.

MBUS_ABOX_CTL

	19:16	**B Credits** Default Value: 1h B credits are used by the Arbiter to initiate read cycles when performing VRH read-modified-writes to the display buffer.
	15:14	**Reserved** Access: RO Format: MBZ
	13	**Regulate B2B Transactions** This field controls the regulation of back to back transactions from this ring stop. 0b: Disable 1b: Enable **[Default]**
	12:8	**BT Credits Pool2** Default Value: 10h BT credits are used by the Arbiter to request trackers from the Display Buffer.
	7:5	**B2B Transactions Delay** This field indicates the number of wait cycles after the maximum back to back transactions is sent. [0-7] 2 **[Default]**
	4:0	**BT Credits Pool1** Default Value: 10h BT credits are used by the Arbiter to request trackers from the Display Buffer.

MBUS_BBOX_CTL

MBUS_BBOX_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Address:	45040h-45043h

2:0 VGA B Credits

Default Value:	4

B credits used by VGA to request data from Display Buffer.

MCPG1 Hysteresis Time Free

OAG_MCPG1_HYSTERESIS_TIME_FREE - MCPG1 Hysteresis Time Free		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DBB4h	
This register counts the time that MCPG hysteresis time is accumulating for media slice 1. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

MCR Packet Control

MCRPKT_CTRL - MCR Packet Control

Register Space: MMIO: 0/2/0
Size (in bits): 32
_Custom_GTIReset: BUS

Address: 00FDCh-00FDFh

DWord	Bit	Description
0	31	**MULTICAST** Access: R/W Value determines the multicast value driven to MCR. 0 - not multicast 1 - multicast The usage model is that the value is returned to the default (1), after completion of the unicast request. Value / Name: 1b: Multicast **[Default]** 0b: Unicast Programming Notes: SLICEID and DUAL_SUBSLICEID are used in Unicast but ignored for Multicast.
	30:27	**SLICEID** Access: R/W Value determines the slice ID driven to MCR. Value / Name: 0000b: **[Default]** [0001b,1111b]: Programming Notes: Values must be in range of slices and subslices in the configuration.
	26:24	**DUAL_SUBSLICEID** Access: R/W Value determines the dual-subslice ID (or l3_bank) driven to MCR. Value / Name: 000b: **[Default]** [001b,111b]: Programming Notes: Values must be in range of slices and subslices in the configuration.

MCRPKT_CTRL - MCR Packet Control		
	23:0	**Reserved** Access: RO Format: MBZ

MCR Packet Control 0

MCRPKT_CTRL_MCFG - MCR Packet Control 0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00FD0h-00FD3h	
DWord	**Bit**	**Description**
0	31	**MULTICAST MCFG** Default Value: 1b Access: R/W Value determines the multicast value driven to MCR for accesses to MCFG. 0 - not multicast 1 - multicast The usage model is that the value is returned to the default (1), after completion of the unicast request.
	30:27	**SLICEID MCFG** Default Value: 0000b Access: R/W Value driven on packet field Slice ID targeting MCFG.
	26:24	**DUAL_SUBSLICEID MCFG** Default Value: 000b Access: R/W Value determines the SQIDI ID driven on packet field Dual-Subslice ID targeting MCFG.
	23:0	**Reserved** Access: RO Format: MBZ

MCRPacketControl1

MCRPKT_CTRL_MDRB - MCRPacketControl1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00FD4h-00FD7h	
DWord	**Bit**	**Description**
0	31	**MULTICAST MDRB** Default Value: 1b Access: R/W Value determines the multicast value driven to MCR for accesses to MDRB. 0 - not multicast 1 - multicast The usage model is that the value is returned to the default (1), after completion of the unicast request.
	30:27	**SLICEID MDRB** Default Value: 0000b Access: R/W Value driven on packet field Slice ID targeting MDRB.
	26:24	**DUAL_SUBSLICEID MDRB** Default Value: 000b Access: R/W Value determines the SQIDI ID driven on packet field Dual-Subslice ID targeting MDRB.
	23:0	**Reserved** Access: RO Format: MBZ

MCR Packet Control 2

MCRPKT_CTRL_SF - MCR Packet Control 2		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00FD8h-00FDBh	
DWord	**Bit**	**Description**
0	31	**MULTICAST SF** Default Value: 1b Access: R/W Value determines the multicast value driven to MCR for accesses to SF. 0 - not multicast 1 - multicast The usage model is that the value is returned to the default (1), after completion of the unicast request.
	30:27	**SLICEID SF** Default Value: 0000b Access: R/W Value driven on packet field Slice ID targeting SF.
	26:24	**DUAL_SUBSLICEID SF** Default Value: 000b Access: R/W Value determines the SQIDI ID driven on packet field Dual-Subslice ID targeting SF.
	23:0	**Reserved** Access: RO Format: MBZ

MDRB Context Base 1

MDRB_CTXBASE1 - MDRB Context Base 1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00DC8h	
RC6 Save Location NOTE: This register is not used since MDRB unit no longer exists. This will be removed in a future project		
DWord	**Bit**	**Description**
0	31:6	**MDRB Memory Base Low** Access: R/W Lock _Custom_GTIReset: BUS This field is used to set the base of memory where the RC6 power context will be saved This value MUST be above the base and below the top of stolen memory This register is locked (becomes read-only) when RC6MEMLOCK is 1
	5:1	**Reserved** Access: RO Format: MBZ
	0	**Ctx Base is Enabled** Access: R/W Lock _Custom_GTIReset: BUS 1'b0 : The MDRB base has not been enabled, so don't do the MDRB context save (This is default value and BIOS has to program it to enable context save) 1'b1 : The MDRB base has been enabled, so go ahead with the context save

MDRB Context Base 2

MDRB_CTXBASE2 - MDRB Context Base 2		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00DCCh	
RC6 Base Location NOTE: This register is not used since MDRB unit is no more there.		
DWord	**Bit**	**Description**
0	31:0	**MDRB Memory Base High** Access: R/W Lock _Custom_GTIReset: BUS This field is used to set the base of memory where the RC6 power context will be saved This value MUST be above the base and below the top of stolen memory This register is locked (becomes read-only) when RC6MEMLOCK is 1

MED0HCP0PowerGoodDelay

MED0HCP0_PG_DLY - MED0HCP0PowerGoodDelay		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
IA/Context savable by MGSR/punit		
DWord	**Bit**	**Description**
0	31:16	**Power Good Delay** Default Value: 00C8h PWRGOOD_DLY Value
	15:0	**RAMP Delay** Default Value: 00C8h RAMP_DLY Value

MED0MFX0PowerGoodDelay

MED0MFX0_PG_DLY - MED0MFX0PowerGoodDelay		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
IA/Context savable by MGSR/punit		
DWord	**Bit**	**Description**
0	31:16	**Power Good Delay** Default Value: 00C8h PWRGOOD_DLY Value
	15:0	**RAMP Delay** Default Value: 00C8h RAMP_DLY Value

MED0PowerGoodDelay

MED0_PG_DLY - MED0PowerGoodDelay		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
IA/Context savable by MGSR/punit		
DWord	**Bit**	**Description**
0	31:16	**Power Good Delay** Default Value: 00C8h PWRGOOD_DLY Value
	15:0	**RAMP Delay** Default Value: 00C8h RAMP_DLY Value

MED1HCP0PowerGoodDelay

MED1HCP0_PG_DLY - MED1HCP0PowerGoodDelay		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
IA/Context savable by MGSR/punit		
DWord	**Bit**	**Description**
0	31:16	**Power Good Delay** Default Value: 00C8h PWRGOOD_DLY Value
	15:0	**RAMP Delay** Default Value: 00C8h RAMP_DLY Value

MED1MFX0PowerGoodDelay

MED1MFX0_PG_DLY - MED1MFX0PowerGoodDelay		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
IA/Context savable by MGSR/punit		
DWord	**Bit**	**Description**
0	31:16	**Power Good Delay** Default Value: 00C8h PWRGOOD_DLY Value
	15:0	**RAMP Delay** Default Value: 00C8h RAMP_DLY Value

MED1PowerGoodDelay

MED1_PG_DLY - MED1PowerGoodDelay		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
IA/Context savable by MGSR/punit		
DWord	**Bit**	**Description**
0	31:16	**Power Good Delay** Default Value: 00C8h PWRGOOD_DLY Value
	15:0	**RAMP Delay** Default Value: 00C8h RAMP_DLY Value

Media Die Recovery

MED_DIE_RECOVERY - Media Die Recovery	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	12298h
Name:	VCS Media Die Recovery
ShortName:	VCS_MED_DIE_RECOVERY

This register is stored in the VCS but is used in the HWM unit. This register programs the die recovery override and engine ID's.

DWord	Bit	Description
0	31:12	**Reserved** Access: RO Format: MBZ
	11:9	**Forced Next Engine ID** Access: R/W This field is the next engine ID.
	8	**Force Next Engine ID** Access: R/W The bit forces the next engine ID.
	7:4	**Reserved** Access: RO Format: MBZ
	3:1	**Forced Previous Engine ID** Access: R/W This field is the previous engine ID.
	0	**Force Previous Engine ID** Access: R/W The bit forces the previous engine ID.

Media FIFO Messaging Register for Shadow Register Unit

MSG_FIFO_MGSR_MEDIA - Media FIFO Messaging Register for Shadow Register Unit

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	080E4h
Name:	Media FIFO Messaging Register for Shadow Register Unit
ShortName:	MSG_FIFO_MGSR_MEDIA

Register that has the ACK information, back from MGSR as to whether a specific VD/VE Box has been blocked/unblocked
0 -- Box has been blocked
1 -- Box has been unblocked
Message registers have bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16].
To set bit0, for example, the data would be 0x0001_0001.
To clear bit0, for example, the data would be 0x0001_0000.
Note that mask bit is the data bit offset + 16.
Message registers are protected from non-GT writes via the Message Channel.

DWord	Bit	Description
0	31:12	**Reserved** Access: RO Format: MBZ
	11	**Acknowledge that Media FIFO has been Blocked for VEBOX3** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VEBOX3 1'b0 : Media FIFO Block Ack for VEBOX3(default) 1'b1 : Media FIFO Unblock Ack VEBOX3 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	10	**Acknowledge that Media FIFO has been Blocked for VEBOX2** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VEBOX2 1'b0 : Media FIFO Block Ack for VEBOX2(default) 1'b1 : Media FIFO Unblock Ack VEBOX2 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.

MSG_FIFO_MGSR_MEDIA - Media FIFO Messaging Register for Shadow Register Unit

	9	**Acknowledge that Media FIFO has been Blocked for VEBOX1** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VEBOX1 1'b0 : Media FIFO Block Ack for VEBOX1(default) 1'b1 : Media FIFO Unblock Ack VEBOX1 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	8	**Acknowledge that Media FIFO has been Blocked for VEBOX0** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VEBOX0 1'b0 : Media FIFO Block Ack for VEBOX0(default) 1'b1 : Media FIFO Unblock Ack VEBOX0 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	7	**Acknowledge that Media FIFO has been Blocked for VDBOX7** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VDBOX7 1'b0 : Media FIFO Block Ack for VDBOX7(default) 1'b1 : Media FIFO Unblock Ack VDBOX7 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	6	**Acknowledge that Media FIFO has been Blocked for VDBOX6** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VDBOX6 1'b0 : Media FIFO Block Ack for VDBOX6(default) 1'b1 : Media FIFO Unblock Ack VDBOX6 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	5	**Acknowledge that Media FIFO has been Blocked for VDBOX5** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VDBOX5 1'b0 : Media FIFO Block Ack for VDBOX5(default)

		1'b1 : Media FIFO Unblock Ack VDBOX5 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	4	**Acknowledge that Media FIFO has been Blocked for VDBOX4** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VDBOX4 1'b0 : Media FIFO Block Ack for VDBOX4(default) 1'b1 : Media FIFO Unblock Ack VDBOX4 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	3	**Acknowledge that Media FIFO has been Blocked for VDBOX3** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VDBOX3 1'b0 : Media FIFO Block Ack for VDBOX3(default) 1'b1 : Media FIFO Unblock Ack VDBOX3 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	2	**Acknowledge that Media FIFO has been Blocked for VDBOX2** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VDBOX2 1'b0 : Media FIFO Block Ack for VDBOX2(default) 1'b1 : Media FIFO Unblock Ack VDBOX2 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.
	1	**Acknowledge that Media FIFO has been Blocked for VDBOX1** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VDBOX1 1'b0 : Media FIFO Block Ack for VDBOX1(default) 1'b1 : Media FIFO Unblock Ack VDBOX1 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.

MSG_FIFO_MGSR_MEDIA - Media FIFO Messaging Register for Shadow Register Unit

	0	**Acknowledge that Media FIFO has been Blocked for VDBOX0** Access: R/W _Custom_GTIReset: BUS Acknowledge that MEDIA FIFO has been Blocked for VDBOX0 1'b0 : Media FIFO Block Ack for VDBOX0(default) 1'b1 : Media FIFO Unblock Ack VDBOX0 Note that the block request goes to MGSR, and MGSR responds to GPM with the blocked ack.

Media unit Level Clock Gating override during rstflow 94B0

MEDMISCCP94B0 - Media unit Level Clock Gating override during rstflow 94B0

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	094B0h

Unit Level Clock Gating Disable bits

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**misccp Clock Gating Disable during rstflow** Access: R/W _Custom_GTIReset: BUS misccp Clock Gating Disable Control: '0' : Clock Gating Enabled. (i.e., clocks can be gated when they are not required to toggle for functionality) '1' : Clock Gating Disabled. (i.e., clocks are toggling, always) w/a for A-step would be to make BIOS to write value 1 to this bit for power-on. Default value = 1

MEMRR_BASE_LSB

MEMRR_BASE_LSB - MEMRR_BASE_LSB

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	108340h

The EMRR range is used to protect Xucode memory from unauthorized reads and writes. Any IO access to this range is aborted. This register controls the location of the EMRR range by indicating its starting address. It functions in tandem with the EMRR mask register.

DWord	Bit	Description
0	31:12	**RANGE_BASE** Default Value: 0000000h Access: RO _Custom_GTIReset: BUS This field corresponds to bits 38:12 of the base address memory range which is allocated to EMRR memory.
	11:4	**Reserved** Access: RO Format: MBZ
	3	**CONFIGURED** Default Value: 0h Access: RO _Custom_GTIReset: BUS This bitfield is required to enable the PRMRR range
	2:0	**Reserved** Access: RO Format: MBZ

MEMRR_BASE_MSB

MEMRR_BASE_MSB - MEMRR_BASE_MSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	108344h	
The EMRR range is used to protect Xucode memory from unauthorized reads and writes. Any IO access to this range is aborted. This register controls the location of the EMRR range by indicating its starting address. It functions in tandem with the EMRR mask register.		
DWord	**Bit**	**Description**
0	31:0	**RANGE_BASE** Default Value: 000h Access: RO _Custom_GTIReset: BUS This field corresponds to bits 63:12 of the base address memory range which is allocated to EMRR memory.

MEMRR_MASK_LSB

MEMRR_MASK_LSB - MEMRR_MASK_LSB

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	108380h

This register controls the size of the EMRR range by indicating which address bits must match the EMRR base register value.

DWord	Bit	Description
0	31:12	**RANGE_BASE** Default Value: 0000000h Access: RO _Custom_GTIReset: BUS This field indicates which address bits must match EMRR base in order to qualify as an EMRR access.
	11	**RANGE_EN** Default Value: 0b Access: RO _Custom_GTIReset: BUS Indicates whether the EMRR range is enabled and valid.
	10	**LOCK** Default Value: 0b Access: RO _Custom_GTIReset: BUS Setting this bit locks all writeable settings in this register, including itself.
	9:0	**Reserved** Access: RO Format: MBZ

MEMRR_MASK_MSB

MEMRR_MASK_MSB - MEMRR_MASK_MSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	108384h	
This register controls the size of the EMRR range by indicating which address bits must match the EMRR base register value.		
DWord	**Bit**	**Description**
0	31:0	**RANGE_MASK** Default Value: 000h Access: RO _Custom_GTIReset: BUS This field indicates which address bits must match EMRR base in order to qualify as an EMRR access.

Message Address

MA_0_2_0_PCI - Message Address

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	000B0h

This register contains the Message Address for MSIs sent by the device.

DWord	Bit	Description
0	31:2	**Message Address Field** Default Value: 00000000000000000000000000000000b Access: R/W _Custom_GTIReset: BUS Used by system software to assign an MSI address to the device.The device handles an MSI by writing the padded contents of the MD register to this address.
	1:0	**Force Dword Align** Default Value: 00b Access: RO _Custom_GTIReset: BUS Hardwired to 0 so that addresses assigned by system software are always aligned on a DWORD address boundary.

Message Control

MC_0_2_0_PCI - Message Control

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 000AEh

Message Signaled Interrupt control register. System software can modify bits in this register, but the device is prohibited from doing so. If the device writes the same message multiple times, only one of those messages is guaranteed to be serviced. If all of them must be serviced, the device must not generate the same message again until the driver services the earlier one.

DWord	Bit	Description
0	15:9	**Reserved** Access: RO Format: MBZ
	8	**Per Vector Mask Capable** Default Value: 1b Access: RO _Custom_GTIReset: BUS SR-IOV requires this capability.
	7	**64 Bit Capable** Access: RO _Custom_GTIReset: BUS **Description**: Hardwired to 0 to indicate that the function does not implement the upper 32 bits of the Message address register and is incapable of generating a 64-bit memory address. **Value** 0b: **[Default]**
	6:4	**Multiple Message Enable** Default Value: 000b Access: R/W _Custom_GTIReset: BUS System software programs this field to indicate the actual number of messages allocated to this device. This number will be equal to or less than the number actually requested. Value: Number of requests000: 1001: 2010: 4011: 8100: 16101: 32110: Reserved111: Reserved
	3:1	**Multiple Message Capable** Default Value: 000b Access: RO

MC_0_2_0_PCI - Message Control

		_Custom_GTIReset: BUS System Software reads this field to determine the number of messages being requested by this device. Hardwired to 000b to indicate number of requests is 1.
	0	**MSI Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS Controls the ability of this device to generate MSIs.

Message Data

MD_0_2_0_PCI - Message Data		
Register Space:	PCI: 0/2/0	
Size (in bits):	16	
Address:	000B4h	
This register contains the Message Data for MSIs sent by the device.		
DWord	**Bit**	**Description**
0	15:0	**MESSDATA** Default Value: 0000000000000000b Access: R/W _Custom_GTIReset: BUS Base message data pattern assigned by system software and used to handle an MSI from the device. When the device must generate an interrupt request, it writes a 32-bit value to the memory address specified in the MA register. The upper 16 bits are always set to 0. The lower 16 bits are supplied by this register.

Message Signaled Interrupts Capability ID

MSI_CAPID_0_2_0_PCI - Message Signaled Interrupts Capability ID

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	000ACh

When a device supports MSI it can generate an interrupt request to the processor by writing a predefined data item (a message) to a predefined memory address.

DWord	Bit	Description
0	15:8	**Pointer to Next Capability** Default Value: 11010000b Access: RO _Custom_GTIReset: BUS This is a hardwired pointer to the next item in the capabilities list.
	7:0	**Capability ID** Default Value: 00000101b Access: RO _Custom_GTIReset: BUS This field is hardwired to the value 05h to identify the CAP_ID as being for MSI registers.

MFC_AVC_CABAC_INSERTION_COUNT

AVC_CABAC_INSERTION_COUNT - MFC_AVC_CABAC_INSERTION_COUNT	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	128ACh

This register stores the count in bytes of **CABAC ZERO_WORD insertion. It is primarily provided for statistical data gathering.**

DWord	Bit	Description
0	31:0	**MFC AVC Cabac Insertion Count** Total number of bytes in the bitstream output before for the CABAC zero word insertion. This count is updated each time when the insertion count is incremented.

MFC_AVC Bitstream Decoding Front-End Parsing Logic Error Counter

MFC_VIN_AVD_ERROR_CNTR - MFC_AVC Bitstream Decoding Front-End Parsing Logic Error Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	12804h

DWord	Bit	Description
0 avd_error_flagsR[31:0]	31:0	**Reserved** Access: RO Format: MBZ

MFC Image Status Control

MFC_IMAGE_STATUS_CONTROL - MFC Image Status Control		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	128B8h	
This register stores the suggested data for next frame in multi-pass.		
DWord	**Bit**	**Description**
0	31:24	**Cumulative slice delta QP**
	23:16	**QP Value** suggested slice QP delta value for frame level Rate control. This value can be +ve or -ve
	15	**QP-Polarity Change** Cumulative slice delta QP polarity change.
	14:13	**Num-Pass Polarity Change** Number of passes after cumulative slice delta QP polarity changes.
	12	**VDENC Slice Overflow Error Occurred** Format: U1 True when slice size exceeds slice max size on final pass when VDENC is using attempting to use slice overflow prevention.
	11:8	**Total Num-Pass**
	7:4	**Reserved** Access: RO Format: MBZ
	3	**Missing Huffman Code** Jpeg HW encoder reports if Huffman table entry is missing.
	2	**Panic** Panic triggered to avoid too big packed file.
	1	**Frame Bit Count** Frame Bit count over-run/under-run flag
	0	**Max Conformance Flag** Max Macroblock conformance flag or Frame Bit count over-run/under-run

MFC Image Status Mask

MFC_IMAGE_STATUS_MASK - MFC Image Status Mask		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	128B4h	
This register stores the image status(flags).		
DWord	**Bit**	**Description**
0	31:0	**Control Mask** Control Mask for dynamic frame repeat.

MFC QP Status Count

MFC_QUP_CT - MFC QP Status Count		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	128BCh	
This register stores the suggested QP COUNTS in multi-pass.		
DWord	**Bit**	**Description**
0	31:24	**Cumulative QP Adjust** Format: U8 Cumulative QP adjustment after multiple passes. If there is no need to multi-pass, this value would be zero. (This is in sign magnitude form).
	23:0	**Cumulative QP** Format: U24 Cumulative QP for all MB of a Frame (Can be used for computing average QP).

MFD Error Status

MFD_ERROR_STATUS - MFD Error Status	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1C0800h
ShortName:	MFD_ERROR_STATUS_VCS0
Description:	For VDBox0
Address:	1C4800h
ShortName:	MFD_ERROR_STATUS_VCS1
Description:	For VDBox1
Address:	1D0800h
ShortName:	MFD_ERROR_STATUS_VCS2
Description:	For VDBox2
Address:	1D4800h
ShortName:	MFD_ERROR_STATUS_VCS3
Description:	For VDBox3
Address:	1E0800h
ShortName:	MFD_ERROR_STATUS_VCS4
Description:	For VDBox4
Address:	1E4800h
ShortName:	MFD_ERROR_STATUS_VCS5
Description:	For VDBox5
Address:	1F0800h
ShortName:	MFD_ERROR_STATUS_VCS6
Description:	For VDBox6
Address:	1F4800h
ShortName:	MFD_ERROR_STATUS_VCS7
Description:	For VDBox7

This register stores the error status flags and count reports by the bit-stream decoder. This register is not part of hardware context save and restore. Driver should read the content prior to starting a new batch/frame.

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ

MFD_ERROR_STATUS - MFD Error Status		
	19:16	**AVC Short Format Error Flags** Exists If: // AVC Short Format == Ture Bit-stream error detected by VLD short format bit-stream decoder**.** These flags are reset at the beginning of a frame and updated until starting of another frame. [19] Slice Type SE Error Flag Invalid Slice Type SE [18] MMCO SE Error Flag Invalid memory management control operation SE. MMCO Loop does not end (mmco control != 0) even after all MMCO SEs are decoded OR MMCO SEs are still being decoded and MMCO SE loop end (mmco control == 0) is hit [17] Reordering IDC Error Flag Syntax Element modification_of_pic_nums_idc >= 6 OR modification_of_pic_nums_idc != 3 (end of reordering loop) but reordering count has already hit maximum value [16] Premature bitstream end is hit before finishing slice header decode
	15:0	**Bit-stream Error flags** Exists If: // AVC CAVLC, AVC CABAC, VC1 and MPEG2 == True Bitstream error detected by the VLD bit-steram decoder. These flags are reset at the beginning of a frame and updated until starting of another frame. AVC CAVLC: Please refer to AVC CAVLC table for each bit field AVC CABAC: Please refer to AVC CABAC table for each bit field VC1: Please refer to VC1 table for each bit field MPEG2: Please refer to MPEG2 table for each bit field

MFD Picture Parameter

MFD_PICTURE_PARAM - MFD Picture Parameter	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	1C0820h
ShortName:	MFD_PICTURE_PARAM_VCS0
Description:	For VDbox0
Address:	1C4820h
ShortName:	MFD_PICTURE_PARAM_VCS1
Description:	For VDbox1
Address:	1D0820h
ShortName:	MFD_PICTURE_PARAM_VCS2
Description:	For VDbox2
Address:	1D4820h
ShortName:	MFD_PICTURE_PARAM_VCS3
Description:	For VDbox3
Address:	1E0820h
ShortName:	MFD_PICTURE_PARAM_VCS4
Description:	For VDbox4
Address:	1E4820h
ShortName:	MFD_PICTURE_PARAM_VCS5
Description:	For VDbox5
Address:	1F0820h
ShortName:	MFD_PICTURE_PARAM_VCS6
Description:	For VDbox6
Address:	1F4820h
ShortName:	MFD_PICTURE_PARAM_VCS7
Description:	For VDbox7

DWord	Bit	Description
0	31:0	**Reserved** Access: RO Format: MBZ

MFX Frame BitStream SE/BIN Count

MFX_SE_BIN_CT - MFX Frame BitStream SE/BIN Count	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1C086Ch
ShortName:	MFX_SE_BIN_CT_VCS0
Description:	For VDBox0
Address:	1C486Ch
ShortName:	MFX_SE_BIN_CT_VCS1
Description:	For VDBox1
Address:	1D086Ch
ShortName:	MFX_SE_BIN_CT_VCS2
Description:	For VDBox2
Address:	1D486Ch
ShortName:	MFX_SE_BIN_CT_VCS3
Description:	For VDBox3
Address:	1E086Ch
ShortName:	MFX_SE_BIN_CT_VCS4
Description:	For VDBox4
Address:	1E486Ch
ShortName:	MFX_SE_BIN_CT_VCS5
Description:	For VDBox5
Address:	1F086Ch
ShortName:	MFX_SE_BIN_CT_VCS6
Description:	For VDBox6
Address:	1F486Ch
ShortName:	MFX_SE_BIN_CT_VCS7
Description:	For VDBox7

This register stores the number of BINs (AVC CABAC) and SEs (CAVLD, VLD) decoded in a frame. This register is not part of hardware context save and restore.

DWord	Bit	Description
0	31:0	**MFX Frame Bit-stream SE/BIN Count** Total number of BINs/SEs decoded in current frame. This number is used with frame performance count to derive Bin/clk or SE/clk.

MFX Frame Macroblock Count

MFX_MB_COUNT - MFX Frame Macroblock Count	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1C0868h
ShortName:	MFX_MB_COUNT_VCS0
Description:	For VDBox0
Address:	1C4868h
ShortName:	MFX_MB_COUNT_VCS1
Description:	For VDBox1
Address:	1D0868h
ShortName:	MFX_MB_COUNT_VCS2
Description:	For VDBox2
Address:	1D4868h
ShortName:	MFX_MB_COUNT_VCS3
Description:	For VDBox3
Address:	1E0868h
ShortName:	MFX_MB_COUNT_VCS4
Description:	For VDBox4
Address:	1E4868h
ShortName:	MFX_MB_COUNT_VCS5
Description:	For VDBox5
Address:	1F0868h
ShortName:	MFX_MB_COUNT_VCS6
Description:	For VDBox6
Address:	1F4868h
ShortName:	MFX_MB_COUNT_VCS7
Description:	For VDBox7

This register stores the number of Macro-blocks decoded/encoded in current frame. This register is not part of hardware context save and restore.

DWord	Bit	Description
0	31:20	**MBZ** Exists If: // JPEG == True Format: MBZ This field is currently reserved

MFX_MB_COUNT - MFX Frame Macroblock Count

	31:16	**Intra MB Count** Exists If: // AVC CAVLC, AVC CABAC, VC1 and MPEG2 == True Format: U16
	19:0	**JPEG Block Count** Exists If: // JPEG == True Format: U20 This 20-bit field indicates the number of 8x8 blocks within the JPEG frame. This field is clear at the start of decoding a new frame.
	15:0	**Number of MB Concealment** Exists If: // AVC CAVLC, AVC CABAC, VC1 and MPEG2 == True This 16-bit field indicates the number of MB is concealed by hardware. This field is clear at the start of decoding a new frame.

MFX Frame Row-Stored/BitStream Read Count

MFX_ROW_PER_BS_COUNT - MFX Frame Row-Stored/BitStream Read Count

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	12880h

This register stores the total number of row-stored/bit-stream read requests made by the pre-fetch engine per frame.This register is not part of hardware context save and restore.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**MFX row-stored/bit-stream read request Count** Total number of row-stored/bit-stream read requests sent by the memory pre-fetch engine per frame.

MFX PAK MPEG TS STATUS

MFX_PAK_MPEG_TS_STATUS - MFX PAK MPEG TS STATUS

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	12950h

This register stores MPEGTS packet status information

DWord	Bit	Description
0	31:28	**Next Continuity Center** Format: U4 HW will update the continuity counter the next MPEGTS packet stream for this stream ID needs to place in the bitstream.
	27:16	**Reserved** Access: RO Format: MBZ
	15:0	**MPEGTS Packet Count** Format: U16 This field counts the total number of written MPEGTS video packets by PAK HW. The PES header (which contains the PCR and PTS value) is included in this count as well.

MFX Pipeline Status Flags

MFX_STATUS_FLAGS - MFX Pipeline Status Flags	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1C0838h
ShortName:	MFX_STATUS_FLAGS_VCS0
Description:	For VDBox0
Address:	1C4838h
ShortName:	MFX_STATUS_FLAGS_VCS1
Description:	For VDBox1
Address:	1D0838h
ShortName:	MFX_STATUS_FLAGS_VCS2
Description:	For VDBox2
Address:	1D4838h
ShortName:	MFX_STATUS_FLAGS_VCS3
Description:	For VDBox3
Address:	1E0838h
ShortName:	MFX_STATUS_FLAGS_VCS4
Description:	For VDBox4
Address:	1E4838h
ShortName:	MFX_STATUS_FLAGS_VCS5
Description:	For VDBox5
Address:	1F0838h
ShortName:	MFX_STATUS_FLAGS_VCS6
Description:	For VDBox6
Address:	1F4838h
ShortName:	MFX_STATUS_FLAGS_VCS7
Description:	For VDBox7
This register stores the various pipeline status flags. This register is not part of hardware context save and restore.	

DWord	Bit	Description
0	31:17	**Reserved** Access: RO Format: MBZ

MFX_STATUS_FLAGS - MFX Pipeline Status Flags

	16	**MFX Active** Frame decoding/encoding is in progress.Set on frame_start; clear on frame_end.
	15:10	**Reserved** Access: RO Format: MBZ
	9	**Streamout Enable**
	8	**Reserved**
	7	**Post Deblocking Mode Enable**
	6	**Pre Deblocking Mode Enable**
	5	**Decoder Mode Select** 0 – Configure the MFD Engine for VLD Mode 1 – Configure the MFD Engine for IT Mode
	4	**Codec Select** 0 – Decode 1 – Encode
	3:2	**Video Mode** 00b – MPEG2 01b – VC1 10b – AVC 11b – JPEG
	1	**Decoder Short Format Mode** 0 – AVC/VC1 Short Format Mode is in use 1 – AVC/VC1 Long Format Mode is in use
	0	**Stitch Mode** 0b – Not in Stitch Mode 1b – In the Special Stitch Mode

MFX SFC LOCK Request

MFX_SFC_LOCK_REQUEST - MFX SFC LOCK Request

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	1C088Ch
ShortName:	MFX_SFC_LOCK_REQUEST_VCS0
Description:	For VDBox0
Address:	1D088Ch
ShortName:	MFX_SFC_LOCK_REQUEST_VCS2
Description:	For VDBox2
Address:	1E088Ch
ShortName:	MFX_SFC_LOCK_REQUEST_VCS4
Description:	For VDBox4
Address:	1F088Ch
ShortName:	MFX_SFC_LOCK_REQUEST_VCS6
Description:	For VDBox6

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**MFX_SFC_Forced_Lock** Format: U1 This bit can only be set by driver and it has to be clear by driver as well. Driver should set this bit before issuing the software (watchdog timer) reset. It tells MFX that a software reset is going to happen. MFX then issues a forced lock to SFC. If SFC is currently locked to MFX, SFC should not unlock itself from MFX. If SFC is NOT currently locked to MFX, SFC should not accept the lock request from MFX. Driver needs to clear this bit after the software reset sequence is complete.

MFX SFC LOCK Status

MFX_SFC_LOCK_STATUS - MFX SFC LOCK Status

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32

Address:	1C0890h
ShortName:	MFX_SFC_LOCK_STATUS_VCS0
Description:	For VDbox0

Address:	1D0890h
ShortName:	MFX_SFC_LOCK_STATUS_VCS2
Description:	For VDBox2

Address:	1E0890h
ShortName:	MFX_SFC_LOCK_STATUS_VCS4
Description:	For VDBox4

Address:	1F0890h
ShortName:	MFX_SFC_LOCK_STATUS_VCS6
Description:	For VDBox6

DWord	Bit	Description
0	31:2	**Reserved** Access: RO Format: MBZ
	1	**MFX_SFC_Forced_Act** Format: U1 This bit can only be set by hardware and it has to be clear by hardware as well. This bit is going to be polled by driver. This bit indicates that MFX has received MFX_SFC_Forced_Lock from driver and it has sent that signal to SFC. Once this bit is set, it indicates SFC status (lock or unlock) will not be changed anymore. Driver will be safe to start the reset process after this bit is set. Hardware has to de-assert this bit after driver de-assert MFX_SFC_Forced_Lock as well.
	0	**MFX_SFC_Usage** Format: U1 This bit can only be set by hardware and it has to be clear by hardware as well. This bit indicates SFC is currently locked to MFX. This bit should be set after SFC accepts the lock request from MFX. This bit should be clear once SFC finishes the workload and unlocked from MFX. In case a reset happens on MFX, this bit must be reset once a new workload is received

MGCMD

MGCMD - MGCMD

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	108300h

Mirror GT hardware uses for Vtd state.

DWord	Bit	Description
0	31	**TE** Access: RO _Custom_GTIReset: BUS 0: Disable Vtd DMA remapping 1: Enable Vtd DMA remapping
	30:26	**Reserved** Access: RO Format: MBZ
	25	**IRE** Access: RO _Custom_GTIReset: BUS No HW usage model. 0: Disable interrupt-remapping hardware 1: Enable interrupt-remapping hardware
	24:0	**Reserved** Access: RO Format: MBZ

MGSR GTI PD Control

GTIPD_CTRL - MGSR GTI PD Control

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	BUS
CrashLogSaved:	true
CrashLogVisibility:	cspec
Address:	00E04h-00E07h

DWord	Bit	Description
0	31:16	**Mask Bits** Access: RO Mask bits apply to [15:0] of same register. If mask is set to 1, corresponding bit in [15:0] is written. If mask is set to 0, corresponding bit in [15:0] is unaffected.
	15:6	**Reserved** Access: RO Format: MBZ
	5:4	**Reserved** Access: RO Format: MBZ
	3	**Reserved** Access: RO Format: MBZ
	2	**Render Unblock** Default Value: 0b Block Access: R/WC Render unblock (1) or block (0)
	1	**GT Block Mode** Default Value: 1b Standby mode Access: R/WC Set GT C6 Standby mode (1) or CPD (0)
	0	**GT Unblock** Default Value: 0b Block Access: R/WC GT unblock (1) or block (0)

MGSR Media PD Control

MEDIAPD_CTRL - MGSR Media PD Control

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	BUS
CrashLogSaved:	true
CrashLogVisibility:	cspec
Address:	00E00h-00E03h

DWord	Bit	Description
0	31:16	**Mask Bits** Access: RO Mask bits applied to [15:0] of same register. If mask is set to 1, corresponding bit in [15:0] is written. If mask is set to 0, corresponding bit in [15:0] is unaffected.
	15:12	**Reserved** Access: RO Format: MBZ
	11:8	**VEBOX Unblock** Default Value: 0b Access: R/WC VEBOX unblock indications for VEBOX[3:0] (1) or block (0)
	7:0	**VDBOX Unblock** Default Value: 0b Access: R/WC VDBOX unblock indications for VDBOX[7:0] (1) or block (0) VDBOX[1:0] reside in Media slice0, VDBOX[3:2] in slice1, VDBOX[5:4] in slice2, VDBOX[7:6] in slice3

MGSR Programmable Shadow 0

PROGSHADOW_0 - MGSR Programmable Shadow 0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00EE0h-00EE3h	
DWord	**Bit**	**Description**
0	31:26	**Reserved** Access: RO Format: MBZ
	25:0	**Shadow Address** Default Value: 00000h Access: R/W Programmable shadow register address.

MGSR Programmable Shadow 1

PROGSHADOW_1 - MGSR Programmable Shadow 1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00EE4h-00EE7h	
DWord	**Bit**	**Description**
0	31:26	**Reserved** Access: RO Format: MBZ
	25:0	**Shadow Address** Default Value: 00000h Access: R/W Programmable shadow register address.

Minimum Grant

MINGNT_0_2_0_PCI - Minimum Grant		
Register Space: PCI: 0/2/0 Size (in bits): 8		
Address: 0003Eh		
The Integrated Graphics Device has no requirement for the settings of Latency Timers.		
DWord	**Bit**	**Description**
0	7:0	**Minimum Grant Value** Default Value: 00000000b Access: RO _Custom_GTIReset: BUS

Minute IA Force Fence

MIA_FORCE_FENCE - Minute IA Force Fence

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Programming Notes

Write by MinIAto issue a fence. Written value is not stored.

Write to this register by the core will trigger GUC Hardware to do following sequencing
Stall the core interface.
Check for all prior writes generated by the core are completed and to global observable point.
Un-Stall the core interface.

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Reserved** Access: RO Format: MBZ

Minute IA Force TLB Invalidate

MIA_INV_TLB - Minute IA Force TLB Invalidate

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Programming Notes

Write to issue a TLB invalidate or Fence write. Written value is not stored.

Write to this register by the core will trigger GUC Hardware to do following sequencing
Stall the core interface.
Check for all prior writes generated by the core are completed and to global observable point.
TLB invalidation generation and completion to memory interface.
Un-Stall the core interface.

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Reserved** Access: RO Format: MBZ

Mirror FUSE A

MIRROR_FUSE_A - Mirror FUSE A		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Mirror Register for Fuses in INF domain.		
DWord	**Bit**	**Description**
0	31:1	**Reserved** Reserved
	0	**Reserved** Access: RO Format: MBZ

Mirror GT C6 entry Count

MIRROR_GT_C6_ENTRY_COUNT - Mirror GT C6 entry Count	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00DACh
Name:	Mirror GT C6 entry Count
ShortName:	MIRROR_GT_C6_ENTRY_COUNT

This register holds the mirrored value, from OA, of the number of GT C6 entries that have happened

DWord	Bit	Description
0	31:0	**Count for number of C6 entries** Access: R/W _Custom_GTIReset: BUS Mirror the number of times that GT has entered C6

Mirror of Base Data of Stolen Memory

BDSM_0_2_0_PCI - Mirror of Base Data of Stolen Memory

Register Space:	PCI: 0/2/0
Size (in bits):	64
Address:	000C0h

Mirror of BSDM from GTTMMADR space. This register contains the base address of graphics data stolen DRAM memory.

DWord	Bit	Description
0..1	63:32	**Graphics Base of Stolen Memory MSB** Default Value: 000000000000b Access: RO Variant _Custom_GTIReset: BUS This register contains bits 63 to 20 of the base address of stolen DRAM memory. BIOS is now able to allocate GDSM above 4GB.
	31:20	**Graphics Base of Stolen Memory LSB** Default Value: 000000000000b Access: RO Variant _Custom_GTIReset: BUS This register contains bits 63 to 20 of the base address of stolen DRAM memory. BIOS is now able to allocate GDSM above 4GB.
	19:1	**Reserved** Access: RO Format: MBZ
	0	**Spare** Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS This was a lock bit prior.

Mirror of Device Enable

DEVEN0_0_2_0_PCI - Mirror of Device Enable

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	00054h

Mirror of DEVEN_0_0_0_PCI.

DWord	Bit	Description
0	15	**Reserved** Access: RO Format: MBZ
	14	**Chap Enable** Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS
	13	**Device 6 Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS
	12:11	**Reserved** Access: RO Format: MBZ
	10	**Device 5 Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS
	9:8	**Reserved** Access: RO Format: MBZ
	7	**Device 4 Enable** Default Value: 1b Access: RO Variant _Custom_GTIReset: BUS
	6	**Reserved** Access: RO Format: MBZ

DEVEN0_0_2_0_PCI - Mirror of Device Enable

5	**Device 3 enable for Display HD Audio**
	Default Value: 1b Access: RO Variant _Custom_GTIReset: BUS
4	**Internal Graphics Engine**
	Default Value: 1b Access: RO Variant _Custom_GTIReset: BUS 0: Bus 0 Device 2 is disabled and hidden1: Bus 0 Device 2 is enabled and visibleThis bit will be set to 0b and remain 0b if Device 2 capability is disabled.
3	**PEG10 Enable**
	Default Value: 1b Access: RO Variant _Custom_GTIReset: BUS
2	**PEG11 Enable**
	Default Value: 1b Access: RO Variant _Custom_GTIReset: BUS
1	**PEG12 Enable**
	Default Value: 1b Access: RO Variant _Custom_GTIReset: BUS
0	**Host Bridge**
	Default Value: 1b Access: RO _Custom_GTIReset: BUS

Mirror of DPRB LSB

DPRB_LSB - Mirror of DPRB LSB		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 090E8h		
DWord	**Bit**	**Description**
0	31:20	**DPRBASE** Access: RO _Custom_GTIReset: BUS 1MB aligned base of DMA Range
	19:0	**Spares** Access: RO _Custom_GTIReset: BUS

Mirror of DPRB MSB

DPRB_MSB - Mirror of DPRB MSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	090ECh	
DWord	**Bit**	**Description**
0	31:0	**DPRBASE** Access: RO _Custom_GTIReset: BUS 1MB aligned base of DMA Range. Bits 63:32 of the DPRbase.

Mirror of DSMBASE LSB

DSMB_LSB - Mirror of DSMBASE LSB		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 090D0h		
DSM Base		
DWord	**Bit**	**Description**
0	31:20	**DSM Base Register LSB** Access: RO _Custom_GTIReset: BUS This register contains the base address of stolen DRAM memory.
	19:0	**Spares** Access: RO _Custom_GTIReset: BUS

Mirror of DSMBASE MSB

DSMB_MSB - Mirror of DSMBASE MSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	090D4h	
DSM Base		
DWord	**Bit**	**Description**
0	31:0	**DSM Base Register** Access: RO _Custom_GTIReset: BUS This register contains the base address of stolen DRAM memory.

Mirror of EMRR Base LSB

EMRRBASE_LSB - Mirror of EMRR Base LSB		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 09200h		
Mirror of EMRR Base		
DWord	**Bit**	**Description**
0	31:12	**EMRR Base LSB** Access: RO _Custom_GTIReset: BUS EMRR Base Value.
	11:0	**Spares** Access: RO _Custom_GTIReset: BUS

Mirror of EMRR Base MSB

EMRRBASE_MSB - Mirror of EMRR Base MSB		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 09204h		
Mirror of EMRR Base		
DWord	**Bit**	**Description**
0	31:0	**EMRR Base MSB** Access: RO _Custom_GTIReset: BUS EMRR Base Value.

Mirror of EU Disable Fuses - Register0

MIRROR_EU_DISABLE0 - Mirror of EU Disable Fuses - Register0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	09134h	
DWord	**Bit**	**Description**
0	31:8	**Reserved** Access: RO Format: MBZ
	7:0	**EU Disable Fuses** Access: RO Variant _Custom_GTIReset: BUS One Bit per EU In a sub-slice. Enable/Disable the same EU# in all the Sub-Slices. **Programming Notes** Bit values of 0 indicate enabled; Bit values of 1 indicate disabled.

Mirror of FUSE1 Control DW

FUSE1 - Mirror of FUSE1 Control DW		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	0911Ch	
DWord	**Bit**	**Description**
0	31:27	**Spares** Access: RO _Custom_GTIReset: BUS
	26	**VA DISABLE** Access: RO _Custom_GTIReset: BUS
	25:24	**Reserved** Access: RO Format: MBZ
	23	**Reserved**
	22	**Reserved**
	21	**Reserved**
	20	**HUC AUTH BYPASS** Access: RO _Custom_GTIReset: BUS This fuse works for both Micro Controllers present in Media pipeline.
	19	**HUC DISABLE** Access: RO _Custom_GTIReset: BUS This fuse works for both Micro Controllers present in Media pipeline.
	18	**Reserved**
	17:16	**Spares1** Access: RO _Custom_GTIReset: BUS
	15	**Authentication Bypass** Access: RO _Custom_GTIReset: BUS
	14	**Reserved**

FUSE1 - Mirror of FUSE1 Control DW

13	**Spares2**	
	Access:	RO
	_Custom_GTIReset:	BUS
12	**Reserved**	
11	**Render Disable**	
	Access:	RO
	_Custom_GTIReset:	BUS
10:9	**Spares3**	
	Access:	RO
	_Custom_GTIReset:	BUS
8	**VME IME Enable**	
	Access:	RO
	_Custom_GTIReset:	BUS
7	**VME CRE Enable**	
	Access:	RO
	_Custom_GTIReset:	BUS
6:5	**Media Decode**	
	Access:	RO
	_Custom_GTIReset:	BUS
	Applicable to Media - Fuse to disable VIN from processing media_objs or turn off the entire crclk tree trunk.	
4	**Disable GT3 Slice Shutdown**	
	Access:	RO
	_Custom_GTIReset:	BUS
	N/A -- Not used by GT hardware: This fuse is actually enforced by the PCU;it is reflected here for driver information only.	
3	**Reserved**	
2	**Spares4**	
	Access:	RO
	_Custom_GTIReset:	BUS
1:0	**Media Encode**	
	Access:	RO
	_Custom_GTIReset:	BUS
	Applicable to Media - One fuse to disable VIN from processing Pak_obj. Second fuse to disable VME.	

Mirror of Fuse 3 control DW

FUSE3 - Mirror of Fuse 3 control DW		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	09118h	
FUSE MIRROR 3		

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28	**GT L3 HASH MODE FUSE** Access: RO _Custom_GTIReset: BUS L3 Bank Hash Mode (used in certain dynamic slice configurations) 0b = Use safe mode, hashing to fewer banks in specific cases 1b = Use all banks when possible
	27:26	**Reserved** Access: RO Format: MBZ
	25:24	**GT WGBox Configuration Fuse** Access: RO _Custom_GTIReset: BUS WGBox configuration 00b = Both WGBOXes enabled 01b = WGBOX1 enabled 10b = WGBOX0 enabled

FUSE3 - Mirror of Fuse 3 control DW		
		SKUs) 1 - Disabled; 0 - Enabled Bit0 - Bank0 Bit1 - Bank1 Likewise, Bit7 - Bank7

Mirror of Global Command Register

GCMD - Mirror of Global Command Register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	090CCh	
DWord	**Bit**	**Description**
0	31	**Translation Enable** Access: RO _Custom_GTIReset: BUS Software writes to this field to request hardware to enable/disable DMA-remapping hardware. 0: Disable DMA-remapping hardware. 1: Enable DMA-remapping hardware. Hardware reports the status of the translation enable operation through the TES field in the Global Status register. Before enabling (or re-enabling) DMA-remapping hardware through this field, software must: • Setup the DMA-remapping structures in memory. • Flush the write buffers (through WBF field), if write buffer flushing is reported as required. • Set the root-entry table pointer in hardware (through SRTP field). • Perform global invalidation of the context-cache and global invalidation of IOTLB • If advanced fault logging supported, setup fault log pointer (through SFL field) and enable advanced fault logging (through EAFL field). Refer to Section 9 for detailed software requirements. There may be active DMA requests in the platform when software updates this field. Hardware must enable or disable remapping logic only at deterministic transaction boundaries, so that any in-flight transaction is either subject to remapping or not at all. Hardware implementations supporting DMA draining must drain any in-flight translated DMA read/write requests queued within the root complex before completing the translation enable command and reflecting the status of the command through the TES field in the GSTS_REG. Value returned on read of this field is undefined.
	30	**Set Root Table Pointer** Access: RO _Custom_GTIReset: BUS Software sets this field to set/update the root-entry table pointer used by hardware. The root-entry table pointer is specified through the Root-entry Table Address register. Hardware reports the status of the "root table pointer set" operation through the RTPS field in the Global Status register. The root table pointer set operation must be performed before enabling or re-enabling(after disabling) DMA remapping through the TE field. After a "root table pointer set" operation, software must globally invalidate the context cache and then globally invalidate the IOTLB. This is required to ensure hardware uses only there mapping structures referenced by the new root table pointer, and not any stale cached entries. While DMA remapping is active, software may update the root table pointer through this field.

GCMD - Mirror of Global Command Register

		However, to ensure valid in-flight DMA requests are deterministically remapped, software must ensure that the structures referenced by the new root table pointer are programmed to provide the same remapping results as the structures referenced by the previous root-table pointer. Clearing this bit has no effect. The value returned on a read of this field is undefined.
	29	**Set Fault Log** Access: RO _Custom_GTIReset: BUS This field is valid only for implementations supporting advanced fault logging. Software sets this field to request hardware to set/update the fault-log pointer used by hardware. The fault-log pointer is specified through Advanced Fault Log register. Hardware reports the status of the fault log set operation through the FLS field in the Global Status register. The fault log pointer must be set before enabling advanced fault logging (through EAFL field).Once advanced fault logging is enabled, the fault log pointer may be updated through this field while DMA remapping is active. Clearing this bit has no effect. The value returned on read of this field is undefined.
	28	**Enable Fault Logging** Access: RO _Custom_GTIReset: BUS This field is valid only for implementations supporting advanced fault logging. Software writes to this field to request hardware to enable or disable advanced fault logging. 0: Disable advanced fault logging. In this case, translation faults are reported through the Fault Recording registers. 1: Enable use of memory-resident fault log. When enabled, translation faults are recorded in the memory-resident log. The fault log pointer must be set in hardware (through SFL field) before enabling advanced fault logging. Hardware reports the status of the advanced fault logging enable operation through the AFLS field in the Global Status register. Value returned on read of this field is undefined.
	27	**Write Buffer Flush** Access: RO _Custom_GTIReset: BUS This bit is valid only for implementations requiring write buffer flushing. Software sets this field to request hardware to flush the root-complex internal write buffers. This is done to ensure any updates to the memory-resident remapping structures are not held in any internal write posting buffers. Refer to Section 11.1 for details on write-buffer flushing requirements. Hardware reports the status of the write buffer flushing operation through the WBFS field in the Global Status register. Clearing this bit has no effect. Value returned on read of this field is undefined.

GCMD - Mirror of Global Command Register

26 Queued Invalidation Enable

Access:	RO
_Custom_GTIReset:	BUS

This field is valid only for implementations supporting queued invalidations.
Software writes to this field to enable or disable queued invalidations.
0: Disable queued invalidations.
1: Enable use of queued invalidations.
Hardware reports the status of queued invalidation enable operation through QIES field in the Global Status register.
Refer to Section 6.2.2 for software requirements for enabling/disabling queued invalidations.
The value returned on a read of this field is undefined.

25 Interrupt Remapping Enable

Access:	RO
_Custom_GTIReset:	BUS

This field is valid only for implementations supporting interrupt remapping.
0: Disable interrupt-remapping hardware
1: Enable interrupt-remapping hardware
Hardware reports the status of the interrupt remapping enable operation through the IRES field in the Global Status register.
There may be active interrupt requests in the platform when software updates this field. Hardware must enable or disable interrupt-remapping logic only at deterministic transaction boundaries, so that any in-flight interrupts are either subject to remapping or not at all.
Hardware implementations must drain any in-flight interrupts requests queued in the Root-Complex before completing the interrupt-remapping enable command and reflecting the status of the command through the IRES field in the Global Status register.
The value returned on a read of this field is undefined.

24 Set Interrupt Remap Table Pointer

Access:	RO
_Custom_GTIReset:	BUS

This field is valid only for implementations supporting interrupt-remapping.
Software sets this field to set/update the interrupt remapping table pointer used by hardware. The interrupt remapping table pointer is specified through the Interrupt Remapping Table Address register.
Hardware reports the status of the interrupt remapping table pointer set operation through the IRTPS field in the Global Status register.
The interrupt remap table pointer set operation must be performed before enabling or re-enabling(after disabling) interrupt-remapping hardware through the IRE field.
After an interrupt remap table pointer set operation, software must globally invalidate the interrupt entry cache. This is required to ensure hardware uses only the interrupt-remapping entries referenced by the new interrupt remap table pointer, and not any stale cached entries.
While interrupt remapping is active, software may update the interrupt remapping table pointer through this field. However, to ensure valid in-flight interrupt requests are deterministically remapped, software must ensure that the structures referenced by the new interrupt remap table pointer are programmed to provide the same remapping results as the structures referenced by

GCMD - Mirror of Global Command Register

		the previous interrupt remap table pointer. Clearing this bit has no effect. The value returned on a read of this field is undefined.
	23	**Compatibility Format Interrupt** Access: RO _Custom_GTIReset: BUS This field is valid only for Intel(R)64 implementations supporting interrupt-remapping. Software writes to this field to enable or disable Compatibility Format interrupts on Intel(R)64 platforms. The value in this field is effective only when interrupt-remapping is enabled and Legacy Interrupt Mode is active. 0: Block Compatibility format interrupts. 1: Process Compatibility format interrupts as pass-through (bypass interrupt remapping). Hardware reports the status of updating this field through the CFIS field in the Global Status register. Refer to Section 5.4.1 for details on Compatibility Format interrupt requests. The value returned on a read of this field is undefined. This field is not implemented on Itanium(TM) implementations.
	22:0	**Spares** Access: RO _Custom_GTIReset: BUS

Mirror of GMCH Graphics Control Register

MGGC - Mirror of GMCH Graphics Control Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	09094h

Mirror of GMCH Graphics Control Register.

DWord	Bit	Description
0	31:16	**Spares** Access: RO _Custom_GTIReset: BUS
	15:8	**Graphics Mode Select** Default Value: 3h Access: RO _Custom_GTIReset: BUS This field selects the amount of Main Memory that is pre-allocated to support the Internal Graphics device in VGA (non-linear) and Native (linear) modes. The BIO Sensures that memory is pre-allocated only when Internal graphics is enabled. 0h: No memory pre-allocated. Device 2 (IGD) does not claim VGA cycles (Mem and IO),and the Sub-Class Code field within Device 2 function 0 Class Code register is 80. 1h-4h: Reserved. 5h-Dh: DVMT (UMA) mode, memory pre-allocated for frame buffer, in quantities as shown in the Encoding table. Eh-Fh: Reserved. NOTE: This register is locked and becomes Read Only when the D_LCK bit in the SMRAMC register is set. This register is also LT lockable. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD (bit 1 of this register) is 0.
	7:6	**GTT Graphics Memory Size** Access: RO _Custom_GTIReset: BUS This field selects the amount of Main Memory that is pre-allocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. GSM is assumed to be a contiguous physical DRAM space with DSM, and BIOS needs to allocate a contiguous memory chunk. Hardware derives the base of GSM from DSM only using the GSM size programmed in the register. 0h: No memory pre-allocated. GTT cycles (Mem and IO) are not claimed. 1h: 2 MB of memory pre-allocated for GTT. 2h: 4 MB of memory pre-allocated for GTT.

		3h: 8 MB of memory pre-allocated for GTT. Hardware functionality in case of programming this value to Reserved is not guaranteed. This register is locked and becomes Read Only when the D_LCK bit in the SMRAMC register is set.
	5:3	**Spares2** Access: RO _Custom_GTIReset: BUS
	2	**Versatile Acceleration Mode Enable** Access: RO _Custom_GTIReset: BUS Enables the use of the iGFX engines for Versatile Acceleration. 1 - iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 048000h. 0 - iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h.
	1	**IGD VGA Disable** Access: RO _Custom_GTIReset: BUS 0: Enable. Device 2 (IGD) claims VGA memory and IO cycles, the Sub-Class Code within Device 2 Class Code register is 00. 1: Disable. Device 2 (IGD) does not claim VGA cycles (Mem and IO), and the Sub-Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field (bits 6:4 of this register)pre-allocates no memory. This bit MUST be set to 1 if Device 2 is disabled either via a fuse or fuse override(CAPID0[46] = 1) or via a register (DEVEN[3] = 0). This register is locked by LT lock.
	0	**Spares3** Access: RO _Custom_GTIReset: BUS

Mirror of Graphics Translation Table and Memory Mapped Range Address (31:0)

GTTMMADR_LSB - Mirror of Graphics Translation Table and Memory Mapped Range Address (31:0)

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	09124h

This register requests allocation for the combined Graphics Translation Table Modification Range and Memory Mapped Range. The range requires 4 MB combined for MMIO and Global GTT aperture, with 2MBof that used by MMIO and 2MB used by GTT. GTTADR begins at (GTTMMADR + 2 MB) while the MMIO base address is the same as GTTMMADR.
For the Global GTT, this range is defined as a memory BAR in graphics device config space. It is an alias into which software is required to write Page Table Entry values (PTEs). Software may read PTE values from the global Graphics Translation Table (GTT). PTEs cannot be written directly into the global GTT memory area.
The device snoops writes to this region in order to invalidate any cached translations within the various TLBs implemented on-chip. There are some exceptions to this - see GTT-TLB in the Programming Interface chapter.
The allocation is for 4MB and the base address is defined by bits [38:22].

DWord	Bit	Description
0	31:22	**Memory Base Address (LSB - 31:22 of 38:22)** Access: RO _Custom_GTIReset: BUS Set by the OS, these bits correspond to address signals [38:22]. 4MB combined for MMIO and Global GTT table aperture (2MB for MMIO and 2 MB for GTT).
	21:4	**Spares** Access: RO _Custom_GTIReset: BUS
	3	**Prefetchable Memory** Access: RO _Custom_GTIReset: BUS Hardwired to 0 to prevent prefetching.
	2:1	**Memory Type** Access: RO _Custom_GTIReset: BUS 00b: To indicate 32 bit base address. 01b: Reserved. 10b: To indicate 64 bit base address. 11b: Reserved.

GTTMMADR_LSB - Mirror of Graphics Translation Table and Memory Mapped Range Address (31:0)		
	0	**Memory I/O Space** Access: RO _Custom_GTIReset: BUS Hardwired to 0 to indicate memory space.

Mirror of Graphics Translation Table and Memory Mapped Range Address UDW

GTTMMADR_MSB - Mirror of Graphics Translation Table and Memory Mapped Range Address UDW

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	09128h

This register requests allocation for the combined Graphics Translation Table Modification Range and Memory Mapped Range. The range requires 4 MB combined for MMIO and Global GTT aperture, with2MB of that used by MMIO and 2MB used by GTT. GTTADR begins at (GTTMMADR + 2 MB) while the MMIO base address is the same as GTTMMADR.
For the Global GTT, this range is defined as a memory BAR in graphics device config space. It is an alias into which software is required to write Page Table Entry values (PTEs). Software may read PTE values from the global Graphics Translation Table (GTT). PTEs cannot be written directly into the global GTT memory area.
The device snoops writes to this region in order to invalidate any cached translations within the various TLBs implemented on-chip. There are some exceptions to this - see GTT-TLB in the Programming Interface chapter.
The allocation is for 4MB and the base address is defined by bits [38:22].

DWord	Bit	Description
0	31:7	**Spares** Access: RO _Custom_GTIReset: BUS
	6:0	**Memory Base Address (MSB - 38:32 of 38:22)** Access: RO _Custom_GTIReset: BUS Set by the OS, these bits correspond to address signals [38:22]. 4MB combined for MMIO and Global GTT table aperture (2MB for MMIO and 2 MB for GTT).

Mirror of GSMBASE LSB

GSMB_LSB - Mirror of GSMBASE LSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	090D8h	
This register contains the base address of stolen DRAM memory for the GTT.		
DWord	**Bit**	**Description**
0	31:20	**GSM Base** Access: RO _Custom_GTIReset: BUS This register contains the base address of stolen DRAM memory for the GTT.
	19:0	**Spares** Access: RO _Custom_GTIReset: BUS

Mirror of GSMBASE MSB

GSMB - Mirror of GSMBASE MSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	090DCh	
This register contains the base address of stolen DRAM memory for the GTT.		
DWord	**Bit**	**Description**
0	31:0	**GSM Base** Access: RO _Custom_GTIReset: BUS This register contains the base address of stolen DRAM memory for the GTT.

Mirror of GT DSS Enable Fuses

MIRROR_GT_DSS_ENABLE - Mirror of GT DSS Enable Fuses

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0913Ch

DWord	Bit	Description
0	31:0	**GT DSS Enable Fuses**

Default Value:	0000003fh Default Value
Access:	RO
_Custom_GTIReset:	BUS

Description
DSS Enable Fuses Encoding:- 32'h0000 = All Sub-Slices Disabled Note: Encoding starts with bit 0 mapped to DSS0 of slice0 and goes on up to bit 31 as per the Project's Number of DSS per Slice. See below for elaborated mapping note for example where there are 6 DSS per Slice- bit0 - DSS 0 of Slice 0 bit1 - DSS 1 of Slice 0 Likewise - bit5- DSS 5of Slice 0 bit 6- DSS0 of Slice 1

Programming Notes
Bit values of 1 indicate DSS Enabled. Bit values of 0 indicate DSS Disabled.

Mirror of GT Slice Enable Fuses

MIRROR_GT_SLICE_EN - Mirror of GT Slice Enable Fuses		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	09138h	
DWord	**Bit**	**Description**
0	31:8	**Reserved** Access: RO Format: MBZ
	7:0	**GT slice Enable Fuses** Access: RO _Custom_GTIReset: BUS Slice Enable Fuses Bit0 - Slice 0 Enabled Bit1 - Slice;1 Enabled Likewise; Bit7 - Slice;7 Enabled **Programming Notes** Bit values of;1 indicate enabled. Bit values of;0 indicate disabled.

Mirror of GT VEBOX and VDBOX Disable

MIRROR_GT_VEBOX_VDBOX_DISABLE - Mirror of GT VEBOX and VDBOX Disable

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	09140h

Mirror of GT VEBOX and VDBOX Disable

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ
	19:16	**GT VEBOX DISABLE** _Custom_GTIReset: BUS VEBOX config fuses encoding:- bit 0 = VEBOX 0 disabled bit 1 = VEBOX 1 disabled bit 2 = VEBOX 2 disabled bit 3 = VEBOX 3 disabled **Programming Notes** Bit values of 0 indicate enabled. Bit values of 1 indicate disabled.
	15:8	**Reserved** Access: RO Format: MBZ
	7:0	**GT VDBOX DISABLE** Access: RO _Custom_GTIReset: BUS VDBOX config fuses encoding:- bit 0 = VDBOX 0 disabled bit 1 = VDBOX 1 disabled Likewise, bit 7 = VDBOX 7 disabled **Programming Notes** Bit values of 0 indicate enabled. Bit values of 1 indicate disabled.

Mirror of MBC IDIMSG Reg

GAM_MBC_MIRROR - Mirror of MBC IDIMSG Reg

Register Space: MMIO: 0/2/0

Size (in bits): 32

MBC IDI Message Register Mirror in GAM

DWord	Bit	Description
0	31:16	**Mask Bits** Access: RO _Custom_GTIReset: BUS Reserved.
	15:9	**Reserved** Access: RO Format: MBZ
	8	**Reserved**
	7:0	**Reserved** Access: RO Format: MBZ

Mirror of PCICMD MAE/BME

PCICMD - Mirror of PCICMD MAE/BME		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	0912Ch	
DWord	**Bit**	**Description**
0	31:11	**Spare** Access: R/W _Custom_GTIReset: BUS
	10	**Interrupt Disable** Access: R/W _Custom_GTIReset: BUS This bit disables the device from asserting INTx#. 0: Enable the assertion of this device's INTx# signal. 1: Disable the assertion of this device's INTx# signal. DO_INTx messages are not sent to DMI. GSA Implementation: When 1, blocks the sending of an MSI interrupt and blocks the sending of a Line interrupt.(The interrupt status is not blocked from being reflected in the INTSTS bit.) When 0, permits the sending of an MSI interrupt or Line interrupt.
	9	**Fast Back to Back** Access: R/W _Custom_GTIReset: BUS Not Implemented. Hardwired to 0.
	8	**SERR Enable** Access: R/W _Custom_GTIReset: BUS Not Implemented. Hardwired to 0.
	7	**Address/Data Stepping Enable** Access: R/W _Custom_GTIReset: BUS Not Implemented. Hardwired to 0.
	6	**Parity Error Enable** Access: R/W _Custom_GTIReset: BUS Not Implemented. Hardwired to 0. Since the IGD belongs to the category of devices that does not corrupt programs or data in system memory or hard drives, the IGD ignores any parity error that it detects and continues with normal operation.

PCICMD - Mirror of PCICMD MAE/BME

	5	**Video Pallete Snooping** Access: R/W _Custom_GTIReset: BUS This bit is hardwired to 0 to disable snooping.
	4	**Memory Write and Invalidate Enable** Access: R/W _Custom_GTIReset: BUS Hardwired to 0. The IGD does not support memory write and invalidate commands.
	3	**Special Cycle Enable** Access: R/W _Custom_GTIReset: BUS This bit is hardwired to 0. The IGD ignores Special cycles.
	2	**Bus Primary Enable** Access: R/W _Custom_GTIReset: BUS 0: Disable IGD bus primaring. 1: Enable the IGD to function as a PCI compliant primary. GSA Implementation: When 0, blocks the sending of MSI interrupts. When 1, permits the sending of above. (Note: See descriptions of the INTDIS, MSE, and INTSTS bits.)
	1	**Memory Access Enable** Access: R/W _Custom_GTIReset: BUS This bit controls the IGD's response to memory space accesses. 0: Disable. 1: Enable.
	0	**I/O Access Enable** Access: R/W _Custom_GTIReset: BUS This bit controls the IGD's response to I/O space accesses. 0: Disable. 1: Enable.

Mirror of PMR HIGH LIMIT (31-0)

PMRHLIMIT_LSB - Mirror of PMR HIGH LIMIT (31-0)

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	090C0h

Register to set up the limit address of DMA-protected high-memory region.
When the LT CMD.LOCK.PMRC command is invoked, this register is locked (treated as RO). When the LT CMD.UNLOCK.PMRCcommand is invoked, this register is unlocked (treated as RW).
This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as 0 in the Capability register).
The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all 1s.
The protected high-memory base & limit registers function as follows.
Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2^^(N+1) bytes.
Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region.

DWord	Bit	Description
0	31:20	**PMR HIGH LIMIT (LSB - 31:20 of 38:20)** Access: RO _Custom_GTIReset: BUS This register specifies the last host physical address of the DMA-protected high-memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.0
	19:0	**Spares** Access: RO _Custom_GTIReset: BUS

Mirror of PMR HIGH LIMIT 63-32

PMRHLIMIT_MSB - Mirror of PMR HIGH LIMIT 63-32

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	090C4h

Register to set up the limit address of DMA-protected high-memory region.
When the LT CMD.LOCK.PMRC command is invoked, this register is locked (treated as RO). When the LT CMD.UNLOCK.PMRCcommand is invoked, this register is unlocked (treated as RW). Refer to Chapter 12 for security considerations.
This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as 0 in the Capability register).
The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all 1s.
The protected high-memory base & limit registers function as follows.
Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2^^(N+1) bytes.
Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region.

DWord	Bit	Description
0	31:7	**Spares** Access: RO _Custom_GTIReset: BUS
	6:0	**PMR HIGH LIMIT (MSB - 38:32 of 38:20)** Access: RO _Custom_GTIReset: BUS This register specifies the last host physical address of the DMA-protected high-memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.

Mirror of RC0 Hysterisis free

MIRROR_RC0_HYSTERISIS_FREE - Mirror of RC0 Hysterisis free		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	00D94h	
Name:	Mirror of RC0 Hysterisis free	
ShortName:	MIRROR_RC0_HYSTERISIS_FREE	
Mirror of RC0 Hysterisis free from OA register DB84h		
DWord	**Bit**	**Description**
0	31:0	**Count RC0 Hysterisis free** Access: R/W _Custom_GTIReset: BUS

Mirror RC0 Any Engine Busy Free

MIRROR_RC0_ANY_ENGINE_BUSY_FREE - Mirror RC0 Any Engine Busy Free	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00D90h
Name:	Mirror RC0 Any Engine Busy Free
ShortName:	MIRROR_RC0_ANY_ENGINE_BUSY_FREE

This register mirrors the count from OA register DB80h

DWord	Bit	Description
0	31:0	**Count for RC0 Any Engine Busy Free** Access: R/W _Custom_GTIReset: BUS Mirror RC0 Any Engine Busy Free by OA

Mirror RC0 wake count free

MIRROR_RC0_WAKE_COUNT_FREE - Mirror RC0 wake count free	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00D98h
Name:	Mirror RC0 wake count free
ShortName:	MIRROR_RC0_WAKE_COUNT_FREE
Access:	R/W
This mirrors the OA register DB88h	

DWord	Bit	Description
0	31:0	**Count for RC0 wake count free** Access: R/W _Custom_GTIReset: BUS

Mirror Rc6 post hysterisis overhead free

MIRROR_RC6_POST_HYSTERISIS_OVERHEAD_FREE - Mirror Rc6 post hysterisis overhead free	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00DA0h
Name:	Mirror Rc6 post hysterisis overhead free
ShortName:	MIRROR_RC6_POST_HYSTERISIS_OVERHEAD_FREE
This is the mirror from OA for register DB90h	

DWord	Bit	Description
0	31:0	**Count for Mirror Rc6 post hysterisis overhead free** Access: R/W _Custom_GTIReset: BUS

Mirror rc6 pre Engine wake overhead free

MIRROR_RC6_PRE_ENGINE_WAKE_OVERHEAD_FREE - Mirror rc6 pre Engine wake overhead free	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	00D9Ch
Name:	Mirror rc6 pre Engine wake overhead free
ShortName:	MIRROR_RC6_PRE_ENGINE_WAKE_OVERHEAD_FREE

Mirrors the OA register DB8Ch

DWord	Bit	Description
0	31:0	**Count for rc6 pre Engine wake overhead free** Access: R/W _Custom_GTIReset: BUS

Misc Clocking Reset Control Registers

MISCCPCTL - Misc Clocking Reset Control Registers

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 09424h

Miscellaneous Clocking / Reset Control Registers

DWord	Bit	Description
0	31	**clock gate control Lock** Access: R/W Lock _Custom_GTIReset: BUS 0 = Bits of MISCCPCTL register are R/W 1 = All bits of MISCCPCTL register are RO (including this lock bit) Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR. Value / Name / Description: 0 / Bits of MISCCPCTL register are R/W 1 / All bits of MISCCPCTL register are RO (including this lock bit)
	30:24	**Bonus ECO bits** Access: R/W _Custom_GTIReset: BUS Bonus ECO bits
	23:20	**DOP clock gating enable for VEbox clks** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level Vebox (cv0clk) Clock Gating via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled
	19:16	**DOP clock gating enable for SFC media clks** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level SFC (csfcclk) Clock Gating in media1 via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled
	15:8	**DOP clock gate enable for Media Clocks** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level Render (cmclk) Clock Gating via PM event messages

		1 - Clock gating is enabled 0 - Clock gating is disabled
	7	**DOP clock gating enable for posh clks** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level posh (cposclk) Clock Gating via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled
	6	**DOP clock gating enable for Media ampler clks** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level Media sampler (scmsclk) Clock Gating via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled
	5	**WIDI1 DOP clock gating enable** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level Media sampler (cw1clk) Clock Gating via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled
	4	**DOP CLock gating Enable for Widi 0 clocks** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level Render (cwclk) Clock Gating via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled
	3	**DOP Clcok gating enable for GUC clocks** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level Render (cpclk) Clock Gating via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled
	2	**DOP clock gating Enable for Fix clocks (cfclk)** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level Render (cfclk/cf2xclk) Clock Gating via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled

MISCCPCTL - Misc Clocking Reset Control Registers

	1	**DOP Clock Gating Enable for Render Clocks** Access: R/W _Custom_GTIReset: BUS Controls the Enabling of the DOP-level Render (crclk/cr2xclk) Clock Gating via PM event messages 1 - Clock gating is enabled 0 - Clock gating is disabled
	0	**Reserved** Access: RO Format: MBZ

MISC CTX control register

MISCCTXCTL - MISC CTX control register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	0942Ch	
DWord	**Bit**	**Description**
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Context Restore ACk indication from Csunit** Access: R/W Set _Custom_GTIReset: BUS Context Restore ACk indication from Csunit 1'b1 : Csunit has completed restoring CPunits adress space Once set, CPunit hardware clears this bit after sending the ctx save ack done message to CS 1'b0 : Csunit has NOT completed restoring CPunits adress space

Miscellaneous Message Register 0 for GTI Doorbell Unit

DRBMISC0 - Miscellaneous Message Register 0 for GTI Doorbell Unit

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	01980h

Message registers have bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16].
In order to set bit0, for example, the data would be 0x0001_0001. In order to clear bit0, for example, the data would be 0x0001_0000.
Note that mask bit is the data bit offset + 16. Message registers are protected from non-GT writes via the Message Channel.

DWord	Bit	Description
0	31:16	**Context Save Mask** Default Value: 001bh Access: WO _Custom_GTIReset: BUS When context save (a read) is in progress, mask is forced to particular value to save off messages that need to be retained across an RC6 event.
	15:7	**Reserved** Access: RO Format: MBZ
	6	**U2CDATPERR** Default Value: 0 Access: RO _Custom_GTIReset: BUS A one indicates that Data Parity Error was detected.
	5	**U2CADDPERR** Default Value: 0 Access: RO _Custom_GTIReset: BUS A one indicates that Address Parity Error was detected.
	4	**CV History Bit** Access: R/W Hardware Clear _Custom_GTIReset: BUS

DRBMISC0 - Miscellaneous Message Register 0 for GTI Doorbell Unit

	CV History Bit Indicates that doorbell unit should mark all active doorbells as RFO required. Basically it means there may have been some snoops that were missed. RPM writes bit every time CV changes.
3	**Reserved**
2	**Reserved** Access: RO Format: MBZ
1	**RFO Enable indication from RPM** Access: R/W Hardware Clear _Custom_GTIReset: BUS RFO Enable bit from RPM Requires MDRB to handshake with ack 1 – Allow RFOs (RPM Enable) 0 – Block RFOs (RPM Disable) **[Default]**
0	**RFO Enable indication from U2C** Access: R/W Hardware Clear _Custom_GTIReset: BUS RFO Enable bit from U2C Requires MDRB to handshake with ack 1 – Allow RFOs (Enable) 0 – Block RFOs (Disable) **[Default]**

Misc Reset Control Register

RSTCTL - Misc Reset Control Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	09420h

Miscellaneous reset control registers.

DWord	Bit	Description
0	31:4	**Reserved** Access: RO Format: MBZ
	3:2	**Reset Staggering Period Control** Access: R/W _Custom_GTIReset: BUS Reset assertion staggering period between reset domains during FLR and soft-resets: 00: 6 csclk staggering reset assertion staggering 01: 12 cs clocks 10: 18 cs clocks 11: 24 cs clocks
	1:0	**Reset Residency Control** Access: R/W _Custom_GTIReset: BUS Reset assertion residency period for FLR and soft-resets. "00" : 8 cs clocks "01" : 16 cs clocks "10" : 32 cs clocks "11" : 64 cs clocks

MMIO_INDEX

MMIO_INDEX - MMIO_INDEX

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	00000h

Contains address and target.
Punit cannot access IO space from message channel.
A 32 bit IO write to this port loads the offset of the MMIO register or offset into the GTT that needs to be accessed.
An IO Read returns the current value of this register. An 8/16 bit IO write to this register is completed but does not update this register.
This mechanism to access internal graphics MMIO registers must not be used to access VGA IO registers which are mapped through the MMIO space. VGA registers must be accessed directly through the dedicated VGA IO ports. This is used by SBIOS. It is not used by graphics driver.
This register is only accessible through the IOSF Primary bus. The base register is defined by IOBAR.

DWord	Bit	Description
0	31:2	**Register_offset** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS This field selects GTT entry or any one of the Dword registers within the MMIO register space of this device.
	1:0	**Target** Default Value: 00b Access: R/W _Custom_GTIReset: BUS 00 = MMIO Registers, 01 = GTT, 1X = Reserved

Mode Register for GAB

GAB_MODE - Mode Register for GAB

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

The GAB_MODE register contains information that controls configurations in the GAB.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask _Custom_GTIReset: DEV
	15:10	**Reserved** Access: RO Format: MBZ
	9	**Reserved**
	8:7	**Reserved** Format: PBC
	6	**Disable Hashing on BCS** _Custom_GTIReset: DEV Two command ports (P0 and P1) from BLT to GAM are address hashed. BLB to GAB has two ports and address hashing is done internal to BLB. BCS to GAB is a single command port, and GAB address hashes the BCS requests into P0 and P1. **Value** / **Name** / **Description** 0b / **[Default]** / BCS traffic is hashed onto P0 and P1 1b / / BCS traffic is sent only on P0 (no hashing) **Programming Notes** When PendQ hashing control is disabled in GAM BLT Module, BCS hashing in GAB must also be disabled by setting this bit to '1. If this is not followed, there can be memory ordering violations on BCS transactions.
	5:3	**BLB Arbitration Priority** Format: U3 _Custom_GTIReset: DEV
	2:0	**BCS Arbitration Priority** Format: U3 _Custom_GTIReset: DEV

Mode Register for GAC

GAC_MODE - Mode Register for GAC	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	1C00A0h-1C00A3h
Name:	Mode Register for GAC
ShortName:	GAC_MODE_VCSUNIT_BE0
Address:	1C40A0h-1C40A3h
Name:	Mode Register for GAC
ShortName:	GAC_MODE_VCSUNIT_BE1
Address:	1D00A0h-1D00A3h
Name:	Mode Register for GAC
ShortName:	GAC_MODE_VCSUNIT_BE2
Address:	1D40A0h-1D40A3h
Name:	Mode Register for GAC
ShortName:	GAC_MODE_VCSUNIT_BE3
Address:	1E00A0h-1E00A3h
Name:	Mode Register for GAC
ShortName:	GAC_MODE_VCSUNIT_BE4
Address:	1E40A0h-1E40A3h
Name:	Mode Register for GAC
ShortName:	GAC_MODE_VCSUNIT_BE5
Address:	1F00A0h-1F00A3h
Name:	Mode Register for GAC
ShortName:	GAC_MODE_VCSUNIT_BE6
Address:	1F40A0h-1F40A3h
Name:	Mode Register for GAC
ShortName:	GAC_MODE_VCSUNIT_BE7

The GAC_MODE register contains information that controls configurations in the GAC.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask _Custom_GTIReset: BUS

GAC_MODE - Mode Register for GAC

	15:1	**Reserved** Access: RO Format: MBZ
	0	**GACunit VCS Fence Performance fix Override** Format: Disable _Custom_GTIReset: BUS

Value	Name	Description
0	**[Default]**	Performance fix **enabled** to block client credits until VCS fence advances.
1		Performance fix to block credits until VCS fence advances, **disabled.** Fence will not block input traffic from clients and will advance only after ingress FIFOs are empty (Legacy behavior.)

Mode Register for GAFS

GAFS_MODE - Mode Register for GAFS

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0212Ch

DWord	Bit	Description
0	31:16	**Mask Bits** Access: WO Format: Mask Masks: These bits serve as write enables for bits 15:0. If this register is written with any of these bits clear the corresponding bit in the field 15:0 will not be modified. Reading these bits always returns 0s.
	15:13	**Reserved** Format: PBC
	12:11	**CLR0 clients ROB low priority threshold Control** This bit field is used to control the threshold at which CLR0 clients will move to the low priority group in the GAFS ROB arbiter. 00b **[Default]** Low priority threshold value = 'd12 01b Low priority threshold value = 'd24 10b Low priority threshold value = 'd36 11b Low priority threshold value = 'd48
	10	**Reserved** Format: PBC
	9	**Min Alloc Configuration** This field can be used to adjust min alloc settings in the read ROB structure in GAFS. This is used in conjunction with bit [2] of this register. {Bit[9], Bit[2]} = 2'b00 : Original values {Bit[9], Bit[2]} = 2'b01 : Override original values to gain 12 ROB locations for generic use {Bit[9], Bit[2]} = 2'b10 :Override original values to gain 22 ROB locations for generic use {Bit[9], Bit[2]} = 2'b11 : Original values **Programming Notes** This bit must be programmed to 1 for achieving performance targets.

Name:	Mode Register for Software Interface
ShortName:	MI_MODE_VECSUNIT3

Address:	1A09Ch-1A09Fh
Name:	Mode Register for Software Interface
ShortName:	MI_MODE_CCSUNIT0

The MI_MODE register contains information that controls software interface aspects of the Memory Interface function.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask A 1 in a bit in this field allows the modification of the corresponding bit in Bits 15:0
	15	**Suspend Flush** Format: U1

Value	Name	Description
0h	No Delay **[Default]**	HW will not delay flush, this bit will get cleared by MI_SUSPEND_FLUSH as well
1h	Delay Flush	Suspend flush is active

Programming Notes
This should only be written to from the ring using MI_SUSPEND_FLUSH. It is considered undefined if written by software through MMIO

MI_MODE - Mode Register for Software Interface

14 **RCS POSH LRCA Disable**

Source:	RenderCS
Exists If:	//RCS

This bit controls the context save of the MI_LOAD_REGISTER_IMM command corresponding to POSH_LRCA as part of the RCS context image. This primary purpose of this bit is for backward compatibility for the render context image.

Value	Name	Description
1		RCS saves the MI_LOAD_REGISTER_IMM command corresponding to POSH_LRCA in context image as NOOPs.
0	**[Default]**	RCS saves the MI_LOAD_REGISTER_IMM command corresponding to POSH_LRCA as part of the context image.

13 **Disable MI_SET_CONTEXT for Execution List**

Format:	U1

Value	Name	Description
0h	Allow **[Default]**	Allow MI_SET_CONTEXT in Execlist mode
1h	Disable	Disable MI_SET_CONTEXT in Execlist Mode

12 **Nested Batch Buffer Enable**

This bit is used to enable or disable third level batch buffer and associated functionality.

Value	Name	Description
0	**[Default]**	HW will only support first level, second level, chained first level and chained second level batch buffer. Nested Level Batch Buffer field must be set in MI_BATCH_BUFFER_START command programmed in a second level batch buffer to inferas a chained second level batch buffer.
1		HW will support first level, second level, third level, chained first level, chained second level and chained third level batch buffer. Nested Level Batch Buffer field must not be set in MI_BATCH_BUFFER_START command programmed in a second level batch buffer to infer a chained second level batch buffer and similarly for chained third level batch buffer.

Programming Notes
This bit must be only programmed from a ring buffer and must not be programmed from a batch buffer. This bit must be static for a given context and remain same through out the life time of a given context.

11 **Invalidate UHPTR enable**

Source:	RenderCS, VideoCS, VideoCS2, VideoEnhancementCS
Exists If:	//RCS, VCS, VECS, BCS
Format:	Enable

If bit set H/W clears the valid bit of UHPTR (2134h, bit 0) when current active head pointer is equal to UHPTR.

MI_MODE - Mode Register for Software Interface

	10	**Atomic Read Return for MI_COPY_MEM_MEM** Format: U1 **Value** / **Name** / **Description** 0h / Disable **[Default]** / Hardware does a regular memory fence write to complete the write to the destination address before moving to the next instruction. 1h / Enable / Hardware does Atomic Move with Read Return to complete the write to the destination address before moving to the next instruction.
	9	**Rings Idle** Format: U1 Read Only Status bit **Value** / **Name** / **Description** 0h / Not Idle **[Default]** / Parser not Idle or Ring Arbiter not Idle. 1h / Idle / Parser Idle and Ring Arbiter Idle. **Programming Notes** Writes to this bit are not allowed.
	8	**Stop Rings** Format: U1 **Value** / **Name** / **Description** 0h / **[Default]** / Normal Operation. 1h / / Parser is turned off and Ring arbitration is turned off. **Programming Notes** Software must set this bit to force the Rings and Command Parser to Idle. Software must read a 1 in the Ring Idle bit after setting this bit to ensure that the hardware is idle. Software must clear this bit for Rings to resume normal operation.
	7:5	**Reserved** Format: PBC
	4:2	**Reserved** Source: BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS Format: PBC
	4:1	**Predicate Enable** Source: RenderCS, PositionCS This field gets set when "MI_SET_PREDICATE" command is parsed by render command streamer. Predicate Disable is the default mode of operation.

MI_MODE - Mode Register for Software Interface

Value	Name	Description
0h	Predicate Disable	Predication is Disabled and RCS will process commands as usual.
1h	Predicate on Result2 clear	Following Commands will be NOOPED by RCS only if the MI_PREDICATE_RESULT_2 is clear.
2h	Predicate on Result2 set	Following Commands will be NOOPED by RCS only if the MI_PREDICATE_RESULT_2 is set.
3h	Predicate on Result clear	Following Commands will be NOOPED by RCS only if the MI_PREDICATE_RESULT is clear.
4h	Predicate on Result set	Following Commands will be NOOPED by RCS only if the MI_PREDICATE_RESULT is set.
5h	Predicate when two or more slices enabled	Following Commands will be NOOPED by RCS only when one slice is enabled, NOOPED when more than one slice is enabled.
6h	Predicate when one or three slices enabled	Following Commands will be Executed by RCS only when two slices are enabled, NOOPED when one or three slices are enabled.
7h	Predicate when one or two slices enabled	Following Commands will be Executed by RCS only when all the three slices are enabled, NOOPED when less than three slices are enabled.
Bh	NOOP in RenderCS	When RenderCS parses MI_SET_PREDICATE command with Predicate Enable set to NOOP in RenderCS, RenderCS NOOPs all the subsequent commands parsed unconditionally until the predication is disabled/modified using MI_SET_PREDICATE command. Other command streamers (non RenderCS) on parsing MI_SET_PREDICATE command with Predicate Enable set to NOOP in RenderCS dont take any action and is equivalent to parsing MI_NOOP command.
Ch	NOOP in PositionCS	When PositionCS parses MI_SET_PREDICATE command with Predicate Enable set to NOOP in PositionCS, PositionCS NOOPs all the subsequent commands parsed unconditionally until the predication is disabled/modified using MI_SET_PREDICATE command. Other command streamers (non PositionCS) on parsing MI_SET_PREDICATE command with Predicate Enable set to NOOP in PositionCS dont take any action and is equivalent to parsing MI_NOOP command.
8h, 9h, Ah	Reserved	
Dh, Eh	Reserved	
Fh	Predicate Always	Following Commands will be NOOPED by RCS unconditionally.

MI_MODE - Mode Register for Software Interface

		Programming Notes SW must use MI_SET_PREDICATE instead of MMIO access.
	1	**Reserved** Source: VideoCS, VideoCS2, VideoEnhancementCS Format: PBC
	1	**Reserved** Source: BlitterCS Format: PBC
	0	**Reserved** Source: CommandStreamer Format: PBC

MSI Mask Bits

MSI_MASK_0_2_0_PCI - MSI Mask Bits		
Register Space:	PCI: 0/2/0	
Size (in bits):	32	
Address:	000B8h	
This register contains the MSI Mask Bits		
DWord	**Bit**	**Description**
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Mask Bit for Vector 0** Default Value: 0b Access: R/W _Custom_GTIReset: BUS For each Mask bit that is set, the function is prohibited from sending the associated message.

MSI Pending Bits

MSI_PEND_0_2_0_PCI - MSI Pending Bits

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	000BCh

This register contains the MSI Pending Bits

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Pending Bit for Vector 0** Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS For each Pending bit that is set, the function has a pending associated message. If this bit is set when the corresponding vector's Mask bit is cleared, the function will send an MSI and then clear the Pending bit.

Multi Context Control Register

MLTICTXCTL - Multi Context Control Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B170h

Masked register for Multi Context

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask Mask bits for each corresponding bit in [15:0]
	15	**AID for RCS** AID0: The AID value for QID = 0
	14	**AID for CCS** AID1: The AID value for QID = 1
	13:4	**Reserved** Access: RO Format: MBZ
	3	**Reserved** Access: RO Format: MBZ
	2	**3D on Render** 3D_ON_RENDER: When set, the L3 will use Render config values, else compute config values.
	1:0	**Multi Context Enable** This Mode enables duel queues to execute on the machine: 1 RCS + 1 CCS If set, then L3 will carve out 4KB of URB per bank for CCS usage. Reserved: 10b, 11b Value / Name: 0 – RCS only enabled **[Default]** 1 – RCS and CCS enabled

Multi Size Aperture Control

MSAC_0_2_0_PCI - Multi Size Aperture Control

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00060h

Description

This register contains MSAC register which determines the size of the graphics memory aperture (GMADR) in function 0 and in the trusted space, and affects certain bits of the GMADR register.
Bits [20:16] 00000b: 128MB, GMADR[26:4] is hardwired to all 0
Bits [20:16] 00001b: 256MB, GMADR[27:4] overridden to all 0
Bits [20:16] 00010b: illegal (hardware will treat this as 00011b)
Bits [20:16] 00011b: 512MB, GMADR[28:27] overridden to all 0
Bits [20:16] 00100-00110b: illegal (hardware will treat this as 00111b)
Bits [20:16] 00111b: 1024MB, GMADR[29:27] overridden to all 0
Bits [20:16] 01000-01110b: illegal (hardware will treat this as 01111b)
Bits [20:16] 01111b: 2048MB, GMADR[30:27] overridden to all 0
Bits [20:16] 10000-11110b: illegal (hardware will treat this as 11111b)
Bits [20:16] 11111b: 4096MB, GMADR[31:27] overridden to all 0

DWord	Bit	Description
0	31:21	**Reserved R/W** Default Value: 000h Access: R/W _Custom_GTIReset: BUS Scratch Bits
	20	**Untrusted Aperture Size Bit 4** Default Value: 0b Access: R/W Key _Custom_GTIReset: BUS
	19	**Untrusted Aperture Size Bit 3** Default Value: 0b Access: R/W Key _Custom_GTIReset: BUS
	18	**Untrusted Aperture Size Bit 2** Default Value: 0b Access: R/W Key _Custom_GTIReset: BUS

MSAC_0_2_0_PCI - Multi Size Aperture Control

	17	**Untrusted Aperture Size Bit 1** Default Value: 0b Access: R/W Key _Custom_GTIReset: BUS
	16	**Untrusted Aperture Size Bit 0** Access: R/W Key _Custom_GTIReset: BUS Value / Name / Description 0b / **[Default]** /
	15:0	**Reserved** Access: RO Format: MBZ

NDE_RSTWRN_OPT

NDE_RSTWRN_OPT

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	46408h-4640Bh
Name:	North Display Reset Warn Options
ShortName:	NDE_RSTWRN_OPT
Reset:	global

This register is used to control the display behavior on receiving a Reset Warning or FLR.

DWord	Bit	Description
0	31:7	**Reserved** Access: RO Format: MBZ
	6	**Reserved** Access: RO Format: MBZ
	5	**Reserved**
	4	**RST PCH Handshake En** This field enables the handshake with south display when processing the reset. This applies to all types of DE resets. By default it is disabled and the north display will not wait for south display to acknowledge the reset. Value: 0b – Disable; 1b – Enable Programming Notes: This must be programmed as part of the display initialization sequence.
	3:0	**Reserved** Access: RO Format: MBZ

NONPIPE_ISOCREQ

NONPIPE_ISOCREQ

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	45230h-45237h
Name:	Non Pipe Isoch Request
ShortName:	NONPIPE_ISOCREQ
Reset:	soft

This register is used to trigger an IsocReq that is not associated with a pipe. When enabled, the write to DWord 1 (higher address DWord) of this register triggers an IsocReq to be sent with the last written values from both DWords.

DWord	Bit	Description
0	31:16	**LTR** Access: R/W This field specifies the latency tolerance (LTR) in microseconds.
	15:0	**Bandwidth** Access: R/W This field specifies the bandwidth requirement in multiples of 100 MB/s.
1	31	**Enable** Access: R/W This field enables IsocReq to be sent when DWord 1 of this register is written. Value: 1b — Name: Enable Value: 0b — Name: Disable
	30:8	**Reserved** Access: RO Format: MBZ
	7:0	**Delay** Access: R/W This field specifies the downwards transition delay in milliseconds.

NOP Identification Register

NOPID - NOP Identification Register	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02094h-02097h
Name:	NOP Identification Register
ShortName:	NOPID_RCSUNIT
Address:	18094h-18097h
Name:	NOP Identification Register
ShortName:	NOPID_POCSUNIT
Address:	22094h-22097h
Name:	NOP Identification Register
ShortName:	NOPID_BCSUNIT
Address:	1C0094h-1C0097h
Name:	NOP Identification Register
ShortName:	NOPID_VCSUNIT0
Address:	1C4094h-1C4097h
Name:	NOP Identification Register
ShortName:	NOPID_VCSUNIT1
Address:	1C8094h-1C8097h
Name:	NOP Identification Register
ShortName:	NOPID_VECSUNIT0
Address:	1D0094h-1D0097h
Name:	NOP Identification Register
ShortName:	NOPID_VCSUNIT2
Address:	1D4094h-1D4097h
Name:	NOP Identification Register
ShortName:	NOPID_VCSUNIT3
Address:	1D8094h-1D8097h
Name:	NOP Identification Register
ShortName:	NOPID_VECSUNIT1
Address:	1E0094h-1E0097h
Name:	NOP Identification Register

NOPID - NOP Identification Register

ShortName:	NOPID_VCSUNIT4
Address:	1E4094h-1E4097h
Name:	NOP Identification Register
ShortName:	NOPID_VCSUNIT5
Address:	1E8094h-1E8097h
Name:	NOP Identification Register
ShortName:	NOPID_VECSUNIT2
Address:	1F0094h-1F0097h
Name:	NOP Identification Register
ShortName:	NOPID_VCSUNIT6
Address:	1F4094h-1F4097h
Name:	NOP Identification Register
ShortName:	NOPID_VCSUNIT7
Address:	1F8094h-1F8097h
Name:	NOP Identification Register
ShortName:	NOPID_VECSUNIT3
Address:	1A094h-1A097h
Name:	NOP Identification Register
ShortName:	NOPID_CCSUNIT0

The NOPID register contains the Noop Identification value specified by the last MI_NOOP instruction that enabled this register to be updated.

DWord	Bit	Description
0	31:22	**Reserved** Access: RO Format: MBZ
	21:0	**Reserved**

Number Of VFs

SRIOV_NUMOFVFS_0_2_0_PCI - Number Of VFs		
Register Space: PCI: 0/2/0 Size (in bits): 32		
Address: 00330h		
Number of VFs enabled by the VMM.		
DWord	**Bit**	**Description**
0	31:24	**Reserved** Access: RO Format: MBZ
	23:16	**Function Dependency Link** Default Value: 00000000b Access: RO _Custom_GTIReset: BUS Same value as the Physical function number indicating no Dependency
	15:0	**Number of Virtual Functions** Default Value: 0000000000000000b Access: R/W _Custom_GTIReset: BUS System SW shall set this field to control the number of VFs that are visible. This field must be programmed before setting VF Enable. Changing this field when VF Enable is set will produced undefined behavior as per the SR-IOV specification. HW will ignore the new value programmed.

OAC Aggregate Perf Counter A0

OAC_OAPERF_A0 - OAC Aggregate Perf Counter A0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register reflects the count value of the OA Performance counter A0.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads. Value: 0x00000000 **[Default]** Value: [0x00000001-0xFFFFFFFF]

OAC Aggregate Perf Counter A0 Upper DWord

OAC_OAPERF_A0_UPPER - OAC Aggregate Perf Counter A0 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A0 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A4

OAC_OAPERF_A4 - OAC Aggregate Perf Counter A4		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A4. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read.Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO,so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A4 Upper DWord

OAC_OAPERF_A4_UPPER - OAC Aggregate Perf Counter A4 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A4 to be read. .Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read..Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO,so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A7

OAC_OAPERF_A7 - OAC Aggregate Perf Counter A7		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A7. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A7 Upper DWord

OAC_OAPERF_A7_UPPER - OAC Aggregate Perf Counter A7 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A7 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A8

OAC_OAPERF_A8 - OAC Aggregate Perf Counter A8		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A8. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A8 Upper DWord

OAC_OAPERF_A8_UPPER - OAC Aggregate Perf Counter A8 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A8 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A9

OAC_OAPERF_A9 - OAC Aggregate Perf Counter A9		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A9. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A9 Upper DWord

OAC_OAPERF_A9_UPPER - OAC Aggregate Perf Counter A9 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A9 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A10

OAC_OAPERF_A10 - OAC Aggregate Perf Counter A10		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A10. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A10 Upper DWord

OAC_OAPERF_A10_UPPER - OAC Aggregate Perf Counter A10 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A10 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A11

OAC_OAPERF_A11 - OAC Aggregate Perf Counter A11		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A11. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A11 Upper DWord

OAC_OAPERF_A11_UPPER - OAC Aggregate Perf Counter A11 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A11 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A12

OAC_OAPERF_A12 - OAC Aggregate Perf Counter A12		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A12. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A12 Upper DWord

OAC_OAPERF_A12_UPPER - OAC Aggregate Perf Counter A12 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A12 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A13

OAC_OAPERF_A13 - OAC Aggregate Perf Counter A13		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A13. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A13 Upper DWord

OAC_OAPERF_A13_UPPER - OAC Aggregate Perf Counter A13 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A13 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A14

OAC_OAPERF_A14 - OAC Aggregate Perf Counter A14		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A14. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A14 Upper DWord

OAC_OAPERF_A14_UPPER - OAC Aggregate Perf Counter A14 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A14 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A15

OAC_OAPERF_A15 - OAC Aggregate Perf Counter A15		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A15. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A15 Upper DWord

OAC_OAPERF_A15_UPPER - OAC Aggregate Perf Counter A15 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A15 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A16

OAC_OAPERF_A16 - OAC Aggregate Perf Counter A16		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A16. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A16 Upper DWord

OAC_OAPERF_A16_UPPER - OAC Aggregate Perf Counter A16 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A16 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A17

OAC_OAPERF_A17 - OAC Aggregate Perf Counter A17		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A17. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A17 Upper DWord

OAC_OAPERF_A17_UPPER - OAC Aggregate Perf Counter A17 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A17 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A18

OAC_OAPERF_A18 - OAC Aggregate Perf Counter A18		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A9. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A18 Upper DWord

OAC_OAPERF_A18_UPPER - OAC Aggregate Perf Counter A18 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A18 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A19

OAC_OAPERF_A19 - OAC Aggregate Perf Counter A19		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A19. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read.Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO,so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A19 Upper DWord

OAC_OAPERF_A19_UPPER - OAC Aggregate Perf Counter A19 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A19 to be read.Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO,so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A20

OAC_OAPERF_A20 - OAC Aggregate Perf Counter A20		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A20. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO,so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A20 Upper DWord

OAC_OAPERF_A20_UPPER - OAC Aggregate Perf Counter A20 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A20 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO,so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A28

OAC_OAPERF_A28 - OAC Aggregate Perf Counter A28		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A28. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A28 Upper DWord

OAC_OAPERF_A28_UPPER - OAC Aggregate Perf Counter A28 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A28 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A29

OAC_OAPERF_A29 - OAC Aggregate Perf Counter A29		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A29. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A29 Upper DWord

OAC_OAPERF_A29_UPPER - OAC Aggregate Perf Counter A29 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A29 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A30

OAC_OAPERF_A30 - OAC Aggregate Perf Counter A30		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A30. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A30 Upper DWord

OAC_OAPERF_A30_UPPER - OAC Aggregate Perf Counter A30 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A30 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A31

OAC_OAPERF_A31 - OAC Aggregate Perf Counter A31		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A31		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A31 Upper DWord

OAC_OAPERF_A31_UPPER - OAC Aggregate Perf Counter A31 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A31 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A32

OAC_OAPERF_A32 - OAC Aggregate Perf Counter A32		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A32		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OACAggregatePerfCounterA32UpperDWord

OAC_OAPERF_A32_UPPER - OACAggregatePerfCounterA32UpperDWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A32 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A33

OAC_OAPERF_A33 - OAC Aggregate Perf Counter A33		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A33		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OACAggregatePerfCounterA33UpperDWord

OAC_OAPERF_A33_UPPER - OACAggregatePerfCounterA33UpperDWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A33 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A34

OAC_OAPERF_A34 - OAC Aggregate Perf Counter A34		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A34		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OACAggregatePerfCounterA34UpperDWord

OAC_OAPERF_A34_UPPER - OACAggregatePerfCounterA34UpperDWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A34 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this upper register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Aggregate Perf Counter A35

OAC_OAPERF_A35 - OAC Aggregate Perf Counter A35		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
This register reflects the count value of the OA Performance counter A35		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OACAggregatePerfCounterA35UpperDWord

OAC_OAPERF_A35_UPPER - OACAggregatePerfCounterA35UpperDWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter A35 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this upper register.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Boolean_Counter_B0

OAC_OAPERF_B0 - OAC Boolean_Counter_B0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter B0 to be read. Since what conditions cause B0 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Boolean_Counter_B1

OAC_OAPERF_B1 - OAC Boolean_Counter_B1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter B1 to be read. Since what conditions cause B1 to increment are defined by the programming of CEC1-0/CEC1-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Boolean_Counter_B2

OAC_OAPERF_B2 - OAC Boolean_Counter_B2

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter B2 to be read. Since what conditions cause B2 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Boolean_Counter_B3

OAC_OAPERF_B3 - OAC Boolean_Counter_B3

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter B3 to be read. Since what conditions cause B3 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Boolean_Counter_B4

OAC_OAPERF_B4 - OAC Boolean_Counter_B4

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter B4 to be read. Since what conditions cause B4 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Boolean_Counter_B5

OAC_OAPERF_B5 - OAC Boolean_Counter_B5

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter B5 to be read. Since what conditions cause B5 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Boolean_Counter_B6

OAC_OAPERF_B6 - OAC Boolean_Counter_B6

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter B6 to be read. Since what conditions cause B6 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Boolean_Counter_B7

OAC_OAPERF_B7 - OAC Boolean_Counter_B7

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register enables the current live value of performance counter B7 to be read. Since what conditions cause B7 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC GPU Ticks Counter

OAC_GPU_TICKS - OAC GPU Ticks Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Reading this register returns the live value of the GPU ticks counter that is sampled and included in the performance counter report header. It increments every GFX clock and hence the number of increments per second changes with GFX frequency.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the GPU tick counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC GPU Ticks Counter Upper DWord

OAC_GPU_TICKS_UPPER - OAC GPU Ticks Counter Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Reading this register returns the live value of the Upper DWord of GPU ticks counter that is sampled and included in the performance counter report header. It increments every GFX clock and hence the number of increments per second changes with GFX frequency.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the GPU tick counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAC Observation Architecture Control

OAC_OACONTROL - OAC Observation Architecture Control

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register controls OAC functionality, report format, and context filtering. If OAC is enabled then it should be enabled in CS as well

DWord	Bit	Description
0	31:4	**Reserved** Format: PBC _Custom_GTIReset: DEV
	3:1	**Counter Select** _Custom_GTIReset: DEV This field selects which performance counter report format to use, please refer to Performance Counter Report Formats section for more details on the structure of the format.
	0	**Performance Counter Enable** Format: Enable _Custom_GTIReset: DEV Global performance counter enable. If clear, no counting will occur. MI_REPORT_PERF_COUNT is undefined when clear. **Programming Notes** "OAC Context Enable" mode bit in RenderEngne CTX_SR_CTL register must be set when "Programmer Counter Enable" is set.

OAC Observation Architecture Status Register

OAC_OASTATUS - OAC Observation Architecture Status Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

This register provides status of report buffer and overflow conditions as well as status of some flags which hardware needs for internal purpose. Software should not program these status bits. Status bits are active high flags (0=false, 1=true)

DWord	Bit	Description
0	31:22	**Reserved** Format: PBC _Custom_GTIReset: DEV
	21	**Start Trigger Flag 1** _Custom_GTIReset: DEV Value / Name: 0 **[Default]**; 1 **Programming Notes**: This bit is for HW internal use to context save /restore Start Trigger 1 occurrence On RC6 entry. Software should not program this bit.
	20	**Start Trigger Flag 2** _Custom_GTIReset: DEV Value / Name: 0 **[Default]**; 1 **Programming Notes**: This bit is for HW internal use to context save /restore Start Trigger 2 occurrence On RC6 entry. Software should not program this bit.
	19	**Report Trigger Flag 1** _Custom_GTIReset: DEV Value / Name: 0 **[Default]**; 1

OAC_OASTATUS - OAC Observation Architecture Status Register

		Programming Notes This bit is for HW internal use to context save /restore Report Trigger 1 occurrence On RC6 entry. Software should not program this bit.
	18	**Report Trigger Flag 2** _Custom_GTIReset: DEV **Value** / **Name** 0 **[Default]** 1 **Programming Notes** This bit is for HW internal use to context save /restore Report Trigger 2 occurrence On RC6 entry. Software should not program this bit.
	17:6	**Reserved** Format: PBC _Custom_GTIReset: DEV
	5:2	**Reserved** Format: PBC _Custom_GTIReset: DEV
	1	**Accumulator Overflow** _Custom_GTIReset: DEV This field indicates that the one or more event accumulator inside the slice-OAunit has overflowed. Once set, this bit will remain set, until SW resets it by either soft reset or writing a 0 to it. **Value** / **Name** / **Description** 0 **[Default]** No overflow has occurred. 1 Overflow has occurred.
	0	**Counter Overflow** _Custom_GTIReset: DEV This bit is set if any of the counters overflows. This bit can be reset by SW by either soft reset or writing a 1 to it. **Value** / **Name** / **Description** 0 **[Default]** Counter Overflow not occurred 1 Counter Overflow occurred

OAG Aggregate Perf Counter A0

OAG_OAPERF_A0 - OAG Aggregate Perf Counter A0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D980h

This register reflects the count value of the OA Performance counter A0.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads. Value: 0x00000000 **[Default]** Value: [0x00000001-0xFFFFFFFF]

OAG Aggregate Perf Counter A0 Upper DWord

OAG_OAPERF_A0_UPPER - OAG Aggregate Perf Counter A0 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D984h

This register enables the current live value of performance counter A0 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A1

OAG_OAPERF_A1 - OAG Aggregate Perf Counter A1		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D988h	
This register reflects the count value of the OA Performance counter A1. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A1 Upper DWord

OAG_OAPERF_A1_UPPER - OAG Aggregate Perf Counter A1 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D98Ch

This register enables the current live value of performance counter A1 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A2

OAG_OAPERF_A2 - OAG Aggregate Perf Counter A2		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D990h	
This register reflects the count value of the OA Performance counter A2. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A2 Upper DWord

OAG_OAPERF_A2_UPPER - OAG Aggregate Perf Counter A2 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D994h

This register enables the current live value of performance counter A2 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A3

OAG_OAPERF_A3 - OAG Aggregate Perf Counter A3		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D998h	
This register reflects the count value of the OA Performance counter A3. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A3 Upper DWord

OAG_OAPERF_A3_UPPER - OAG Aggregate Perf Counter A3 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D99Ch

This register enables the current live value of performance counter A3 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A4

OAG_OAPERF_A4 - OAG Aggregate Perf Counter A4		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9A0h	
This register reflects the count value of the OA Performance counter A4. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A4 Lower DWord Free

OAG_OAPERF_A4_LOWER_FREE - OAG Aggregate Perf Counter A4 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAD4h

This register counts the same event as counter A4 however is not affected by context ID or other conditions that prevent A4 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A4 Upper DWord

OAG_OAPERF_A4_UPPER - OAG Aggregate Perf Counter A4 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9A4h

This register enables the current live value of performance counter A4 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A4 Upper DWord Free

OAG_OAPERF_A4_UPPER_FREE - OAG Aggregate Perf Counter A4 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAD8h

This register counts the same event as counter A4 however is not affected by context ID or other conditions that prevent A4 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A5

OAG_OAPERF_A5 - OAG Aggregate Perf Counter A5		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9A8h	
This register reflects the count value of the OA Performance counter A5. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A5 Upper DWord

OAG_OAPERF_A5_UPPER - OAG Aggregate Perf Counter A5 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9ACh

This register enables the current live value of performance counter A5 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A6

OAG_OAPERF_A6 - OAG Aggregate Perf Counter A6		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9B0h	
This register reflects the count value of the OA Performance counter A6. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A6 Lower DWord Free

OAG_OAPERF_A6_LOWER_FREE - OAG Aggregate Perf Counter A6 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DADCh

This register counts the same event as counter A6 however is not affected by context ID or other conditions that prevent A6 from incrementing. his counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A6 Upper DWord

OAG_OAPERF_A6_UPPER - OAG Aggregate Perf Counter A6 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9B4h

This register enables the current live value of performance counter A6 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A6 Upper DWord Free

OAG_OAPERF_A6_UPPER_FREE - OAG Aggregate Perf Counter A6 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAE0h

This register counts the same event as counter A6 however is not affected by context ID or other conditions that prevent A6 from incrementing. his counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A7

OAG_OAPERF_A7 - OAG Aggregate Perf Counter A7		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9B8h	
This register reflects the count value of the OA Performance counter A7. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A7 Upper DWord

OAG_OAPERF_A7_UPPER - OAG Aggregate Perf Counter A7 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9BCh

This register enables the current live value of performance counter A7 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A8

OAG_OAPERF_A8 - OAG Aggregate Perf Counter A8		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9C0h	
This register reflects the count value of the OA Performance counter A8. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A8 Upper DWord

OAG_OAPERF_A8_UPPER - OAG Aggregate Perf Counter A8 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9C4h

This register enables the current live value of performance counter A8 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A9

OAG_OAPERF_A9 - OAG Aggregate Perf Counter A9		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9C8h	
This register reflects the count value of the OA Performance counter A9. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A9 Upper DWord

OAG_OAPERF_A9_UPPER - OAG Aggregate Perf Counter A9 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9CCh

This register enables the current live value of performance counter A9 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A10

OAG_OAPERF_A10 - OAG Aggregate Perf Counter A10		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9D0h	
This register reflects the count value of the OA Performance counter A10. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A10 Upper DWord

OAG_OAPERF_A10_UPPER - OAG Aggregate Perf Counter A10 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9D4h

This register enables the current live value of performance counter A10 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A11

OAG_OAPERF_A11 - OAG Aggregate Perf Counter A11		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9D8h	
This register reflects the count value of the OA Performance counter A11. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A11 Upper DWord

OAG_OAPERF_A11_UPPER - OAG Aggregate Perf Counter A11 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9DCh

This register enables the current live value of performance counter A11 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A12

OAG_OAPERF_A12 - OAG Aggregate Perf Counter A12		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9E0h	
This register reflects the count value of the OA Performance counter A12. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A12 Upper DWord

OAG_OAPERF_A12_UPPER - OAG Aggregate Perf Counter A12 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9E4h

This register enables the current live value of performance counter A12 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A13

OAG_OAPERF_A13 - OAG Aggregate Perf Counter A13		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9E8h	
This register reflects the count value of the OA Performance counter A13. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A13 Upper DWord

OAG_OAPERF_A13_UPPER - OAG Aggregate Perf Counter A13 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9ECh

This register enables the current live value of performance counter A13 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A14

OAG_OAPERF_A14 - OAG Aggregate Perf Counter A14		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9F0h	
This register reflects the count value of the OA Performance counter A14. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A14 Upper DWord

OAG_OAPERF_A14_UPPER - OAG Aggregate Perf Counter A14 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9F4h

This register enables the current live value of performance counter A14 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A15

OAG_OAPERF_A15 - OAG Aggregate Perf Counter A15		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0D9F8h	
This register reflects the count value of the OA Performance counter A15. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A15 Upper DWord

OAG_OAPERF_A15_UPPER - OAG Aggregate Perf Counter A15 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D9FCh

This register enables the current live value of performance counter A15 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A16

OAG_OAPERF_A16 - OAG Aggregate Perf Counter A16		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA00h	
This register reflects the count value of the OA Performance counter A16. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A16 Upper DWord

OAG_OAPERF_A16_UPPER - OAG Aggregate Perf Counter A16 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA04h

This register enables the current live value of performance counter A16 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A17

OAG_OAPERF_A17 - OAG Aggregate Perf Counter A17		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA08h	
This register reflects the count value of the OA Performance counter A17. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A17 Upper DWord

OAG_OAPERF_A17_UPPER - OAG Aggregate Perf Counter A17 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA0Ch

This register enables the current live value of performance counter A17 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A18

OAG_OAPERF_A18 - OAG Aggregate Perf Counter A18		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA10h	
This register reflects the count value of the OA Performance counter A9. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A18 Upper DWord

OAG_OAPERF_A18_UPPER - OAG Aggregate Perf Counter A18 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA14h

This register enables the current live value of performance counter A18 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A19

OAG_OAPERF_A19 - OAG Aggregate Perf Counter A19		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA18h	
This register reflects the count value of the OA Performance counter A19. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A19 Lower DWord Free

OAG_OAPERF_A19_LOWER_FREE - OAG Aggregate Perf Counter A19 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAE4h

This register counts the same event as counter A19 however is not affected by context ID or other conditions that prevent A19 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A19 Upper DWord

OAG_OAPERF_A19_UPPER - OAG Aggregate Perf Counter A19 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA1Ch

This register enables the current live value of performance counter A19 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A19 Upper DWord Free

OAG_OAPERF_A19_UPPER_FREE - OAG Aggregate Perf Counter A19 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAE8h

This register counts the same event as counter A19 however is not affected by context ID or other conditions that prevent A19 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A20

OAG_OAPERF_A20 - OAG Aggregate Perf Counter A20		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA20h	
This register reflects the count value of the OA Performance counter A20. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A20 Lower DWord Free

OAG_OAPERF_A20_LOWER_FREE - OAG Aggregate Perf Counter A20 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAECh

This register counts the same event as counter A20 however is not affected by context ID or other conditions that prevent A20 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A20 Upper DWord

OAG_OAPERF_A20_UPPER - OAG Aggregate Perf Counter A20 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA24h

This register enables the current live value of performance counter A20 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A20 Upper DWord Free

OAG_OAPERF_A20_UPPER_FREE - OAG Aggregate Perf Counter A20 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAF0h

This register counts the same event as counter A20 however is not affected by context ID or other conditions that prevent A20 from incrementing. his counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A21

OAG_OAPERF_A21 - OAG Aggregate Perf Counter A21		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA28h	
This register reflects the count value of the OA Performance counter A21. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A21 Upper DWord

OAG_OAPERF_A21_UPPER - OAG Aggregate Perf Counter A21 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA2Ch

This register enables the current live value of performance counter A21 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A22

OAG_OAPERF_A22 - OAG Aggregate Perf Counter A22		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA30h	
This register reflects the count value of the OA Performance counter A22. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A22 Upper DWord

OAG_OAPERF_A22_UPPER - OAG Aggregate Perf Counter A22 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA34h

This register enables the current live value of performance counter A22 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A23

OAG_OAPERF_A23 - OAG Aggregate Perf Counter A23		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA38h	
This register reflects the count value of the OA Performance counter A23. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A23 Upper DWord

OAG_OAPERF_A23_UPPER - OAG Aggregate Perf Counter A23 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA3Ch

This register enables the current live value of performance counter A23 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A24

OAG_OAPERF_A24 - OAG Aggregate Perf Counter A24		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA40h	
This register reflects the count value of the OA Performance counter A24. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A24 Upper DWord

OAG_OAPERF_A24_UPPER - OAG Aggregate Perf Counter A24 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA44h

This register enables the current live value of performance counter A24 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A25

OAG_OAPERF_A25 - OAG Aggregate Perf Counter A25		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA48h	
This register reflects the count value of the OA Performance counter A25. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A25 Upper DWord

OAG_OAPERF_A25_UPPER - OAG Aggregate Perf Counter A25 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA4Ch

This register enables the current live value of performance counter A25 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A26

OAG_OAPERF_A26 - OAG Aggregate Perf Counter A26		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA50h	
This register reflects the count value of the OA Performance counter A26. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A26 Upper DWord

OAG_OAPERF_A26_UPPER - OAG Aggregate Perf Counter A26 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA54h

This register enables the current live value of performance counter A26 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A27

OAG_OAPERF_A27 - OAG Aggregate Perf Counter A27		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA58h	
This register reflects the count value of the OA Performance counter A27. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A27 Upper DWord

OAG_OAPERF_A27_UPPER - OAG Aggregate Perf Counter A27 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA5Ch

This register enables the current live value of performance counter A27 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A28

OAG_OAPERF_A28 - OAG Aggregate Perf Counter A28		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA60h	
This register reflects the count value of the OA Performance counter A28. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A28 Upper DWord

OAG_OAPERF_A28_UPPER - OAG Aggregate Perf Counter A28 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA64h

This register enables the current live value of performance counter A28 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A29

OAG_OAPERF_A29 - OAG Aggregate Perf Counter A29		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA68h	
This register reflects the count value of the OA Performance counter A29. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A29 Upper DWord

OAG_OAPERF_A29_UPPER - OAG Aggregate Perf Counter A29 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA6Ch

This register enables the current live value of performance counter A29 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A30

OAG_OAPERF_A30 - OAG Aggregate Perf Counter A30		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA70h	
This register reflects the count value of the OA Performance counter A30. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A30 Upper DWord

OAG_OAPERF_A30_UPPER - OAG Aggregate Perf Counter A30 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA74h

This register enables the current live value of performance counter A30 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A31

OAG_OAPERF_A31 - OAG Aggregate Perf Counter A31		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA78h	
This register reflects the count value of the OA Performance counter A31		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A31 Upper DWord

OAG_OAPERF_A31_UPPER - OAG Aggregate Perf Counter A31 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA7Ch

This register enables the current live value of performance counter A31 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A32

OAG_OAPERF_A32 - OAG Aggregate Perf Counter A32		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA80h	
This register reflects the count value of the OA Performance counter A32		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A33

OAG_OAPERF_A33 - OAG Aggregate Perf Counter A33		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA84h	
This register reflects the count value of the OA Performance counter A33		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A34

OAG_OAPERF_A34 - OAG Aggregate Perf Counter A34		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA88h	
This register reflects the count value of the OA Performance counter A34		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter A35

OAG_OAPERF_A35 - OAG Aggregate Perf Counter A35		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA8Ch	
This register reflects the count value of the OA Performance counter A35		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM0 Lower DWord Free

OAG_OAPERF_SPM0_LOWER_FREE - OAG Aggregate Perf Counter SPM0 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB30h

This register counts the same event as counter SPM0 however is not affected by context ID or other conditions that prevent SPM0 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM0 Upper DWord Free

OAG_OAPERF_SPM0_UPPER_FREE - OAG Aggregate Perf Counter SPM0 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB34h

This register counts the same event as counter SPM0 however is not affected by context ID or other conditions that prevent SPM0 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM1 Lower DWord Free

OAG_OAPERF_SPM1_LOWER_FREE - OAG Aggregate Perf Counter SPM1 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB38h

This register counts the same event as counter SPM1 however is not affected by context ID or other conditions that prevent SPM1 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM1 Upper DWord Free

OAG_OAPERF_SPM1_UPPER_FREE - OAG Aggregate Perf Counter SPM1 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB3Ch

This register counts the same event as counter SPM1 however is not affected by context ID or other conditions that prevent SPM1 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM2 Lower DWord Free

OAG_OAPERF_SPM2_LOWER_FREE - OAG Aggregate Perf Counter SPM2 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB40h

This register counts the same event as counter SPM2 however is not affected by context ID or other conditions that prevent SPM2 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM2 Upper DWord Free

OAG_OAPERF_SPM2_UPPER_FREE - OAG Aggregate Perf Counter SPM2 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB44h

This register counts the same event as counter SPM2 however is not affected by context ID or other conditions that prevent SPM2 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM3 Lower DWord Free

OAG_OAPERF_SPM3_LOWER_FREE - OAG Aggregate Perf Counter SPM3 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB48h

This register counts the same event as counter SPM3 however is not affected by context ID or other conditions that prevent SPM3 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM3 Upper DWord Free

OAG_OAPERF_SPM3_UPPER_FREE - OAG Aggregate Perf Counter SPM3 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB4Ch

This register counts the same event as counter SPM3 however is not affected by context ID or other conditions that prevent SPM3 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM4 Lower DWord Free

OAG_OAPERF_SPM4_LOWER_FREE - OAG Aggregate Perf Counter SPM4 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB50h

This register counts the same event as counter SPM4 however is not affected by context ID or other conditions that prevent SPM4 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM4 Upper DWord Free

OAG_OAPERF_SPM4_UPPER_FREE - OAG Aggregate Perf Counter SPM4 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB54h

This register counts the same event as counter SPM4 however is not affected by context ID or other conditions that prevent SPM4 from incrementing. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM5 Lower DWord Free

OAG_OAPERF_SPM5_LOWER_FREE - OAG Aggregate Perf Counter SPM5 Lower DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB58h

Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted used this register. This counter is free running, always enabled and counts irrespective of OA enable configuration.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Aggregate Perf Counter SPM5 Upper DWord Free

OAG_OAPERF_SPM5_UPPER_FREE - OAG Aggregate Perf Counter SPM5 Upper DWord Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB5Ch

Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is counted using this register. This counter is free running, always enabled and counts irrespective of OA enable configuration.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Any Media Fixed Function 0 Wake Count Free

OAG_ANY_MEDIA_FF0_WAKE_COUNT_FREE - OAG Any Media Fixed Function 0 Wake Count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBA8h

This register counts the number of media fixed function wake events for Media FF0. This counter is free running, always enabled and counts irrespective of OA being enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Any Media Fixed Function 1 Wake Count Free

OAG_ANY_MEDIA_FF1_WAKE_COUNT_FREE - OAG Any Media Fixed Function 1 Wake Count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBB8h
This register counts the number of media fixed function wake events. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.	

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Any Media Fixed Function Busy Free

OAG_ANY_MEDIA_FF_BUSY_FREE - OAG Any Media Fixed Function Busy Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBA0h

This register counts the time that any media fixed function is busy. This counter is free running, always enabled and counts irrespective of OA being enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG BLT Busy Free

OAG_BLT_BUSY_FREE - OAG BLT Busy Free		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DBBCh	
This register counts the time that BLT engine is busy. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG BLT Wake Count Free

OAG_BLT_WAKE_COUNT_FREE - OAG BLT Wake Count Free		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DBC0h	
This register counts the number of times that BLT wakes up. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Boolean Counter B0

OAG_OAPERF_B0 - OAG Boolean Counter B0	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA94h

This register enables the current live value of performance counter B0 to be read. Since what conditions cause B0 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Boolean Counter B1

OAG_OAPERF_B1 - OAG Boolean Counter B1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA98h

This register enables the current live value of performance counter B1 to be read. Since what conditions cause B1 to increment are defined by the programming of CEC1-0/CEC1-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Boolean Counter B2

OAG_OAPERF_B2 - OAG Boolean Counter B2	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DA9Ch

This register enables the current live value of performance counter B2 to be read. Since what conditions cause B2 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Boolean Counter B3

OAG_OAPERF_B3 - OAG Boolean Counter B3	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAA0h

This register enables the current live value of performance counter B3 to be read. Since what conditions cause B3 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Boolean Counter B4

OAG_OAPERF_B4 - OAG Boolean Counter B4	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAA4h

This register enables the current live value of performance counter B4 to be read. Since what conditions cause B4 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Boolean Counter B5

OAG_OAPERF_B5 - OAG Boolean Counter B5	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAA8h

This register enables the current live value of performance counter B5 to be read. Since what conditions cause B5 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Boolean Counter B6

OAG_OAPERF_B6 - OAG Boolean Counter B6	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAACh

This register enables the current live value of performance counter B6 to be read. Since what conditions cause B6 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Boolean Counter B7

OAG_OAPERF_B7 - OAG Boolean Counter B7	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAB0h

This register enables the current live value of performance counter B7 to be read. Since what conditions cause B7 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Context Control

OAG_OAGLBCTXCTRL - OAG Context Control

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	02B28h

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: PBC _Custom_GTIReset: DEV
	7:2	**Timer Period** Default Value: 00b Access: R/W Specifies the period of the timer strobe as a function of the minimum TIME_STAMP resolution. The period is determined by selecting a specified bit from the TIME_STAMP register as follows: StrobePeriod = MinimumTimeStampPeriod * 2 **(TimerPeriod + 1)** The exponent is defined by this field. **Programming Notes** **Note:** The TIME_STAMP is not reset at start time so the phase of the strobe is not synchronized with the enable of the OA unit. This could result in approximately a full StrobePeriod elapsing prior to the first trigger. Usage for this mechanism should be time based periodic triggering, typically.
	1	**Timer Enable** Access: R/W This field enables the timer logic to output a periodic strobe, as defined by the Timer Period. When disabled the timer output is not asserted. Users should be aware that the timer-based report logic and the Boolean report trigger logic are logically OR'd together with no buffering of report triggers. This implies that only one performance counter report will be generated for clocks where both the timer-based report logic and the Boolean report trigger logic trigger a performance counter report. **Value** / **Name** / **Description** 0 / Disable **[Default]** / Counter does not get written out on regular interval 1 / Enable / Counter gets written out on regular intervals, defined by the Timer Period **Programming Notes** When "Specific Context Enable" bit is set to '1' in OACONTROL register, Timer based report trigger function gets enabled only for the selected context.

OAG_OAGLBCTXCTRL - OAG Context Control

		When "Specific Context Enable" bit is set to '0' in OACONTROL register, Timer based report trigger function gets enabled for all contexts.
	0	**Counter Stop-Resume Mechanism** Access: R/W Counter stop-resume mechanism

Value	Name	Description
1	Resume	Resume counting for all counters

OAG Customizable Event Creation 0-0

OAG_CEC00 - OAG Customizable Event Creation 0-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D940h

Description
This register is used to define custom counter event 0, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. 0b – Pass-through – Input bit is passed through to comparator as is 1b – Negated – Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). 01b – Prev Event – Selects the conditioned/flopped input from the last CEC block as the input bus to CEC0 block 11b – Reserved –
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.

OAG_CEC00 - OAG Customizable Event Creation 0-0

2:0 **Compare Function**

Format:	U3
_Custom_GTIReset:	DEV

This field selects the function used by the CEC0 comparator when comparing the compare value to the value active on the CEC0 conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Customizable Event Creation 1-0

OAG_CEC10 - OAG Customizable Event Creation 1-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D948h

Description
This register is used to define custom counter event 1, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. 0b – Pass-through – Input bit is passed through to comparator as is 1b – Negated – Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). 01b – Prev Event – Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b – Reserved –
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.

OAG_CEC10 - OAG Customizable Event Creation 1-0

2:0 **Compare Function**

Format:	U3
_Custom_GTIReset:	DEV

This field selects the function used by the CEC comparator when comparing the compare value to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Customizable Event Creation 1-1

OAG_CEC11 - OAG Customizable Event Creation 1-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D94Ch

Description
This register configures the input conditioning portion of CEC (custom event creation) block 1, bit definitions in this register refer to the CEC block diagram.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG Customizable Event Creation 2-0

OAG_CEC20 - OAG Customizable Event Creation 2-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D950h

Description
This register is used to define custom counter event 2, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. 0b – Pass-through – Input bit is passed through to comparator as is 1b – Negated – Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). 01b – Prev Event – Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b – Reserved –
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.

OAG_CEC20 - OAG Customizable Event Creation 2-0

	2:0	**Compare Function** Format: U3 _Custom_GTIReset: DEV This field selects the function used by the CEC comparator when comparing the compare value to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Customizable Event Creation 2-1

OAG_CEC21 - OAG Customizable Event Creation 2-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D954h

Description
This register configures the input conditioning portion of CEC (custom event creation) block 2, bit definitions in this register refer to the CEC block diagram.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG Customizable Event Creation 3-0

OAG_CEC30 - OAG Customizable Event Creation 3-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D958h

Description
This register is used to define custom counter event 3, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. 0b – Pass-through – Input bit is passed through to comparator as is 1b – Negated – Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). 01b – Prev Event – Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b – Reserved –
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.

OAG_CEC30 - OAG Customizable Event Creation 3-0

2:0 **Compare Function**

Format:	U3
_Custom_GTIReset:	DEV

This field selects the function used by the CEC comparator when comparing the compare value to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Customizable Event Creation 3-1

OAG_CEC31 - OAG Customizable Event Creation 3-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D95Ch

Description
This register configures the input conditioning portion of CEC (custom event creation) block 3, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG Customizable Event Creation 4-0

OAG_CEC40 - OAG Customizable Event Creation 4-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D960h

Description
This register is used to define custom counter event 4, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. 0b – Pass-through – Input bit is passed through to comparator as is 1b – Negated – Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). 01b – Prev Event – Selects the conditioned/flopped input from the last CEC block as the input bus to CEC0 block 11b – Reserved –
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.

OAG_CEC40 - OAG Customizable Event Creation 4-0

2:0 **Compare Function**

Format:	U3
_Custom_GTIReset:	DEV

This field selects the function used by the CEC comparator when comparing the compare value to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Customizable Event Creation 5-0

OAG_CEC50 - OAG Customizable Event Creation 5-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D968h

Description
This register is used to define custom counter event 5, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Address:	0D96Ch

Description
This register configures the input conditioning portion of CEC (custom event creation) block 5, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG Customizable Event Creation 6-0

OAG_CEC60 - OAG Customizable Event Creation 6-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D970h

Description
This register is used to define custom counter event 6, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. **Value** / **Name** / **Description** / **Programming Notes** 0b / Pass-through / Input bit is passed through to comparator as is / 1b / Negated / Input bit is negated before passing to comparator /
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). **Value** / **Name** / **Description** 01b / Prev Event / Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b / Reserved /
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.

OAG_CEC60 - OAG Customizable Event Creation 6-0

2:0 **Compare Function**

Format:	U3
_Custom_GTIReset:	DEV

This field selects the function used by the CEC comparator when comparing the compare value to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Customizable Event Creation 6-1

OAG_CEC61 - OAG Customizable Event Creation 6-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D974h

Description
This register configures the input conditioning portion of CEC (custom event creation) block 6, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG Customizable Event Creation 7-0

OAG_CEC70 - OAG Customizable Event Creation 7-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D978h

Description
This register is used to define custom counter event 7, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. 0b – Pass-through – Input bit is passed through to comparator as is 1b – Negated – Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). 01b – Prev Event – Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b – Reserved –
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.

OAG_CEC70 - OAG Customizable Event Creation 7-0

2:0 **Compare Function**

Format:	U3
_Custom_GTIReset:	DEV

This field selects the function used by the CEC comparator when comparing the compare value to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Customizable Event Creation 7-1

OAG_CEC71 - OAG Customizable Event Creation 7-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D97Ch

Description
This register configures the input conditioning portion of CEC (custom event creation) block 3, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.
This register can be used to customize counters for events from both unslice and slice units.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. 0b – Live – Input bit is not delayed by 1 clock before event calculation 1b – Delayed – Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. 0b – Unmasked – Input bit is considered in event calculation 1b – Masked – Input bit is ignored in event calculation

OAG GPU Ticks Counter

OAG_GPU_TICKS - OAG GPU Ticks Counter		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DA90h	
Reading this register returns the live value of the GPU ticks counter that is sampled and included in the performance counter report header. It increments every GFX clock and hence the number of increments per second changes with GFX frequency.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the GPU tick counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG GPU Ticks Counter Upper DWord

OAG_GPU_TICKS_UPPER - OAG GPU Ticks Counter Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Reading this register returns the live value of the Upper DWord of GPU ticks counter that is sampled and included in the performance counter report header. It increments every GFX clock and hence the number of increments per second changes with GFX frequency.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the GPU tick counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG GTI Busy Free

OAG_GTI_BUSY_FREE - OAG GTI Busy Free		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DBCCh	
This register counts the time that any engine residing in GTI(currently WG, BLT, or GuC) is busy. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG GTI Wake Count Free

OAG_GTI_WAKE_COUNT_FREE - OAG GTI Wake Count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBD0h

This register counts the number of times that GTI wakes up due to one of the engines resident in GTI (currently WG, BLT, and GuC) becoming busy. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG GuC Busy Free

OAG_GUC_BUSY_FREE - OAG GuC Busy Free		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DBC4h	
This register counts the time that GuC is busy. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG GuC Wake Count Free

OAG_GUC_WAKE_COUNT_FREE - OAG GuC Wake Count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBC8h

This register counts the number of times that GuC wakes up. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Interrupt Mask Register

OAG_OA_IMR - OAG Interrupt Mask Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB14h

The OAIMR register is used by software to control whether OA generates an interrupt or not.

DWord	Bit	Description
0	31:29	**Reserved** Default Value: 7h Format: PBC _Custom_GTIReset: DEV
	28	**Mask Bit** _Custom_GTIReset: DEV Value / Name / Description 0h / Not Masked / May generate an interrupt 1h / Masked **[Default]** / Will not generate an interrupt
	27:0	**Reserved** Default Value: FFFFFFFh Format: PBC _Custom_GTIReset: DEV

OAG MCPG0 Hysteresis Time Free

OAG_MCPG0_HYSTERESIS_TIME_FREE - OAG MCPG0 Hysteresis Time Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBA4h
This register counts the time that MCPG hysteresis time is accumulating for media slice 0.This counter is free running, always enabled and counting irrespective of OA enabled or disabled.	

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Media Sampler Really Busy Free

OAG_MEDIA_SAMPLER_REALLY_BUSY_FREE - OAG Media Sampler Really Busy Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBACh
This register counts the time that media sampler is really busy. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.	

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Media Sampler Wake Count Free

OAG_MEDIA_SAMPLER_WAKE_COUNT_FREE - OAG Media Sampler Wake Count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBB0h

This register counts the number of times that media sampler wakes up. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Observation Architecture Buffer

OAG_OABUFFER - OAG Observation Architecture Buffer

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB08h

This register is used to program the OA unit.

Programming Notes

This MMIO must be set before the OATAILPTR register and set after the OAHEADPTR register. This is to enable proper functionality of the overflow bit.

DWord	Bit	Description
0	31:6	**Report Buffer Offset** _Custom_GTIReset: DEV This field specifies 64B aligned GFX MEM address where the chap counter values are reported.
	5:3	**Inter Trigger Report Buffer Size** _Custom_GTIReset: DEV This field indicates the size of report buffer for time/event-based report trigger mechanisms.

Value	Name	Description
0h	128 KB or 1MB **[Default]**	All context considered.
1h	256 KB or 2MB	
2h	512 KB or 4MB	
3h	1 MB or 8MB	
4h	2 MB or 16MB	
5h	4 MB or 32MB	
6h	8 MB or 64MB	
7h	16 MB or 128MB	

	2	**OA Report Trigger Select** _Custom_GTIReset: DEV

Value	Name	Description
0		Level Report trigger
1		Edge Report trigger

	1	**Disable Overrun Mode** Format: Enable _Custom_GTIReset: DEV This field defines the mode of reporting for internal trigger/timer based reporting. When this bit is set, overrun does not lose reports but stops reporting. Based on the head and tail pointer, when

HW detects room for the report, it would resume reporting to the buffer. This mode would not set the over-run bit in the register. When this mode bit is reset, buffer overrun can happen and lose the reports while setting the buffer over-run bit.

Value	Name	Description
0h	Disable **[Default]**	Counter gets written out on regular intervals, defined by the Timer Period
1h	Enable	Counter does not get written out on regular interval

0 **Memory Select PPGTT/GGTT Access**

_Custom_GTIReset:	DEV

Value	Name
0h	PPGTT
1h	GGTT **[Default]**

Programming Notes
When each context has its own Per Process GTT, this field should be always set to GGTT.

OAG Observation Architecture Control

OAG_OACONTROL - OAG Observation Architecture Control

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAF4h

This register controls global OA functionality, report format, interrupt steering and context filtering.

DWord	Bit	Description
0	31:18	**Reserved** Format: PBC _Custom_GTIReset: DEV
	17:7	**Reserved** Access: RO Format: MBZ
	6	**OA Context control select** _Custom_GTIReset: DEV **Description**: This field is obsolete Bit field to indicate which context control inputs are to be chosen in the OACS **Value 0**: OAG RCS Select **[Default]** — Select the OA context control from RCS (Default) **Value 1**: Global — Select the Global OA context control
	5	**Interrupt Steering Bit** _Custom_GTIReset: DEV When set, OACS unit sends interrupt messages to the SHIM of the GUC through message channel. When reset, OACS unit sends the interrupt message to Display Engine as config writes on GAM interface.
	4:2	**Counter Select** _Custom_GTIReset: DEV This field selects which performance counter report format to use, please refer to Performance Counter Report Formats section for more details on the structure of the format.
	1	**Reserved** Access: RO Format: MBZ

OAG_OACONTROL - OAG Observation Architecture Control

	0	**Performance Counter Enable** Format: Enable _Custom_GTIReset: DEV Global performance counter enable. If clear, no counting will occur. MI_REPORT_PERF_COUNT is undefined when clear. **Programming Notes** When this bit is set, OABUFFER, OAHEADPTR and OATAILPTR must be programmed correctly to ensure report triggers due to Context Switch and GO transition happen correctly.

OAG Observation Architecture Report Trigger 2

OAG_OAREPORTTRIG2 - OAG Observation Architecture Report Trigger 2

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D924h

This register controls some of the Boolean logic defining Boolean/threshold report trigger 0. The bit definitions in this register refer to the stages in the report trigger block diagram in the Performance Counter Reporting section.

Report triggers generated from OAREPORTTRIG 1-4 and OAREPORTTRIG 5-8 are ORed to form a new report trigger. Report trigger behavior can be derived by programming these two sets of OA REPORT registers with the same value. Users should be aware that while programming Timer based and Threshold Counter based triggers simultaneously for internal reporting, they should be programmed such way that they are not consecutively triggered. If programmed simultaneously, RTL pulse detection logic will have problem when these triggers occur in consecutive clock cycles.

DWord	Bit	Description
0	31	**Report Trigger Enable** Format: Enable _Custom_GTIReset: DEV Enable Boolean/threshold report trigger 0. Users should be aware that the timer-based report logic and the Boolean report trigger logic are logically OR'd together with no buffering of report triggers. This implies that only one performance counter report will be generated for clocks where both the timer-based report logic and the Boolean report trigger logic trigger a performance counter report. When "Specific Context Enable" bit set to '1' in OACONTROL register, Boolean/Threshold report trigger function gets enabled only for the selected context. When "Specific Context Enable" bit set to '0' in OACONTROL register, Boolean/Threshold report trigger function gets enabled for all contexts.
	30:24	**Reserved** Format: PBC _Custom_GTIReset: DEV
	23	**Threshold Enable** Format: Enable _Custom_GTIReset: DEV Enable the threshold compare logic within the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).

OAG_OAREPORTTRIG2 - OAG Observation Architecture Report Trigger 2

	22	**Invert D Enable 0** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the D stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	21	**Invert C Enable 1** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the C stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	20	**Invert C Enable 0** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the C stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	19	**Invert B Enable 3** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the B stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	18	**Invert B Enable 2** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the B stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	17	**Invert B Enable 1** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the B stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	16	**Invert B Enable 0** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the B stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	15	**Invert A Enable 15** Format: Enable _Custom_GTIReset: DEV

OAG_OAREPORTTRIG2 - OAG Observation Architecture Report Trigger 2

		Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	14	**Invert A Enable 14** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	13	**Invert A Enable 13** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	12	**Invert A Enable 12** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	11	**Invert A Enable 11** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	10	**Invert A Enable 10** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	9	**Invert A Enable 9** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	8	**Invert A Enable 8** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).

OAG_OAREPORTTRIG2 - OAG Observation Architecture Report Trigger 2

	7	**Invert A Enable 7** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	6	**Invert A Enable 6** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	5	**Invert A Enable 5** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	4	**Invert A Enable 4** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	3	**Invert A Enable 3** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	2	**Invert A Enable 2** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).
	1	**Invert A Enable 1** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).

OAG_OAREPORTTRIG2 - OAG Observation Architecture Report Trigger 2

	0	**Invert A Enable 0** Format: Enable _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 0 logic (see block diagram in the Performance Counter Reporting section).

OAG Observation Architecture Report Trigger 6

OAG_OAREPORTTRIG6 - OAG Observation Architecture Report Trigger 6

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D934h

This register controls some of the Boolean logic defining Boolean/threshold report trigger 1. Note that Boolean report triggers 0 and 1 are logically OR'd together without buffering, this implies that only one performance counter report will be generated for clocks where both Boolean report triggers evaluate true. The bit definitions in this register refer to the stages in the report trigger block diagram in the Performance Counter Reporting section.

Report triggers generated from OAREPORTTRIG 1-4 and OAREPORTTRIG 5-8 are ORed to form a new report trigger. Report trigger behavior can be derived by programming these two sets of OA REPORT registers with the same value. Users should be aware that while programming Timer based and Threshold Counter based triggers simultaneously for internal reporting, they should be programmed such way that they are not consecutively triggered. If programmed simultaneously, RTL pulse detection logic will have problem when these triggers occur in consecutive clock cycles.

DWord	Bit	Description
0	31	**Report Trigger Enable** _Custom_GTIReset: DEV Enable Boolean/threshold report trigger 0. Users should be aware that the timer-based report logic and the Boolean report trigger logic are logically OR'd together with no buffering of report triggers. This implies that only one performance counter report will be generated for clocks where both the timer-based report logic and the Boolean report trigger logic trigger a performance counter report. When "Specific Context Enable" bit set to '1' in OACONTROL register, Boolean/Threshold report trigger function gets enabled only for the selected context. When "Specific Context Enable" bit set to '0' in OACONTROL register, Boolean/Threshold report trigger function gets enabled for all contexts.
	30:24	**Reserved** Format: PBC _Custom_GTIReset: DEV
	23	**Threshold Enable** _Custom_GTIReset: DEV Enable the threshold compare logic within the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	22	**Invert D Enable 0** _Custom_GTIReset: DEV

OAG_OAREPORTTRIG6 - OAG Observation Architecture Report Trigger 6

		Invert the specified signal at the D stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	21	**Invert C Enable 1** _Custom_GTIReset: DEV Invert the specified signal at the C stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	20	**Invert C Enable 0** _Custom_GTIReset: DEV Invert the specified signal at the C stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	19	**Invert B Enable 3** _Custom_GTIReset: DEV Invert the specified signal at the B stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	18	**Invert B Enable 2** _Custom_GTIReset: DEV Invert the specified signal at the B stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	17	**Invert B Enable 1** _Custom_GTIReset: DEV Invert the specified signal at the B stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	16	**Invert B Enable 0** _Custom_GTIReset: DEV Invert the specified signal at the B stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	15	**Invert A Enable 15** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	14	**Invert A Enable 14** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	13	**Invert A Enable 13** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).

OAG_OAREPORTTRIG6 - OAG Observation Architecture Report Trigger 6

	12	**Invert A Enable 12** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	11	**Invert A Enable 11** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	10	**Invert A Enable 10** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	9	**Invert A Enable 9** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	8	**Invert A Enable 8** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	7	**Invert A Enable 7** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	6	**Invert A Enable 6** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	5	**Invert A Enable 5** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	4	**Invert A Enable 4** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	3	**Invert A Enable 3** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see

OAG_OAREPORTTRIG6 - OAG Observation Architecture Report Trigger 6

		block diagram in the Performance Counter Reporting section).
	2	**Invert A Enable 2** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	1	**Invert A Enable 1** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).
	0	**Invert A Enable 0** _Custom_GTIReset: DEV Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).

OAG Observation Architecture Report Trigger Counter

OAG_OARPTTRIG_COUNTER - OAG Observation Architecture Report Trigger Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB10h

This register provides status of report trigger threshold count 1 and 2. This register is for HW internal purpose and power context save/restored. This register must not be programmed by SW.

DWord	Bit	Description
0	31:16	**Report Trig Threshold Count 1 Status** _Custom_GTIReset: DEV **Programming Notes** This field is for HW internal use to context save/restore rpt trigger threshold count 1. It always indicates current value of HW's internal report trigger count. SW should not program these bits.
	15:0	**Report Trig Threshold count 2 status** _Custom_GTIReset: DEV **Programming Notes** This field is for HW internal use to context save/restore rpt trigger threshold count 2. It always indicates current value of HW's internal report trigger count. SW should not program these bits.

OAG Observation Architecture Start Trigger 5

OAG_OASTARTTRIG5 - OAG Observation Architecture Start Trigger 5

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0D910h

This register provides the threshold value optionally used to define the start trigger for B7-B4 counters. Note that the value in this register must match the value in OASTARTTRIG1 to have B7-B0 start at the same time. The bit definition in this register refers to the stages in the start trigger block diagram in the Performance Counter Reporting section.

DWord	Bit	Description
0	31:16	**Reserved** Format: PBC _Custom_GTIReset: DEV
	15:0	**Threshold Value** Format: U16 _Custom_GTIReset: DEV **Programming Notes** Threshold value for the compare logic within the start trigger logic for B7-B4 counters.

OAG Observation Architecture Start Trigger Counter

OAG_OASTARTTRIG_COUNTER - OAG Observation Architecture Start Trigger Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB0Ch

This register provides status of start trigger threshold count 1 and 2. This register is for HW internal purpose.

DWord	Bit	Description
0	31:16	**Start Trig Threshold Count 1 Status** _Custom_GTIReset: DEV **Programming Notes** This field is for HW internal use to context save/restore start trigger threshold count 1. It always indicates current value of HW's internal start trigger count. SW should not program these bits.
	15:0	**Start Trig Threshold count 2 status** _Custom_GTIReset: DEV **Programming Notes** : This field is for HW internal use to context save/restore start trigger threshold count 2. It always indicates current value of HW's internal start trigger count. SW should not program these bits.

OAG Observation Architecture Status Register

OAG_OASTATUS - OAG Observation Architecture Status Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DAFCh

This register provides status of report buffer and overflow conditions as well as status of some flags which hardware needs for internal purpose. Software should not program these status bits. Status bits are active high flags (0=false, 1=true)

DWord	Bit	Description
0	31:22	**Reserved** Format: PBC _Custom_GTIReset: DEV
	21	**Start Trigger Flag 1** _Custom_GTIReset: DEV Value / Name: 0 **[Default]**; 1 Programming Notes: This bit is for HW internal use to context save /restore Start Trigger 1 occurrence On RC6 entry. Software should not program this bit.
	20	**Start Trigger Flag 2** _Custom_GTIReset: DEV Value / Name: 0 **[Default]**; 1 Programming Notes: This bit is for HW internal use to context save /restore Start Trigger 2 occurrence On RC6 entry. Software should not program this bit.
	19	**Report Trigger Flag 1** _Custom_GTIReset: DEV Value / Name: 0 **[Default]**

OAG_OASTATUS - OAG Observation Architecture Status Register

1	

Programming Notes

This bit is for HW internal use to context save /restore Report Trigger 1 occurrence On RC6 entry. Software should not program this bit.

18 **Report Trigger Flag 2**

_Custom_GTIReset:	DEV

Value	Name
0	**[Default]**
1	

Programming Notes

This bit is for HW internal use to context save /restore Report Trigger 2 occurrence On RC6 entry. Software should not program this bit.

17 **Tail Pointer Wrap Flag**

Format:	U1
_Custom_GTIReset:	DEV

Value	Name
0	
1	**[Default]**

Programming Notes

This bit is for HW internal use to context save /restore Tail Pointer Wrap Flag. SW should not program this bit. This bit gets programmed only when Tail Pointer Wrap Mask bit is set.

16 **Head Pointer Wrap Flag**

Format:	U1
_Custom_GTIReset:	DEV

Value	Name
0	
1	**[Default]**

Programming Notes

This bit is for HW internal use to context save /restore Head Pointer Wrap Flag. SW should not program this bit. This bit gets programmed only when Head Pointer Wrap Mask bit is set.

OAG_OASTATUS - OAG Observation Architecture Status Register

	15:7	**Reserved** Format: PBC _Custom_GTIReset: DEV
	6	**Reserved** Access: RO Format: MBZ
	5	**Reserved** Format: PBC _Custom_GTIReset: DEV
	4	**Accumulator Overflow** _Custom_GTIReset: DEV This field indicates that the one or more event accumulator inside the slice-OAunit has overflowed. Once set, this bit will remain set, until SW resets it by either soft reset or writing a 0 to it.

Value	Name	Description
0	**[Default]**	No overflow has occurred.
1		Overflow has occurred.

	3	**Overrun Status** _Custom_GTIReset: DEV This bit is read only and writing to this bit will have no effect. This bit will reflect the status of overrun irrespective of Overun Mode enabled or disabled.

Value	Name	Description
0	**[Default]**	No overrun has occurred
1		Overrun has occurred

	2	**Counter Overflow** _Custom_GTIReset: DEV This bit is set if any of the counters overflows. This bit can be reset by SW by either soft reset or writing a 0 to it.

Value	Name	Description
0	**[Default]**	Counter Overflow Not Occurred
1		Counter Overflow Occurred

	1	**Buffer Overflow** _Custom_GTIReset: DEV This bit is set when the Tail-pointer - Head pointer > max internal trigger buffer size

Value	Name	Description
0h	**[Default]**	Buffer Overflow Not Occurred
1		Buffer Overflow Occurred

OAG_OASTATUS - OAG Observation Architecture Status Register

	0	**Report Lost Error** Format: Enable _Custom_GTIReset: DEV This bit is set if the Report Trigger due to "Internal Report Trigger-1", "Internal Report Trigger-2" or "Timer Triggered" or "MMIO Trigger" to write out the counter values is dropped, while there is an ongoing report in progress. The report request is ignored and the counter continue to count. This bit will be set along with this MMIO Trigger Queue Full, in case of dropped request for MMIO trigger.

Value	Name	Description
0	**[Default]**	Report Lost Error Not Occurred
1		Report Lost Error Occurred

Programming Notes
This bit can be reset by SW by either soft reset or writing a 0 to it.

OAG Observation Architecture Tail Pointer

OAG_OATAILPTR - OAG Observation Architecture Tail Pointer

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB04h

This register allows software to program tail pointer and also indicates current tail pointer value.

DWord	Bit	Description
0	31:6	**Tail Pointer** _Custom_GTIReset: DEV Virtual address of the internal trigger based buffer that is updated for every 64B cacheline write to memory when reporting via internal report trigger. This pointer will not be updated for MI_REPORT_PERF_COUNT command based writes. **Programming Notes** Before enabling internally triggered performance counter reporting, SW must ensure that this address matches the Report Buffer Offset programmed in OABUFFER register (i.e. tail pointer must start at the beginning of the report buffer). SW must ensure that Tail pointer and the Head Pointer match before enabling internally triggered performance counter reporting.
	5:0	**Reserved** Format: PBC _Custom_GTIReset: DEV

OAG RC0 Any Engine Busy Free

OAG_RC0_ANY_ENGINE_BUSY_FREE - OAG RC0 Any Engine Busy Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB80h

This register counts the time that any engine is truly busy (not simply powered up). This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads. Unit in GPMusec. Refer to **Timestamp Bases** for details.

OAG RC0 Clocks Free

OAG_RC0_CLOCKS_FREE - OAG RC0 Clocks Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB90h

This register counts the clocks that GFX has been in RC0 in increments of 64 GFX clocks. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG RC0 Hysteresis Free

OAG_RC0_HYSTERISIS_FREE - OAG RC0 Hysteresis Free	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	0DB84h

This register counts the time that any engine is truly busy (not simply powered up). This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG RC0 Wake Count Free

OAG_RC0_WAKE_COUNT_FREE - OAG RC0 Wake Count Free		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	0DB88h	
This counter is free running, always enabled and counting irrespective of OA enabled or disabled.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG RC6 Entry Count Free

OAG_RC6_ENTRY_COUNT_FREE - OAG RC6 Entry Count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB9Ch

This register counts number rc6 entries. This counter is free running, always enabled and counting irrespective of OA enabled or disabled. This is an RPM mirrored register.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG RC6 Pre Engine Wake Overhead Free

OAG_RC6_PRE_ENGINE_WAKE_OVERHEAD_FREE - OAG RC6 Pre Engine Wake Overhead Free	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	0DB8Ch
This register counts the time between boot complete and Go=1. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.	

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG RCPG Hysteresis Time Free

OAG_RCPG_HYSTERESIS_TIME_FREE - OAG RCPG Hysteresis Time Free

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBE0h

This register counts the time RCPG hysteresis count is accumulating. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Render Busy Free

OAG_RENDER_BUSY_FREE - OAG Render Busy Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBDCh

This register counts the time that any render engine is busy. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Render Wake Count Free

OAG_RENDER_WAKE_COUNT_FREE - OAG Render Wake Count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBE4h

This register counts the number of render wakes that have occurred. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Slice Customizable Event Creation 0-0

OAG_SCEC0_0 - OAG Slice Customizable Event Creation 0-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC00h

This register is used to define the slice custom counter event 0, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. **Value** / **Name** / **Description** 0b / Pass-through / Input bit is passed through to comparator as is 1b / Negated / Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). **Value** / **Name** / **Description** 01b / Prev Event / Selects the conditioned/flopped input from the last CEC block as the input bus to CEC0 block 11b / Reserved /
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.
	2:0	**Compare Function** Format: U3 _Custom_GTIReset: DEV This field selects the function used by the CEC0 comparator when comparing the compare value

OAG_SCEC0_0 - OAG Slice Customizable Event Creation 0-0

to the value active on the CEC0 conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Slice Customizable Event Creation 1-0

OAG_SCEC1_0 - OAG Slice Customizable Event Creation 1-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC08h

This register is used to define slice custom counter event 1, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. **Value** / **Name** / **Description** 0b / Pass-through / Input bit is passed through to comparator as is 1b / Negated / Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). **Value** / **Name** / **Description** 01b / Prev Event / Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b / Reserved /
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.
	2:0	**Compare Function** Format: U3 _Custom_GTIReset: DEV This field selects the function used by the CEC comparator when comparing the compare value

OAG_SCEC1_0 - OAG Slice Customizable Event Creation 1-0

to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Slice Customizable Event Creation 1-1

OAG_SCEC1_1 - OAG Slice Customizable Event Creation 1-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC0Ch

This register configures the input conditioning portion of slice CEC (custom event creation) block 1, bit definitions in this register refer to the CEC block diagram.

<table>
<tr><th>DWord</th><th>Bit</th><th>Description</th></tr>
<tr><td>0</td><td>31:16</td><td>Considerations
<table>
<tr><td>_Custom_GTIReset:</td><td>DEV</td></tr>
</table>
This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case.
<table>
<tr><th>Value</th><th>Name</th><th>Description</th></tr>

OAG Slice Customizable Event Creation 3-0

OAG_SCEC3_0 - OAG Slice Customizable Event Creation 3-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC18h

This register is used to define slice custom counter event 3, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. **Value** / **Name** / **Description** 0b / Pass-through / Input bit is passed through to comparator as is 1b / Negated / Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). **Value** / **Name** / **Description** 01b / Prev Event / Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b / Reserved /
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.
	2:0	**Compare Function** Format: U3 _Custom_GTIReset: DEV This field selects the function used by the CEC comparator when comparing the compare value

OAG_SCEC3_0 - OAG Slice Customizable Event Creation 3-0

to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Slice Customizable Event Creation 3-1

OAG_SCEC3_1 - OAG Slice Customizable Event Creation 3-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC1Ch

This register configures the input conditioning portion of Slice CEC (custom event creation) block 3, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG Slice Customizable Event Creation 4-0

OAG_SCEC4_0 - OAG Slice Customizable Event Creation 4-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC20h

This register is used to define slice custom counter event 4, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. Value / Name / Description: 0b / Pass-through / Input bit is passed through to comparator as is 1b / Negated / Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). Value / Name / Description: 01b / Prev Event / Selects the conditioned/flopped input from the last CEC block as the input bus to CEC0 block 11b / Reserved /
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.
	2:0	**Compare Function** Format: U3 _Custom_GTIReset: DEV This field selects the function used by the CEC comparator when comparing the compare value

OAG_SCEC4_0 - OAG Slice Customizable Event Creation 4-0

to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Slice Customizable Event Creation 5-0

OAG_SCEC5_0 - OAG Slice Customizable Event Creation 5-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC28h

This register is used to define slice custom counter event 5, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. Value / Name / Description: 0b / Pass-through / Input bit is passed through to comparator as is 1b / Negated / Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). Value / Name / Description: 01b / Prev Event / Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b / Reserved /
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.
	2:0	**Compare Function** Format: U3 _Custom_GTIReset: DEV This field selects the function used by the CEC comparator when comparing the compare value

OAG_SCEC5_0 - OAG Slice Customizable Event Creation 5-0

to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Slice Customizable Event Creation 5-1

OAG_SCEC5_1 - OAG Slice Customizable Event Creation 5-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC2Ch

This register configures the input conditioning portion of CEC (custom event creation) block 5, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG Slice Customizable Event Creation 6-0

OAG_SCEC6_0 - OAG Slice Customizable Event Creation 6-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC30h

This register is used to define slice custom counter event 6, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. **Value** / **Name** / **Description** 0b / Pass-through / Input bit is passed through to comparator as is 1b / Negated / Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). **Value** / **Name** / **Description** 01b / Prev Event / Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b / Reserved /
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.
	2:0	**Compare Function** Format: U3 _Custom_GTIReset: DEV This field selects the function used by the CEC comparator when comparing the compare value

OAG_SCEC6_0 - OAG Slice Customizable Event Creation 6-0

to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Slice Customizable Event Creation 6-1

OAG_SCEC6_1 - OAG Slice Customizable Event Creation 6-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC34h

This register configures the input conditioning portion of slice CEC (custom event creation) block 6, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG Slice Customizable Event Creation 7-0

OAG_SCEC7_0 - OAG Slice Customizable Event Creation 7-0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC38h

This register is used to define slice custom counter event 7, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:21	**Negate** Format: U11 _Custom_GTIReset: DEV The 11-bit array defined in this field allows input bus bits [10:0] to be individually negated in order to facilitate more complicated custom event creation (e.g. A & (!B | !C)). Note that LSB of this field affects bit 0 of the selected input bus. **Value** / **Name** / **Description** 0b / Pass-through / Input bit is passed through to comparator as is 1b / Negated / Input bit is negated before passing to comparator
	20:19	**Source Select** Format: U2 _Custom_GTIReset: DEV Selects the input signals to the Boolean event definition logic (see block diagram in the Custom Event Counters section). **Value** / **Name** / **Description** 01b / Prev Event / Selects the conditioned/flopped input from the previous CEC block as the input bus to this CEC block 11b / Reserved /
	18:3	**Compare Value** Format: U16 _Custom_GTIReset: DEV The value in this field is compared the 16-bit conditioned input bus that are fed into the comparator(see block diagram in the Custom Event Counters section). The type of comparison that is done is controlled by the Compare Function. When the compare function is true, then the signal for the custom event is asserted. This signal in turn can be counted by the B0 performance counter or fed into other CEC blocks.
	2:0	**Compare Function** Format: U3 _Custom_GTIReset: DEV This field selects the function used by the CEC comparator when comparing the compare value

OAG_SCEC7_0 - OAG Slice Customizable Event Creation 7-0

to the value active on the CEC conditioned input bus (see block diagram in the Custom Event Counters section).

Value	Name	Description
000b	Any Are Equal	Compare and assert output if any are equal (Can be used as OR function)
001b	Greater Than	Compare and assert output if greater than
010b	Equal	Compare and assert output if equal to (Can also be used as AND function)
011b	Greater Than or Equal	Compare and assert output if greater than or equal
100b	Less Than	Compare and assert output if less than
101b	Not Equal	Compare and assert output if not equal
110b	Less Than or Equal	Compare and assert output if less than or equal
111b	Reserved	

OAG Slice Customizable Event Creation 7-1

OAG_SCEC7_1 - OAG Slice Customizable Event Creation 7-1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DC3Ch

This register configures the input conditioning portion of slice CEC (custom event creation) block 3, bit definitions in this register refer to the CEC block diagram in the Custom Event Counters section.

DWord	Bit	Description
0	31:16	**Considerations** _Custom_GTIReset: DEV This 16-bit field allows individual bits of the bus selected as the input to CEC block to be delayed by 1 clock relative to the non-delayed bits in the bus (see block diagram in the Custom Event Counters section). See CEC0-1 register definition for an example use case. Value / Name / Description 0b / Live / Input bit is not delayed by 1 clock before event calculation 1b / Delayed / Input bit is delayed by 1 clock before event calculation
	15:0	**Mask** _Custom_GTIReset: DEV This 16-bit field allows individual input bits to be ignored in custom event calculation. See block diagram in the Custom Event Counters section for more details on where this field is used. Value / Name / Description 0b / Unmasked / Input bit is considered in event calculation 1b / Masked / Input bit is ignored in event calculation

OAG SQ Full Occupancy count Free

OAG_SQ_FULL_OCCUPANCY_COUNT_FREE - OAG SQ Full Occupancy count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB98h
This register counts the number of GFX clocks that SQ was full. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.	

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG SQ Memory Bound Stall count Free

OAG_SQ_MBSTALL_COUNT_FREE - OAG SQ Memory Bound Stall count Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DB94h

This register counts the number of GFX clocks that SQ read has been stalled. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Unslice Busy Free

OAG_UNSLICE_BUSY_FREE - OAG Unslice Busy Free	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0DBD4h

This register counts the number of times that unslice wakes up due to any unslice engine (currently WG, BLT, GuC, and media fixed functions)becoming busy. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAG Unslice Wake Count Free

OAG_UNSLICE_WAKE_COUNT_FREE - OAG Unslice Wake Count Free		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DBD8h	
This register counts the number of times that unslice wakes up due to any unslice engine (currently WG, BLT, GuC, and media fixed functions)becoming busy. This counter is free running, always enabled and counting irrespective of OA enabled or disabled.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAM GPU Ticks Counter

OAM_GPU_TICKS - OAM GPU Ticks Counter		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Reading this register returns the live value of the GPU ticks counter that is sampled and included in the performance counter report header. It increments every GFX clock and hence the number of increments per second changes with GFX frequency.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the GPU tick counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAM GPU Ticks Counter Upper DWord

OAM_GPU_TICKS_UPPER - OAM GPU Ticks Counter Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Reading this register returns the live value of the Upper DWord of GPU ticks counter that is sampled and included in the performance counter report header. It increments every GFX clock and hence the number of increments per second changes with GFX frequency.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the GPU tick counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OA Programmable Event Source Select Register

OAG_OA_PESS - OA Programmable Event Source Select Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02B2Ch

The OA_PESS register is used by software to control programmable event P15 to P0 source selection generated from 'unslice' or 'aggregated P events generated from slice'. Bit[0] indicates selection for P0, bit[1] for P1 and so on.

DWord	Bit	Description
0	31:16	**Reserved** Default Value: 0000h Format: PBC _Custom_GTIReset: DEV
	15:0	**P event source select** _Custom_GTIReset: DEV

Value	Name	Description
0h	P event generated from unslice **[Default]**	Bit wise select for P[15:0] events generated from boolean logic present in unslice
1h	P event generated from slice	Bit wise select for P[15:0] events generated from boolean logic present in slice in an aggregated manner

OAR Aggregate Perf Counter A0

OAR_OAPERF_A0 - OAR Aggregate Perf Counter A0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02800h

This register reflects the count value of the OA Performance counter A0.

DWord	Bit	Description
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads. Value: 0x00000000 — **[Default]** Value: [0x00000001-0xFFFFFFFF]

OAR Aggregate Perf Counter A0 Upper DWord

OAR_OAPERF_A0_UPPER - OAR Aggregate Perf Counter A0 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02804h

This register enables the current live value of performance counter A0 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A1

OAR_OAPERF_A1 - OAR Aggregate Perf Counter A1		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02808h	
This register reflects the count value of the OA Performance counter A1. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A1 Upper DWord

OAR_OAPERF_A1_UPPER - OAR Aggregate Perf Counter A1 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0280Ch

This register enables the current live value of performance counter A1 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A2

OAR_OAPERF_A2 - OAR Aggregate Perf Counter A2		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02810h	
This register reflects the count value of the OA Performance counter A2. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A2 Upper DWord

OAR_OAPERF_A2_UPPER - OAR Aggregate Perf Counter A2 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02814h

This register enables the current live value of performance counter A2 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A3

OAR_OAPERF_A3 - OAR Aggregate Perf Counter A3		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02818h	
This register reflects the count value of the OA Performance counter A3. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A3 Upper DWord

OAR_OAPERF_A3_UPPER - OAR Aggregate Perf Counter A3 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0281Ch

This register enables the current live value of performance counter A3 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A4

OAR_OAPERF_A4 - OAR Aggregate Perf Counter A4		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02820h	
This register reflects the count value of the OA Performance counter A4. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A4 Upper DWord

OAR_OAPERF_A4_UPPER - OAR Aggregate Perf Counter A4 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02824h

This register enables the current live value of performance counter A4 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A5

OAR_OAPERF_A5 - OAR Aggregate Perf Counter A5		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02828h	
This register reflects the count value of the OA Performance counter A5. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A5 Upper DWord

OAR_OAPERF_A5_UPPER - OAR Aggregate Perf Counter A5 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0282Ch

This register enables the current live value of performance counter A5 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A6

OAR_OAPERF_A6 - OAR Aggregate Perf Counter A6		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02830h	
This register reflects the count value of the OA Performance counter A6. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A6 Upper DWord

OAR_OAPERF_A6_UPPER - OAR Aggregate Perf Counter A6 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02834h

This register enables the current live value of performance counter A6 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A7

OAR_OAPERF_A7 - OAR Aggregate Perf Counter A7		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02838h	
This register reflects the count value of the OA Performance counter A7. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A7 Upper DWord

OAR_OAPERF_A7_UPPER - OAR Aggregate Perf Counter A7 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0283Ch

This register enables the current live value of performance counter A7 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A8

OAR_OAPERF_A8 - OAR Aggregate Perf Counter A8		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02840h	
This register reflects the count value of the OA Performance counter A8. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A8 Upper DWord

OAR_OAPERF_A8_UPPER - OAR Aggregate Perf Counter A8 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02844h

This register enables the current live value of performance counter A8 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A9

OAR_OAPERF_A9 - OAR Aggregate Perf Counter A9		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02848h	
This register reflects the count value of the OA Performance counter A9. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A9 Upper DWord

OAR_OAPERF_A9_UPPER - OAR Aggregate Perf Counter A9 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0284Ch

This register enables the current live value of performance counter A9 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A10

OAR_OAPERF_A10 - OAR Aggregate Perf Counter A10		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02850h	
This register reflects the count value of the OA Performance counter A10. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A10 Upper DWord

OAR_OAPERF_A10_UPPER - OAR Aggregate Perf Counter A10 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02854h

This register enables the current live value of performance counter A10 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A11

OAR_OAPERF_A11 - OAR Aggregate Perf Counter A11		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02858h	
This register reflects the count value of the OA Performance counter A11. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A11 Upper DWord

OAR_OAPERF_A11_UPPER - OAR Aggregate Perf Counter A11 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0285Ch

This register enables the current live value of performance counter A11 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A12

OAR_OAPERF_A12 - OAR Aggregate Perf Counter A12		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02860h	
This register reflects the count value of the OA Performance counter A12. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A12 Upper DWord

OAR_OAPERF_A12_UPPER - OAR Aggregate Perf Counter A12 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02864h

This register enables the current live value of performance counter A12 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A13

OAR_OAPERF_A13 - OAR Aggregate Perf Counter A13		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02868h	
This register reflects the count value of the OA Performance counter A13. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A13 Upper DWord

OAR_OAPERF_A13_UPPER - OAR Aggregate Perf Counter A13 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0286Ch

This register enables the current live value of performance counter A13 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A14

OAR_OAPERF_A14 - OAR Aggregate Perf Counter A14		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02870h	
This register reflects the count value of the OA Performance counter A14. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A14 Upper DWord

OAR_OAPERF_A14_UPPER - OAR Aggregate Perf Counter A14 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02874h

This register enables the current live value of performance counter A14 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A15

OAR_OAPERF_A15 - OAR Aggregate Perf Counter A15		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02878h	
This register reflects the count value of the OA Performance counter A15. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A15 Upper DWord

OAR_OAPERF_A15_UPPER - OAR Aggregate Perf Counter A15 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0287Ch

This register enables the current live value of performance counter A15 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A16

OAR_OAPERF_A16 - OAR Aggregate Perf Counter A16		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02880h	
This register reflects the count value of the OA Performance counter A16. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A16 Upper DWord

OAR_OAPERF_A16_UPPER - OAR Aggregate Perf Counter A16 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02884h

This register enables the current live value of performance counter A16 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A17

OAR_OAPERF_A17 - OAR Aggregate Perf Counter A17		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02888h	
This register reflects the count value of the OA Performance counter A17. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A17 Upper DWord

OAR_OAPERF_A17_UPPER - OAR Aggregate Perf Counter A17 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0288Ch

This register enables the current live value of performance counter A17 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A18

OAR_OAPERF_A18 - OAR Aggregate Perf Counter A18		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02890h	
This register reflects the count value of the OA Performance counter A9. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A18 Upper DWord

OAR_OAPERF_A18_UPPER - OAR Aggregate Perf Counter A18 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02894h

This register enables the current live value of performance counter A18 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A19

OAR_OAPERF_A19 - OAR Aggregate Perf Counter A19		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02898h	
This register reflects the count value of the OA Performance counter A19. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A19 Upper DWord

OAR_OAPERF_A19_UPPER - OAR Aggregate Perf Counter A19 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0289Ch

This register enables the current live value of performance counter A19 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A20

OAR_OAPERF_A20 - OAR Aggregate Perf Counter A20		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028A0h	
This register reflects the count value of the OA Performance counter A20. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A20 Upper DWord

OAR_OAPERF_A20_UPPER - OAR Aggregate Perf Counter A20 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028A4h

This register enables the current live value of performance counter A20 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A21

OAR_OAPERF_A21 - OAR Aggregate Perf Counter A21		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028A8h	
This register reflects the count value of the OA Performance counter A21. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A21 Upper DWord

OAR_OAPERF_A21_UPPER - OAR Aggregate Perf Counter A21 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028ACh

This register enables the current live value of performance counter A21 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A22

OAR_OAPERF_A22 - OAR Aggregate Perf Counter A22		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028B0h	
This register reflects the count value of the OA Performance counter A22. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A22 Upper DWord

OAR_OAPERF_A22_UPPER - OAR Aggregate Perf Counter A22 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028B4h

This register enables the current live value of performance counter A22 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A23

OAR_OAPERF_A23 - OAR Aggregate Perf Counter A23		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028B8h	
This register reflects the count value of the OA Performance counter A23. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A23 Upper DWord

OAR_OAPERF_A23_UPPER - OAR Aggregate Perf Counter A23 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028BCh

This register enables the current live value of performance counter A23 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A24

OAR_OAPERF_A24 - OAR Aggregate Perf Counter A24		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028C0h	
This register reflects the count value of the OA Performance counter A24. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A24 Upper DWord

OAR_OAPERF_A24_UPPER - OAR Aggregate Perf Counter A24 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028C4h

This register enables the current live value of performance counter A24 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A25

OAR_OAPERF_A25 - OAR Aggregate Perf Counter A25		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028C8h	
This register reflects the count value of the OA Performance counter A25. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A25 Upper DWord

OAR_OAPERF_A25_UPPER - OAR Aggregate Perf Counter A25 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028CCh

This register enables the current live value of performance counter A25 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A26

OAR_OAPERF_A26 - OAR Aggregate Perf Counter A26		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028D0h	
This register reflects the count value of the OA Performance counter A26. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A26 Upper DWord

OAR_OAPERF_A26_UPPER - OAR Aggregate Perf Counter A26 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028D4h

This register enables the current live value of performance counter A26 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A27

OAR_OAPERF_A27 - OAR Aggregate Perf Counter A27		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028D8h	
This register reflects the count value of the OA Performance counter A27. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A27 Upper DWord

OAR_OAPERF_A27_UPPER - OAR Aggregate Perf Counter A27 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028DCh

This register enables the current live value of performance counter A27 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A28

OAR_OAPERF_A28 - OAR Aggregate Perf Counter A28		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028E0h	
This register reflects the count value of the OA Performance counter A28. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A28 Upper DWord

OAR_OAPERF_A28_UPPER - OAR Aggregate Perf Counter A28 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028E4h

This register enables the current live value of performance counter A28 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A29

OAR_OAPERF_A29 - OAR Aggregate Perf Counter A29		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028E8h	
This register reflects the count value of the OA Performance counter A29. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A29 Upper DWord

OAR_OAPERF_A29_UPPER - OAR Aggregate Perf Counter A29 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028ECh

This register enables the current live value of performance counter A29 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A30

OAR_OAPERF_A30 - OAR Aggregate Perf Counter A30		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028F0h	
This register reflects the count value of the OA Performance counter A30. DefaultValue="00000000h"		
DWord	**Bit**	**Description**
0	31:0	**Considerations** _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A30 Upper DWord

OAR_OAPERF_A30_UPPER - OAR Aggregate Perf Counter A30 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028F4h

This register enables the current live value of performance counter A30 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A31

OAR_OAPERF_A31 - OAR Aggregate Perf Counter A31		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	028F8h	
This register reflects the count value of the OA Performance counter A31		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A31 Upper DWord

OAR_OAPERF_A31_UPPER - OAR Aggregate Perf Counter A31 Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	028FCh

This register enables the current live value of performance counter A31 to be read. Please refer to the detailed description of the aggregating performance counters in the Aggregating Counters section for more details on what event is reported via this register.

DWord	Bit	Description
0	31:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:0	**Upper Value** Format: U8 _Custom_GTIReset: DEV This 8-bit field returns bits 39:32 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A32

OAR_OAPERF_A32 - OAR Aggregate Perf Counter A32		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02900h	
This register reflects the count value of the OA Performance counter A32		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A33

OAR_OAPERF_A33 - OAR Aggregate Perf Counter A33		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02904h	
This register reflects the count value of the OA Performance counter A33		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A34

OAR_OAPERF_A34 - OAR Aggregate Perf Counter A34		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02908h	
This register reflects the count value of the OA Performance Aggregating counter A34		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Aggregate Perf Counter A35

OAR_OAPERF_A35 - OAR Aggregate Perf Counter A35		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0290Ch	
This register reflects the count value of the OA Performance counter A35		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Boolean_Counter_B0

OAR_OAPERF_B0 - OAR Boolean_Counter_B0

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02920h

This register enables the current live value of performance counter B0 to be read. Since what conditions cause B0 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Boolean_Counter_B1

OAR_OAPERF_B1 - OAR Boolean_Counter_B1	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02924h

This register enables the current live value of performance counter B1 to be read. Since what conditions cause B1 to increment are defined by the programming of CEC1-0/CEC1-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Boolean_Counter_B2

OAR_OAPERF_B2 - OAR Boolean_Counter_B2	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02928h

This register enables the current live value of performance counter B2 to be read. Since what conditions cause B2 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Boolean_Counter_B3

OAR_OAPERF_B3 - OAR Boolean_Counter_B3	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0292Ch

This register enables the current live value of performance counter B3 to be read. Since what conditions cause B3 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Boolean_Counter_B4

OAR_OAPERF_B4 - OAR Boolean_Counter_B4	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02930h

This register enables the current live value of performance counter B4 to be read. Since what conditions cause B4 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Boolean_Counter_B5

OAR_OAPERF_B5 - OAR Boolean_Counter_B5	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02934h

This register enables the current live value of performance counter B5 to be read. Since what conditions cause B5 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Boolean_Counter_B6

OAR_OAPERF_B6 - OAR Boolean_Counter_B6	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02938h

This register enables the current live value of performance counter B6 to be read. Since what conditions cause B6 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Boolean_Counter_B7

OAR_OAPERF_B7 - OAR Boolean_Counter_B7	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0293Ch

This register enables the current live value of performance counter B7 to be read. Since what conditions cause B7 to increment are defined by the programming of CEC0-0/CEC0-1, please refer to the description of these registers and the values they hold to determine what event is reported via this register.

DWord	Bit	Description
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the live performance counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR GPU Ticks Counter

OAR_GPU_TICKS - OAR GPU Ticks Counter		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	02910h	
Reading this register returns the live value of the GPU ticks counter that is sampled and included in the performance counter report header. It increments every GFX clock and hence the number of increments per second changes with GFX frequency.		
DWord	**Bit**	**Description**
0	31:0	**Considerations** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 31:0 of the GPU tick counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR GPU Ticks Counter Upper DWord

OAR_GPU_TICKS_UPPER - OAR GPU Ticks Counter Upper DWord

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Reading this register returns the live value of the Upper DWord of GPU ticks counter that is sampled and included in the performance counter report header. It increments every GFX clock and hence the number of increments per second changes with GFX frequency.

DWord	Bit	Description
0	31:0	**Upper Value** Format: U32 _Custom_GTIReset: DEV This 32-bit field returns bits 63:32 of the GPU tick counter value when read. Note that there is no "latch and hold" mechanism for performance counters when they are accessed through MMIO, so the value returned from this register may be different on back-to-back reads.

OAR Observation Architecture Control

OAR_OACONTROL - OAR Observation Architecture Control

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02960h
Name:	OAR Observation Architecture Control
ShortName:	OAR_OACONTROL

This register controls OAR functionality, report format, and context filtering. If OAR is enabled then it should be enabled in CS as well

DWord	Bit	Description
0	31:4	**Reserved** Format: PBC _Custom_GTIReset: DEV
	3:1	**Counter Select** _Custom_GTIReset: DEV This field selects which performance counter report format to use, please refer to Performance Counter Report Formats section for more details on the structure of the format.
	0	**Performance Counter Enable** Format: Enable _Custom_GTIReset: DEV Global performance counter enable. If clear, no counting will occur. MI_REPORT_PERF_COUNT is undefined when clear. **Programming Notes** "OAR Context Enable" mode bit in RenderEngne CTX_SR_CTL register must be set when "Programmer Counter Enable" is set. OAC and OAR concurrent enabling is not supported (OAG is recommended instead).

OAR Observation Architecture Status Register

OAR_OASTATUS - OAR Observation Architecture Status Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02968h
Name:	OAR Observation Architecture Status Register
ShortName:	OAR_OASTATUS

This register provides status of report buffer and overflow conditions as well as status of some flags which hardware needs for internal purpose. Software should not program these status bits. Status bits are active high flags (0=false, 1=true)

DWord	Bit	Description
0	31:22	**Reserved** Format: PBC _Custom_GTIReset: DEV
	21	**Start Trigger Flag 1** _Custom_GTIReset: DEV Value / Name: 0 **[Default]**; 1 **Programming Notes**: This bit is for HW internal use to context save /restore Start Trigger 1 occurrence On RC6 entry. Software should not program this bit.
	20	**Start Trigger Flag 2** _Custom_GTIReset: DEV Value / Name: 0 **[Default]**; 1 **Programming Notes**: This bit is for HW internal use to context save /restore Start Trigger 2 occurrence On RC6 entry. Software should not program this bit.
	19	**Report Trigger Flag 1** _Custom_GTIReset: DEV Value / Name

OAR_OASTATUS - OAR Observation Architecture Status Register

0	**[Default]**
1	

Programming Notes
This bit is for HW internal use to context save /restore Report Trigger 1 occurrence On RC6 entry. Software should not program this bit.

18 Report Trigger Flag 2

_Custom_GTIReset:	DEV

Value	Name
0	**[Default]**
1	

Programming Notes
This bit is for HW internal use to context save /restore Report Trigger 2 occurrence On RC6 entry. Software should not program this bit.

17:6 Reserved

Format:	PBC
_Custom_GTIReset:	DEV

5:2 Reserved

Format:	PBC
_Custom_GTIReset:	DEV

1 Accumulator Overflow

_Custom_GTIReset:	DEV

This field indicates that the one or more event accumulator inside the slice-OAunit has overflowed. Once set, this bit will remain set, until SW resets it by either soft reset or writing a 0 to it.

Value	Name	Description
0	**[Default]**	No overflow has occurred.
1		Overflow has occurred.

0 Counter Overflow

_Custom_GTIReset:	DEV

This bit is set if any of the counters overflows. This bit can be reset by SW by either soft reset or writing a 1 to it.

Value	Name	Description
0	**[Default]**	Counter Overflow not occurred
1		Counter Overflow occurred

Observation Architecture Control Context ID

OACTXID - Observation Architecture Control Context ID	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02364h
Name:	Observation Architecture Control Context ID
ShortName:	OACTXID

This register has the context details when Specific context Enable is set. This register is implemented in render command streamer and render context save/restored. This register should be initialized by SW appropriately on the very first submission of a context when OA is enabled.

DWord	Bit	Description
0	31:0	**Select Context ID** _Custom_GTIReset: DEV Specifies the context ID of the one context that affects the performance counters when "Specific Context Enable" bit is set. All other contexts are ignored. **Ring Buffer Mode of Scheduling:** Bits[31:12] represent the CCID and bits [11:0] must be zero. **Execlist mode of scheduling:** Bits[31:0] represent the context id.

Observation Architecture Control per Context

OACTXCONTROL - Observation Architecture Control per Context

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	02360h
Name:	Observation Architecture Control per Context
ShortName:	OACTXCONTROL

This register is implemented in render command streamer and render context save/restored. This register should be initialized by SW appropriately on the very first submission of a context when OA is enabled.

DWord	Bit	Description
0	31	**Reserved** Format: PBC _Custom_GTIReset: DEV
	30:8	**Reserved** Format: PBC _Custom_GTIReset: DEV
	7:2	**Timer Period** _Custom_GTIReset: DEV Specifies the period of the timer strobe as a function of the minimum TIME_STAMP resolution. The period is determined by selecting a specified bit from the TIME_STAMP register as follows:StrobePeriod = MinimumTimeStampPeriod * 2 **(TimerPeriod + 1)**The exponent is defined by this field. **Note:** The TIME_STAMP is not reset at start time so the phase of the strobe is not synchronized with the enable of the OA unit. This could result in approximately a full StrobePeriod elapsing prior to the first trigger. Usage for this mechanism should be time based periodic triggering, typically.
	1	**Timer Enable** _Custom_GTIReset: DEV This field enables the timer logic to output a periodic strobe, as defined by the Timer Period. When disabled the timer output is not asserted. Users should be aware that the timer-based report logic and the Boolean report trigger logic are logically OR'd together with no buffering of report triggers. This implies that only one performance counter report will be generated for clocks where both the timer-based report logic and the Boolean report trigger logic trigger a performance counter report. When "Specific Context Enable" bit is set to '1' in OACONTROL register, Timer based report trigger function gets enabled only for the selected context.When "Specific Context Enable" bit is set to '0' in OACONTROL register, Timer based report trigger function gets enabled for all

contexts.

Value	Name	Description
0h	Disable **[Default]**	Counter does not get written out on regular interval
1h	Enable	Counter gets written out on regular intervals, defined by the Timer Period

0 **Counter Stop-Resume Mechanism**

_Custom_GTIReset:	DEV

Value	Name	Description
1h		resume counting for all counters

Observation Architecture Head Pointer

OAG_OAHEADPTR - Observation Architecture Head Pointer		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	0DB00h	
This register allows SW to program head pointer.		
DWord	**Bit**	**Description**
0	31:6	**Head Pointer** _Custom_GTIReset: DEV Virtual address of the internal trigger based buffer that is updated by software after consuming reports from the report buffer. This pointer must be updated by SW only when using time or event-based report triggering. **Programming Notes** SW must ensure that Head Pointer and the Tail Pointer match before enabling internally triggered performance counter reporting.
	5:0	**Reserved** Format: PBC _Custom_GTIReset: DEV

OUTPUT_CSC_COEFF

OUTPUT_CSC_COEFF	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	192
_Custom_Display_DoubleBufferArmedBy:	Write to CSC_MODE

OUTPUT_CSC_POSTOFF

OUTPUT_CSC_POSTOFF	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	96
_Custom_Display_DoubleBufferArmedBy:	Write to CSC_MODE
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank after armed

Address:	49074h-4907Fh
Name:	Pipe Output CSC Post-Offsets
ShortName:	OUTPUT_CSC_POSTOFF_A
Reset:	soft

Address:	49174h-4917Fh
Name:	Pipe Output CSC Post-Offsets
ShortName:	OUTPUT_CSC_POSTOFF_B
Reset:	soft

Address:	49274h-4927Fh
Name:	Pipe Output CSC Post-Offsets
ShortName:	OUTPUT_CSC_POSTOFF_C
Reset:	soft

Address:	49374h-4937Fh
Name:	Pipe Output CSC Post-Offsets
ShortName:	OUTPUT_CSC_POSTOFF_D
Reset:	soft

The post-offset is intended to add an offset from 0 on the Y or RGB channels and to convert UV channels from 2's complement to excess 0.5 as they exit pipe output color space conversion (CSC).

DWord	Bit	Description
0	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PostCSC High Offset** This value is used to give an offset to the high color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
1	31:13	**Reserved** Access: RO Format: MBZ

OUTPUT_CSC_POSTOFF		
	12:0	**PostCSC Medium Offset** This value is used to give an offset to the medium color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
2	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PostCSC Low Offset** This value is used to give an offset to the low color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).

OUTPUT_CSC_PREOFF

OUTPUT_CSC_PREOFF	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	96
_Custom_Display_DoubleBufferArmedBy:	Write to CSC_MODE
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank after armed

Address:	49068h-49073h
Name:	Pipe Output CSC Pre-Offsets
ShortName:	OUTPUT_CSC_PREOFF_A
Reset:	soft

Address:	49168h-49173h
Name:	Pipe Output CSC Pre-Offsets
ShortName:	OUTPUT_CSC_PREOFF_B
Reset:	soft

Address:	49268h-49273h
Name:	Pipe Output CSC Pre-Offsets

Reset:	soft

Address:	49368h-49373h
Name:	Pipe Output CSC Pre-Offsets
ShortName:	OUTPUT_CSC_PREOFF_D
Reset:	soft

The pre-offset is intended to remove an offset from 0 on the Y or RGB channels and to convert UV channels from excess 0.5 to 2's complement as they enter pipe output color space conversion (CSC).

DWord	Bit	Description
0	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PreCSC High Offset** This value is used to give an offset to the high color channel as it enters CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
1	31:13	**Reserved** Access: RO Format: MBZ

OUTPUT_CSC_PREOFF		
	12:0	**PreCSC Medium Offset** This value is used to give an offset to the medium color channel as it enters CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
2	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PreCSC Low Offset** This value is used to give an offset to the low color channel as it enters CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).

Outstanding Page Request Allocation

OPRA_0_2_0_PCI - Outstanding Page Request Allocation		
Register Space:	PCI: 0/2/0	
Size (in bits):	32	
Address:	0030Ch	
DWord	**Bit**	**Description**
0	31:0	**Outstanding Page Request Allocation** Default Value: 00000000000000000000000000000000b Access: R/W _Custom_GTIReset: BUS This register contains the number of outstanding page request messages the associated Page Request Interface is allowed to issue.

Outstanding Page Request Capacity

OPRC_0_2_0_PCI - Outstanding Page Request Capacity		
Register Space:	PCI: 0/2/0	
Size (in bits):	32	
Address:	00308h	
DWord	**Bit**	**Description**
0	31:0	**Outstanding Page Request Capacity** Default Value: 00000000000000001000000000000000b Access: RO _Custom_GTIReset: BUS This register contains the number of outstanding page request messages the associated Page Request Interface physically supports. This is the upper limit on the number of pages that can be usefully allocated to the Page Request Interface. Hardwired to 32,768 requests.

PAGE_FAULT_MODE

PAGE_FAULT_MODE - PAGE_FAULT_MODE

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0E454h
Name:	PAGE_FAULT_MODE
ShortName:	PAGE_FAULT_MODE

This register is written as part of Context Submission to TDL. The data written is the lower 32 bits of the Context Descriptor Format structure.

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7:6	**FAULT_MODE** Access: WO **Fault Model:** Applicable only in advanced context

Value	Name	Description
00b	Fault and Hang **[Default]**	In Legacy Context mode, this is the only valid encoding.
01b	Fault and Halt	Restriction : Only valid in Advanced Context mode.
010b	Fault and Stream	Restriction : Only valid in Advanced Context mode.
Others	Reserved	

DWord	Bit	Description
	5:0	**Reserved** Access: RO Format: MBZ

ShortName:	PDP0_VECSUNIT3

Address:	1A270h-1A277h
Name:	Page Directory Pointer Descriptor - PDP0/PML4/PASID
ShortName:	PDP0_CCSUNIT0

PDP0/PML4/PASID: This register can contain three values which depend on the element descriptor definition. **PASID[19:0]:** Populated in the first 20bits of the register and selected when Advanced Context flag is set in the element descriptor in execlist mode of submission. This is not valid in ring buffer mode of scheduling. **PML4[38:12]:** Pointer to base address of PML4 and selected when Legacy Context flag is set and 64b address support is selected.**PDP0[38:12]:** Pointer to one of the four page directory pointer (lowest) and defines the first 0-1GB of memory mapping. This is valid when Legacy Context Flag is set and 64bit virtual addressing is not supported.*Note: This is a guest physical address.*

Programming Notes
Execlist Based Scheduling: SW should update PDP0/12/3 registers in context image with proper values before submitting the context to HW in execlist mode of scheduling. HW restores these registers as part of context restore to set the PPGTT access accordingly. PPGTT is always enabled in advanced context mode of execlist based scheduling and can be disabled only in legacy context mode. Privilege Access Bit in Element Descriptor controls the PPGTT enabling in legacy context mode.
Ring Buffer Based Scheduling: A write via MMIO to PDP0_DESCRIPROR (lower Dword) triggers the Page Directory Restore in HW when PPGTT is enabled. SW should ensure PDP1/2/3 registers are programmed appropriately prior to programming PDP0. PDP0_DESCRIPTOR lower dword should be programmed at the end. Per-Process GTT Enable Bit in GFX_MODE register controls the PPGTT enabling and disabling. Programming Per-Process GTT Enable Bit in GFX_MODE register doesn't enable/disable the PPGTT translation of memory access immediately; the change comes in to affect only when the Page Directory registers are programmed. Programming Per-Process GTT Enable Bit in GFX_MODE register bit must be followed by programming Page Directory Registers in order to enable or disable the PPGTT translation of memory access. PDP* DESCRIPTOR registers must always be programmed through MI_LOAD_REGISTER_IMMEDIATE command in ring buffer with

PDP0 - Page Directory Pointer Descriptor - PDP0/PML4/PASID

PDP0_DESCRIPRTOR lower dword written at the end. PDP0/12/3 registers are context save restored. PDP descriptors are context save restored per render context in RCS and must be programmed following MI_SET_CONTEXT command, in case of PDP descriptors programmed without context set (MI_SET_CONTEXT) will get lost on C6 entry/exit. PDP descriptors are context save restored in VCS, BCS and VECS engines and must be programmed following setup of CCID register, in case of PDP descriptors programmed without CCID set will get lost on C6 entry/exit. PDP descriptor registers should be programmed after ensuring the pipe is completely flushed and TLB's invalidated.

DWord	Bit	Description
0	63	**PD Load Busy** Access: RO This read-only field gets set when PDP0 is written to indicating Page Directory Restore activity is in progress and will get reset once the activity is completed.
	62:0	**PDP0 Descriptor**

ShortName:	PDP3_VECSUNIT3

Address:	1A288h-1A28Fh
Name:	Page Directory Pointer Descriptor - PDP3
ShortName:	PDP3_CCSUNIT0

PDP3[38:12]: Pointer to one of the four page directory pointer (lowest+3) and defines the first 3-4GB of memory mapping. This is valid when Legacy Context Flag is set and 64bit virtual addressing is not supported. *Note: This is a guest physical address.*

DWord	Bit	Description
0	63:0	**PDP3 Descriptor**

Page Req Queue Tail Shadow Register DW0

PRQTP_DW0 - Page Req Queue Tail Shadow Register DW0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00EC4h-00EC7h	
DWord	**Bit**	**Description**
0	31:0	**TailPtr** Access: R/W Shadow register for Page Req Queue Tail register DW0. Usage: GAM will provide the data which is readable via address F0C8.

Page Req Queue Tail Shadow Register DW1

PRQTP_DW1 - Page Req Queue Tail Shadow Register DW1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00EC8h-00ECBh	
DWord	**Bit**	**Description**
0	31:0	**TailPtr** Access: R/W Shadow register for Page Req Queue Tail register DW1. Usage: GAM will provide the data which is readable via address F0CC.

Page Request Control

PR_CTRL_0_2_0_PCI - Page Request Control

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	00304h

DWord	Bit	Description
0	15:2	**Reserved** Access: RO Format: MBZ
	1	**Reset** Default Value: 0b Access: RO _Custom_GTIReset: BUS When the Enable field is clear, or is being cleared in the same register update that sets this field, writing a 1b to this field, clears the associated implementation dependent page request credit Counter and pending request state for the associated Page Request Interface. No action is initiated if this field is written to 0b or if this field is written with any value when the PRE field is set. Processor graphics does not use this field, and hardwires it as read-only (0).
	0	**Page-Request Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS When Set, indicates that the page request interface on the endpoint is allowed to make page requests. If both this field and the Stopped field in Page Request Status register are Clear, then the Page request interface will not issue new page requests, but has outstanding page requests for which page responses is not yet received. When this field transitions from 0 to 1, all the status fields in the Page-Request Status register are cleared. Enabling a page request interface that has not successfully stopped has indeterminate results.

Page Request Extended Capability Header

PR_EXTCAP_0_2_0_PCI - Page Request Extended Capability Header

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00300h

Page Request Extended Capability reports support for page-faults on Device-2, compliant to PCI-Express ATS 1.1 Specification

DWord	Bit	Description
0	31:20	**Next Capability Offset** Default Value: 000000000000b Access: RO Variant _Custom_GTIReset: BUS This is a hardwired pointer to the next item in the capabilities list. Value 000h (Default) indicates that this is the end of the PCI-Express Extended capability Linked List. When Graphics Virtualization is enabled, this field is hardwired to point to the next PCI Capability structure, the SRIOV Extended Capability Header at 320h. When Graphics Virtualization is disabled, this field will be hardwired to 000h to indicate the end of PCI-Express Extended capability Linked List.
	19:16	**Version** Default Value: 0001b Access: RO _Custom_GTIReset: BUS Hardwired to capability version 1.
	15:0	**Capability ID** Default Value: 0000000000010011b Access: RO _Custom_GTIReset: BUS Hardwired to the Page Request Extended Capability ID

Page Request Queue Address Register 0

PAGEREQ_QADDR_0 - Page Request Queue Address Register 0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	0F0D0h	
Register to configure the base address and size of the page request queue.		
DWord	**Bit**	**Description**
0	31:12	**Page Request Queue Base Register** Default Value: 00000h Access: R/W This field points to the base of 4KB aligned invalidation request queue. Hardware may ignore and not implement bits 63:HAW, where HAW is the host address width. Reads of this field return the value that was last programmed to it.
	11:3	**Reserved** Access: RO Format: MBZ
	2:0	**Queue Size** Default Value: 000b Access: R/W This field specifies the size of the page request queue. A value of X in this field indicates a page request queue of (2X) 4KB pages. The number of entries in the invalidation queue is 2(X+8).

Page Request Queue Address Register 1

PAGEREQ_QADDR_1 - Page Request Queue Address Register 1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	0F0D4h	
Register to configure the base address and size of the page request queue.		
DWord	**Bit**	**Description**
0	31:0	**Page Request Queue Base Register** Default Value: 00000000h Access: R/W This field points to the base of 4KB aligned invalidation request queue. Hardware may ignore and not implement bits 63:HAW, where HAW is the host address width. Reads of this field return the value that was last programmed to it.

Page Request Queue Head Register 0

PAGEREQ_QHEAD_0 - Page Request Queue Head Register 0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	0F0C0h	
Register indicating the page request queue head.		
DWord	**Bit**	**Description**
0	31:19	**Reserved** Access: RO Format: MBZ
	18:4	**Queue Head** Default Value: 000000000000000b Access: R/W Specifies the offset (128-bit aligned) to the page request queue for the command that is processed next by software. GFX implementation: GFX has to read the content of the Head pointer as tail pointer gets close to it to prevent overflows in page request queue.
	3:0	**Reserved** Access: RO Format: MBZ

Page Request Queue Head Register 1

PAGEREQ_QHEAD_1 - Page Request Queue Head Register 1	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	0F0C4h

Register indicating the page request queue head.

DWord	Bit	Description
0	31:0	**Page Request Queue Head Register 1 Reserved** Default Value: 00000000h Access: RO Bit[63:32]: Reserved.

Page Request Queue Tail Register 0

PAGEREQ_QTAIL_0 - Page Request Queue Tail Register 0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	0F0C8h	
Register indicating the page request queue tail.		
DWord	**Bit**	**Description**
0	31:1	**Queue Tail** Default Value: 00000000000000000000000000000000b Access: R/W Bit[31:19]: Reserved. Bit[18:4]: Specifies the offset (128-bit aligned) to the page request queue for the request that is written next by hardware. GFX Implementation: GT manages the tail pointer value as part of page requests. The value can be acquired as part of the RC6 exit. Bit[3:1]: Reserved.
	0	**Valid Bit** Default Value: 0b Access: R/W This bit can only be cleared by SW, which also clears the other fields.

Page Request Queue Tail Register 1

PAGEREQ_QTAIL_1 - Page Request Queue Tail Register 1			
Register Space:	MMIO: 0/2/0		
Size (in bits):	32		
_Custom_GTIReset:	BUS		
Address:	0F0CCh		
Register indicating the page request queue tail.			
DWord	**Bit**	**Description**	
0	31:0	**Page Request Queue Tail Register 1 Reserved**	
		Default Value:	00000000h
		Access:	RO
		Bit[63:32]: Reserved.	

Page Request Status

PR_STATUS_0_2_0_PCI - Page Request Status

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 00306h

DWord	Bit	Description
0	15	**PRG Response PASID Required** Default Value: 1b Access: RO _Custom_GTIReset: BUS If set, the Function expects a PASID TLP Prefix on PRG Response Messages when the corresponding page requests had a PASID TLP Prefix. If Clear, the function does not expect PASID TLP Prefixes on any PRG Response Message. Function behavior is undefined if this bit is Clear and the Function receives a PRG Response Message with a PASID TLP Prefix. Function behavior is undefined if this bit is Set and the Function receives a PRG Response Message with no PASID TLP Prefix when the corresponding Page Requests had a PASID TLP Prefix. This bit is RsvdZ if the Function does not support the PASID TLP Prefix.
	14:9	**Reserved** Access: RO Format: MBZ
	8	**Stopped** Access: RO _Custom_GTIReset: BUS When this field is Set, the associated page request interface has stopped issuing additional Page requests and that all previously issued Page requests have completed. When this field is clear the associate Page request interface either has not stopped or has stopped issuing new Page requests but has outstanding Page requests. Value: 1b — Name: **[Default]**
	7:2	**Reserved** Access: RO Format: MBZ
	1	**Unexpected Page Request Group Index** Default Value: 0b Access: R/W One Clear _Custom_GTIReset: BUS When Set, indicates the function received a PRG response message containing a PRG index that has no matching request, a response failure. This field is Set by the Function and cleared when a 1b is written to the field.

PR_STATUS_0_2_0_PCI - Page Request Status

	0	**Response Failure** Default Value: 0b Access: R/W One Clear _Custom_GTIReset: BUS When Set, indicates the function received a PRG response message indicating a response failure. The function expects no further response from the host (any received are ignored). This field is Set by the Function and cleared when a 1b is written to this field.

PAK_NUM_OF_SLICES

PAK_NUM_OF_SLICES - PAK_NUM_OF_SLICES		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	12954h	
ShortName:	PAK_NUM_OF_SLICES1	
Address:	1C954h	
ShortName:	PAK_NUM_OF_SLICES2	

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Number of slices in a frame.** This field indicates number of slices in the current frame. This register is updated at the end of each slice.

PAK_Stream-Out Report (Errors)

PAK_ERR - PAK_Stream-Out Report (Errors)		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	128E8h	

DWord	Bit	Description
0	31:22	**Reserved** Access: RO Format: MBZ
	21	**Incorrect IntraMBFlag in I-slice(AVCf)**
	20	**Out of Range Symbol Code(AVC/mpeg2)**
	19	**Incorrect MBType(AVC/mpeg2**
	18	**Motion Vectors are not inside the frame boundary(mpeg2)**
	17	**Scale code is zero(mpeg2)**
	16	**Incorrect DCTtype for given motionType(mpeg2)**
	15:8	**MB Y-position** This field indicates Macro Block(MB) Y- position where an error occurred while encoding.
	7:0	**MB X-position** This field indicates Macro Block(MB) X- position where an error occurred while encoding.

PAK_Stream-Out Report (Warnings)

PAK_WARN - PAK_Stream-Out Report (Warnings)		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	128E4h	
DWord	**Bit**	**Description**
0	31:22	**Reserved** Access: RO Format: MBZ
	21	**Skip Run Greater Than 8192 (AVC)**
	20	**Incorrect SkipMB (AVC and mpeg2)**
	19	**Incorrect MV difference for dual-prime MB (mpeg2)**
	18	**End of Slice signal missing on last MB of a Row(mpeg2)**
	17	**Incorrect DCT type for field picture**
	16	**MVs are not within defined range by fcode**
	15:8	**MB Y-position**
	7:0	**MB X-position**

PAK Report Running Status

PAK_REPORT_STAT - PAK Report Running Status

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	128ECh

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**PAK Status** 0 – PAK engine is IDLE 1 – PAK engine is currently generating bit stream.

There are 256 instances of this register format per display pipe.	

Restriction
This register must be written only as a full 32 bit dword. Byte or word writes are not supported.

DWord	Bit	Description
0	31:24	**Reserved** Access: RO Format: MBZ
	23:16	**Red Legacy Palette Entry** Default Value: UUh Red legacy palette entry value.
	15:8	**Green Legacy Palette Entry** Default Value: UUh Green legacy palette entry value.
	7:0	**Blue Legacy Palette Entry** Default Value: UUh Blue legacy palette entry value.

PAL_PREC_DATA

PAL_PREC_DATA	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	4A404h-4A407h
Name:	Pipe Precision Palette Data
ShortName:	PAL_PREC_DATA_A

Reset:	soft

These are the precision palette entries used for the 10 bpc, split, and 12 bpc gamma.The Precision Palette Index Value indicates the precision palette location to be accessed through this register.

Programming Notes

For 10 bpc, program with the color 10 bit palette entry fraction value. For 12 bpc gamma odd indexes, program with the upper 10 bits of the color palette entry fraction value. For 12 bpc gamma even indexes, program the MSbs with the lower 6 bits of the color palette entry fraction value, then program all 0s in the LSbs. For split gamma indexes 0 to 511, program with the first gamma (before CSC) color 10 bit palette entry fraction value. For split gamma indexes 512 to 1023, program with the second gamma (after CSC) color 10 bit palette entry fraction value.

Restriction

This register must be written only as a full 32 bit dword. Byte or word writes are not supported.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ

PAL_PREC_DATA		
	29:20	**Red Precision Palette Entry** Default Value: UUUUUUUUUUb Red precision palette entry value.
	19:10	**Green Precision Palette Entry** Default Value: UUUUUUUUUUb Green precision palette entry value.
	9:0	**Blue Precision Palette Entry** Default Value: UUUUUUUUUUb Blue precision palette entry value.

PAL_PREC_INDEX

PAL_PREC_INDEX	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	4A400h-4A403h
Name:	Pipe Precision Palette Index
ShortName:	PAL_PREC_INDEX_A
Reset:	soft
Address:	4AC00h-4AC03h
Name:	Pipe Precision Palette Index

ShortName:	PAL_PREC_INDEX_D
Reset:	soft

This index controls access to the array of precision palette data values.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**Index Auto Increment** This field enables the index auto increment. 0b – No Increment – Do not automatically increment the index value. 1b – Auto Increment – Increment the index value with each read or write to the data register.
	14:10	**Reserved** Access: RO Format: MBZ

PAL_PREC_INDEX		
	9:0	**Index Value** This field indicates the data location to be accessed through the data register. This value can be automatically incremented by a read or a write to the data register if the index auto increment bit is set. When automatically incrementing, the current automatically calculated index value can be read here, and the index will roll over to 0 after reaching the end of the allowed range. **Value** / **Name** [0,1023] /

PAL_PREC_MULTI_SEG_DATA

PAL_PREC_MULTI_SEG_DATA	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	4A40Ch-4A40Fh
Name:	Pipe Precision Multi Segment Palette Data
ShortName:	PAL_PREC_MULTI_SEG_DATA_A

This index controls access to the array of precision palette data values used in the multi-segment gamma mode.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**Index Auto Increment** This field enables the index auto increment. Value 0b – Name: No Increment – Description: Do not automatically increment the index value. Value 1b – Name: Auto Increment – Description: Increment the index value with each read or write to the data register.
	14:5	**Reserved** Access: RO Format: MBZ

PAL_PREC_MULTI_SEG_INDEX		
	4:0	**Index Value** This field indicates the data location to be accessed through the data register. This value can be automatically incremented by a read or a write to the data register if the index auto increment bit is set. When automatically incrementing, the current automatically calculated index value can be read here, and the index will roll over to 0 after reaching the end of the allowed range. **Value** / **Name** [0,17] /

PASID Capability

PASID_CAP_0_2_0_PCI - PASID Capability

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	00104h

PASID capability reports support for Process Address Space ID(PASID) on Device-2, compliant to PCI-Express PASID ECN.

DWord	Bit	Description
0	15:13	**Reserved** Access: RO Format: MBZ
	12:8	**Maximum PASID Width** Default Value: 10100b Access: RO _Custom_GTIReset: BUS Indicates the width of the PASID field supported by the Endpoint. Hardwired to 14h to indicate support for all PASID values (20 bits).
	7:3	**Reserved** Access: RO Format: MBZ
	2	**Privilege Mode Supported** Default Value: 0b Access: RO _Custom_GTIReset: BUS Hardwired to 0, the Endpoint supports operating in Non-privileged mode only, and will never request privileged mode in requests-with-PASID.
	1	**Execute Permission Supported** Access: RO _Custom_GTIReset: BUS **Description**: Hardwired to 0, the Endpoint supports requests-with-PASID that requests execute permission. **Value** 0b — **Name** **[Default]**
	0	**Reserved** Access: RO Format: MBZ

PASID Control

PASID_CTRL_0_2_0_PCI - PASID Control

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 00106h

Process Address Space ID (PASID) control for Device-2.

DWord	Bit	Description
0	15:3	**Reserved** Access: RO Format: MBZ
	2	**Privileged Mode Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Hardwired to 0, the Endpoint is not permitted to request privileged mode in requests-with-PASID.
	1	**Execute Permission Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS If Set, the Endpoint is permitted to request execute permission in requests-with-PASID. If Clear, the Endpoint is not permitted to do so. Behavior is undefined if this bit changes value when ATS Enable field in ATS Capability is Set. Processor graphics does not use this field. Software is expected to Set this field before configuring extended-context-entry for Device-2 with the Execute Request Enable field Set.
	0	**PASID Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS If Set, the Endpoint is permitted to generate requests-with-PASID. If Clear, the Endpoint is not permitted to do so. Behavior is undefined if this bit changes value when ATS Enable field in ATS Capability is Set. If Privileged Mode Supported field in PASID Capability register is Clear, then this field is treated as Reserved(0).Processor graphics does not use this field. Software is expected to Set this field before configuring extended-context-entry for Device-2 with Supervisor Request Enable field Set. For compatibility reasons, this field is implemented as RW.

PASID Extended Capability Header

PASID_EXTCAP_0_2_0_PCI - PASID Extended Capability Header

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00100h

PASID capability reports support for Process Address Space ID(PASID) on Device-2, compliant to PCI-Express PASID ECN.

DWord	Bit	Description
0	31:20	**Next Capability Offset** Default Value: 001000000000b Access: RO _Custom_GTIReset: BUS This is a hardwired pointer to the next item in the capabilities list.
	19:16	**Version** Default Value: 0001b Access: RO _Custom_GTIReset: BUS Hardwired to capability version 1.
	15:0	**Capability ID** Default Value: 0000000000011011b Access: RO _Custom_GTIReset: BUS Hardwired to the PASID Extended Capability ID

PAT Index

PAT_INDEX - PAT Index

Register Space:	MMIO: 0/2/0

PCI Command

PCICMD_0_2_0_PCI - PCI Command

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 00004h

This 16-bit register provides basic control over the IGD's ability to respond to PCI cycles. The PCICMD Register in the IGD disables the IGD PCI compliant primary accesses to main memory.

DWord	Bit	Description
0	15:11	**Reserved** Access: RO Format: MBZ
	10	**Interrupt Disable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This bit disables the device from asserting INTx#. 0: Enable the assertion of this device's INTx# signal. 1: Disable the assertion of this device's INTx# signal. DO_INTx messages will not be sent to DMI.
	9	**Fast Back-to-Back** Default Value: 0b Access: RO _Custom_GTIReset: BUS Not Implemented. Hardwired to 0.
	8	**SERR Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Not Implemented. Hardwired to 0.
	7	**Wait Cycle Control** Default Value: 0b Access: RO _Custom_GTIReset: BUS Not Implemented. Hardwired to 0.
	6	**Parity Error Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Not Implemented. Hardwired to 0. Since the IGD belongs to the category of devices that does

PCICMD_0_2_0_PCI - PCI Command

		not corrupt programs or data in system memory or hard drives, the IGD ignores any parity error that it detects and continues with normal operation.
	5	**Video Palette Snooping** Default Value: 0b Access: RO _Custom_GTIReset: BUS This bit is hardwired to 0 to disable snooping.
	4	**Memory Write and Invalidate Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Hardwired to 0. The IGD does not support memory write and invalidate commands.
	3	**Special Cycle Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS This bit is hardwired to 0. The IGD ignores Special cycles.
	2	**Bus Primary Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS 0: Disable IGD bus primaring. 1: Enable the IGD to function as a PCI compliant primary.
	1	**Memory Access Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This bit controls the IGD's response to memory space accesses. 0: Disable. 1: Enable.
	0	**I/O Access Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This bit controls the IGD's response to I/O space accesses. 0: Disable. 1: Enable. This field is RO 1'b0 if DEV2CTL[0] IOBARDIS at offset 0x58 is 1b.

PCI Express Capability

PCIECAP_0_2_0_PCI - PCI Express Capability

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 00072h

PCI Express Capability

DWord	Bit	Description
0	15:14	**Reserved** Access: RO Format: MBZ
	13:9	**Interrupt Message Number** Default Value: 00000b Access: RO _Custom_GTIReset: BUS This field indicates which MSI vector is used for the interrupt message generated in association with any of the status bits of this Capability structure. Since this device only supports one MSI vector, this field is hardwired to 0.
	8	**Slot Implemented** Default Value: 0b Access: RO _Custom_GTIReset: BUS This field is hardwired to 0 for an endpoint device.
	7:4	**Device Type** Default Value: 1001b Access: RO _Custom_GTIReset: BUS This field is hardwired to 9h to indicate a Root Complex Integrated Endpoint.
	3:0	**Capability Version** Default Value: 0010b Access: RO _Custom_GTIReset: BUS This field is hardwired to 2h to indicate Functions compliant to PCI Express 3.0 Base Specification.

PCI Express Capability Header

PCIECAPHDR_0_2_0_PCI - PCI Express Capability Header		
Register Space:	PCI: 0/2/0	
Size (in bits):	16	
Address:	00070h	
PCI Express Capability Header		
DWord	**Bit**	**Description**
0	15:8	**Next Capability Pointer** Default Value: 10101100b Access: RO _Custom_GTIReset: BUS This field is hardwired to point to the next PCI Capability structure, the MSI Capabilities at ACh.
	7:0	**Capability Identifier** Default Value: 00010000b Access: RO _Custom_GTIReset: BUS This field is hardwired to 10h to indicate that this is a PCI Express Capability structure.

PCI Express Capability Structure

DEVICESTS_0_2_0_PCI - PCI Express Capability Structure

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	0007Ah

PCI Express Capability Structure

DWord	Bit	Description
0	15:6	**Reserved** Access: RO Format: MBZ
	5	**Transactions Pending** Default Value: 0b Access: RO _Custom_GTIReset: BUS When Set, this bit indicates that the Function has issued Non-Posted Requests that have not been completed. A Function reports this bit is cleared only when all outstanding Non-Posted Requests have completed or have been terminated by the Completion Timeout mechanism. This bit must also be cleared upon the completion of an FLR.
	4	**Aux Power Detected** Default Value: 0b Access: RO _Custom_GTIReset: BUS Functions that require Aux power report this bit as Set if Aux power is detected by the Function. Hardwired to 0b, the integrated graphics device does not require Aux power.
	3	**Unsupported Request Detected** Default Value: 0b Access: RO _Custom_GTIReset: BUS This bit indicates the Function received an Unsupported Request. Hardwired to 0b, the Root Complex Integrated Endpoint graphics device does not use the PCI Express error reporting mechanism.
	2	**Fatal Error Detected** Default Value: 0b Access: R/WC _Custom_GTIReset: BUS This bit indicates status of fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register.

DEVICESTS_0_2_0_PCI - PCI Express Capability Structure

	1	**Non-Fatal Error Detected** Default Value: 0b Access: R/WC _Custom_GTIReset: BUS This bit indicates status of non fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register.
	0	**Correctable Error Detected** Default Value: 0b Access: R/WC _Custom_GTIReset: BUS This bit indicates status of correctable errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register.

PCI Express Device Control

DEVICECTL_0_2_0_PCI - PCI Express Device Control

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	00078h

PCI Express Device Control

DWord	Bit	Description
0	15	**Initiate Function Level Reset** Default Value: 0b Access: R/W _Custom_GTIReset: BUS A write of 1b initiates Function Level Reset to the Function. During FLR, a read will return 1b since device 2 reads abort. If a local panel is powered on and configured to power down on reset, the FLR will typically take several hundred milliseconds to complete. The worst possible, although unrealistic, delay is 5 seconds.
	14:12	**Max Read Request Size** Default Value: 000b Access: RO _Custom_GTIReset: BUS Functions that do not generate Read Requests larger than 128 bytes and Functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only (RO) with a value of 000b.
	11	**Enable No Snoop** Default Value: 0b Access: RO _Custom_GTIReset: BUS This bit is permitted to be hardwired to 0b if a Function would never Set the No Snoop attribute in transactions it initiates. The graphics device never generates a PCI Express TLP.
	10	**Aux Power PM Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Functions that do not implement this capability hardwire this bit to 0b.
	9	**Phantom Functions Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Functions that do not implement this capability hardwire this bit to 0b.

DEVICECTL_0_2_0_PCI - PCI Express Device Control

	8	**Extended Tag field Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Functions that do not implement this capability hardwire this bit to 0b.
	7:5	**Max Payload Size** Default Value: 000b Access: RO _Custom_GTIReset: BUS Functions that support only the 128-byte max payload size are permitted to hardwire this field to 000b.
	4	**Enable Relaxed Ordering** Default Value: 0b Access: RO _Custom_GTIReset: BUS A Function is permitted to hardwire this bit to 0b if it never sets the Relaxed Ordering attribute in transactions it initiates as a Requester. The graphics device never generates a PCI Express TLP.
	3	**Unsupported Request Response Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
	2	**Fatal Error Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This bit, in conjunction with other bits, controls sending ERR_FATAL Messages (see Section 6.2.5 and Section 6.2.6 for details).
	1	**Non-Fatal Error Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This bit, in conjunction with other bits, controls sending ERR_NONFATAL Messages (see Section 6.2.5 and Section 6.2.6 for details).

DEVICECTL_0_2_0_PCI - PCI Express Device Control		
	0	**Correctable Error Enable** Default Value: 0b Access: R/W _Custom_GTIReset: BUS This bit, in conjunction with other bits, controls sending ERR_COR Messages (see Section 6.2.5 and Section 6.2.6 for details).

PCI Mirror of GMCH Graphics Control

MGGC0_0_2_0_PCI - PCI Mirror of GMCH Graphics Control

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	00050h

Mirror of GGC register from GTTMMADR Space at offset 0x108040.

DWord	Bit	Description
0	15:8	**GMS** Default Value: 05h Access: RO Variant _Custom_GTIReset: BUS This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics device in VGA (non-linear) and Native (linear) modes. It corresponds to DSM (Data Stolen Memory region) region. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD (bit 1 of this register) is 0. BIOS Requirement: Given new sizes allow down to 8MB allocation, BIOS has to ensure there is sufficient space for WOPCM and basic GFX Stolen functions. 00h:0MB 01h:32MB 02h:64MB 03h:96MB 04h:128MB 05h:160MB 06h:192MB 07h:224MB 08h:256MB 09h:288MB 0Ah:320MB 0Bh:352MB 0Ch:384MB 0Dh:416MB 0Eh:448MB 0Fh:480MB 10h:512MB 11h - 1Fh: Reserved 20h:1024MB 21h - 2Fh: Reserved 30h:1536MB 31h - 3Fh: Reserved 40h: 2048MB 41h - EFh: Reserved

F6h: 28MB
F7h: 32MB
F8h: 36MB
F9h: 40MB
FAh: 44MB
FBh: 48MB
FCh: 52MB
FDh: 56MB
FEh: 60MB
FFh: Reserved Hardware functionality in case of programming this value to Reserved is not guaranteed.

7:6 **GGMS**

Default Value:	00b
Access:	RO Variant
_Custom_GTIReset:	BUS

This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled.
GSM is assumed to be a contiguous physical DRAM space with DSM, and BIOS needs to allocate a contiguous memory chunk. Hardware will derive the base of GSM from DSM only using the GSM size programmed in the register.
Hardware functionality in case of programming this value to Reserved is not guaranteed.
0x0:No Preallocated Memory
0x1:2MB of Preallocated Memory
0x2:4MB of Preallocated Memory
0x3:8MB of Preallocated Memory

5:3 **Reserved**

Access:	RO
Format:	MBZ

2 **VAMEN**

Default Value:	0b
Access:	RO Variant
_Custom_GTIReset:	BUS

Enables the use of the iGFX engines for Versatile Acceleration.
0 - iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h.
1 - iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 038000h.

MGGC0_0_2_0_PCI - PCI Mirror of GMCH Graphics Control

	1	**IVD** Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS 0: Enable. Device 2 (IGD) claims VGA memory and IO cycles, the Sub-Class Code within Device 2 Class Code register is 00. 1: Disable. Device 2 (IGD) does not claim VGA cycles (Mem and IO), and the Sub- Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field (bits 7:3 of this register) pre-allocates no memory.
	0	**SPARE** Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS Note: This bit was maintained as a placeholder for compatibility. Prior, it locked the register.

PCI Status

PCISTS2_0_2_0_PCI - PCI Status

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 00006h

PCISTS is a 16-bit status register that reports the occurrence of a PCI compliant primary abort and PCI compliant target abort. PCISTS also indicates the DEVSEL# timing that has been set by the IGD.

DWord	Bit	Description
0	15	**Detected Parity Error** Default Value: 0b Access: RO _Custom_GTIReset: BUS Since the IGD does not detect parity, this bit is always hardwired to 0.
	14	**Signaled System Error** Default Value: 0b Access: RO _Custom_GTIReset: BUS The IGD never asserts SERR#, therefore this bit is hardwired to 0.
	13	**Received Primary Abort Status** Default Value: 0b Access: RO _Custom_GTIReset: BUS The IGD never gets a Primary Abort, therefore this bit is hardwired to 0.
	12	**Received Target Abort Status** Default Value: 0b Access: RO _Custom_GTIReset: BUS The IGD never gets a Target Abort, therefore this bit is hardwired to 0.
	11	**Signaled Target Abort Status** Default Value: 0b Access: RO _Custom_GTIReset: BUS Hardwired to 0. The IGD does not use target abort semantics.
	10:9	**DEVSEL Timing** Default Value: 00b Access: RO _Custom_GTIReset: BUS Hardwired to 00.

PCISTS2_0_2_0_PCI - PCI Status

8	**Primary Data Parity Error Detected**
	Default Value: 0b Access: RO _Custom_GTIReset: BUS
	Since Parity Error Response is hardwired to disabled, and the IGD does not do any parity detection, this bit is hardwired to 0.
7	**Fast Back-to-Back**
	Default Value: 0b Access: RO _Custom_GTIReset: BUS
	Hardwired to 0 to be compliant to PCI Express Base Spec (rev 3.0).
6	**User Defined Format**
	Default Value: 0b Access: RO _Custom_GTIReset: BUS
	Hardwired to 0.
5	**66 MHz PCI Capable**
	Default Value: 0b Access: RO _Custom_GTIReset: BUS
	Hardwired to 0.
4	**Capability List**
	Default Value: 1b Access: RO _Custom_GTIReset: BUS
	This bit is hardwired to 1 to indicate that the register at 34h provides an offset into the function's PCI Configuration Space containing a pointer to the location of the first item in the list.
3	**Interrupt Status**
	Default Value: 0b Access: RO Variant _Custom_GTIReset: BUS
	This bit reflects the state of the interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the devices INTx# signal be asserted.
2:0	**Reserved**
	Access: RO Format: MBZ

PCU Interrupt Definition

PCU Interrupt Definition

Register Space:	MMIO: 0/2/0

Pinned Surface Per Process Virtual Address Base Register

PINNED_SURFACE_PPBASE_H - Pinned Surface Per Process Virtual Address Base Register

Register Space: MMIO: 0/2/0
Size (in bits): 32

Pinned Surface Per Process Virtual Address Base register

DWord	Bit	Description
0	31:0	**Per Process Virtual Base_H** Default Value: 0000h Access: R/W _Custom_GTIReset: DEV Per Process Virtual Address Base - PPBASE[47:16] 4KB Page number of the surface(s) in Per-Process Virtual Address Space (ie, index into the PPGTT)

Pinned Surface Process ID Register

PINNED_SURFACE_PROCESS_ID - Pinned Surface Process ID Register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Pinned Surface Process ID register		
DWord	**Bit**	**Description**
0	31:0	**Process ID** Default Value: 0000h Access: R/W _Custom_GTIReset: DEV ID of the Process that owns the pinned surfaces represented by this register.

Pinned Surface Virtual Address Base Register

PINNED_SURFACE_ADDR_BASE - Pinned Surface Virtual Address Base Register

Register Space: MMIO: 0/2/0
Size (in bits): 32

Pinned Surface Virtual Address Base register

DWord	Bit	Description
0	31:28	**Per Process Virtual Base_L** Default Value: 0000b Access: R/W _Custom_GTIReset: DEV Per Process Virtual Address Base - PPBASE[15:12] 4KB Page number of the surface(s) in Per-Process Virtual Address Space (ie, index into the PPGTT)
	27:20	**Reserved** Access: RO Format: MBZ
	19:0	**Global Virtual Address Base** Default Value: 00000000000000000000b Access: R/W _Custom_GTIReset: DEV 4KB Page number of the surface(s) in Global Virtual Address Space (ie, index into the GGTT). The entire range from Base to Base+Size-1 must fall within the Pinned Range of the GGTT.

PIPE_ARB_CTL

PIPE_ARB_CTL	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank OR pipe disabled

Address:	70028h-7002Bh
Name:	Pipe Arbiter Control
ShortName:	PIPE_ARB_CTL_A
Reset:	soft

Address:	71028h-7102Bh
Name:	Pipe Arbiter Control
ShortName:	PIPE_ARB_CTL_B
Reset:	soft

Address:	72028h-7202Bh
Name:	Pipe Arbiter Control
ShortName:	PIPE_ARB_CTL_C
Reset:	soft

Address:	73028h-7302Bh
Name:	Pipe Arbiter Control
ShortName:	PIPE_ARB_CTL_D
Reset:	soft

There is one instance of this register per pipe.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30:21	**Reserved** Access: RO Format: MBZ
	20	**Disable Weighted Arbitration** This field disables the weighted pipe slice arbitration. 0b – Enable **[Default]** 1b – Disable
	19	**Reserved**

PIPE_ARB_CTL

18:16	**Additional Slots** These additional Slots gets added to each arbitration cycle during which the clients gets serviced in a round robin manner. A programmed value of 1b results in 1 additional slot.
15:14	**Reserved** Access: RO Format: MBZ
13	**Use Programmed Slots** When this field is set, HW uses the Slots programmed in the PLANE_CTL register instead of the HW defaults.
12	**Disable Block Valid Check** The field disables the block valid check done at pipe arbiter. 0b: Enable 1b: Disable
11:10	**DSB Arbitration Interval** This field defines the DSB requests service interval in the pipe arbitration. 00b: 16 clocks 01b: 32 clocks 10b: 64 clocks **[Default]** 11b: 128 clocks
9:8	**Request Vs Data Arbitration** This field selects the arbitration weightage for the Streamer and the DDB requests. 00b: Allow 1 Streamer requests every 2 DDB requests. 01b: Allow 1 Streamer requests every 4 DDB requests. 10b **[Default]**: Allow 1 Streamer requests every 8 DDB requests. 11b: Allow 1 Streamer requests every 16 DDB requests.
7:6	**Reserved** Access: RO Format: MBZ
5:0	**Frame Start Drain Delay** This field contains the time, in microseconds, the pipe waits before draining the data from the Display Buffer. [0-31] 15 **[Default]**

PIPE_BOTTOM_COLOR

PIPE_BOTTOM_COLOR

Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank OR pipe disabled

Address:	70034h-70037h
Name:	Pipe Bottom Color
ShortName:	PIPE_BOTTOM_COLOR_A
Reset:	soft

Address:	71034h-71037h
Name:	Pipe Bottom Color
ShortName:	PIPE_BOTTOM_COLOR_B
Reset:	soft

Address:	72034h-72037h
Name:	Pipe Bottom Color
ShortName:	PIPE_BOTTOM_COLOR_C
Reset:	soft

Address:	73034h-73037h
Name:	Pipe Bottom Color
ShortName:	PIPE_BOTTOM_COLOR_D
Reset:	soft

This register sets the color that appears underneath the bottom most plane in the pipe blender Z-order. The value for each color channel is represented in an unsigned 0.10 format with 0 integer and 10 fractional bits.

DWord	Bit	Description
0	31	**Pipe Gamma Enable** This bit enables pipe gamma correction for the bottom color. This field is deprecated. Value: 0b — Name: Disable Value: 1b — Name: Enable
	30	**Pipe CSC Enable** This bit enables pipe color space conversion for the bottom color. This field is deprecated.

PIPE_BOTTOM_COLOR

		Value / **Name** 0b — Disable 1b — Enable
	29:20	**V R Bottom Color** Format: U0.10 This field sets the bottom color for the V or Red channel.
	19:10	**Y G Bottom Color** Format: U0.10 This field sets the bottom color for the Y or Green channel.
	9:0	**U B Bottom Color** Format: U0.10 This field sets the bottom color for the U or Blue channel.

PIPE_DMCSCANLINECOMP

PIPE_DMCSCANLINECOMP

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	7000Ch-7000Fh
Name:	Pipe Scan Line Compare for DMC
ShortName:	PIPE_DMCSCANLINECOMP_A
Reset:	soft
Address:	7100Ch-7100Fh
Name:	Pipe Scan Line Compare for DMC
ShortName:	PIPE_DMCSCANLINECOMP_B
Reset:	soft
Address:	7200Ch-7200Fh
Name:	Pipe Scan Line Compare for DMC
ShortName:	PIPE_DMCSCANLINECOMP_C
Reset:	soft
Address:	7300Ch-7300Fh
Name:	Pipe Scan Line Compare for DMC
ShortName:	PIPE_DMCSCANLINECOMP_D
Reset:	soft

DWord	Bit	Description
0	31	**Enable Compare** This field enables the scan line compare for DMC event generation. When this register is written with this bit set to 1b, the display engine will, trigger a scan line event after reaching the programmed scan line number. It will do the same on every frame. Value / Name: 0b – Do nothing 1b – Enable compare Restriction: Do not enable this register if the event is not needed in the DMC.
	30:20	**Reserved** Access: RO Format: MBZ
	19:0	**Scan Line Value** This field specifies the ending scan line number of the scan line window.

PIPE_DSS_CTL1

PIPE_DSS_CTL1

Display stream splitter

DWord	Bit	Description
0	31	**Splitter Enable** This field enables stream splitting. This bit must be set to enable MSO configuration. **Value** / **Name** 0b – Disable 1b – Enable **Restriction** Splitter enable is supported for pipe A only.
	30	**Joiner Enable** This field enables stream joiner after compression. **Value** / **Name** 0b – Disable

PIPE_DSS_CTL1

	1b	Enable

29 Big_Joiner_Enable

When big_joiner_enable is '1', this dssunit will be working with another dssunit in adjacent pipe either as a primary or as a secondary.

Value	Name
0b	Disable
1b	Enable

28 Primary_Big_Joiner_Enable

This bit indicates that this pipe is the primary/secondary when Big_Joiner_Enable bit is set in this register.

Value	Name
0b	Secondary
1b	Primary

27 Reserved

26:25 Reserved

Access:	RO
Format:	MBZ

24 Dual Link Mode

This field selects the split pattern. Applicable only if splitter mode is enabled through DSS configuration bits.

Value	Name
0b	Front-Back mode
1b	Interleave mode

23:20 Reserved

Access:	RO
Format:	MBZ

19:16 Overlap

MIPI use case (mainly dual link mode):
This field specifies the number of pixels of overlap.
1 to 15 = valid integer number of overlap pixels.
0 = Sink device requires no overlap pixels.
eDP use case:
This field specifies the number of overlap pixels the sink device uses in the active data.
1 to 8 = valid integer number of overlap pixels.
0 = Sink device requires no overlap pixels.

15:12 Reserved

Access:	RO
Format:	MBZ

PIPE_DSS_CTL1		
	11:0	**Left DL buffer Target Depth** This field indicates the number of pixels to hold in the secondary link buffer before enabling the timing generator, so the Primary and Secondary client controllers are in sync. Valid only when operating in front back dual link mode. Value should only be programmed for the Secondary client controller. If bit 31 is set then the target for the Secondary controller must be non-zero. Maximum value is 1440 decimal.

PIPE_DSS_CTL2

PIPE_DSS_CTL2

Register Space:	MMIO: 0/2/0

	18:17	**Reserved** Access: RO Format: MBZ
	16	**Reserved** Access: RO Format: MBZ
	15	**Right Branch VDSC Enable** Display stream compression on right branch enable/disable. It is double buffered on rising edge of vblank. Restriction : Display stream compression is supported for pipe active sizes up to 4096 pixels. **Value** / **Name** 0b – Disable 1b – Enable
	14	**Spare 14**
	13	**Spare 13**
	12	**Spare 12**
	11:0	**Right DL Buffer Target Depth** This field indicates the number of pixels to hold in the secondary link buffer before enabling the timing generator, so the Primary and Secondary client controllers are in sync. Valid only when operating in front back dual link mode. Value should only be programmed for the Secondary controller. If bit 31 is set then the target for the Secondary controller must be non-zero. Maximum value is 1440 decimal. Default is 0.

PIPE_FLIPCNT

PIPE_FLIPCNT	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	70044h-70047h
Name:	Pipe Flip Count
ShortName:	PIPE_FLIPCNT_A
Reset:	soft
Address:	71044h-71047h
Name:	Pipe Flip Count
ShortName:	PIPE_FLIPCNT_B
Reset:	soft
Address:	72044h-72047h
Name:	Pipe Flip Count
ShortName:	PIPE_FLIPCNT_C
Reset:	soft
Address:	73044h-73047h
Name:	Pipe Flip Count
ShortName:	PIPE_FLIPCNT_D
Reset:	soft

DWord	Bit	Description
0	31:0	**Pipe Flip Counter** This field provides read back of the display pipe flip counter. The counter increments on the start of each flip to the selected plane of this pipe. The start of flip is when the plane surface address is updated, not when the flip completes. The flip can be through command streamer asynchronous and synchronous flips or MMIO writes to the plane 1 surface address. It rolls over back to 0 after (2^32)-1 flips. Pipe flipcounter is restricted to one plane at a time. The plane select is programmed in PIPE_MISC2->Flip Timestamp Plane Select.

PIPE_FLIPDONETMSTMP

PIPE_FLIPDONETMSTMP	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	70054h-70057h
Name:	Pipe Flip Done Time Stamp
ShortName:	PIPE_FLIPDONETMSTMP_A
Reset:	soft
Address:	71054h-71057h
Name:	Pipe Flip Done Time Stamp
ShortName:	PIPE_FLIPDONETMSTMP_B
Reset:	soft
Address:	72054h-72057h
Name:	Pipe Flip Done Time Stamp
ShortName:	PIPE_FLIPDONETMSTMP_C
Reset:	soft
Address:	73054h-73057h
Name:	Pipe Flip Done Time Stamp
ShortName:	PIPE_FLIPDONETMSTMP_D
Reset:	soft

DWord	Bit	Description
0	31:0	**Pipe Flip Done Time Stamp** This field provides read back of the display pipe flip done time stamp. The time stamp value is sampled when hardware latches on to the new surface and the flip done gets sent. The flip can be through command streamer asynchronous and synchronous flips or MMIO writes to the plane. The TIMESTAMP_CTR register has the current time stamp value. Flip time stamp sampling is restricted to one plane at a time. The plane select is programmed in PIPE_MISC2->Flip Timestamp Plane Select.

PIPE_FLIPTMSTMP

PIPE_FLIPTMSTMP	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	7004Ch-7004Fh
Name:	Pipe Flip Time Stamp

Reset:	soft

Address:	73018h-7301Fh
Name:	Pipe Isoch Offset addition
ShortName:	PIPE_ISOCREQ_OFFSET_D
Reset:	soft

The values programmed in this register will added as offsets to the LTR, BW and Delay. SW must ensure to clear these registers if no offset is desired to be added.
For example, If LTR offset is programmed to 0x0100 in this register, then this value is added to the LTR value programmed in PIPE_ISOCREQ.

DWord	Bit	Description
0	31:16	**LTR offset** Access: R/W This field specifies the latency tolerance (LTR) offset to be added to LTR value in PIPE_ISOCREQ for this pipe in microseconds.
	15:0	**Bandwidth offset** Access: R/W This field specifies the bandwidth requirement offset to be added to BW value in the PIPE_ISOCREQ register
1	31:8	**Reserved** Access: RO Format: MBZ

PIPE_ISOCREQ_OFFSET - PIPE_ISOCREQ_OFFSET		
	7:0	**Delay Offset** Access: R/W This field specifies the offset to be added to the downwards transition delay programmed in the PIPE_ISOCREQ.

PIPE_MISC

PIPE_MISC	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank OR pipe disabled

Address:	70030h-70033h
Name:	Pipe Miscellaneous
ShortName:	PIPE_MISC_A
Reset:	soft

Address:	71030h-71033h
Name:	Pipe Miscellaneous
ShortName:	PIPE_MISC_B
Reset:	soft

Address:	72030h-72033h
Name:	Pipe Miscellaneous
ShortName:	PIPE_MISC_C
Reset:	soft

Address:	73030h-73033h
Name:	Pipe Miscellaneous
ShortName:	PIPE_MISC_D
Reset:	soft

DWord	Bit	Description
0	31:30	**Stereo Mask Pipe Int** This field controls which pipe vertical timing (vertical blank, scan line, and vertical sync) events will be reported in interrupts during stereo 3D mode.

Value	Name	Description
00b	Mask None	No masking. Report both the left and right eye vertical events.
01b	Mask Left	Mask the left eye vertical events. Only report right eye events.
10b	Mask Right	Mask the right eye vertical events. Only report left eye events.
11b	Reserved	Reserved

Restriction
This field must be programmed prior to enabling stereo 3D mode and must not be changed while stereo 3D is enabled. In the stacked frame mode the vertical sync is not generated in the gap between left and right eye images, and the scan line count increments across the entire tall frame, so masking may cause unexpected behavior for those events.

PIPE_MISC

29:28 **Stereo Mask Pipe Render**

This field controls which pipe vertical timing (vertical blank, scan line, and vertical sync) events will be reported in render responses during stereo 3D mode.

Value	Name	Description
00b	Mask None	No masking. Report both the left and right eye vertical events.
01b	Mask Left	Mask the left eye vertical events. Only report right eye events.
10b	Mask Right	Mask the right eye vertical events. Only report left eye events.
11b	Reserved	Reserved

Restriction
This field must be programmed prior to enabling stereo 3D mode and must not be changed while stereo 3D is enabled. In the stacked frame mode the vertical sync is not generated in the gap between left and right eye images, and the scan line count increments across the entire tall frame, so masking may cause unexpected behavior for those events.

27 **YUV420 Enable**

This field enables YUV420 output from this pipe. This is only for use with HDMI and DP.

Value	Name
0b	Disable
1b	Enable

Restriction
This field must be programmed prior to enabling the transcoder attached to this pipe.

26 **YUV420 Mode**

This field specifies the mode in which YUV420 pixels are generated by this pipe.

Value	Name
0b	Bypass
1b	Full blend

25 **Pipe Gamma Input Clamp Disable**

This field controls the pipe post csc gamma input clamp operation. When this bit is set to 0b the negative pixel values get clamped to zero at the gamma input.

Value	Name
0b	Enable **[Default]**
1b	Disable

24 **Allow Double Buffer Update Disable**

Access:	R/W

This field controls whether double buffer updates are allowed to be disabled for the double buffered pipe registers listed below. The DOUBLE_BUFFER_CTL register can be configured to globally disable double buffer updates for those resources that allow them to be disabled.

PIPE_MISC

		Value / **Name** 0b — Not Allowed 1b — Allowed **[Default]**
	23	**HDR Mode** This field enables the HDR mode, allowing for higher precision output from the HDR supporting planes and bypassing the SDR planes in blending. In addition to setting bit 8 of this register (Pixel Rounding),this bit must be set to 1b to passthrough the frame buffer pixels unmodified across the pipe. **Value** / **Name** 0b — Disable 1b — Enable
	22	**Change Mask for LDPST** This field controls the change tracking for the LACE. Change tracking can be used by PSR/SRD and WD **Value** / **Name** 0b — Not Masked 1b — Masked
	21	**Change Mask for Register Write** This field controls change tracking for the pipe register write. Change tracking can be used by PSR/SRD and WD. **Value** / **Name** 0b — Not Masked 1b — Masked
	20	**Change Mask for Vblank Vsync Int** This field controls change tracking for the vblank or vsync interrupt enable. Change tracking can be used by PSR/SRD and WD. **Value** / **Name** 0b — Not Masked 1b — Masked
	19	**Reserved**
	18	**Reserved**
	17	**Reserved**
	16	**Reserved**
	15:14	**Rotation Info** This field indicates to internal KVMR screen capture that the display has been rotated through software or hardware rotation. Select the closest value if the rotation is not an exact multiple of 90 degrees. Hardware rotation of the display output is controlled through the plane control registers, not through this field.

PIPE_MISC

Value	Name	Description
00b	None	No rotation on this pipe
01b	90	90 degree rotation on this pipe
10b	180	180 degree rotation on this pipe
11b	270	270 degree rotation on this pipe

Restriction
This field must be programmed in order for internal KVMR screen capture to work correctly when display is rotated by software or hardware.

13 **Reserved**

Access:	RO
Format:	MBZ

12 **OLED Compensation**

This field enables the OLED compensation on the pipe. When this bit is set, plane 5 is used as the OLED compensation plane with up to 10 bits per channel precision. OLED compensation must be used only when the pipe is configured to output RGB format.
The OLED compensation plane size must be same as the pipe active size.

Value	Name
0b	Disable
1b	Enable

11 **Pipe output color space select**

This field indicates the output color space.This field affects the values of the pipe border and some capture functions.This field does not affect the planes, pipe CSC, or ports.

Value	Name
0b	RGB
1b	YUV

Restriction
This field must be set to match the color space that will be output from the pipe CSC or output from the planes if they pipe CSC is bypassed.

10 **xvYCC Color Range Limit**

This field limits the color range of the pipe output to 1 to 254 for 8-bit components, 4 to 1019 for 10bit components, and 16 to 4079 for 12-bit components. Values outside of the range will be clamped to fit within the range.

Value	Name	Description
0b	Full	Do not limit the range
1b	Limit	Limit range

PIPE_MISC

9	**Pixel Extension** This field controls how the pixel extension is handled in the pipe. In scenarios where the frame buffers bpc is larger or equal to the port output bpc, this bit may be programmed to 'Zero Extend'.

Value	Name
0b	MSB Extend **[Default]**
1b	Zero Extend

8	**Pixel Rounding** This field controls the pixel rounding at the end of the pipe. This bit must be set to 1b to passthrough the frame buffer pixels unmodified across the pipe.

Value	Name
0b	Round Up **[Default]**
1b	Truncate

7:5	**Dithering BPC** This field selects the number of bits per color to be used in dithering.

Value	Name	Description
000b	8 bpc	8 bits per color
001b	10 bpc	10 bits per color
010b	6 bpc	6 bits per color
Others	Reserved	Reserved

Programming Notes
When dithering is enabled, the value selected here should match the bits per color selected in the Transcoder DDI Function Control register attached to this pipe.

4	**Dithering enable** This field enables dithering.

Value	Name
0b	Disable
1b	Enable

3:2	**Dithering type** This field selects the dithering type.

Value	Name	Description
00b	Spatial	Spatial
01b	ST1	Spatio-Temporal 1
10b	ST2	Spatio-Temporal 2
11b	Temporal	Temporal
