Name:	Pipe Scan Line
ShortName:	PIPE_SCANLINE_D
Reset:	soft

This register enables the read back of the pipe vertical line counter. The value increments at the leading edge of HSYNC. The value resets to line zero at the first active line of the display. In interlaced display timings, the scan line counter provides the current line in the field. One field can have a total number of lines that is one greater than the other field.

DWord	Bit	Description
0	31	**Current Field** This is an indication of the current display field.

Value	Name	Description
0b	Odd	First field (odd field)
1b	Even	Second field (even field)

30:20	**Reserved**

Access:	RO
Format:	MBZ

19:0	**Line Counter for Display** This is an indication of the current display scan line.

PIPE_SCANLINE		
		Programming Notes
		The line count value is from the display output timing generator, representing the scan line currently being output to a receiver. Due to buffering within the display engine, the line being fetched (read) from the frame buffer is not directly linked to the line being output. It is possible for the fetched line to be hundreds of lines ahead of the timing generator output line.

PIPE_SCANLINECOMP

PIPE_SCANLINECOMP	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	70004h-70007h
Name:	Pipe Scan Line Compare
ShortName:	PIPE_SCANLINECOMP_A
Reset:	soft

Reset:	soft
Address:	73004h-73007h
Name:	Pipe Scan Line Compare
ShortName:	PIPE_SCANLINECOMP_D
Reset:	soft

This register is used to initiate a display scan line compare. This MMIO driven scan line compare can not be used at the same time as the command streamer driven scan line compare on the same pipe. When this register is written with the Initiate Compare bit set to 1b, the Display Engine (DE) will start comparing the display pipe or plane (selectable) current scan line value (current scan line) with the start scan line value (current scan line >= start scan line) and the end scan line value (current scan line <= end scan line) to decide if the pipe scan line is inside or outside the scan line window of interest. DE will wait until the current scan line is either outside (Inclusive mode) or inside (Exclusive mode) the scan line window, then trigger a scan line event and stop any further comparing. The scan line event can cause display to send a scan line compare response to the command streamer, (used for releasing a MI_WAIT_FOR_EVENT on scan line window), if unmasked in the DERRMR mask register 0x44050. The scan line event can also cause display to generate a scan line compare interrupt, if the interrupt registers are configured for that. The value programmed should be the desired value - 1, so for scan line 0, the value programmed is vertical total, and for scan line 1, the value programmed is 0. The programmable range can include the vertical blank. In interlaced display timings, the current scan line is the current line of the current interlaced field. Either MMIO or a MI_LOAD_REGISTER_IMM command can be used to unmask the scan line render response 0x44050. That can be done anytime before programming this register. There is one instance of this register per pipe.

Restriction
A new scan line compare must not be started until after the previous compare has finished. The end scan line value must be greater than or equal to the start scan line value.When using LRI care must be taken to follow all

PIPE_SCANLINECOMP

the programming rules for LRI targeting the display engine.

<table>
<tr><th>DWord</th><th>Bit</th><th>Description</th></tr>
<tr><td>0</td><td>31</td><td>Initiate Compare
This field initiates the scan line compare. When this register is written with this bit set to 1b, the display engine will do one complete comparison cycle, trigger a scan line event, then stop comparing.
<table>
<tr><th>Value</th><th>Name</th></tr>
<tr><td>0b</td><td>Do nothing</td></tr>

ShortName:	PIPE_SEAM_EXCESS_C
Reset:	soft
Address:	63020h-63023h
Name:	Pipe Seam Excess
ShortName:	PIPE_SEAM_EXCESS_D
Reset:	soft

This register defines the number of excess pixels within the Pipe window (on the right or left) that the Scaler will need to remove from the post scaled image.
When an image is split across two Pipes, scaled, and then joined at the Port, the Scalers within each Pipe will operate on a split image that contains overlap pixels around where the final seam will be to facilitate a seamless join at the Port. For example, if the left portion of an image is being scaled in Pipe A and the right portion of the image is being scaled in Pipe B, then there will be an excess number of pixels (i.e. overlap pixels) on the right side of the Pipe A image and an excess number of pixels on the left side of the Pipe B image. The overlap pixels of the window within each of the Pipes need to be dropped by the Scaler before they are delivered to the Port.
Notes:

1. Dropping of the overlap/excess pixels is done at the very end of the Pipe within the Scaler regardless of whether a Scaler is bound to the Pipe, or not.
2. The values programmed within this register are one-based (i.e. a programming of 1 equals 1 pixel of excess)
3. The values programmed within this register will be added to the Horizontal Active programming of the TRANS_HTOTAL register of the port bound to this pipe. I.e. the pipe will see a Horizontal size equal to Horizontal Active + Left Excess Amount + Right Excess Amount

PIPE_SEAM_EXCESS - PIPE_SEAM_EXCESS

Restriction :

1. The number of excess pixels cannot exceed the size of the horizontal blank, otherwise there will not be enough time to throw them away before starting the next line and the image will be corrupted
2. Pillarbox boarders must be even
3. The source size on each pipe, including pre-scale excess, must be a multiple of 2. When the Pipe output format is YUV 420 with full blend, the source size is required to be a multiple of 4.

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:16	**Right Excess Amount** This field defines the number of excess pixels to drop, if any, on the right side of the Pipe window
	15:13	**Reserved** Access: RO Format: MBZ
	12:0	**Left Excess Amount** This field defines the number of excess pixels to drop, if any, on the left side of the Pipe window

PIPE_SRCSZ

This Register is to add pipe DMC enable. To use pipeDMC driver must enable pipeDMC first.

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**pipedmc_enable** Access: R/W Setting this bit enables the pipeDMC.

Pixel Shader Scheduling Mode

PSS_MODE - Pixel Shader Scheduling Mode

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	07038h
Name:	Pixel Shader Scheduling Mode
ShortName:	PSS_MODE

Mode registers for Pixel Shader Scheduling.

DWord	Bit	Description
0	31:16	**Mask** Access: WO _Custom_GTIReset: DEV Must be set to modify corresponding bit in Bits 15:0 (All implemented bits)
	15:14	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	13:10	**Maximum Allowed PS Thread Dependencies** Default Value: 8h Access: R/W Format: U4 _Custom_GTIReset: DEV Sets the maximum number of dependencies that a pixel shader thread can have. If a thread requires more than this number, thread dispatch will be stalled until enough threads that this thread is dependent on have retired. Since maximum number of dependencies in a Pixel Shader is 8 (for fused-SIMD16, corresponding to 8 2X2 pixel block; fused-SIMD32 corresponding to 8 4x2 pixel blocks), programming a value higher than 0X8 is illegal. If HW chooses to launch lower SIMD thread e.g. fused-SIMD8, it will not have more than 4 dependencies. Hence, programming 0x8 guarantees maximum dependencies for all SIMD width dispatches.
	9	**3D Scoreboard Address XOR Disable** Access: R/W Format: Disable _Custom_GTIReset: DEV

Value	Name	Description
0h	Enabled **[Default]**	3D Scoreboard Address calculation includes XOR of higher bits
1h	Disabled	3D Scoreboard Address calculation based on lower address bits only

PSS_MODE - Pixel Shader Scheduling Mode

8 Reserved

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

7 Stalling behavior disable for PS Dispatch for PTBR

Access:	R/W
_Custom_GTIReset:	DEV

This bit, when enabled, allows PS dispatch function to not stall when no TILE ID is free for incoming new tile access under PTBR. Although this behavior is non stalling, it has a potential to reduce number of color pixel blocks from tile cache in certain cases.

Value	Name	Description
0	**[Default]**	This is a default value and default behavior is to have PS dispatch stall when there are no free TILE_IDs available for incoming new access on a new TILE under PTBR.
1		When this bit is set, PS dispatch does not stall for a new incoming tile but simply uses the next TILE_ID without waiting for it to be free. SW should enable this bit if there are perf downsides with stalling behavior and additional discard BW is not significant.

6:5 Thread Scheduler Mode

Access:	R/W
Format:	U2
_Custom_GTIReset:	DEV

Selects the PSD selection policy

Value	Name	Description
0h	8x8 Round-Robin **[Default]**	Scheduler alternates PSDs to load entire 8x8
1h	8x8 Fixed	Scheduler statically hashes each 8x8 based on xy address
2h	8x8 Dynamic	At the start of each 8x8, scheduler selects a PSD to load entire 8x8 based on EU load
3h	Reserved	

4 Disable 4x4 schedule optimization

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

If set, prevent scheduler from attempting to pack 4x4 at SIMD16 alignment.

Value	Name
0h	4x4 packed at SIMD16 alignment if possible **[Default]**
1h	scheduler does not consider 4x4 when packing threads

PSS_MODE - Pixel Shader Scheduling Mode

	3	**Disable 4x2 schedule optimization** Access: R/W Format: Disable _Custom_GTIReset: DEV If set, prevent scheduler from attempting to pack 4x2 at SIMD8 alignment. **Value** / **Name** 0h: 4x2 packed at SIMD8 alignment if possible **[Default]** 1h: scheduler does not consider 4x2 when packing threads
	2	**Disable fused thread scheduling** Access: R/W Format: Disable _Custom_GTIReset: DEV If set, scheduler will only populate the first thread of a fused thread. A fused thread will still be dispatched, but will only contain a single thread. **Value** / **Name** 0h: Fused thread enabled **[Default]** 1h: Fused thread disabled
	1:0	**Limit maximum number of polys per fused-thread** Access: R/W Format: U2 _Custom_GTIReset: DEV Limit the scheduler to pack no more than the indicated number polys into a single fused-thread. **Value** / **Name** 0h: Polys per fused-thread is not limited **[Default]** 1h: Maximum polys per fused-thread limited to 1 2h: Maximum polys per fused-thread limited to 2 3h: Maximum polys per fused-thread limited to 3

Pixel Shader Scheduling Mode 2

PSS_MODE2 - Pixel Shader Scheduling Mode 2

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0703Ch
Name:	Pixel Shader Scheduling Mode
ShortName:	PSS_MODE2

Mode register for Pixel Shader Scheduling.

DWord	Bit	Description
0	31:16	**Mask** Access: WO _Custom_GTIReset: DEV Must be set to modify corresponding bit in Bits 15:0 (All implemented bits)
	15:9	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	8	**PS Load Bias match size** Access: R/W _Custom_GTIReset: DEV Select the granularity of xy compare for determining if the incoming 8x8 matches history buffer used for **8x8 Match PS Load Bias**. Value: 0h — Name: 8x8 **[Default]** Value: 1h — Name: 16x16
	7:6	**8x8 Match PS Load Bias** Access: R/W Format: U2 _Custom_GTIReset: DEV When scheduler is in dynamic mode, PSS will be create a load imbalance by the selected number of threads when a new 8x8 matches history buffer or any partially collected threads. This will direct matching 8x8 to the same PSD when load is not extremely skewed. Value: 0h — Name: 2_7 **[Default]** Value: 1h — Name: 4_7 Value: 2h — Name: 8_7 Value: 3h — Name: 0_7

PSS_MODE2 - Pixel Shader Scheduling Mode 2

5 Scoreboard Stall Flush Control

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name	Description
0h	Start Thread Group **[Default]**	pipe_control with **Stall at Scoreboard** set creates a new thread group instead of stalling at scoreboard. PS threads launched after pipe_control will have sendc dependency to all threads before pipe_control. This is a pipelined flush and will not drain EUs of PS threads.
1h	Scoreboard Stall	pipe_control with **Stall at Scoreboard** set stalls at PSS scoreboard until all previous threads have completed. This will drain EUs of all PS threads.

4 Thread Group Dependency Control

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name
0h	Use 9th dependency to enforce ordering between thread groups. **[Default]**
1h	Perform stall at PSSunit when thread group changes.

3 Over-subscribe PS thread allocation

Access:	R/W
Format:	Enable
_Custom_GTIReset:	DEV

Value	Name
0h	Number of enabled threads does not affect PS thread scheduling **[Default]**
1h	Number of PS threads scheduled per-PSD will not exceed number of enabled threads

2:0 PS Dispatch Time-out Values

Access:	R/W
_Custom_GTIReset:	DEV

Valid values other than 111, allow SW to program number of clocks PS dispatch function wait to combine fuse thread sequence (aka bundle).
Setting 111 disables the time-out mechanism and will wait indefinitely for an event to end the collection of pixels.

Value	Name	Description	Programming Notes
0h	32_2	PS dispatch function waits for 32 clocks for gathering more pixels in the current bundle.	
1h	64	PS dispatch function waits for 64	

PSS_MODE2 - Pixel Shader Scheduling Mode 2

				clocks for gathering more pixels in the current bundle.	
		2h	128	PS dispatch function waits for 128 clocks for gathering more pixels in the current bundle.	
		3h	256	PS dispatch function waits for 256 clocks for gathering more pixels in the current bundle.	
		4h	512	PS dispatch function waits for 512 clocks for gathering more pixels in the current bundle.	
		5h	1024	PS dispatch function waits for 1024 clocks for gathering more pixels in the current bundle.	
		6h	2048 **[Default]**	PS dispatch function waits for 2048 clocks for gathering more pixels in the current bundle.	
		7h		PSD waits indefinitely to assemble a bundle before dispatching a PS.	This value may not be programmed if non-promoted depth or stencil is enabled.

This register is used to specify the distance from the main surface base address and the stride of the auxiliary surface.Unlike the surface base address, this register value cannot be updated through flips.

DWord	Bit	Description
0	31:12	**Auxiliary Surface Distance** When using a compressed surface, this field represents the distance of the control surface in 4K pages, where a value of [31:12] = 1 represents one 4K page.
	11:10	**Reserved** Access: RO Format: MBZ
	9:0	**Auxiliary Surface Stride** **Description** This field is unused. Leave at default value.

This register programs the clear color value to be used with render decompression. The value is used only when render decompression and clear color are both enabled in the plane control register.
The register value can be updated when flipping to a new surface with new clear color value. It does not need to be updated if the new surface has the same clear color value as the previous surface.

DWord	Bit	Description
0	31:0	**Clear Color Value DW0** This field gives the 32 bit value of the clear color.
1	31:0	**Clear Color Value DW1** This field gives the upper 32 bit value of the clear color. This field is used only with 64 bits formats, ignored otherwise.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30	**Pipe Gamma Enable** This bit enables pipe gamma correction for the plane pixel data. This field is deprecated. Use 'GAMMA_MODE.Post CSC Gamma Enable' for enabling pipe gamma across all pixels from all planes. Value 0b: Disable Value 1b: Enable
	29	**Remove YUV Offset** This field controls whether the plane removes or preserves the 1/2 offset on U and V components when the source pixel format is YUV and the plane YUV to RGB CSC is disabled. This bit has no effect on RGB source pixel formats Value 0b: Remove: Remove 1/2 offset on UV components Value 1b: Preserve: Preserve 1/2 offset on UV components
	28	**YUV Range Correction Disable** Setting this bit disables the YUV range correction logic inside the plane. The range correction logic is used to expand the compressed range YUV to full range YUV. The Y channel is expanded from the 8 bit +16 to +235 range to full range. The U and V channels are expanded from the 8 bit -112 to +112 range to full range. Extended range values will be preserved after the expansion. This bit has no effect on RGB source pixel formats since they automatically bypass range correction.

PLANE_COLOR_CTL

Value	Name
0b	Enable
1b	Disable

27:24 **Reserved**

Access:	RO
Format:	MBZ

23 **Pipe CSC Enable**

This bit enables pipe color space conversion and the pipe pre color space conversion gamma for the plane pixel data. This is separate from the color conversion logic within the plane.

This field is deprecated.
Use 'CSC_MODE.Pipe CSC Enable', 'GAMMA_MODE.Pre CSC Gamma Enable' for enabling pipe color space conversion and gamma respectively across all pixels from all planes. Plane CSC must be used for plane specific color space conversion.

Value	Name
0b	Disable
1b	Enable

22 **Reserved**

21 **Plane CSC Enable**

This field enables the plane color space conversion. This field applies only to planes 1 through 3.

Value	Name
0b	Disable
1b	Enable

20 **Plane Input CSC Enable**

This field enables the plane input color space conversion. This field applies only to planes 1 through 3.

Value	Name
0b	Disable
1b	Enable

19:17 **Plane CSC Mode**

Description
This field specifies the mode of plane color space conversion operation.
This is used only for planes 4 through 7. For planes 1 through 3, CSC is programmed in PLANE_CSC_* registers.

Value	Name	Description
000b	Bypass	Pixel data bypasses the plane color space conversion
001b	YUV601 to RGB601	YUV BT.601 to RGB BT.601 conversion.

010b	YUV709 to RGB709	YUV BT.709 to RGB BT.709 conversion.
011b	YUV2020 to RGB2020	YUV BT.2020 to RGB BT.2020 conversion.
100b	RGB709 to RGB2020	RGB BT.709 to RGB BT.2020 conversion.

16 **Reserved**

Access:	RO
Format:	MBZ

15 **Plane Post CSC Gamma Multi Segment Enable**

This bit enables plane post CSC gamma multi segment processing. It is only used for HDR tone Mapping. It is only valid if Plane Gamma (bit[13]) is enabled.

Value	Name
1b	Enable
0b	Disable **[Default]**

14 **Plane Pre CSC Gamma Enable**

This bit controls plane internal pre-CSC gamma correction.

Value	Name
1b	Enable
0b	Disable

13 **Plane Gamma Disable**

This bit controls plane internal post-CSC gamma correction.

Value	Name
1b	Disable
0b	Enable

12 **Plane Gamma Mode**

This field specifies the plane gamma mode of operation. This field is ignored if plane gamma is disabled.

Value	Name	Description
0b	Direct **[Default]**	Direct mode is used for regular plane gamma programming. Lookup is based on incoming pixel individual r, g, b values. The output is a computed by lookup of two nearest points and interpolation.
1b	Multiply	[] Multiple mode is used when plane gamma is used for HDR tone mapping. Lookup is based on a pseudo luminance of the incoming pixel calculated using Lin = 0.25*Red input + 0.625*Green input + 0.125*Blue input. An adjustment factor 'F' is computed by lookup of two nearest points and interpolation. Output is computed by multiplying each color channel with the adjustment factor F.

11 **Plane Gamma Multiplier Precision**

This field specifies the plane gamma entry format in the multiplier mode. This field is ignored in the direct lookup mode. The gamma entries can be programmed in either unsigned 0.24 format or unsigned 8.16 format.

PLANE_COLOR_CTL

Value	Name
0b	U0.24 **[Default]**
1b	U8.16

10:6 **Reserved**

Access:	RO
Format:	MBZ

5:4 **Alpha Mode**

This field controls how the plane will use per pixel alpha data from frame buffer. Constant plane alpha is defined in PLANE_KEYMSK and PLANE_KEYMAX registers.

RGB 64-bit - only alpha in 0-1 range supported with 8 bit granularity.
RGB 64-bit UINT - only 8 upper bits of alpha used.
RGB 2:10:10:10 - 2 bit alpha expanded out to 8 bit to give full range of opacity.
XR_BIAS 10:10:10 - 2 bit alpha expanded out to 8 bit to give full range of opacity.

Value	Name	Description
00b	Disable	Alpha channel ignored.
10b	Enable with SW pre-multiply	Alpha channel used. Color channels should be pre-multiplied with alpha by software.
11b	Enable with HW pre-multiply	Alpha channel used. Color channels will be pre-multiplied with alpha by hardware.

Restriction
Per pixel alpha is supported only with RGB pixel formats.
FBC is not compatible with per pixel alpha.

3:0 **Reserved**

The post-offset is intended to add an offset from 0 on the Y or RGB channels and to convert UV channels from 2's complement to excess 0.5 as they exit plane color space conversion (CSC).

DWord	Bit	Description
0	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PostCSC High Offset** This value is used to give an offset to the high color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
1	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PostCSC Medium Offset** This value is used to give an offset to the medium color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
2	31:13	**Reserved** Access: RO Format: MBZ

PLANE_CSC_POSTOFF		
	12:0	**PostCSC Low Offset** This value is used to give an offset to the low color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).

The pipe scaler can be attached to a plane to scale the plane output before blending.

Restriction
Refer to 'Plane Capability and Interoperability' page for plane capabilities and restrictions.

DWord	Bit	Description
0	31	**Plane Enable** When this bit is set, the plane will generate pixels for display. When cleared to zero, plane memory fetches cease and plane output is transparent. Value: 0b — Name: Disable Value: 1b — Name: Enable
	30:28	**Pipe Slice Arbitration Slots** This field specifies the number of slots allocated to this plane in pipe slice request arbitration. This field is ignored when the 'PIPE_SLICE_ARBITRATION_CTL->Use Programmed Slots' is not set. This field is zero based; a programmed value of 0 results in 1 slot allocation.
	27:23	**Source Pixel Format** This field selects the source pixel format for the plane. Before entering the blender, each source format is converted to the pipe pixel format. The 8-bpp indexed format will always use the pipe palette. In planar YUV formats Y samples appear first in memory followed by interleaved UV samples. YUV 4:2:2 byte order is programmed separately. YUV 4:2:0 and YUV 4:4:4 byte order is not programmable. RGB color order is programmed separately for some formats. Refer to Universal Plane, Plane Pixel Formats section for color channel bit mappings. YUV 4:2:0 P010, P012 and P016 formats share the same 16 bpc memory layout but use 10, 12 and 16 bits per channel respectively. The color values are stored in the most significant bits. 64-bit formats supported only on the HDR planes. P01x output is only allowed from HDR planes.

Value	Name	Description
00000b	YUV 422 Packed 8 bpc	YUV 4:2:2 packed, 8 bpc
00010b	YUV 420 Planar 8 bpc	YUV 4:2:0 Planar, 8 bpc - NV12
00100b	RGB 2101010	RGB 2:10:10:10, 32 bit.
00110b	YUV 420 Planar 10 bpc	YUV 4:2:0 Planar, 10 bpc - P010
01000b	RGB 8888	RGB 8:8:8:8, 32 bit
01010b	YUV 420 Planar 12 bpc	YUV 4:2:0 Planar 12 bpc - P012
01100b	RGB 16161616 Float	RGB 16:16:16:16 Floating Point, 64 bit (FP16)
01110b	YUV 420 Planar 16 bpc	YUV 4:2:0 Planar, 16 bpc - P016
10000b	YUV 444 Packed 8 bpc	YUV 4:4:4 packed (MSB-X:Y:U:V), 8bpc
10100b	RGB 2101010 XR_BIAS	RGB 2:10:10:10 Extended Range Bias (MSB-X:B:G:R), 32 bit
11000b	Indexed 8 bit	Indexed 8-bit
11100b	RGB 565	RGB 5:6:5 (MSB-R:G:B), 16 bit
00001b	YUV 422 Packed 10 bpc	YUV 4:2:2 packed, 10 bpc - Y210
00011b	YUV 422 Packed 12 bpc	YUV 4:2:2 packed, 12 bpc - Y212
00101b	YUV 422 Packed 16 bpc	YUV 4:2:2 packed, 16 bpc - Y216
00111b	YUV 444 Packed 10 bpc	YUV 4:4:4 packed (MSB-X:V:Y:U), 10 bpc - Y410
01001b	YUV 444 Packed 12 bpc	YUV 4:4:4 packed (MSB-X:V:Y:U), 12 bpc - Y412
01011b	YUV 444 Packed 16 bpc	YUV 4:4:4 packed (MSB-X:V:Y:U), 16 bpc - Y416

Restriction
Plane scaling is not compatible with the Indexed 8-bit, XR_BIAS source pixel formats.

22:21 **Key Enable**

This field enables color keying. The key color, range, channel enables, and mask are programmed in PLANE_KEYVAL, PLANE_KEYMSK, and PLANE_KEYMAX.

Value	Name	Description
00b	Disable	Disable keying for this plane.
01b	Source Key Enable	This plane's pixels will be checked for a key match. The blend between this plane and the plane below will treat the key matched pixels as transparent.
10b	Destination Key Enable	This plane's pixels will be checked for a key match. The blend between this plane and the plane above will treat the pixels above as opaque only where this plane is key matched and the plane above is opaque. When plane gamma is enabled, the gamma processing may shift the pixel color values sent to blender and may cause it to not match the key color as desired. The recommendation is to use the pipe gamma when destination keying is enabled.
11b	Source Key Window	This plane's pixels will be checked for a key match. The blend between this plane and the plane below will treat the key matched pixels as

PLANE_CTL

	Enable	transparent only where the plane below is opaque.

Restriction
Plane color keying is not compatible with the Indexed 8-bit pixel format. Destination key/Source Key Window should be enabled only on one set (a pair) of planes, per pipe, at a time. Source key and Source Key Window must not be enabled on the bottom most active plane. Destination key must not be enabled on the top most active plane.

20 **RGB Color Order**

This field is used to select the color order when using RGB data formats, except RGB 32-bit XR_BIAS 10:10:10 and 16-bit BGRX 5:6:5. For other formats, this field is ignored.

Value	Name	Description
0b	BGRX	BGRX (MSB-X:R:G:B)
1b	RGBX	RGBX (MSB-X:B:G:R)

19 **Planar YUV420 component**

This field selects the planar YUV420 component for the plane when NV12/P0xx source pixel formats is used. This field must be set to '0b' for other (YUV non-planar/RGB) surface formats.

Value	Name	Description
0b	UV	Planes 1 to 5 can be configured as UV plane. Planes 6 and 7 must not be configured as a UV plane.
1b	Y	Planes 6 and 7 can be configured as Y plane. Planes 1 to 5 must not be configured as a Y plane.

18 **Reserved**

Access:	RO
Format:	MBZ

17:16 **YUV 422 Byte Order**

This field is used to select the byte order for YUV 4:2:2 8bpc data formats. For other formats, this field is ignored.

Value	Name	Description
00b	YUYV	YUYV (MSB-V:Y2:U:Y1)
01b	UYVY	UYVY (MSB-Y2:V:Y1:U)
10b	YVYU	YVYU (MSB-U:Y2:V:Y1)
11b	VYUY	VYUY (MSB-Y2:U:Y1:V)

15 **Render Decomp**

This bit enables the Display decompression of Render compressed surfaces.

Value	Name
0b	Disable
1b	Enable

PLANE_CTL

Restriction
Color Clear is supported.
Only the Left-right cache-line pair decompression is supported. The compressed surface should be Y (Legacy) or Y F Tiled. Decompression is not supported with 90/270 degree rotation.
Decompression is supported with RGB8888, RGB1010102 and FP16 formats.
Decompression is supported on all planes and pipes.

14 **Reserved**

Access:	RO
Format:	MBZ

13 **Clear Color Disable**

Description
This field disables the render decompression clear color mode. It is ignored when the Render Decomp field is disabled. The color value must be programmed in PLANE_CC_VAL before flipping to the surface that uses clear color value.

Value	Name
1b	Disable
0b	Enable **[Default]**

12:10 **Tiled Surface**

This field indicates that the surface data is in tiled memory. This bit may be updated through MMIO writes or through a command streamer initiated synchronous flip.

Value	Name
000b	Linear memory
001b	Tile X memory
100b	Tile Y (Legacy) memory

Restriction
Interlaced mode is not supported with Y Tiling. Tile Ys is not supported.

9 **Async Address Update Enable**

Access:	R/W

This bit will enable asynchronous updates of the plane surface address when written by MMIO (MMIO asynchronous flips). The surface address will change as soon as possible. This bit is not double buffered and the changes will apply immediately. When performing an asynchronous update, only the plane surface can be updated. Changes to stride, pixel, format, compression, FBC, etc. are not allowed.

Value	Name	Description
0b	Sync	Surface Address MMIO writes will update synchronous to start of vertical blank
1b	Async	Surface Address MMIO writes will update asynchronous to start of vertical blank

Restriction
No command streamer (ring) flips to this plane are allowed when this bit is enabled. Command streamer flips will set a similar bit in the flip message that it sends to display.
Asynchronous S3D flips are not allowed.
Each async surface address write must be followed by a wait for flip done indication before writing the surface address register again.

8 **Horizontal Flip**

This field controls the horizontal flipping of the plane. When horizontal flipping is enabled with rotation, the horizontal flip operation is logically performed first followed by rotation. For further information refer to "Universal Plane" section.

Value	Name
0b	Disable **[Default]**
1b	Enable

Restriction
Horizontal flip is not supported with linear surface formats.

7:6 **Stereo Surface Vblank Mask**

This field controls which vertical blank (left eye, right eye, or both) will be used for the plane surface address double-buffering during stereo 3D mode. This field is ignored when not in stereo 3D mode.

Value	Name	Description
00b	Mask None	Both the left and right eye vertical blanks will be used.
01b	Mask Left	Mask the left eye vertical blank. Only the right eye vertical blank will be used.
10b	Mask Right	Mask the right eye vertical blank. Only the left eye vertical blank will be used.

5 **Reserved**

4 **Media Decomp**

Description
This bit enables the Display decompression of Media compressed surfaces. 'Media Decomp' and 'Render Decomp' are mutually exclusive and must not enabled at the same time for a given plane.
Media decompression is supported with NV12, P0xx, YUV422, YUV444, RGB8888, RGB1010102 and FP16 formats.

PLANE_CTL

Value	Name
0b	Disable
1b	Enable

3 **Allow Double Buffer Update Disable**

Access:	R/W

This field controls whether double buffer updates are allowed to be disabled for this plane. The DOUBLE_BUFFER_CTL register can be configured to globally disable double buffer updates for resources that allow them to be disabled. This field applies only to the plane registers that supports double buffering. Scaler registers used for plane scaling purposes are not included in this.

Value	Name
0b	Not Allowed
1b	Allowed **[Default]**

2 **Reserved**

Access:	RO
Format:	MBZ

1:0 **Plane Rotation**

This field controls hardware rotation of the plane.

Value	Name
00b	No rotation
01b	90 degree rotation
10b	180 degree rotation
11b	270 degree rotation

Programming Notes
Hardware does not change the plane position when rotation is enabled. Software may need to adjust the plane position to match the physical orientation of the display.

Restriction
90/270 degree rotation requires the surface to be Y Tiled. Interlaced mode is not supported with 90/270 degree rotation. Render-Display decompression is not supported with 90/270 degree rotation.
90/270 rotation is supported with plane width (pre-rotation) up to 4096 pixels.

Description

This register programs the chroma upsampler for processing pixel streams from hybrid planar YUV 420 (NV12, P0xx) surfaces.
This dedicated chroma upsampling capability is available only in Planes 1 through 3. Planes 4 and 5 must use plane scaler (PS_CTRL) for chroma upsampling.
The following table shows phase programming for frequently used YUV420 to YUV444 chroma upsampling scenarios.

YUV 420Chroma Siting	Horz Phase	Vert Phase	Programmed Horz Initial Phase	Programmed Horz Initial Phase Sign	Programmed Vert Initial Phase	Programmed Vert Initial Phase Sign
Top Left	0	0	0	0	0	0
Top	-0.25	0	0.25	1	0	0
Left (MPEG-2)	0	-0.25	0	0	0.25	1
Center (MPEG-1)	-0.25	-0.25	0.25	1	0.25	1

Restriction :
When the Chroma upsampler is enabled, then:

1. The maximum horizontal plane size allowed is 4096 pixels
2. The minimum horizontal plane size allowed is 8 pixels

PLANE_CUS_CTL

3. The minimum vertical plane size allowed is 4 lines
4. The horizontal and vertical plane size should be even

DWord	Bit	Description
0	31	**Chroma Upsampler Enable** This field enables the plane chroma upsampler for handling hybrid planar YUV 420 (NV12, P0xx) formats. Value: 0b – Disable; 1b – Enable
	30	**Y Binding** This field defines the Y plane from where the chroma upsampler will receive the Y pixels stream when processing hybrid planar YUV 420 (NV12, P0xx) formats. Value: 0b – Plane 6; 1b – Plane 7
	29:24	**Reserved** Access: RO Format: MBZ
	23	**Reserved**
	22	**Reserved** Access: RO Format: MBZ
	21:20	**Reserved**
	19	**Horz Initial Phase Sign** This field is defines the direction of the horizontal initial phase adjustment on the UV stream during upsampling. A positive initial phase will have an effect of shifting the UV pixels to the right with respect to the Y pixels whereas a negative initial phase will have an effect of shifting left. The sign bit must be zero if the initial phase is zero. Value: 0b – Positive Initial Phase; 1b – Negative Initial Phase
	18	**Reserved** Access: RO Format: MBZ
	17:16	**Horz Initial Phase** This field defines the horizontal initial phase adjustment required on the UV stream during

upsampling. This field should be programmed based on the YUV 420 chroma siting.

Value	Name
00b	0
01b	0.25
10b	0.5
11b	Reserved

15 **Vert Initial Phase Sign**

This field is defines the direction of the vertical initial phase adjustment on the UV stream during upsampling.
A positive initial phase will have an effect of shifting the UV pixels down with respect to the Y pixels whereas a negative initial phase will have an effect of shifting up.
The sign bit must be zero if the initial phase is zero.

Value	Name
0b	Positive Initial Phase
1b	Negative Initial Phase

14 **Reserved**

Access:	RO
Format:	MBZ

13:12 **Vert Initial Phase**

This field defines the vertical initial phase adjustment required on the UV stream during upsampling. This field should be programmed based on the YUV 420 chroma siting.

Value	Name
00b	0
01b	0.25
10b	0.5
11b	Reserved

11 **Reserved**

10:9 **Power Up Delay**

This field indicates the wait (in CD clocks) between powering up the line buffer arrays.

8 **Reserved**

7:6 **Reserved**

Access:	RO
Format:	MBZ

5 **ECC Single Error**

Access:	R/WC

This field indicates that an single bit error encountered at the ECC logic. Hardware will correct the single bit errors. Hardware will set the bit; SW can clear with a write of 1.

PLANE_CUS_CTL		
	4	**ECC Double Error** Access: R/WC This field indicates that an double bit error encountered at the ECC logic. Hardware will not correct the double bit errors. Hardware will set the bit; SW can clear with a write of 1.
	3:1	**Reserved** Access: RO Format: MBZ
	0	**Power Up In Progress** Access: RO This field is set when the chroma upsampler line buffers are being powered up. Chroma upsampler cannot handle pixel traffic when this bit is set.

The post-offset is intended to add an offset from 0 on the Y or RGB channels and to convert UV channels from 2's complement to excess 0.5 as they exit plane input color space conversion (CSC).

DWord	Bit	Description
0	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PostCSC High Offset** This value is used to give an offset to the high color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
1	31:13	**Reserved** Access: RO Format: MBZ
	12:0	**PostCSC Medium Offset** This value is used to give an offset to the medium color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
2	31:13	**Reserved** Access: RO Format: MBZ

PLANE_INPUT_CSC_POSTOFF		
	12:0	**PostCSC Low Offset** This value is used to give an offset to the low color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).

When plane source is YUV, this register specifies the maximum YUV key value to be used together with the minimum YUV key value and the channel enables to determine if the plane matches the key. When plane source is RGB, this register is not used.

DWord	Bit	Description
0	31:24	**Plane Alpha Value** Specifies the plane alpha value when plane alpha is enabled in PLANE_KEYMSK register.
	23:16	**V Key Max Value** Specifies the maximum key value for the V channel.
	15:8	**Y Key Max Value** Specifies the maximum key value for the Y channel.
	7:0	**U Key Max Value** Specifies the maximum key value for the U channel.

When plane source is YUV, this register specifies the minimum YUV key value to be used together with the maximum YUV key value and the channel enables to determine if the plane matches the key. When plane source is RGB, this register specifies the RGB key value to be used together with the channel masks to determine if the plane matches the key. RGB key matches can only occur for positive pixel values in the 0 to 1 range. Extended range pixel values will not match. MSB bits are used for comparison.

Restriction : Keying is not supported in HDR mode.

DWord	Bit	Description
0	31:24	**Reserved** Access: RO Format: MBZ
	23:16	**V Min or R Key Value** Specifies the minimum key value for the V channel or the compare value for Red channel.
	15:8	**Y Min or G Key Value** Specifies the minimum key value for the Y channel or the compare value for Green channel.
	7:0	**U Min or B Key Value** Specifies the minimum key value for the U channel or the compare value for Blue channel.

PLANE_OFFSET

Name: Selective Fetch Plane Offset

ShortName: SEL_FETCH_PLANE_OFFSET_7_A

Reset: soft

This register specifies the panning for the plane surface. The start position is specified in this register as a (x, y) offset from the beginning of the surface. When performing 180 rotation, hardware will internally add the plane size to the offsets so the plane will start displaying from the bottom right corner of the image.

Restriction

Plane Size + Plane Offset should not exceed the surface <stride/width> (in pixels)
X and Y offset restrictions are specified in the following table. For formats not specified in the table, both odd and even offsets are supported.

PixelFormat	Rotate	Start X Position	Start Y Position
YUV 420 Planar - NV12	All	Even	Even
YUV 420 Planar - P01x	All	Even	Even
YUV 422	All	Even	Even

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:16	**Start Y Position** The Start Y Position or the Y Offset is the vertical offset in lines of the beginning of the active display plane relative to the display surface.
	15:13	**Reserved** Access: RO Format: MBZ
	12:0	**Start X Position** The Start X Position or the X Offset is the horizontal offset in pixels of the beginning of the active display plane relative to the display surface.

PLANE_POS

Name:	Selective Fetch Plane Position
ShortName:	SEL_FETCH_PLANE_POS_7_A
Reset:	soft

This register specifies the screen position of the plane. The origin of the plane position is always the upper left corner of the display pipe source image area. When plane scaling is not enabled on this plane, this is the position of the plane when blended with other planes on this pipe. When plane scaling is enabled on this plane, the scaler window position is the position of the plane when blended with other planes on this pipe. When performing rotation, the plane image is rotated by hardware, but the position is not, so it must be adjusted if it is desired to maintain the same apparent position on a physically rotated display.

Restriction

When plane scaling is not enabled on this plane, the plane must be completely contained within the pipe source area. Pipe source size >= plane position + plane size. When plane scaling is enabled on this plane, the X and Y positions must be programmed to 0.

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:16	**Y Position** This specifies the vertical position of the plane upper left corner in lines.
	15:13	**Reserved** Access: RO Format: MBZ
	12:0	**X Position** This specifies the horizontal position of the plane upper left corner in pixels.

PLANE_POST_CSC_GAMC_INDEX and PLANE_POST_CSC_GAMC_DATA registers are used to program the values	

PLANE_POST_CSC_GAMC_DATA

that determine the characteristics of the gamma correction for the plane pixel data after plane Color Space Conversion.
The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.
For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as 16 bits per color in an unsigned 0.16 format with 0 integer and16 fractional. The 33rd, 34th and 35th entries are stored as19 bits per color in an unsigned 3.16 format with 3 integer and16 fractional bits.
For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 33rd and 34th gamma entries to create the result value.
For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.
For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.
Plane Post-CSC Gamma correction gets enabled or disabled based on the 'Plane Gamma Disable' bit in the 'PLANE_COLOR_CTL' register. The same set of values is used for gamma correction of the red, blue and green channels.

Programming Notes

To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.

Restriction

The gamma curve must be flat or increasing, never decreasing in Direct mode. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

PLANE_POST_CSC_GAMC_INDEX and PLANE_POST_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the plane pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion, if needed.
The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.
For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as 24 bits per color in an unsigned 0.24 format with 0 integer and 24 fractional. The 33rd, 34th and 35th entries are stored as27 bits per color in an unsigned 3.24 format with 3 integer and 24 fractional bits.
For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 33rd and 34th gamma entries to create the result value.
For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.
For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.
Pre-CSC Gamma correction gets enabled or disabled based on the "Pipe CSC Enable" bit in the plane control register. The same set of values is used for gamma correction of the red, blue and green channels.
See Pipe Gamma for an example gamma curve diagram.
To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the

PLANE_POST_CSC_GAMC_DATA_ENH

34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.
For HDR tone mapping usages, only the first 33 entries get used. The entries are used either in an unsigned 0.24 format or unsigned 8.16 format based on PLANE_COLOR_CTL->Plane Gamma Multiplier Precision programming.

Restriction
The gamma curve must be flat or increasing, never decreasing when used in the direct lookup mode. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

PLANE_POST_CSC_GAMC_INDEX

31:11 Reserved

Access:	RO
Format:	MBZ

10 Index Auto Increment

This field enables the index auto increment.

Value	Name	Description
0b	No Increment	Do not automatically increment the index value.
1b	Auto Increment **[Default]**	Increment the index value with each read or write to the data register.

9:6 Reserved

Access:	RO
Format:	MBZ

5:0 Index Value

Access:	Write/Read Status

This index controls access to the array of plane pre color space conversion gamma values.
This value can be automatically incremented by a read or a write to the data register if the index auto increment bit is set.
When automatically incrementing, the index will roll over to 0 after writing or reading the entire allowed range.
While in auto increment mode, after performing reads or writes to only part of the range, the auto increment bit must be cleared before resetting the index value.

PLANE_PRE_CSC_GAMC_INDEX and PLANE_PRE_CSC_GAMC_DATA registers are used to program the values that	

PLANE_PRE_CSC_GAMC_DATA

determine the characteristics of the gamma correction for the plane pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion, if needed.
The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.
For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as16 bits per color in an unsigned 0.16 format with 0 integer and 16 fractional. The 33rd, 34th and 35th entries are stored as 19 bits per color in an unsigned 3.16 format with 3 integer and 16 fractional bits.
For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 33rd and 34th gamma entries to create the result value.
For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.
For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.
Plane Pre-CSC Gamma correction gets enabled or disabled based on the 'Plane Pre CSC Gamma Enable'bit in the 'PLANE_COLOR_CTL'register. The same set of values is used for gamma correction of the red, blue and green channels.

Programming Notes

To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.

Restriction

The gamma curve must be flat or increasing, never decreasing. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

PLANE_PRE_CSC_GAMC_INDEX and PLANE_PRE_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the plane pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion, if needed.
The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.
For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 129 gamma entries to create the result value. The first 128 entries are stored as 24 bits per color in an unsigned 0.24 format with 0 integer and 24 fractional. The 129th, 130th and 131th entries are stored as 27 bits per color in an unsigned 3.24 format with 3 integer and 24 fractional bits.
For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 129th and 130th gamma entries to create the result value.
For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 130th and 131st gamma entries to create the result value.
For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.
Pre-CSC Gamma correction gets enabled or disabled based on the "Plane Pre CSC Gamma Enable" bit in the plane color control register. The same set of values is used for gamma correction of the red, blue and green channels.
See Pipe Gamma for an example gamma curve diagram.

Programming Notes

PLANE_PRE_CSC_GAMC_DATA_ENH

To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 128 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 129th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 130th gamma entry.

Restriction
The gamma curve must be flat or increasing, never decreasing. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

DWord	Bit	Description

PLANE_PRE_CSC_GAMC_INDEX

31:11 Reserved

Access:	RO
Format:	MBZ

10 Index Auto Increment

This field enables the index auto increment.

Value	Name	Description
0b	No Increment	Do not automatically increment the index value.
1b	Auto Increment **[Default]**	Increment the index value with each read or write to the data register.

9:6 Reserved

Access:	RO
Format:	MBZ

5:0 Index Value

Access:	Write/Read Status

This index controls access to the array of plane pre color space conversion gamma values.
This value can be automatically incremented by a read or a write to the data register if the index auto increment bit is set.
When automatically incrementing, the index will roll over to 0 after writing or reading the entire allowed range.
While in auto increment mode, after performing reads or writes to only part of the range, the auto increment bit must be cleared before resetting the index value.

PLANE_SIZE

Name: Selective Fetch Plane Size

ShortName: SEL_FETCH_PLANE_SIZE_7_A

Reset: soft

This register specifies the plane source size, the size of the image fetched from the frame buffer. When plane scaling is not enabled on this plane, this is the size of the plane when blended with other planes on this pipe. When plane scaling is enabled on this plane, the scaler window size is the size of the plane when blended with other planes on this pipe.

Restriction

When plane scaling is not enabled on this plane, the plane must be completely contained within the pipe source area. Pipe source size >= plane position + plane size.

For OLED compensation plane size restrictions, refer to PIPE_MISC->OLED Compensation (bit[12]).

Height and Width restrictions are specified in the following table. For formats not specified in the table, both odd and even sizes are supported.

PixelFormat	Rotate	Width	Height
YUV 420 Planar - NV12	All	Even	Even
YUV 420 Planar - P01x	All	Even	Even
YUV 422	All	Even	Even
RGB565	90, 270	Even	Even

If Plane Scaling or using the Chroma Up-Sampler (CUS) for this plane, please refer to **PS_CTRL** or **PLANE_CUS_CTL** respectively, for further size restrictions.

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:16	**Height** This specifies the height of the plane in lines. The value in the register is the height minus one. **Restriction** The height must be at least one line when non-interlaced, two lines when interlaced. The height is limited to maximum of 4320 lines. Refer to size restrictions within PS_CTRL when plane scaling is enabled.
	15:13	**Reserved** Access: RO Format: MBZ
	12:0	**Width** This specifies the width of the plane in pixels. The value in the register is the width minus one. **Restriction** The width must be even (programmed value odd) when YUV 4:2:2 or YUV 4:2:0 source pixel format is used. For YUV4:2:0 (NV12), the UV plane must be greater than or equal to 8 and the Y plane must be greater than or equal to 16.

<table>
<tr><th colspan="3">PLANE_SIZE</th></tr>
<tr><td></td><td></td><td>The width must be greater than or equal to 4 for 32bpp, YUV212 and YUV216 formats, greater than or equal to 8 for 16bpp formats, and greater than or equal to 16 for 8bpp formats.
The width must be greater than or equal to 2 for 64bpp formats.
The width must be greater than or equal to 8 for P010, P012 and P016 formats.
The width should be less than or equal to the stride in pixels.

For planar YUV 420 formats, refer to chroma upsampler size restrictions in PLANE_CUS_CTL register.
<table><tr><th>Tiling format</th><th>Bytes per pixel</th><th>Max Width supported in pixels</th></tr><tr><td>Linear, X Tiling</td><td>1,2,4,8</td><td>5120</td></tr><tr><td>Y Tiling</td><td>1,2,4,8</td><td>5120</td></tr></table></td></tr>

DWord	Bit	Description
0	31:18	**Reserved** Access: RO Format: MBZ
	17:12	**Reserved** Access: RO Format: MBZ
	11	**Reserved** Access: RO Format: MBZ
	10:0	**Stride** This field specifies the stride for the plane. The field is used to determine the line to line increment for the plane. For Linear memory, this field specifies the stride in chunks of 64 bytes (1 cache line). If the programmed value is 100, the actual stride = 100 * 64 = 6400 bytes. For X-Tiled & Y-Tiled memory, this field specifies the stride in number of tiles. For Tile X, if the programmed value is 10, the actual stride = 10 * 512 (X tile width) = 5120 bytes. For Tile Y, if the programmed value is 10, the actual stride = 10 * 128 (Y tile width) = 1280 bytes. **Tile Format** / **Width in bytes** Tile X: 512 Tile Y (legacy): 128 Restriction : For YUV planar (NV12 or P0xx) plane pixel formats, the stride calculated in bytes should be equal for the Y and UV surfaces. The stride in bytes must not exceed the of the size of 8K pixels.

PLANE_STRIDE

Tile Format	Pixel Format	Maximum Stride in tiles
Linear	64 bpp pixel format	1024
	32 bpp pixel format	512
	16 bpp pixel format	256
	8 bpp pixel format	128
X Tiling	64 bpp pixel format	128

Writes to this register arm primary registers for this pipe. A write to this register is considered a flip and can cause a flip done interrupt if the interrupt registers are configured for that. The values in this register may be updated through MMIO writes or through command streamer initiated flips. Synchronous updates (synchronous command streamer flips or synchronous MMIO writes) will update the plane surface values at the start of the next vertical blank. Asynchronous updates (asynchronous command streamer flips or asynchronous MMIO writes) will update the plane surface values at the next TLB request or at the start of the next vertical blank. Stereo 3D synchronous updates (stereo 3D command streamer flips or synchronous MMIO writes while stereo 3D is enabled) will update at the start of either the left or right eye vertical blank, selectable by the plane control register stereo surface vblank mask.

Double buffering control does not apply to PLANE_SURF updates that occur when the plane is disabled. An interrupt event is generated immediately when the PLANE_SURF is written. If the interrupt is unmasked, the interrupt is logged in the IIR.

Asynchronous flip completion time depends greatly on how much data has been prefetched for power savings, and can take up to 1 full frame to complete. For faster flip completion, disable FBC and render compression and allocate a small amount of data buffer for the plane.

DWord	Bit	Description
0	31:12	**Surface Base Address** Format: GraphicsAddress[31:12]
	11	**Reserved**
	10:7	**Reserved** Access: RO Format: MBZ
	6:4	**Reserved**
	3	**Ring Flip Source** This bit indicates if the source of the last ring flip was CS or BCS. This will determine where the flip done response is sent. Value: 0b — Name: CS

Programming Notes

There are eight regular watermarks and a transition watermark per plane/cursor. For YUV planar source formats, only the Y surface watermark value should be programmed. Watermark programming instructions are documented separately.

Restriction

For minimum watermark requirements refer to Display Watermark Programming section.

DWord	Bit	Description
0	31	**Enable** This field enables this watermark. All the watermarks at this level for all enabled planes must be enabled before the level will be used. Value: 1b — Name: Enable Value: 0b — Name: Disable
	30	**Reserved**
	29:27	**Reserved** Access: RO Format: MBZ
	26:19	**Reserved** Access: RO Format: MBZ
	18:14	**Lines** Default Value: 01h This field contains the watermark value in lines. Hardware ignores the lines for the transition watermark.
	13:12	**Reserved** Access: RO Format: MBZ

PLANE_WM		
	11	**Reserved** Access: RO Format: MBZ
	10:0	**Blocks** Default Value: 007h This field contains the watermark value in blocks of 8 cachelines.

POISON DATA HANDLING ENABLE

POISON_DATA_HANDLING_ENABLE - POISON DATA HANDLING ENABLE

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100120h

This register holds the enable for Poison data detection and corking behavior for Gunit.

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**ERROR CONTROL** Access: R/W _Custom_GTIReset: BUS Enable Poison Data detection and Corking behavior for Gunit Value / Name 0b **[Default]** 1b

POISON DATA STATUS

POISON_DATA_STATUS - POISON DATA STATUS

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	100124h

This register holds the sticky bit which when set will indicate a Poisoned data has been received on IOSF-Primary.

DWord	Bit	Description
0	31:9	**Reserved** Access: RO Format: MBZ
	8	**DEDICATED PATH ERROR STATUS** Access: R/W One Clear _Custom_GTIReset: DEV Set to 1 when Poisoned data has been received from IOSF-Primary on Dedicated memory path. This sticky bit must survive Platform/SoC level reset. 0b **[Default]** 1b
	7:1	**Reserved** Access: RO Format: MBZ
	0	**ERROR STATUS** Access: R/W One Clear _Custom_GTIReset: DEV Set to 1 when Poisoned data has been received from IOSF-Primary. This sticky bit must survive Platform/SoC level reset. 0b **[Default]** 1b

7:4 Static Power Down
This field powers down individual lanes for the DDI that is accessed through this instance of the register. To save power, unused lanes should be powered down after link training is complete.

Value	Name	Description
0000b	Power up all lanes	Enable x4
1100b	Power down lanes 3,2	Enable x2
1110b	Power down lanes 3,2,1	Enable x1
0011b	Power down lanes 1,0	Enable x2 Reversed
0111b	Power down lanes 2,1,0	Enable x1 Reversed
1011b	Power down lanes 3,1,0	Enable DSI x1
1010b	Power down lanes 3,1	Enable DSI x2
1000b	Power down lane 3	Enable DSI x3

3 o_edp4k2k_mode_ovrd_en
eDP power optimized setting

Value	Name
1b	Enable **[Default]**
0b	Disable

2 o_edp4k2k_mode_ovrd_val
eDP power optimized setting. Valid only when corresponding enable bit (o_edp4k2k_mode_ovrd_en) is set and specific voltage swing programming is used.

Value	Name
1b	Optimized
0b	Non-optimized

1 o_rterm100en_h_ovrd_en

Display Driver writes to these bits to tell FIA hardware which Main Links of the Display Port are enabled on Type-C Connector 0. FIA hardware uses this information for PHY to Controller signal mapping.
For example, in DP Pin Assignment C, the register DFLEXDPSP1.DPX4TXLATC0 tells Display Driver that all the 4 TX Lanes in PHY can be used. However, Display Driver may choose to use only x1, i.e. for ML0. Then Display Driver will program 0001b to this register. For x2 and x4, Display Driver will program 0011b and 1111b, respectively.
Note that display driver should not use its internal lane reversal feature with Type-C ALT connections.
Display Driver is expected to write to this register when the DDI Interface between DP Controller and FIA is in the Safe Mode, e.g. pllen=pwrreq=lane_enable=0. Display Driver writes to this register and then only it brings up the DP Controller, i.e. to bring the DDI interface out from Safe Mode.
A mode set is required to switch the number of DP lanes.
This register is applicable in both Type-C connector's Alternate mode and also DP connector mode.

DWord	Bit	Description

Similar to register DFLEXDPMLE1.DPMLETC0 but this register is for Type-C Connector 2.

Value	Name	Description
0001b	ML0	
0011b	ML[1:0]	
1100b	ML[3:2]	This setting should not be used with Type-C ALT connections.
1111b	ML[3:0]	

7:4 **Displayport Main Link Enable for Type-C Connector 1**

Similar to register DFLEXDPMLE1.DPMLETC0 but this register is for Type-C Connector 1.

PORT_TX_DFLEXDPMLE1 - PORT_TX_DFLEXDPMLE1

Value	Name	Description
0001b	ML0	
0011b	ML[1:0]	
1100b	ML[3:2]	This setting should not be used with Type-C ALT connections.
1111b	ML[3:0]	

3:0 **Displayport Main Link Enable for Type-C Connector 0**

Display Port Main Link Enable for Type-C Connector 0 (DPMLETC0):
4 bits correspond to 4 Main Link in DP Controller. Bit [0] is ML0,bit [1] is ML1 and so on.
The Type-C Connector number is logical number. Its not physical lane numbers. Refer to the SOC block diagram for the mapping of Type-C Connector number to the actual physical lane number of the PHY.
Display Driver writes to these bits to tell FIA hardware which Main Links of the Display Port are enabled on Type-C Connector 0. FIA hardware use this information for PHY to Controller signal mapping.
For example, in DP Pin Assignment C, the register DFLEXDPSP1.DPX4TXLATC0 tells Display Driver that all the 4 TX Lane in PHY can be used. However, Display Driver may choose to use only x1, i.e. for ML0. Then Display Driver will program 0001b to this register. For x2 and x4, Display Driver will program 0011b and 1111b, respectively.

Value	Name	Description
0001b	ML0	
0011b	ML[1:0]	
1100b	ML[3:2]	This setting should not be used with Type-C ALT connections.
1111b	ML[3:0]

4 **Modular FIA (MF)**

Description
This bit is set by IOM FW and read by Display Driver. It tells the Display Driver if Modular FIA is used in the SOC. If Modular FIA is used in the SOC, then Display Driver will access the additional instances of FIA based on pre-assigned offset in GTTMADDR space. Each Modular FIA instance houses only 2 Type-C Ports. If Modular FIA is not used in the SOC, then a single monolithic FIA is used to house all the Type-C Ports which has only one IOSF Sideband Port ID.
Modular FIA is always used. IOM FW will program the MF bit in all FIA instances.

Value	Name
0b	Monolithic FIA
1b	Modular FIA

3:0 **Display Port x4 TX Lane Assignment for Type-C Connector 0**

DPX4TXLATC0

SOC FW writes to these bits to tell display software the Lane Assignment, which it generates

PORT_TX_DFLEXDPSP - PORT_TX_DFLEXDPSP

based on the DP Pin Assignment and the Connector Orientation. Display software uses this value to determine the number of lanes that can be enabled, and along with other registers, to determine the DP mode programming. See the Typec PHY DDI Buffer page for DP mode programming.
The 4 bits correspond to 4 TX, i.e. TX[3:0] Lane in PHY.
Lower 2 bits correspond to the 2 lower TX lane on the PHY of Type-C connector.
Upper 2 bits correspond to the upper 2 TX lane on the PHY of Type-C connector.
For example, in DP Pin Assignment D (Multi function) and Flip case, the x2 TX lane are on the upper TypeC Lane, hence the value written into this register will be 1100b.
Another example, in DP Pin Assignment B (Multi function) Active Gen2 cable and Flip case, the x1 TX lane is on the 1st TX of upper TypeC Lane, hence the value written into this register will be 0100b.

Value	Name
0001b	PHY TX[0]
0010b	PHY TX[1]
0011b	PHY TX[1:0]
0100b	PHY TX[2]
0101b	PHY TX[2] TX[0]
1000b	PHY TX[3]
1100b	PHY TX[3:2]
1111b	PHY TX[3:0]

This register controls Tx Equalization within the Combo-PHY's AFE.

Restriction : Do not change the default Cursor Coefficient values within this register since that will change the equalization being applied by the PHY

DWord	Bit	Description
0	31	**MIPI EQ Select** This bit controls the Tx Equalization level of the PHY This bit is equivalent to the **TxEqLevelHS** PPI pin, but it is only used by the PHY when both the MIPI EQ Override Enable and MIPI EQ Enable bits are set. **Value** / **Name** 0b – Low Levlel Equalization (3.5 dB) 1b – High Level Equalization (7 dB)
	30	**MIPI EQ Enable** This bit represents the Tx Equalization active state (i.e. enable) This bit is equivalent to the **TxEqActiveHS** PPI pin, but it is only used by the PHY when the MIPI EQ Override Enable is set **Value** / **Name** 0b – Tx Equalization Disabled 1b – Tx Equalization Enabled
	29:24	**Post Cursor Coeff 0** Default Value: bh Default post cursor coeff Restriction : Do not change the default value
	23	**MIPI EQ Override Enable** This bit controls whether the PPI Tx Equalization pins are driving the equalization logic, or the override bits from this register **Value** / **Name** 0b – PPI inputs drive EQ logic 1b – This register drives EQ logic
	22:6	**Reserved** Access: RO Format: MBZ
	5:0	**Cursor Coeff 0** Default Value: 34h Default cursor coeff Restriction : Do not change the default value

This register contains the LRCA address for the POSH pipe to which POCS does context save/restore. LRCA address programmed in this register is only effective when "POSH Enable" field is set in CTX_SR_CTL register. This register is not functional and must not be programmed for VideoCS, VideoEnhacementCS, BlitterCS.

Power Clock State Register

PWR_CLK_STATE - Power Clock State Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	020C8h-020CBh
Name:	PWR_CLK_STATE
ShortName:	PWR_CLK_STATE_RCSUNIT_BE_COMPUTE

Address:	1A0C8h-1A0CBh
Name:	PWR_CLK_STATE
ShortName:	PWR_CLK_STATE_CCSUNIT_BE_COMPUTE0

This register contains the mode selection for configuring render engine to attain desired performance and power requirements for a given context. This register is render context save/restored. This register must be initialized correctly when the context is submitted for the first time. This register is context save/restored as part of Exec-List context image in both Exec-List and Ring-Buffer mode of scheduling. This register contents are valid only when "Enable" bit [31] of the register is set.

Programming Notes

This register is only functional for RenderCS. This register must not be exercised in VideoCS, BlitterCS and VideoEnhancementCS.

This register must not be programmed directly through CPU MMIO cycle.
Exec-List Scheduling Mode: Every context can have its own required render engine configuration by programming this register appropriately in the logical render context image in memory (LRCA) before submitting the context to the execlist submit port. This register must not be programmed using MI_LOAD_REGISTER_IMM command in ring buffer or in batch buffer.

Name:	Pipe Pre CSC Gamma Data
ShortName:	PRE_CSC_GAMC_DATA_D
Reset:	soft

Description

PRE_CSC_GAMC_INDEX and PRE_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the pipe pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion Gamma if desired.
The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.
For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as16 bits per color in an unsigned 0.16 format with 0 integer and 16 fractional. The 33rd, 34th and 35th entries are stored as 19 bits per color in an unsigned 3.16 format with 3 integer and 16 fractional bits.
For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 33rd and 34th gamma entries to create the result value.
For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.
For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.

PRE_CSC_GAMC_DATA

Pre-CSC Gamma correction gets enabled or disabled based on the "Pipe CSC Enable" bit in the PLANE_COLOR_CTL register. The same set of values is used for gamma correction of the red, blue and green channels.
See Pipe Gamma for an example gamma curve diagram.

Programming Notes

To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.
Recommended sRGB degamma programming:

Index	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Values	0	9F	153	253	3AC	565	783	A0C	D06	1076	145F	18C8	1DB3	2325	2922	2FAE	36CB	3E7E	46CA	4FB1	5938	6361	6E2E	79A4	85C4	9292	A00F	AE3F	BD25	CCC2	DD19	EE2D	10000

Restriction

The gamma curve must be flat or increasing, never decreasing. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

DWord	Bit	Description
0	31:11	**Reserved** Access: RO Format: MBZ
	10	**Index Auto Increment** This field enables the index auto increment. Value 0b: No Increment — Do not automatically increment the index value. Value 1b: Auto Increment **[Default]** — Increment the index value with each read or write to the data register.
	9:8	**Reserved** Access: RO Format: MBZ
	7:6	**Reserved** Access: RO Format: MBZ

PRE_CSC_GAMC_INDEX

	5:0	**Index Value** Access: Write/Read Status This index controls access to the array of pipe pre color space conversion gamma values. This value can be automatically incremented by a read or a write to the data register if the index auto increment bit is set. When automatically incrementing, the index will roll over to 0 after writing or reading the entire allowed range. While in auto increment mode, after performing reads or writes to only part of the range, the auto increment bit must be cleared before resetting the index value. **Value** / **Name** [0,34]

This register captures the context switch status on a context switch and gets saved as part of the context image. This register doesn't get restored on a context restore. For all functional purposes this register must be red or sampled form the context image in memory and must not be sampled live from reading to this register.
This register is for HW internal purpose and must not be programmed by SW.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:13	**CS Engine ID** This field holds the EngineID of the command streamer on which the context got recently executed.
	12:7	**CS Instance ID** This field holds the InstanceID of the command streamer on which the context got recently executed.
	6:4	**Reserved** Access: RO Format: MBZ
	3:2	**Context Switch Status** This field indicates the preemption boundary and must be inferred based on the value in "Pipeline Selection" field.

PREEMPTION_STATUS - Preemption Status

Value	Name	Description	Exists If
0h		**Command Boundary:** Context switched out on a clean command boundary with no work pending from the commands executed.	
1h		**Thread Group Boundary:** Context got switched out in middle of workload (Media/GPGPU Walker) execution in Media or GPGPU mode of operation. Workload got preempted on a thread group boundary. HW will resume from the point it got preempted on resubmission of the context.	//PipelineSelection != 0
1h		**Object Boundary:** Context got switch out in middle of workload (3DPRIMTIVE) execution in 3D mode of operation. Workload got preempted on an object level boundary. HW will resume from the point it got preempted on resubmission of the context.	//PipelineSelection == 0
2h		**Mid Thread Boundary:**Context got switched out in middle of workload (Media/GPGPU Walker) execution in Media or GPGPU mode of operation. Workload got preempted in middle of thread execution (mid-thread boundary). HW will resume from the point it got preempted on resubmission of the context.	//PipelineSelection != 0
3h	Reserved		

1:0 **Pipeline Selection**

Access:	RO
Format:	U2

This bit indicates the pipeline select mode (PIPELINE_SELECT) at the time of context switch.

Value	Name	Description
0h		3D mode of operation.
1h		Media mode of operation.
2h		GPGPU mode of operation.
3h	Reserved

These are the coefficient values for scaler.	

PS_COEF_DATA

The scaler coefficient Index indicates the coefficients array location to be accessed through this register.
The contents of the coefficient array is uninitialized until Software loads the array (i.e. the array is not resettable). Use of the coefficient array or reading from the coefficient array before Software has initialized it will result in non-deterministic behavior or read back data.

Restriction
This register must be written only as a full 32 bit dword. Byte or word writes are not supported.

DWord	Bit	Description
0	31:16	**Coefficient2** Format: SCALER_COEFFICIENT_FORMAT Specifies the value for the second coefficient stored in this dword.
	15:0	**Coefficient1** Format: SCALER_COEFFICIENT_FORMAT Specifies the value for the first coefficient stored in this dword.

Description

The pipe scalers are used to scale the output of a display pipe or of a display plane. All pipes have two scalers each.
The scaler preserves 8 bits of alpha and 10 bits of each color channel for plane scaling and 12 bits of each color channel for pipe scaling.
The scalers can be assigned to any plane (except cursor) output or the output of the display pipe (after blending and color correction, before dithering and color clamping).
Downscale usages have scale factor restrictions:

- All scaler modes support a downscale factor of less than 3.0 in each direction.
- Pipe YUV 420 encoding for port output supports Y downscale factor of less than 1.5 in each direction.

Beyond the restrictions of the Scaler output fitting within the destination window size, there are effectively no upscale restrictions except for the following:
(Scale Factor) * 2^{15} >= 1.0
Where the Scale Factor = (Source Size) / (Destination Size)

The scalers support horizontal source sizes up to 5120 and vertical source sizes up to 4096.

Programming Notes

The scalers must not be enabled when the horizontal source sizes are greater than 5120 and the vertical sizes greater than 4320.

Driver is responsible for making sure all the plane, pipe, and scaler size registers are programmed appropriately and gets applied atomically to the same frame since hardware does not ensure an atomic update of plane, scaler, and pipe source size registers.

When scaling a pipe, the scaler window size and position must fit within the pipe active size. If there is a seam present (i.e. PIPE_SEAM_EXCESS is non-zero), then the pipe's horizontal active size that the scaler sees is the horizontal active size defined within the TRANS_HTOTAL register plus the amount(s) specified within the PIPE_SEAM_EXCESS.
Pipe Horizontal Active = Horizontal Active + Left Excess Amount + Right Excess Amount

Refer to 'YUV 420 Support' page for scaler restrictions with YUV 420 pipe output.

Restriction

Down scaling (scaler input size is larger than scaler window size) can reduce the maximum supported pixel rate for a pipe as well as increase the watermark and data buffer requirements. Refer to the Display Resolution Support page and Watermark Calculations page for detailed calculations.

Scaler 1 and 2 must not be both scaling the same plane output.
When scaling a pipe, the scaler window size and position must fit within the pipe active size.
When scaling a plane, the plane position must be programmed to 0 and the scaler window size and position must fit within the pipe source size.
When scaling is enabled, the scaler input width should be a minimum of 8 pixels and the height should be minimum of 8 scanlines.

PS_CTRL

When the plane scaling is used with YUV 420 planar formats, the height should be a minimum of 16 scanlines. When using down scaling (scaler input size is larger than scaler output size) the maximum supported pixel rate will be reduced by the down scale amount.

DWord	Bit	Description
0	31	**Enable Scaler** This field enables the scaler. Value: 0b = Disable; 1b = Enable
	30	**Reserved**
	29	**Scaler Mode** The Planar mode must be used when non-HDR capable planes are using YUV 420 planar surface formats. In this configuration, the scaler takes care of both the chroma upsampling and scaling. The Planar mode must not be used for the HDR capable planes. They have dedicated chroma upsamplers and only use the scaler in Normal mode for scaling. Value: 0b = Normal; 1b = Planar
	28	**Adaptive Filtering** This field enables the scaler adaptive vertical and horizontal filtering. When adaptive filtering is enabled, the adaptive threshold values must be programmed in the PS_ADAPTIVE_CTRL register and the Filter Set Select bits should be programmed. Value: 0h = Disable; 1h = Enable
	27:25	**Scaler Binding** This field selects the where the scaling operation is done. When scaling a pipe, the pipe source size specifies the input size to the scaler. When scaling a plane, the PLANE_SIZE specifies the input size to the scaler. Any border around a scaled plane window will become transparent at the plane blender. Value: 000b = Pipe Scaler; 001b = Plane 1 Scaler; 010b = Plane 2 Scaler; 011b = Plane 3 Scaler; 100b = Plane 4 Scaler; 101b = Plane 5 Scaler; 110b = Plane 6 Scaler; 111b = Plane 7 Scaler

PS_CTRL

Programming Notes
When plane scaling is enabled on planes 1 through 3, make sure that the *PLANE_CUS_CTL.Plane Scaling Enabled* (bit 30) is programmed correctly.

Restriction
The scaler input size should be at least 8 scanlines. Plane/Pipe scaling is not compatible with interlaced fetch mode. Plane up and down scaling is not compatible with keying. Keying can be enabled with 1:1 plane scaling. Plane scaling is not compatible with the Indexed 8-bit, XR_BIAS, or any pixel values less than 0 or greater than 1.

24:23 **FILTER SELECT**

This field selects filter coefficients. The medium coefficients will provide an unfiltered image when the scale factor is 1:1.
In the programmed mode, the filter coefficients must be programmed using the PS_COEF_INDEX and PS_COEF_DATA registers and the Filter Set Select bits should be programmed.

Value	Name
00b	Medium
01b	Programmed
10b	Edge Enhance
11b	Bilinear

22 **ADAPTIVE FILTER SELECT**

This field selects the filter coefficients used for adaptive filtering. The field is ignored when adaptive filtering is not enabled.

Value	Name
0b	Medium
1b	Edge Enhance

21 **Pipe Scaler Location**

This field selects where the pipe scaling is done in the pipe.

Value	Name	Description
0b	After Output CSC	This is a non-linear tap point
1b	After CSC	This is a linear tap point

Restriction
The HDR Mode cannot be enabled for the Pipe(PIPE_MISC[23] = 0), when the Scaler is bound to the linear tap point

PS_HPHASE

Name: PS Horizontal Phase 1

ShortName: PS_HPHASE_2_D

Reset: soft

Description
This register programs the scaler horizontal filtering initial phase. The initial phase within the -0.5 to 1.5 range is supported. Refer to PS_VPHASE for programming details.
The programming of this register is ignored by the pipe scaler when the pipe is in the Full Blend YUV420 mode. The scaler hardware is responsible for calculating and applying the appropriate horizontal phase when encoding the YUV420 format.

DWord	Bit	Description
0	31:30	**Y Initial HPhase Int** This field specifies the integer part of the Y horizontal filtering initial phase when the scaler is operating on YUV420 hybrid planar formats. This field is ignored for non-YUV420 pixel formats.
	29:17	**Y Initial HPhase Frac** This field specifies the most significant 13 bits of the fractional part of the Y horizontal filtering initial phase when the scaler is operating onYUV420 hybrid planar formats. This field should be programmed with the fractional portion of the initial phase multiplied by 2^13. This field is ignored for non-YUV420 pixel formats.
	16	**Y Initial HPhase Trip** This field specifies whether the initial trip, that may occur while applying the initial phase, is used in Y horizontal filtering. This field is ignored for non-YUV420 pixel formats. Value: 1b — Name: Enable Value: 0b — Name: Disable
	15:14	**UV or RGB Initial HPhase Int** This field specifies the integer part of the UV or RGB horizontal filtering initial phase.

Reset: soft

Description

This register programs the scaler vertical filtering initial phase. The programming of this register is ignored in the pipe scaler PF/ID fetch mode, and the pipe scaler is responsible for applying the appropriate vertical phase to the proper frame when interlacing.
The initial phase within the -0.5 to 1.5 range is supported.
Programming +ve intital phase:

- Initial Phase Trip = 1b
- Initial Phase Int = Desired Initial Phase Int
- Initial Phase Frac = Desired Initial Phase Frac

Programming -ve initial phase:

- Initial Phase Trip = 0b
- Initial Phase Int = 00b
- Initial Phase Frac = 1 - Desired Initial Phase Frac

For example, -0.25 initial phase should be programmed as

- Initial Phase Trip = 0b
- Initial Phase Int = 00b
- Initial Phase Frac = 1 - 0.25 = 0.75

The following table shows phase programming for frequently used YUV420 to YUV444 chroma upsampling scenarios (chroma being filtered to the center of the pixel).

YUV 420 Chroma Siting	H Phase	V Phase	Programmed H Initial Phase	Programmed H Initial Trip	Programmed V Initial Phase	Programmed V Initial Trip
Top Left	0.25	0.25	0.25	1	0.25	1
Bottom Right (MPEG-1)	-0.25	-0.25	0.75	0	0.75	0
Bottom Center (MPEG-2)	0	-0.25	0	0	0.75	0

The programming of this register is ignored by a pipe scaler when the pipe is in the Full Blend YUV420 mode. The scaler hardware is responsible for calculating and applying the appropriate vertical phase when encoding the YUV420 format.

DWord	Bit	Description
0	31:30	**Y Initial VPhase Int** This field specifies the integer part of the Y vertical filtering initial phase when the scaler is operating on YUV420 hybrid planarformats. This field is ignored for non-YUV420 pixel formats.

PS_VPHASE

	29:17	**Y Initial VPhase Frac** This field specifies the most significant 13 bits of the fractional part of the Y vertical filtering initial phase when the scaler is operating on YUV420 hybrid planar formats. This field should be programmed with the fractional portion of the initial phase multiplied by 2^13. This field is ignored for non-YUV420 pixel formats.
	16	**Y Initial VPhase Trip** This field specifies the whether the initial trip, that may occur while applying the initial phase, is used in Y vertical filtering. This field is ignored for non-YUV420 pixel formats. **Value** / **Name** 1b – Used 0b – Not Used
	15:14	**UV or RGB Initial VPhase Int** This field specifies the integer part of the UV or RGB vertical filtering initial phase.
	13:1	**UV or RGB Initial VPhase Frac** This field specifies the most significant 13 bits of the fractional part of the UV or RGB vertical filtering initial phase. This field should be programmed with the fractional portion of the initial phase multiplied by 2^13.
	0	**UV or RGB Initial VPhase Trip** This field specifies whether the initial trip, that may occur while applying the initial phase, is used in UV or RGB vertical filtering. **Value** / **Name** 1b – Used 0b – Not Used

Reset: soft

This register specifies the size in pixels of the scaled output window. A programmed value of (100, 100) will result in scaled output window of size 100x100 pixels.
Writes to this register arm PS registers on this pipe. After arming, any write to other PS registers will disarm all PS registers. Subsequent write to this register will arm them again.

Restriction

When scaling a pipe, the scaled output must fit inside the pipe active area, so Pipe active size >= PS window position + PS window size. When scaling a plane, the scaled output must fit inside the pipe source area, so Pipe source size >= PS window position + PS window size.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:16	**XSIZE** This field specifies the horizontal size in pixels of the scaled output window. Restriction : When the pipe scalar is configured to output YUV 420, the X size must be even.
	15:13	**Reserved** Access: RO Format: MBZ
	12:0	**YSIZE** This field specifies the vertical size in scan lines of the scaled output window. Restriction : Bit 0 must be zero for interlaced modes. **Restriction** When the pipe scalar is configured to output YUV 420, the Y size must be even.

PS Depth Count

PS_DEPTH_COUNT - PS Depth Count	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02350h

This register stores the value of the count of samples that have passed the depth test. This register is part of the context save and restore. Note that the value of this register can be obtained in a pipeline-synchronous fashion without a pipeline flush by using the 3DCONTROL command. See 3D Overview in the 3D volume.

DWord	Bit	Description
0..1	63:32	**Depth Count UDW** This register reflects the total number of samples that have passed the depth test (i.e., will be visible). All samples are counted when Statistics Enable is set in the Windower State. See the Windower chapter of the 3D volume for details. Samples that pass the depth test but fail the stencil test will not be counted.
	31:0	**Depth Count LDW** This register reflects the total number of samples that have passed the depth test (i.e., will be visible). All samples are counted when Statistics Enable is set in the Windower State. See the Windower chapter of the 3D volume for details. Samples that pass the depth test but fail the stencil test will not be counted.

PS Depth Count for Slice0

PS_DEPTH_COUNT_SLICE0 - PS Depth Count for Slice0	
Register Space:	MMIO: 0/2/0

Name:	PS Invocation Count for Slice2
ShortName:	PS_INVOCATION_COUNT_SLICE2

This register stores the value of the count of pixels that get shaded in Slice2. This register is part of the render context save and restore. This register should not be programmed by SW.

DWord	Bit	Description
0..1	63:32	**PS Invocation Count UDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice2. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.
	31:0	**PS Invocation Count LDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice2. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.

PS Invocation Count for Slice3

PS_INVOCATION_COUNT_SLICE3 - PS Invocation Count for Slice3	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02458h
Name:	PS Invocation Count for Slice3
ShortName:	PS_INVOCATION_COUNT_SLICE3

This register stores the value of the count of pixels that get shaded in Slice3. This register is part of the render context save and restore. This register should not be programmed by SW.

DWord	Bit	Description
0..1	63:32	**PS Invocation Count UDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice3. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.
	31:0	**PS Invocation Count LDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice3. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.

PS Invocation Count for Slice4

PS_INVOCATION_COUNT_SLICE4 - PS Invocation Count for Slice4	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02468h
Name:	PS Invocation Count for Slice4
ShortName:	PS_INVOCATION_COUNT_SLICE4

This register stores the value of the count of pixels that get shaded in Slice4. This register is part of the render context save and restore. This register should not be programmed by SW.

DWord	Bit	Description
0..1	63:32	**PS Invocation Count UDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice4. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.
	31:0	**PS Invocation Count LDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice4. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.

PS Invocation Count for Slice5

PS_INVOCATION_COUNT_SLICE5 - PS Invocation Count for Slice5	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	024A0h
Name:	PS Invocation Count for Slice5
ShortName:	PS_INVOCATION_COUNT_SLICE5

This register stores the value of the count of pixels that get shaded in Slice5. This register is part of the render context save and restore. This register should not be programmed by SW.

DWord	Bit	Description
0..1	63:32	**PS Invocation Count UDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice4. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.
	31:0	**PS Invocation Count LDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice4. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.

PS Invocation Count for Slice6

PS_INVOCATION_COUNT_SLICE6 - PS Invocation Count for Slice6	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	025D0h
Name:	PS Invocation Count for Slice6
ShortName:	PS_INVOCATION_COUNT_SLICE6

This register stores the value of the count of pixels that get shaded in Slice6. This register is part of the render context save and restore. This register should not be programmed by SW.

DWord	Bit	Description
0..1	63:32	**PS Invocation Count UDW** Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower in Slice4. ShortName:	PSR_MASK_C
Reset:	soft
Address:	63860h-63863h
Name:	Transcoder PSR Event Mask
ShortName:	PSR_MASK_D
Reset:	soft

Some of the masking is controlled here and some in the PIPE_MISC register.

Restriction
Only bit 30 (Idle Frame Override) can be changed while PSR or PSR2 is enabled. The other fields must not be changed while PSR or PSR2 is enabled.

DWord	Bit	Description
0	31:30	**Idle Frame Override** This field overrides the entry/exit conditions to force PSR or PSR2 Deep Sleep entry/exit.

Value	Name	Description
00b,01b	No Override	Do not override. Use regular entry and exit conditions.
10b	Force Idle Frame	Force Idle Frames to force PSR entry or PSR2 Deep Sleep
11b	Force Non-Idle Frame	Force Non-Idle Frames to force PSR exit or exit from PSR2 Deep Sleep

DWord	Bit	Description
0	29	**Reserved**

Access:	RO
Format:	MBZ

PSR_MASK

28 Mask Max Sleep

This field controls the mask for the max sleep time event.

Value	Name
0b	Not Masked
1b	Masked

27 Mask LPSP

This field controls the mask for the low power single pipe event. This field is ignored by transcoder A/B/C.

Value	Name
0b	Not masked
1b	Masked

26 Mask Memup

This field controls the mask for the memory up event.

Value	Name	Description
0b	Not Masked	
1b	Masked **[Default]**	Masked - will not be considered in PSR idleness tracking (default)

25 Mask Hotplug

This field controls the mask for the hotplug event. Not used in PSR2 Deep Sleep entry/exit.

Value	Name
0b	Not Masked
1b	Masked

24 Mask FBC Modify

This field controls the mask for the FBC front buffer modify event.

Value	Name
0b	Not Masked
1b	Masked

23:16 Reserved

Access:	RO
Format:	MBZ

15 Exit on Pixel Underrun

This field controls the mask for exit on pixel underrun.

Value	Name
0b	Not Masked
1b	Masked **[Default]**

14:1 Reserved

Access:	RO
Format:	MBZ

PSR_MASK		
	0	**Global Mask** This field is no longer used. The global mask function moved to 0x42084 bit 0. **Value** / **Name** 0b – Not Masked 1b – Masked

PSR2_CTL

PSR2_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	60900h-60903h
Name:	PSR2 Control
ShortName:	PSR2_CTL_A
Reset:	soft

Programming Notes

To use FBC modification tracking for idleness calculations when FBC is disabled, program FBC_CTL CPU Fence Enable, FBC_CONTROL_SA_REGISTER, FBC_CPU_FENCE_OFFSET_REGISTER, FBC_RT_BASE_ADDR_REGISTER, and BLITTER_TRACKING_REGISTER as they are programmed when FBC is enabled.

Restriction

- PSR needs to be enabled only when at least one plane is enabled.
- PSR2 is limited to 30bpp 10:10:10, even when using the manual tracking mode.
- Only the PSR2 Enable can be changed while PSR2 is enabled. The other fields must not be changed while PSR2 is enabled. Selective Update Tracking Enable must be set before or along with PSR2 enable
- PSR2 is supported for pipe active sizes up to 5120 pixels wide and 3200 lines tall.

DWord	Bit	Description
0	31	**PSR2 Enable** This bit enables Revision 2.0 of the Panel Self Refresh function. Updates will take place at the start of the next vertical blank. The port will send PSR2 VDMs while enabled.

Value	Name
0b	Disable
1b	Enable

Programming Notes

Clear the register field SRD_CTL [TP2 TP3 Select] before enabling this bit.
Do not set the register field SRD_CTL [TP2 TP3 Select] while PSR2 is enabled.

Restriction

- PSR2 must not be enabled when the PSR Setup time from DPCD 00071h is greater than the time for vertical blank minus one line.
- PSR2 must not be enabled together with Interlacing, Black Frame Insertion (BFI), Compression Mode, or S3D.
- Disable FBC when PSR2 is enabled.

PSR2_CTL

30 Selective Update Tracking Enable

Access:	Double Buffered
_Custom_Display_DoubleBufferUpdatePoint:	Start of vertical blank OR transcoder disabled

This field enables the Selective Update Tracking Mechanism. Updates to this field will take effect at the next vertical blank.

Value	Name
0b	Disable
1b	Enable

Restriction
This field must be enabled anytime before PSR2 Enable. It must be disabled anytime after PSR2 disable.

29 Context restore to PSR2 Deep Sleep State

This field restores PSR2 into Deep Sleep State

Value	Name
0b	Disable
1b	Enable

Restriction
This bit should only be used with context save restore.

28 Block count number

This field selects block count number before SU turn on sequence

Value	Name
0b	2 blocks
1b	3 blocks

27 Aux Frame Sync Enable

This field selects whether the frame sync will be sent on Aux channel.

Value	Name
1b	Enable
0b	Disable

Restriction
Must be programmed to match the panel's requirements.

26 Y-coordinate valid

This field selects whether PSR2 Y-coordinate valid behaves as per eDP 1.4a

Value	Name
0b	Include Y-coordinate valid eDP1.4a
1b	Do not include Y-coordinate valid eDP 1.4

PSR2_CTL

25 — Y-coordinate enable

This field selects whether PSR2 VSC packet will include vertical line count.

Value	Name
0b	Do not include count
1b	Include count

24:20 — Max SU Disable Time

Default Value:	00000b Disabled

This field is the maximum time to spend in PSR2 Selective update without fetching a full frame. It is programmed in increments of sixty frames. Programming all 1s gives 31x60 frames time.

Restriction
Programming all 0s disable the forced fetch of a full frame in SU.

19 — Reserved

18 — PSR2 RAM power state

Access:	RO

17:16 — Reserved

15:13 — IO buffer Wake

This field selects the number of lines before the Selective Update Region to wake the IO Buffers.

Value	Name
000b	5 lines
001b	6 lines
010b	7 lines **[Default]**
011b	8 lines
100b	9 lines
101b	10 lines
110b	11 lines
111b	12 lines

Restriction
To program line 9 to 12, block count number bit [28] must be set.

12:10 — Fast Wake

This field selects the number of lines before the Selective Update Region to send the Fast Wake.

Value	Name
000b	5 lines
001b	6 lines
010b	7 lines **[Default]**
011b	8 lines

PSR2_CTL

		100b: 9 lines 101b: 10 lines 110b: 11 lines 111b: 12 lines **Restriction** To program line 9 to 12, block count number bit [28] must be set.
	9:8	**TP2 Time** This field selects the TP2 time when training the link on exit from PSR2 DeepSleep (waking). **Value** / **Name** 00b: 500us 01b: 100us 10b: 2.5ms 11b: 50us
	7:4	**Frames Before SU Entry** Default Value: 0001b 1 Frames Before SU Entry This field is the number of frames it takes to enter into Selective Update when PSR2 is enabled. Note: HW takes a minimum of 2frames, so'0' and '1' are not valid entries for this field.
	3:0	**Idle Frames** This field is the number of idle frames required before entering PSR2 Deep Sleep. Write to this field doesn't cause a PSR2 exit and frame update. **Value** / **Name** 0000b: Deep Sleep Disabled 0001b: 1 idle frame **[Default]**

PSR2_MAN_TRK_CTL

PSR2_MAN_TRK_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	60910h-60913h
Name:	PSR2 Manual Tracking Control
ShortName:	PSR2_MAN_TRK_CTL_A
Reset:	soft

Programming Notes

The frame is divided into blocks of four scan lines each. The blocks are addressed starting from 1 for the first block of the frame and ending with ROUNDUP[(TRANS_VTOTAL Vertical Active + 1) / 4]for the last block of the frame.
Software must provide the starting and ending block address of the selective update region.
The SU Region Start Address is programmed to the first block of the selective update region.
The SU Region End Address is programmed to the final block of the selective update region + 1.
There can be only one selective update region in a frame.
To disable selective update, set the selective update region to the full frame by programming SU Region Start Address to the startof the frame and SU Region End Address to the end of the frame.

DWord	Bit	Description
0	31	**PSR2 Manual Tracking Enable** This bit enables the manual tracking mode for PSR2 Selective Update. Restriction : This field cannot be modified while PSR2_CTL bit [30] is "1'. SW must make sure PSR2_CTL bit [30] is disabled before this bit is disabled. Restriction : This bit should not be modified without a modeset. Value: 0b = Disable; 1b = Enable
	30:21	**SU Region Start Address** This field indicates the starting block address of the selective update region.
	20:11	**SU Region End Address** This field indicates the ending block address of the selective update region.
	10:4	**Reserved** Access: RO Format: MBZ

PSR2_MAN_TRK_CTL

	3	**SF Single full frame** Access: R/W Set This bit will select for a single a full frame fetch, using the regular plane and cursor registers (not SEL_FETCH registers), and update when Selective Fetch is enabled. It is cleared on vblank. Do not set this bit to 1 if Selective Fetch is not enabled.
	2	**SF Continuous full frame** This bit will select for full frame fetches, using the regular plane and cursor registers (not SEL_FETCH registers), and updates continuously when Selective Fetch is enabled, until disabled by software. Do not set this bit to 1 if Selective Fetch is not enabled.
	1	**SF Partial Frame Enable** This field enables the planes to use the SEL_FETCH registers for selective fetch on selective update frames.

Value	Name
0b	Disable
1b	Enable

	0	**Allow Double Buffer Update Disable** This field controls whether double buffer updates are allowed to be disabled for this register.

Value	Name
0b	Not Allowed
1b	Allowed

PSR2_STATUS

	24:20	**Max Sleep Time Counter** Access: RO This field provides the live status of the sleep time counter.
	19:16	**PSR2 Deep Sleep Entry Count** Access: RO The value in this register represents the number of times PSR2 Deep Sleep has been entered. The count will increment with each entry. After reaching the maximum count value the counter will rollover and continue from 0.
	15:12	**Reserved** Access: RO Format: MBZ
	11:10	**Reserved** Access: RO Format: MBZ
	9	**PSR2 idle frame indication** Access: RO This bit gets set when DP link goes to sleep state and gets reset on PSR2 exit.
	8	**Sending TP2** Access: RO

Description
This field indicates if TP2 is currently being sent.
Recommendation is to not use this status bit.

Value	Name	Description
0b	Not Sending	Not sending TP2
1b	Sending	Sending TP2

	7	**Reserved**
	6	**Reserved**
	5	**PSR2 deep Sleep Entry Completion** Access: R/WC This is a sticky bit which is set on PSR2 deep sleep entry completion. Clear this bit by writing a 1b to it.

Value	Name
0b	Not complete
1b	Complete

PSR2_STATUS

	4	**PSR2 SU Entry Completion** Access: R/WC This is a sticky bit which is set on PSR2 SU entry completion. Clear this bit by writing a 1b to it. **Value** / **Name** 0b: Not complete 1b: Complete
	3:0	**Idle Frame Counter** Access: RO This field provides the live status of the idle frame counter.

PSR2_SU_ECC_STAT

PSR2_SU_ECC_STAT

Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32
Address:	60A64h-60A67h
Name:	PSR2 Selective Update ECC Status
ShortName:	PSR2_SU_ECC_STAT_A
Reset:	soft

Each of these fields is a sticky bit that gives the ECC error status for any PSR2 memory bank.

A '1' in a bit indicates that ECC detected an error. A write of '1' to a bit will clear the bit. Single errors are corrected by ECC. Double errors are not correctable.

DWord	Bit	Description
0	31:17	**Reserved** Access: RO Format: MBZ
	16	**Double Error Any Bank** Description: Errors in banks 8-13 are missed and not reported.
	15:1	**Reserved** Access: RO Format: MBZ
	0	**Single Error Any Bank** Description: Errors in banks 8-13 are missed and not reported.

PSR2_SU_STATUS

PSR2_SU_STATUS	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	96
Address:	60914h-6091Fh
Name:	PSR2 Selective Update Status
ShortName:	PSR2_SU_STATUS_A
Reset:	soft

A frame is divided into selective update blocks of four scan lines each. This register provides the count of the number of selective update blocks per frame, for the last eight frames

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:20	**Number of SU blocks in frame N - 2** This field indicates the number of selective update blocks in frame N - 1.
	19:10	**Number of SU blocks in frame N - 1** This field indicates the number of selective update blocks in frame N - 1.
	9:0	**Number of SU blocks in frame N** This field indicates the number of selective update blocks in frame N.
1	31:30	**Reserved** Access: RO Format: MBZ
	29:20	**Number of SU blocks in frame N - 5** This field indicates the number of selective update blocks in frame N - 1.
	19:10	**Number of SU blocks in frame N - 4** This field indicates the number of selective update blocks in frame N - 1.
	9:0	**Number of SU blocks in frame N - 3** This field indicates the number of selective update blocks in frame N.
2	31:20	**Reserved** Access: RO Format: MBZ
	19:10	**Number of SU blocks in frame N - 7** This field indicates the number of selective update blocks in frame N - 1.
	9:0	**Number of SU blocks in frame N - 6** This field indicates the number of selective update blocks in frame N.

PTBR Number Of Pages Recorded

PTBR_NUM_PAGES_RECORDED_REGISTER - PTBR Number Of Pages Recorded

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	18594h
Name:	Register Template Address
ShortName:	PTBR_NUM_PAGES_RECORDED_REGISTER

This is a running count of number of pages allocated by the OVR unit for the visibility data. This includes pages that could have been allocated but were not allocated because the OVR unit early terminated the pages with out of memory marker. This register is engine context save/restored.

DWord	Bit	Description
0	31:17	**Reserved** Access: RO Format: MBZ
	16:0	**PTBR_NUM_PAGES_RECORDED** Default Value: 0h Access: R/W Format: U17 _Custom_GTIReset: DEV This is a running count of number of pages allocated by the OVR unit for the visibility data. This includes pages that could have been allocated but were not allocated because the OVR unit early terminated the pages with out of memory marker. **Programming Notes** SW must not write to this register.

PTBR Page Pool Size Register

PTBR_PAGE_POOL_SIZE_REGISTER - PTBR Page Pool Size Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	18590h
Name:	Register Template Address
ShortName:	PTBR_PAGE_POOL_SIZE_REGISTER

Indicates the size of the PTBR Page Pool Size allocated by SW. The page pool size is with respect to the PTBR_PAGE_POOL_BASE_ADDRESS programmed through 3DSTATE_PTBR_PAGE_POOL_BASE_ADDRESS command. SW can do multiple writes to this register with the increased page pool size as it allocates more pages to the PTBR page pool.
Coming out of reset or on executing PTBR_PAGE_POOL_RESTART by 3DSTATE_PTRB_PAGE_POOL_BASE_ADDRESS command, HW initializes PTBR_PAGE_POOL_SIZE to 0x0. HW on detecting a write to this register compares its current PTBR_PAGE_POOL_SIZE with that of the value programmed in this register to add more pages to the Free-List and updates itself with the latest value.
This is an non-privileged register and engine context save/restored by HW.

Programming Notes

- SW must not write a value to this register less than the existing value. SW must use the Restart field of the 3DSTATE_PTBR_PAGE_POOL_ADDRESS command to decrease the size of the pool.
- SW must always program PTBR_PAGE_POOL_SIZE_REGISTER through MI_LOAD_REGISTER_IMM command or any other MI command to load register in the command sequence.
- SW must ensure following state are set in HW prior to programming this register: 3DSTATE_PTBR_PAGE_POOL_BASE_ADDRESS 3DSTATE_PTBR_FEE_LIST_BASE_ADDRESS

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**PTBR_PAGE_POOL_SIZE** Default Value: 0h Access: R/W Format: U16-1 _Custom_GTIReset: DEV Indicates the PTBR page pool size (4KB granularity). A value of '0x0' indicates a single page and a value of 99h indicates 154 pages are available in the page pool for use by HW. Valid Range [0..65534].

PTE SW Fault Repair High

PTESWC_H - PTE SW Fault Repair High		
Register Space:	MMIO: 0/2/0

PWR_WELL_CTL

PWR_WELL_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	45400h-45403h
Name:	Power Well Control 1
ShortName:	PWR_WELL_CTL1
Reset:	soft
CrashLogSaved:	true
CrashLogPriority:	2
CrashLogVisibility:	public
ExternalLongName:	DE Power Well Control 1
ExternalDescription:	Display engine power well control
Address:	45404h-45407h
Name:	Power Well Control 2
ShortName:	PWR_WELL_CTL2
Reset:	soft

This register is used for display power control. There are multiple instances of this register format to allow software components to have parallel control of the display power.
PWR_WELL_CTL1 is generally used for BIOS to control power.
PWR_WELL_CTL2 is generally used for driver to control power.
The power enable requests from all sources are logically ORd together to enable the power, so the power will only disable after all sources have requested the power to disable.
When a power well is disabled (powered down), access to any registers in the power well will complete, but write data will be dropped and read data will be all zeroes.
The display connections diagram indicates which functional blocks are contained in each power well. The display MMIO register specification has a field for each register to indicate which power well it is in.

Restriction
The power request field must not be changed for a resource while a power enable/disable for that resource is currently in progress, as indicated by power well state for that resource.
Power wells must be enabled and disabled following the display initialization and mode set sequences.

PWRCTXSAVE Message Register for Boot Controller Unit

MSG_PWRCTXSAVE_MBC - PWRCTXSAVE Message Register for Boot Controller Unit

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0850Ch

Message registers have bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16].
To **set** bit0, for example, the data would be 0x0001_0001.
To **clear** bit0, for example, the data would be 0x0001_0000.
Note that mask bit is the data bit offset + 16.
Message registers are protected from non-GT writes via the Message Channel.

DWord	Bit	Description
0	31:10	**Reserved** Access: RO Format: MBZ
	9	**Power Context Save Request** Access: R/W _Custom_GTIReset: BUS Power Context Save Request 1'b0: Power context save is not being requested (default). 1'b1: Power context save is being requested. Unit needs to self-clear this bit upon sampling.
	8:0	**QWord Credits for Power Context Save Request** Access: R/W _Custom_GTIReset: BUS QWord Credits for Power Context Save Request. Minimum Credits = 1: Unit may send 1 QWord pair (enough for first LRI at least). Maximum Credits = 511: Unit may send 511 QWord pairs. A QWord pair is defined as a 32-bit register address and the corresponding 32-bitsof register data. Note that the LRI header and END commands are 64-bits each(32-bit command followed by 32-bit NOOP) and consume one QWord credit. Only valid with PWRCTXSAVE_REQ (Bit9).

RC6 Context Base

RC6CTXBASE - RC6 Context Base

ShortName:	HCP_SFC_LOCK_REQUEST_VCS4
Description:	For VDBox4
Address:	1F2910h
ShortName:	HCP_SFC_LOCK_REQUEST_VCS6
Description:	For VDBox6

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**HCP_SFC_Forced_Lock** Format: U1 This bit can only be set by driver and it has to be clear by driver as well. Driver should set this bit before issuing the software (watchdog timer) reset. It tells HCP that a software reset is going to happen. HCP then issues a forced lock to SFC. If SFC is currently locked to HCP, SFC should not unlock itself from HCP. If SFC is NOT currently locked to HCP, SFC should not accept the lock request from HCP. Driver needs to clear this bit after the software reset sequence is complete.

Register_HCPSFCLOCKStatus

HCP_SFC_LOCK_STATUS - Register_HCPSFCLOCKStatus

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1C2914h
ShortName:	HCP_SFC_LOCK_STATUS_VCS0
Description:	For VDbox0
Address:	1D2914h
ShortName:	HCP_SFC_LOCK_STATUS_VCS2
Description:	For VDBox2
Address:	1E2914h
ShortName:	HCP_SFC_LOCK_STATUS_VCS4
Description:	For VDBox4
Address:	1F2914h
ShortName:	HCP_SFC_LOCK_STATUS_VCS6
Description:	For VDBox6

DWord	Bit	Description
0	31:2	**Reserved** Access: RO Format: MBZ
	1	**HCP_SFC_Forced_Act** Format: U1 This bit can only be set by hardware and it has to be clear by hardware as well. This bit is going to be polled by driver. This bit indicates that HCP has received HCP_SFC_Forced_Lock from driver and it has sent that signal to SFC. Once this bit is set, it indicates SFC status (lock or unlock) will not be changed anymore. Driver will be safe to start the reset process after this bit is set. Hardware has to de-assert this bit after driver de-assert HCP_SFC_Forced_Lock as well.
	0	**HCP_SFC_Usage** Format: U1 This bit can only be set by hardware and it has to be clear by hardware as well. This bit indicates SFC is currently locked to HCP. This bit should be set after SFC accepts the lock request from HCP. This bit should be clear once SFC finishes the workload and unlocked from HCP. In case a reset happens on HCP, this bit must be reset once a new workload is received

Render and Media Context Restore Needed

RENDER_MEDIA_NEED_RESTORE - Render and Media Context Restore Needed		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	080F0h	
DWord	**Bit**	**Description**
0	31:2	**Reserved** Access: RO
	1	**Render Context Restore is needed** Access: RO _Custom_GTIReset: BUS Render Context Restore Needed Flag to support Render Powergating Feature This flag will let PM know if Media context need to be restored on C6 exit 1'b0: Do not proceed if Wait for VCR1 is set (default). 1'b1: Proceed to unblocking FIFO.
	0	**Media Context Restore is needed** Access: RO _Custom_GTIReset: BUS Render Context Restore Needed Flag to support Render Powergating Feature This flag will let PM know if Media context need to be restored on C6 exit 1'b0: Do not proceed if Wait for VCR1 is set (default). 1'b1: Proceed to unblocking FIFO.

Render Control Unit Mode Register

RCU_MODE - Render Control Unit Mode Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	14800h

Mode register for Render Control Unit (RCU).

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask Must be set to modify corresponding bit in Bits 15:0. (All implemented bits)
	15:5	**Reserved** Format: PBC
	4:3	**Reserved** Format: PBC
	2	**Disable Dual Context Limiting to Dual Queue** This bit enables two contexts of different address space to run in parallel. By default, HW enables RenderCS and ComputeCS to run contexts concurrently only when the executing contexts are from the same address space otherwise the context execution gets serialized. Two contexts are said to be from the same address space when they have the identical Virtual Function Number and the Page Directory Pointer-0. This both controls disabling of the default HW behavior. **Value** / **Name** / **Description** 0 / Force Run Alone when different context **[Default]** / HW allows concurrent execution only when both contexts are from the same address space. 1 / Enable Dual Context / Concurrent execution of context on RenderCS and ComputeCS is allowed with no address space comparison.
	1	**Reserved** Format: PBC
	0	**Compute Engine Enable** **Description** This bit indicates if Compute Engine (a.k.a Dual Context or Multi Context) is enabled or not. This bit must be treated as global control for enabling and disabling of compute engine. Hardware allocates required resources for the compute engine based on this bit. • Mid Thread Preemption for GPGPU workloads is not supported when compute engine is enabled. Hardware implicitly demotes the GPGPU preemption granularity to Thread Group or lower irrespective of the preemtion granularity programmed through GPGPU_PREEMPTION_CONTROL

mode bits.

- HW reserves 4KB of URB space per bank for Compute Engine out of the total storage available in L3. SW must consider that 4KB of storage per bank will be reduced from what is programmed for the URB space in L3 for Render Engine executed workloads. Example: When URB space programmed is 64KB (per bank) for Render Engine, the actual URB space available for operation is only 60KB (per bank). Similarly, when URB space programmed is 128KB (per bank) for render engine, the actual URB space available for operation is only 124KB (per bank). More detailed description available in "L3 Cache" section of the PRM.

In Dual Context mode of operation Compute Engine and Render Engine address space separation is based on the memory access address bit [47]. Each of the engine's addressable space is limited to 128 TB ([46:0]).

Value	Name	Description
0	**[Default]**	Compute engine is disabled.
1		Compute engine is enabled.

Programming Notes
This bit must be programmed when render engine is idle with no contexts getting executed.

Render Control Unit Power Clock State Register

RCU_PWR_CLK_STATE - Render Control Unit Power Clock State Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	148C8h

This register provides a mechanism to override the PWR_CLK_STATE requested by the RenderCS or ComputeCS. Both ComputeCS and RenderCS make their R_PWR_CLK_STATE request to Render Control Unit (RCU), RCU computes the required PWR_CLK_STATE and interfaces with power management to get the desired state.

DWord	Bit	Description
0	31	**Power Clock State Enable** Format: U1 When enabled (set) RCU will force the PWR_CLK_STATE programmed in the RCU_PWR_CLK_STATE to Power Management instead of the PWR_CLK_STATE received from the RenderCS or ComputeCS. RCU will enforce the updated value of RCU_PWR_CLK_STATE on an engines PWR_CLK_STATE request when the requesting engine is the only active engine in the GPU, i.e RCU will ensure the other engines are not active and are not impacted on changing the PWR_CLK_STATE. (Example: Updated value in RCU_PWR_CLK_STATE will be used to override the RenderCS PWR_CLK_STATE request when ComputeCS is idle or Vice-Versa).
	30:0	**Render Power Clock State** Format: U31

Value	Name	Description
0h	Power Clock State Disabled	No specific power state set, bits[30:0] are ignored.
1h	Power Clock State Enabled	Power state is set and bit[30:0] are valid and have the desired state. RCU will use the powe state to overide the values recevied from RenderCS or ComputeCS.

Reported BitRateControl Convergence Status

MFX_VP8_BRC_CONVERGENCE_STATUS - Reported BitRateControl Convergence Status

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	1C928h
ShortName:	MFX_VP8_BRC_CONVERGENCE_STATUS_VD2

This register stores BitRateControl Convergence Status.

DWord	Bit	Description
0	31	**Reserved**
	30:28	**Reserved**
	27	**Reserved**
	26:24	**Reserved**
	23	**Reserved**
	22:20	**Reserved**
	19	**Reserved**
	18:16	**Reserved**
	15:12	**Reserved** Access: RO Format: MBZ
	11:8	**Total Num of Pass** Format: U4 This bit indicates the number of Multipass including current frame. Note that Initial Pass is not counted.
	7:2	**Reserved** Access: RO Format: MBZ
	1	**Overflow OR Underflow Flag** Format: U1 This bit indicates the current frame has BRC overflow OR underflow.
	0	**MB Max. Conformance Flag** Format: U1 This contains flag that indicate Inter MB or Intra MB Max. Conformance is not met. This is legacy support and this feature is not validated.

Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 01

MFX_VP8_BRC_CUMULATIVE_D_LOOP_FILTER01 - Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 01

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	1C920h

This register stores per segment Bit Rate Control DeltaLoopFilter.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30:24	**Segment1 CumulativeDeltaLoopFilter** Format: S6 This contains Segment1 CumulativeDeltaLoopFilter in Bit Rate Control. It accumulates all Segment1 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	23:22	**Reserved** Access: RO Format: MBZ
	21:16	**Segment1 LoopFilter** Format: U6 This contains Segment1 LoopFilter used in current frame. This register is valid after a BRC pass is done.
	15	**Reserved** Access: RO Format: MBZ
	14:8	**Segment0 CumulativeDeltaLoopFilter** Format: S6 This contains Segment0 CumulativeDeltaLoopFilter in Bit Rate Control. It accumulates all Segment0 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects CumulativeDeltaLoopFilter. If Segmentation is enabled, this field reflects Segment0 CumulativeDeltaLoopFilter.
	7:6	**Reserved** Access: RO Format: MBZ

MFX_VP8_BRC_CUMULATIVE_D_LOOP_FILTER01 - Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 01		
	5:0	**Segment0 LoopFilter** Format: U6 This contains Segment0 LoopFilter used in current frame. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects LoopFilter. If Segmentation is enabled, this field reflects Segment0 LoopFilter.

Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 23

MFX_VP8_BRC_CUMULATIVE_D_LOOP_FILTER23 - Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 23

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	1C924h

This register stores per segment Bit Rate Control DeltaLoopFilter.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30:24	**Segment3 CumulativeDeltaLoopFilter** Format: S6 This contains Segment3 CumulativeDeltaLoopFilter in Bit Rate Control. It accumulates all Segment3 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	23:22	**Reserved** Access: RO Format: MBZ
	21:16	**Segment3 LoopFilter** Format: U6 This contains Segment3 LoopFilter used in current frame. This register is valid after a BRC pass is done.
	15	**Reserved** Access: RO Format: MBZ
	14:8	**Segment2 CumulativeDeltaLoopFilter** Format: S6 This contains Segment2 CumulativeDeltaLoopFilter in Bit Rate Control. It accumulates all Segment2 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	7:6	**Reserved** Access: RO Format: MBZ

MFX_VP8_BRC_CUMULATIVE_D_LOOP_FILTER23 - Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 23		
	5:0	**Segment2 LoopFilter** Format: U6 This contains Segment2 LoopFilter used in current frame. This register is valid after a BRC pass is done.

Reported BitRateControl CumulativeDeltaQindex and Qindex 01

MFX_VP8_BRC_CUMULATIVE_DQ_INDEX01 - Reported BitRateControl CumulativeDeltaQindex and Qindex 01

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	12918h
ShortName:	MFX_VP8_BRC_CUMULATIVE_DQ_INDEX01_VB0
Address:	1C918h
ShortName:	MFX_VP8_BRC_CUMULATIVE_DQ_INDEX01_VB1

This register stores per segment Bit Rate Control CumulativeDeltaQindex.

DWord	Bit	Description
0	31:24	**Segment1 CumulativeDeltaQindex** Format: S7 This contains Segment1 CumulativeDeltaQindex in Bit Rate Control. It accumulates all Segment1 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	23	**Reserved** Access: RO Format: MBZ
	22:16	**Segment1 Qindex** Format: U7 This contains Segment1 Qindex used in current frame. This register is valid after a BRC pass is done.
	15:8	**Segment0 CumulativeDeltaQindex** Format: S7 This contains Segment0 CumulativeDeltaQindex in Bit Rate Control. It accumulates all Segment0 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects CumulativeDeltaQindex. If Segmentation is enabled, this field reflects Segment0 CumulativeDeltaQindex.
	7	**Reserved** Access: RO Format: MBZ
	6:0	**Segment0 Qindex** Format: U7 This contains Segment0 Qindex used in current frame. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects Qindex. If Segmentation is enabled, this field reflects Segment0 Qindex.

Reported BitRateControl CumulativeDeltaQindex and Qindex 23

MFX_VP8_BRC_CUMULATIVE_DQ_INDEX23 - Reported BitRateControl CumulativeDeltaQindex and Qindex 23

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	1291Ch
ShortName:	MFX_VP8_BRC_CUMULATIVE_DQ_INDEX23_VB0
Address:	1C91Ch
ShortName:	MFX_VP8_BRC_CUMULATIVE_DQ_INDEX23_VB1

This register stores per segment Bit Rate Control CumulativeDeltaQindex and Qindex.

DWord	Bit	Description
0	31:24	**Segment3 CumulativeDeltaQindex** Format: S7 This contains Segment3 CumulativeDeltaQindex in Bit Rate Control. It accumulates all Segment3 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	23	**Reserved** Access: RO Format: MBZ
	22:16	**Segment3 Qindex** Format: U7 This contains Segment3 Qindex used in current frame. This register is valid after a BRC pass is done.
	15:8	**Segment2 CumulativeDeltaQindex** Format: S7 This contains Segment2 CumulativeDeltaQindex in Bit Rate Control. It accumulates all Segment2 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	7	**Reserved** Access: RO Format: MBZ
	6:0	**Segment2 Qindex** Format: U7 This contains Segment2 Qindex used in current frame. This register is valid after a BRC pass is done.

Reported BitRateControl DeltaLoopFilter

MFX_VP8_BRC_D_LOOP_FILTER - Reported BitRateControl DeltaLoopFilter

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	12914h
ShortName:	MFX_VP8_BRC_D_LOOP_FILTER_VB0
Address:	1C914h
ShortName:	MFX_VP8_BRC_D_LOOP_FILTER_VB1

This register stores per segment Bit Rate Control DeltaLoopFilter.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30:24	**Segment3 DeltaLoopFilter** Format: S6 This contains Segment3 DeltaLoopFilter in Bit Rate Control. This register is valid after a BRC pass is done
	23	**Reserved** Access: RO Format: MBZ
	22:16	**Segment2 DeltaLoopFilter** Format: S6 This contains Segment2 DeltaLoopFilter in Bit Rate Control. This register is valid after a BRC pass is done
	15	**Reserved** Access: RO Format: MBZ
	14:8	**Segment1 DeltaLoopFilter** Format: S6 This contains Segment1 DeltaLoopFilter in Bit Rate Control. This register is valid after a BRC pass is done.
	7	**Reserved** Access: RO Format: MBZ

MFX_VP8_BRC_D_LOOP_FILTER - Reported BitRateControl DeltaLoopFilter		
	6:0	**Segment0 DeltaLoopFilter** Format: S6 This contains Segment0 DeltaLoopFilter in Bit Rate Control. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects DeltaLoopFilter. If Segmentation is enabled, this field reflects Segment0 DeltaLoopFilter.

Reported BitRateControl DeltaQindex

MFX_VP8_BRC_DQ_INDEX - Reported BitRateControl DeltaQindex

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	12910h
ShortName:	MFX_VP8_BRC_DQ_INDEX_VB0
Address:	1C910h
ShortName:	MFX_VP8_BRC_DQ_INDEX_VB1

This register stores per segment Bit Rate Control DeltaQindex.

DWord	Bit	Description
0	31:24	**Segment3 DeltaQindex** Format: S7 This contains Segment3 DeltaQindex in Bit Rate Control. This register is valid after a BRC pass is done
	23:16	**Segment2 DeltaQindex** Format: S7 This contains Segment2 DeltaQindex in Bit Rate Control. This register is valid after a BRC pass is done
	15:8	**Segment1 DeltaQindex** Format: S7 This contains Segment1 DeltaQindex in Bit Rate Control. This register is valid after a BRC pass is done.
	7:0	**Segment0 DeltaQindex** Format: S7 This contains Segment0 DeltaQindex in Bit Rate Control. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects DeltaQindex. If Segmentation is enabled, this field reflects Segment0 DeltaQindex.

Reported BitRateControl parameter Mask

MFX_VP8_CNTRL_MASK - Reported BitRateControl parameter Mask

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	12900h
ShortName:	MFX_VP8_CNTRL_MASK_VB0
Address:	1C900h
ShortName:	MFX_VP8_CNTRL_MASK_VB1

This register stores the count of bytes of the bitstream output per frame

DWord	Bit	Description
0	31:6	**Reserved** Access: RO Format: MBZ
	5	**Final Bitstream Buffer Overrun Mask** Format: U1 This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit5. This denotes Final bitstream buffer overrun feature is enabled.
	4	**Intermediate Bitstream Buffer Overrun Mask** Format: U1 This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit4. This denotes intermediate bitstream buffer overrun feature is enabled.
	3	**Intra MB Bit Count Conformance Mask** Format: U1 This is legacy support as AVC for Intra MB Bit Count conformance. This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit3. This feature is not validated.
	2	**Inter MB Bit Count Conformance Mask** Format: U1 This is legacy support as AVC for Inter MB Bit Count conformance. This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit2. This feature is not validated.
	1	**Frame Bit Rate Overflow Mask** Format: U1 This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit0. It denotes if Frame Bit Rate Overflow is enabled for Bit Rate Control

MFX_VP8_CNTRL_MASK - Reported BitRateControl parameter Mask		
	0	**Frame Bit Rate Underflow Mask** Format: U1 This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit1. It denotes if Frame Bit Rate Underflow is enabled for Bit Rate Control

Reported BitRateControl parameter Status

MFX_VP8_CNTRL_STATUS - Reported BitRateControl parameter Status

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	12904h
ShortName:	MFX_VP8_CNTRL_STATUS_VB0
Address:	1C904h
ShortName:	MFX_VP8_CNTRL_STATUS_VB1

This register stores the count of bytes of the bitstream output per frame

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7	**QindexClampHigh Status** Format: U1 This denotes if Qindex is clamped by QindexClampHigh value programmed in MFX_VP8_PIC_STATE.DW7.
	6	**QindexClampLow Status** Format: U1 This denotes if Qindex is clamped by QindexClampLow value programmed in MFX_VP8_PIC_STATE.DW7.
	5	**Final Bitstream Buffer Overrun Status** Format: U1 This denotes if Final bitstream buffer overrun.
	4	**Intermediate Bitstream Buffer Overrun Status** Format: U1 This denotes if any of the Intermediate bitstream buffer overrun. (including FrameHeader, Partition1 to Partition8)
	3	**Intra MB Bit Count Conformance Status** Format: U1 This is legacy support as AVC for Intra MB Bit Count conformance. It denotes if Intra MB Bit Count meets conformance size. This feature is not validated.
	2	**Inter MB Bit Count Conformance Status** Format: U1 This is legacy support as AVC for Inter MB Bit Count conformance. It denotes if Inter MB Bit Count meets conformance size. This feature is not validated.

MFX_VP8_CNTRL_STATUS - Reported BitRateControl parameter Status		
	1	**Frame Bit Rate Overflow Status** Format: U1 It denotes if Frame Bit Rate Overflow in current frame
	0	**Frame Bit Rate Underflow Status** Format: U1 It denotes if Frame Bit Rate Underflow in current frame

Reported Bitstream Output Bit Count for Syntax Elements Only

HCP_BITSTREAMSE_BITCOUNT_FRAME - Reported Bitstream Output Bit Count for Syntax Elements Only

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1E9A8h

This register stores the count of number of bits in the bitstream due to syntax elements only. This excludes header/ byte alignment /tail/EMU/CABAC-0word/padding bits but includes the stop-one-bit. This register is part of the context save and restore.

DWord	Bit	Description
0	31:0	**HCP Bitstream Syntax Element Only Bit Count** Format: U32 Total number of bits in the bitstream output due to syntax elements only. It includes the data bytes only. This count is updated for every time the internal bitstream counter is incremented and its reset at image start.

Reported Bitstream Output Bit Count for Syntax Elements Only Register

MFC_BITSTREAM_SE_BITCOUNT_FRAME - Reported Bitstream Output Bit Count for Syntax Elements Only Register	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	128A4h

This register stores the count of number of bits in the bitstream due to syntax elements only. This excludes header/ byte alignment /tail/EMU/CABAC-0word/padding bits but includes the stop-one-bit. This register is part of the context save and restore.

DWord	Bit	Description
0	31:0	**MFC Bitstream Syntax Element Only Bit Count** Total number of bits in the bitstream output due to syntax elements only. It includes the data bytes only. This count is updated for every time the internal bitstream counter is incremented and its reset at image start.

Reported Bitstream Output Byte Count per Frame Register

MFC_BITSTREAM_BYTECOUNT_FRAME - Reported Bitstream Output Byte Count per Frame Register		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	128A0h	
This register stores the count of bytes of the bitstream output per frame		
DWord	**Bit**	**Description**
0	31:0	**MFC Bitstream Byte Count per Frame** Total number of bytes in the bitstream output per frame from the encoder. This includes header/tail/byte alignment/data bytes/EMU (emulation) bytes/cabac-zero word insertion/padding insertion. This count is updated for every time the internal bitstream counter is incremented and its reset at image start.

Reported Bitstream Output Byte Count per Tile

HCP_BITSTREAM_BYTECOUNT_TILE - Reported Bitstream Output Byte Count per Tile

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1E9CCh

This register stores the count of bytes of the bitstream output per tile.

DWord	Bit	Description
0	31:0	**HCP Bitstream Byte Count per Tile** Format: U32 Total number of bytes in the bitstream output per Tile from the encoder. This includes header/byte alignment/data bytes/EMU (emulation) bytes/. This count is updated for every time the internal bitstream counter is incremented and its reset at tile start.

Reported Bitstream Output CABAC Bin Count Register

MFC_AVC_CABAC_BIN_COUNT_FRAME - Reported Bitstream Output CABAC Bin Count Register		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	128A8h	
This register stores the count of number of bins per frame.		
DWord	**Bit**	**Description**
0	31:0	**MFC AVC Cabac Bin Count** Total number of BINs in the bitstream output per frame from the encoder. This count is updated for every time the bin counter is incremented and its reset at image start.

Reported Final Bitstream Byte Count

MFX_VP8_FRM_BYTE_CNT - Reported Final Bitstream Byte Count		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	12908h	
ShortName:	MFX_VP8_FRM_BYTE_CNT_01	
Address:	1C908h	
ShortName:	MFX_VP8_FRM_BYTE_CNT_02	
This register stores the count of bytes of the bitstream output per frame		
DWord	**Bit**	**Description**
0	31:0	**Final BitStream Byte Count** Format: U32 This register contains Final Bitstream byte count

Reported Frame Zero Padding Byte Count

MFX_VP8_FRM_ZERO_PAD - Reported Frame Zero Padding Byte Count

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1290Ch
ShortName:	MFX_VP8_FRM_ZERO_PAD_VB0
Address:	1C90Ch
ShortName:	MFX_VP8_FRM_ZERO_PAD_VB1

This register stores Frame Zero Padding Byte Count

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Frame Zero Padding Byte Count** Format: U16 This register contains Frame Zero Padding byte count This is legacy support. This feature is not validated.

Reported Timestamp Count

TIMESTAMP - Reported Timestamp Count	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV

ShortName:	TIMESTAMP_VECSUNIT3

Address:	1A358h-1A35Fh
Name:	Reported Timestamp Count
ShortName:	TIMESTAMP_CCSUNIT0

This register provides an elapsed real-time value that can be used as a timestamp for GPU events over short periods of time. Note that the value of this register can be obtained in a 3D pipeline-synchronous fashion without a pipeline flush by using the PIPE_CONTROL command. See 3D Geometry Pipeline in the "3D and Media" volume. This register (effectively) counts at a constant frequency by adjusting the increment amount according to the actual reference clock frequency. SW therefore does not need to know the reference clock frequency.

This register provides an elapsed real-time value that can be used as a timestamp. The accumulated value in this register is of the timestamp stamp granularity (base unit) defined in the Time Stamp Bases subsection in Power Management chapter.

This register is *not* reset by a graphics reset. It will maintain its value unless a full chipset reset is performed.

DWord	Bit	Description
0..1	63:36	**Reserved** Access: RO Format: MBZ
	35:32	**Timestamp Value UN** Format: U4 This register increments for every timestamp base unit. The granularity of the time stamp base unit is defined in the Time Stamp Bases subsection in Power Management chapter. Note: This is the Upper Nibble of the Timesamp Value, a 36-bit signal.

TIMESTAMP - Reported Timestamp Count		
	31:0	**Timestamp Value LDW** Format: U32 This register increments for every timestamp base unit. The granularity of the time stamp base unit is defined in the Time Stamp Bases subsection in Power Management chapter.

Soft reset flow for an engine (Render, Blitter, Video, Video Enhancement) is asynchronous to the context execution in HW. SW needs a deterministic way to ensure it resets the context it intends to. One way to achieve this is to ensure HW doesn't switch out the context while SW is doing a soft reset. This is achieved by having an explicit interface between HW-SW to prepare the engine prior to the soft reset. SW sets the Request Reset in RESET_CTRL register of an engine indicating SW wants to initiate a soft reset flow for the corresponding engine. In response to Request Reset bit set, HW sets Ready for Reset bit of RESET_CTRL register indicating engine readiness for reset. As part of the reset readiness HW will not allow any context switch to take place and also ensure any ongoing context switch is paused on a clean context boundary (context save in progress is completed, Context Switch Status Buffer updates are allowed to complete).
SW polls for Ready for Reset bit to be set before it does soft reset for the corresponding engine. Reading EXECLIST_STATUS register at this point provides the active context in HW that will get reset. On engine reset Request Reset bit will get reset with rest of the engine logic.
Upon polling EXECLIST_STATUS register for active context SW might decide not to reset the engine and can reset the Request Reset in RESET_CTRL register. On Request Reset getting reset by SW, HW must continue with execution.
SW setting Ready for Reset bit in RESET_CTRL register of an engine need not be followed by the corresponding engine reset.
SW writing to Request Reset bit in RESET_CTRL register is preparing the engine for reset whereas SW writing to GDRST triggers the actual reset flow in HW.

Programming Notes
SW must not do Reset Readiness Handshake as part of the reset recovery on a CAT error.

DWord	Bit	Description

RESET_CTRL - Reset Control Register

0	31:16	**Mask** Access: WO Format: Mask Must be set to modify corresponding bit in Bits 15:0. (All implemented bits)
	15:4	**Reserved** Access: RO Format: MBZ
	3	**Reserved** Format: PBC
	2	**Reserved**
	1	**Ready for Reset** Format: U1 When set indicates render engine is ready for reset. This bit gets cleared on engine reset or when Soft Reset In progress is cleared.
	0	**Request Reset** Format: U1 "Request Reset" bit must be read as "Readyness for Reset". When set indicates SW wishes to reset the render engine. On seeing this bit set Command Streamer will take appropriate action and set Ready For Reset status bit. This bit gets cleared on engine reset. This bit can also be cleared by writing "0" to this bit.

Revision Identification and Class Code register

RID2_CC_0_2_0_PCI - Revision Identification and Class Code register

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00008h

This register contains the revision number for Device #2 Functions 0 and contains the device programming interface information related to the Sub-Class Code and Base Class Code definition for the IGD. This register also contains the Base Class Code and the function sub-class in relation to the Base Class Code.

DWord	Bit	Description
0	31:24	**Base Class Code** Default Value: 00000011b Access: RO Variant _Custom_GTIReset: BUS This is an 8-bit value that indicates the base class code. When MGGC0[VAMEN] is 0 this code has the value 03h, indicating a Display Controller. When MGGC0[VAMEN] is 1 this code has the value 03h, indicating a Display Controller Device.
	23:16	**Sub-Class Code** Default Value: 00000000b Access: RO Variant _Custom_GTIReset: BUS When MGGC0[VAMEN] is 0, this value is 00h. When MGGC0[VAMEN] is 1, this value is 80h, indicating other display device.
	15:8	**Programming Interface** Default Value: 00000000b Access: RO _Custom_GTIReset: BUS When MGGC0[VAMEN] is 0 this value is 00h, indicating a Display Controller. When MGGC0[VAMEN] is 1 this value is 00h, indicating a NOP.
	7:0	**Revision Identification Number** Default Value: 00h Access: R/W Variant _Custom_GTIReset: BUS All 8 bits of Revision ID is acquired through fuse pull as per Chassis 2.1 updates

ShortName:	RING_BUFFER_HEAD_PREEMPT_REG_CCSUNIT0

This register contains the Head pointer offset in the ring when the last PREEMPTABLE command was executed and caused the head pointer to move due to the UHPTR register being valid. If the PREEMPTABLE command is executed as part of the batch buffer then the value of the register will be the offset in the ring of the command past the batch buffer start that contained the preemptable command.
This is a global register and context save/restored as part of power context image.

Preemptable Commands	Source
• MI_ARB_CHECK • 3D_PRIMITIVE • GPGPU_WALKER • MEDIA_STATE_FLUSH • PIPE_CONTROL (Only in GPGPU mode of pipeline selection) • MI_ATOMIC (Post Sync Operation set in GPGPU mode of pipeline selection) • MI_SEMAPHORE_SIGNAL (Post Sync Operation set in GPGPU mode of pipeline selection)	RenderCS

Preemptable Commands	Source

RING_BUFFER_HEAD_PREEMPT_REG - RING_BUFFER_HEAD_PREEMPT_REG

MI_ARB_CHECK	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS

Programming Notes

Programming Restriction:
This register should NEVER be programmed by driver. This is for HW internal use only.

DWord	Bit	Description
0	31:21	**Last Wrap Count**
	20:2	**Preempted Head Offset** Format: U19 This field contains the Head pointer offset in the ring when the last MI_ARB_CHECK command was executed and caused the head pointer to move due to the UHPTR register being valid.
	1:0	**Ring/Batch Indicator** Value / Name / Description 0h / Ring / Preemptable command was executed in ring and caused head pointer to be updated. 1h / Batch / Preemptable command was executed in batch and caused head pointer to be updated. 2h / 2nd level batch / Preemptable command was executed in second level batch and caused head pointer to be updated.

ShortName:	RING_BUFFER_CTL_CCSUNIT0

These registers are used to define and operate the "ring buffer" mechanism which can be used to pass instructions to the command interface. The buffer itself is located in a linear memory region. The ring buffer is defined by a 4 Dword register set that includes starting address, length, head offset, tail offset, and control information. These registers can only be updated through a restore of a context thru execution list submission.

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20:12	**Buffer Length** Format: U9-1 This field is written by SW to specify the length of the ring buffer in 4 KB Pages. Range = [0 = 1 page = 4 KB, 1FFh = 512 pages = 2 MB] Value / Name / Description: 0 — 1 page = 4 KB 1FFh — 512 pages = 2 MB
	11	**RBWait** Indicates that this ring has executed a WAIT_FOR_EVENT instruction and is currently waiting. Software can write a "1" to clear this bit, write of "0" has no effect. When the RB is waiting for an event and this bit is cleared, the wait will be terminated and the RB will be returned to arbitration.

RING_BUFFER_CTL - Ring Buffer Control

10	**Semaphore Wait** Indicates that this ring has executed a MI_SEMAPHORE_WAIT instruction and is currently waiting for wait condition to satisfy. Software can write a "1" to clear this bit, write of "0" has no effect. **Programming Notes** Writing a value of 1 will unconditionally cancel the semaphore wait on the next memory comparison. Memory comparison is triggered in signal mode on receiving a semaphore signal and in poll mode on wait timer getting expired.
9:3	**Reserved** Access: RO Format: MBZ
2:1	**Automatic Report Head Pointer** This field is written by software to control the automatic reporting (write) of this ring buffer's Head Pointer register (register DWord 1) to the corresponding location within the Hardware Status Page. Automatic reporting can either be disabled or enabled at 4KB, 64KB or 128KB boundaries within the ring buffer. When **Execlist Enable** bit is set the head pointer will be reported to the head pointer location in the Per-Process Hardware Status Page.

Value	Name	Description
0	MI_AUTOREPORT_OFF	Automatic reporting disabled
1	MI_AUTOREPORT_64KB	Report every 16 pages (64KB)
2	MI_AUTOREPORT_4KB	Report every page (4KB) This mode must not be enabled in Ring Buffer mode of scheduling to minimize the auto reports.
3	MI_AUTO_REPORT_128KB	Report every 32 pages (128KB).

0	**Ring Buffer Enable** Format: Enable This field is used to enable or disable this ring buffer. It can be enabled or disabled regardless of whether there are valid instructions pending. If disabled and the ring head equals ring tail, all state currently loaded in hardware is considered invalid. **Programming Notes** Ring Buffer Mode of Scheduling: SW must follow the below programming notes during SW initialization phase or while enabling render engine's ring buffer for the first time, this would be coming out of boot, standby, hibernate or reset. This flow must be also followed during ring replay when ring buffer is disabled and enabled. • SW must set the Force Wakeup bit to prevent GT from entering C6. • SW must dispatch workload (dummy context) to initialize render engine with default state such that any context switches that occur subsequently (Power Save) will save and restore coherent device state. Indirect pointers used in 3D states must point to valid graphics surface existing in memory. PP_DCLV followed by PP_DIR_BASE register should

		be programmed as part of initialization workload if PPGTT is enabled in GFX_MODE register. • SW must ensure all the register (MMIO) initialization/programming through CPU happens in this block or latter, this ensures the MMIO state is save/restored on subsequent context switches (Power Sequences). • Once the render engine is programmed with valid state and the configuration, Force Wakeup bit should be reset to enable C6 entry.

These registers are used to define and operate the "ring buffer" mechanism which can be used to pass instructions to the command interface. The buffer itself is located in a linear memory region. The ring buffer is defined by a 4 Dword register set that includes starting address, length, head offset, tail offset, and control information. These registers can only be updated through a restore of a context thru execution list submission.

DWord	Bit	Description
0	31:21	**Wrap Count** Format: U11 This field is incremented by 1 whenever the **Head Offset** wraps from the end of the buffer back to the start (i.e., whenever it wraps back to 0). Appending this field to the **Head Offset** field effectively creates a virtual 4GB Head "Pointer" which can be used as a tag associated with instructions placed in a ring buffer. The Wrap Count itself will wrap to 0 upon overflow.
	20:2	**Head Offset** Format: GraphicsAddress[20:2] This field indicates the offset of the *next* instruction DWord to be parsed. Software will initialize this field to select the first DWord to be parsed once the RB is enabled. (Writing the Head Offset while the RB is enabled is UNDEFINED). Subsequently, the device will increment this offset as it executes instructions - until it reaches the QWord specified by the **Tail Offset**. At this point the ring buffer is considered "empty". **Programming Notes** An RB can be enabled empty or containing some number of valid instructions.

These registers are used to define and operate the "ring buffer" mechanism which can be used to pass instructions to the command interface. The buffer itself is located in a linear memory region. The ring buffer is defined by a 4 Dword register set that includes starting address, length, head offset, tail offset, and control information. These registers can only be updated through a restore of a context thru execution list submission.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30:21	**Reserved** Access: RO Format: MBZ
	20:3	**Tail Offset** Format: GraphicsAddress[20:3] This field is written by software to specify where the valid instructions placed in the ring buffer end. The value written points to the QWord past the last valid QWord of instructions. In other words, it can be defined as the next QWord that software will write instructions into. Software must write subsequent instructions to QWords following the Tail Offset, possibly wrapping around to the top of the buffer (i.e., software can't skip around within the buffer).Note that all DWords prior to the location indicated by the **Tail Offset** must contain valid instruction data - which may require instruction padding by software. See **Head Offset** for more information.

RING_BUFFER_TAIL - Ring Buffer Tail		
	2:0	**Reserved** Access: RO Format: MBZ

Ring Context Address Register 0 for GTI Doorbell Unit

DRBCTXADDR0 - Ring Context Address Register 0 for GTI Doorbell Unit

Register Space:	MMIO: 0/2/0
Size (in bits):	64
Address:	01950h

DWord	Bit	Description
0..1	63:32	**CTX base address 63:32** Access: R/W _Custom_GTIReset: BUS Bits [63:32] of HPA base address which MDRB will use as the offset for its context save / restore
	31:6	**CTX base address 31:6** Access: R/W _Custom_GTIReset: BUS Bits [31:6] of HPA base address which MDRB will use as the offset for its context save / restore
	5:0	**Reserved** Access: RO Format: MBZ

Ring Context Start Register for GTI Doorbell Unit

DRBCTXSTART - Ring Context Start Register for GTI Doorbell Unit

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0194Ch

Message registers have bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16].
In order to set bit0, for example, the data would be 0x0001_0001. In order to clear bit0, for example, the data would be 0x0001_0000.
Note that mask bit is the data bit offset + 16. Message registers are protected from non-GT writes via the Message Channel.

DWord	Bit	Description
0	31:16	**Context Save Mask** Access: WO _Custom_GTIReset: BUS This registers isn't context save/restored.
	15:2	**Reserved** Access: RO Format: MBZ
	1:0	**Context start** Access: R/W Hardware Clear _Custom_GTIReset: BUS RPM will program these bits to notify MDRB to initiate either a context save or a context restore. MDRB will clear these bits once the context procedure is completed and the ACK is sent back to RPM. 2'b11 = Reserved 2'b10 = Context restore start 2'b01 = Context save start 2'b00 = Normal operation - DEFAULT Programming Note - It is assumed that this value will be static once programmed and not changed until MDRB clears the bits after ACKing the context procedure back to RPM

RMTIMEOUTREG_CAPTURE

RMTIMEOUTREG_CAPTURE		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	420E0h-420E3h	
Name:	RM TIMEOUT REGISTER OFFSET

DWord	Bit	Description
0	31:0	**REGISTER OFFSET VALUE** Access: RO Offset of the Register that caused RM TIMEOUT.

RSA for uOS/Soft Scratch

UOS_RSA_SCRATCH - RSA for uOS/Soft Scratch

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Description

There are 64 Dword registers (2048 bits) for RSA check for uOS code, which is performed by the on chip Boot ROM code. This RSA check is done to ensure that the full HASH check value used for Hash operation of the uOS by Shim, itself is correct. These registers can also be used as Soft Scratch registers defined for use after the RSA operation at Boot. Note that these registers contents are not context saved/restored for C6 purposes. Usage: The Host programs these 64 registers, before programming the DMA. The Boot ROM then on being initiated reads these 64 registers and starts the RSA unwrap.

DWord	Bit	Description
0	31:0	**RSA/Scratch**

RTADDR_LSB

RTADDR_LSB - RTADDR_LSB

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	124830h

Register providing the base address of root-entry table.

DWord	Bit	Description
0	31:12	**RTA** Default Value: 0000000h Access: R/W _Custom_GTIReset: BUS This register points to base of page aligned, 4KB-sized root-entry table in system memory. Hardware ignores and not implements bits 63:HAW, where HAW is the host address width. Software specifies the base address of the root-entry table through this register, and programs it in hardware through the SRTP field in the Global Command register. Reads of this register returns value that was last programmed to it.
	11	**RTT** Default Value: 0h Access: R/W _Custom_GTIReset: BUS This field specifies the type of root-table referenced by the Root Table Address (RTA) field; 0: Root Table1: Extended Root Table
	10:0	**Reserved** Access: RO Format: MBZ

RTADDR_MSB

RTADDR_MSB - RTADDR_MSB

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	124834h

Register providing the base address of root-entry table.

DWord	Bit	Description
0	31:14	**Reserved** Access: RO Format: MBZ
	13:7	**Reserved** Access: RO Format: MBZ
	6:0	**RTA** Default Value: 00h Access: R/W _Custom_GTIReset: BUS This register points to base of page aligned, 4KB-sized root-entry table in system memory. Hardware ignores and not implements bits 63:HAW, where HAW is the host address width. Software specifies the base address of the root-entry table through this register, and programs it in hardware through the SRTP field in the Global Command register. Reads of this register returns value that was last programmed to it.

Sampler Dummy Register

SMP_DUMMY - Sampler Dummy Register	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0E000h
Name:	Sampler Dummy Address
ShortName:	Sampler_Dummy_Address

This register is defined so that a non-posted MMIO cycle to this destination would ensure all cycles are flushed on the message channel between the source and destination. This register is used in the engine context to ensure all state is delivered. The value programmed in this register must not change the behavior of the GPU.

DWord	Bit	Description
0	31:0	**Reserved** Access: RO Format: MBZ

SAMPLER Mode Register

SAMPLER_MODE - SAMPLER Mode Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	0E18Ch
Name:	SAMPLER Mode Register
ShortName:	SAMPLER_MODE

This register has bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16]. To set bit0, for example, the data would be 0x0001_0001. To clear bit0, for example, the data would be 0x0001_0000. Note that mask bit is the data bit offset + 16.

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask
	15	**enble smallPL** Format: enable **Programming Notes** This bit MUST be set to ensure optimal power in 3D Sampler. Must not be enabled if **cache_flush** message is sent to sampler.
	14	**L1 Cache Set Selection** This field controls how Set0 and Set1 of the Sampler L1 Cache are selected. **Value** / **Name** / **Description** 0h / Extended_Tag **[Default]** / When this bit is set to 0h, Sampler will use Bit 8 of the Extended Tag To Control Set selection. 1h / XOR_UVQ / When this bit is set to 1h, Sampler will use an XOR of Various u, v, and q texel coordinate bits to select set
	13:12	**Sampler Cache Set XOR selection** Format: U2 These bits have an impact only when the Sampler cache is configured in 16 way set associative mode. If the cache is being used for immediate data or for blitter data these bits have no effect. **Value** / **Name** / **Description** 00b / None / No XOR. 01b / Scheme 1 / New_set_mask[3:0] = Tiled_address[16:13]. New_set[3:0] less than or = New_set_mask[3:0] ^Old_set[3:0]. Rationale: These bits can distinguish among 16 different equivalent classes of virtual pages. These bits also represent the lsb for tile rows

SAMPLER_MODE - SAMPLER Mode Register

		ranging from a pitch of 1 tile to 16 tiles.
10b	Scheme 2	New_set_mask[3] = Tiled_address[17] ^ Tiled_address[16]. New_set_mask[2] = Tiled_address[16] ^ Tiled_address[15]. New_set_mask[1] = Tiled_address[15] ^ Tiled_address[14]. New_set_mask[0] = Tiled_address[14] ^ Tiled_address[13]. New_set[3:0] less than or = New_set_mask[3:0] ^ Old_set[3:0]. Rationale: More bits on each XOR can give better statistical uniformity on sets and since two lsbs are taken for each tile row size, it reduces the chance of aliasing on sets.
11b	Scheme 3 **[Default]**	New_set_mask[3] = Tiled_address[22] ^ Tiled_address[21] ^ Tiled_address[20] ^ Tiled_address[19]. New_set_mask[2] = Tiled_address[18] ^ Tiled_address[17] ^ Tiled_address[16]. New_set_mask[1] = Tiled_address[15] ^ Tiled_address[14]. New_set_mask[0] = Tiled_address[13]. New_set[3:0] less than or = New_set_mask[3:0] ^ Old_set[3:0]. Rationale: More bits on each XOR can give better statistical uniformity on sets and since each XOR has different bits, it reduces the chance of aliasing on sets even more.

Programming Notes

This field should be programmed as "00b" corresponding to NO XOR option when 3D map performance fix in MT is enabled using the field "Sampler Set Remapping for 3D Disable" in the SAMPLER Mode Register.

11:10	**ECO Reserved 2b** Format: MBZ
9	**ECO_SCRATCH_9** Format: MBZ
8	**Sampler L2 Disable** Format: Disable Will disable the L2 cache and force all access to be misses
7	**ECO Reserved 3** Format: MBZ
6	**Compressed Overfill disable** Format: disable
5	**Headerless Message for Pre-emptable Contexts** Format: Enable When set to 1h, this bit enables sampler to support headerless messages for pre-emptable GPGPU contexts. When set to 0h, it reverts to the previous behavior where pre-emptable GPGPU contexts must have headers on all sampler messages.

SAMPLER_MODE - SAMPLER Mode Register

Value	Name	Description
0h		Headers must be used on all sampler messages if this bit is programmed to 0h.
1h	**[Default]**	Headerless sampler messages may be used for pre-emptable contexts (this is the default behavior all contexts)

4 **ECO Reserved**

3 **ECO Reserved 5**

Format:	MBZ

2 **ECO Reserved 4-2**

1 **PL float to fix precision fix disable**

Format:	disable

If disabled use legacy behavior

0 **Indirect State Base Addr Override**

Format:	Enable

This bit is used to control whether Indirect State (Border Color) to be relative to same base address as SAMPLER_STATE or relative to the DYNAMIC_STATE_BASE_ADDR

This bit must be set to 1. Border Color must be in the Dynamic State heap in order to allow for resource copy of sampler state to work correctly.

Value	Name	Description
0h	OVERRIDE_DISABLE **[Default]**	When set to 0h, this bit allows Indirect State (.e.g Border Color) to be stored in the Bindless Sampler State heap. This bit should not be set to 0h by SW as this will prevent resource copies of sampler state from being done correct when border color is required.
1h	OVERRIDE_ENABLE	When set to 1h, this bit allows Indirect State (e.g. Border Color) to be stored in the Dynamic State heap. This bit must be set to 1h by SW to ensure resource copies of sampler state are done correctly when border color is required.

ShortName:	SBB_PREEMPT_ADDR_CCSUNIT0

Description

This register gets updated with the DWord-aligned graphics memory address of the PREEMPTABLE command in the second level batch buffer on which preemption has occurred.
This register value should be looked at only when the preemption has occurred in the second level batch buffer. This is indicated by "Ring/Batch Indicator" in "RING_BUFFER_HEAD_PREEMPT_REG". This register value retains its previous value and doesn't change when the preemption occurs on a preemptable command in ring buffer or in batch buffer.
Preemption is triggered by valid UHPTR in ring buffer mode of scheduling and by a pending execlistin Exec-List mode of scheduling.
This is a global register and context save/restored as part of power context image.

Refer to **Preemption > ExecList Scheduling** for a list of preemptible commands.

Programming Notes

Programming Restriction: This register should NEVER be programmed by driver, this is for HW internal use only.

DWord	Bit	Description

SBB_PREEMPT_ADDR - Second Level Batch Buffer Head Pointer Preemption Register

ShortName:	SBB_ADDR_CCSUNIT0

This register contains the current DWord Graphics Memory Address of the last-initiated batch buffer.

Programming Notes

This register should NEVER be programmed by driver, this is for HW internal use only. This register should not be written by software. These fields should only get written by a context restore. Software should always set these fields via the MI_BATCH_BUFFER_START command when initiating a batch buffer. This register is saved and restored with context.

DWord	Bit	Description
0	31:2	**Second Level Batch Buffer Head Pointer** Format: GraphicsAddress[31:2] This field specifies the DWord-aligned Graphics Memory Address where the last initiated Second Level Batch Buffer is currently fetching commands. This field is meaningful only when Valid field is set to "1".
	1	**Reserved** Access: RO Format: MBZ
	0	**Valid** Format: U1

SBB_ADDR - Second Level Batch Buffer Head Pointer Register

Value	Name	Description
0h	Invalid **[Default]**	Second Level Batch buffer Invalid
1h	Valid	Second Batch buffer Valid.

Name:	Semaphore Polling Interval on Wait
ShortName:	SEMA_WAIT_POLL_CCSUNIT0

The SEMA_WAIT_POLL register contains Poll Interval field which specifies the minimum number of microseconds allowed for command streamer to wait before re-fetching the data from the address mentioned in the MI_SEMAPHORE_WAIT command on WAIT Mode set to POLL until the condition is satisfied while the context is not switched out. When a value of 0 is written the poll interval will be equal to the memory latency of the read completion.

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20:0	**Poll Interval** Minimum number of micro-seconds allowed

Address:	1A020h-1A023h
Name:	SEMAPHORE_SIGNAL_PORT
ShortName:	SEMAPHORE_SIGNAL_PORT_CCSUNIT0

Each engine implements SEMAPHORE_SIGNAL_PORT register for receiving semaphore signal from the scheduler (SW or FW). A write to the SEMAPHORE_SIGNAL_PORT with data as 0xFFFF_FFFF is decoded as semaphore signal by an engine. An engine waiting on un-successful MI_SEMAPHORE_WAIT (signal mode) command will reacquire the semaphore data from memory and re-evaluate the semaphore comparison on receiving the semaphore signal. SEMAPHORE_SIGNAL_PORT register is privileged. Writing to the SEMAPHORE_SIGNAL_PORT of an idle engine (no context) does not trigger any action in HW and is of no use.

DWord	Bit	Description
0	31:0	**Semaphore Signal Value** Format: U32

Value	Name
001b	**[Default]**

15:0 **PFET Ladder Step Sequence**

Access:	R/W Lock
_Custom_GTIReset:	BUS

PFET Ladder STEP sequence
The PFET ladder has 16 steps, each represented by its corresponding bit in pfetlddrstepseq[15:0]. If the bit location is set, it means we must step on that ladder stage before we go to the next stage.
The SPC controller will step through all the steps with asserted bits periodically with period equal to strbpulsprd[2:0]
Programming Rule: pfetldrstepseq[15] and pfetldrstepseq[0] must be '1; A '0 setting for these bits is illegal.
15'FFFFh: Ladder step (ladder_sel) goes 0, 1, 2, ?.15.
15'FFF1h: Ladder step goes 0, 4, 5, 6,?15; Steps 1, 2, 3 are skipped.
15'D555h: Ladder step goes 0, 2, 4, 6, 8, 10, 12, 14, 15; Steps 1, 3, 5, 7, 9, 11, 13 are skipped.
15'80001h: Ladder step goes 0, 15; Steps 1, 2, 3, 4, ?14 are skipped.

	15:0	**PFET Ladder Step Sequence** Default Value: 1111111111111111b Access: R/W Lock _Custom_GTIReset: BUS PFET Ladder STEP sequence The PFET ladder has 16 steps, each represented by its corresponding bit in pfetlddrstepseq[15:0]. If the bit location is set, it means we must step on that ladder stage before we go to the next stage. The SPC controller will step through all the steps with asserted bits periodically with period equal to strbpulsprd[2:0] Programming Rule: pfetldrstepseq[15] and pfetldrstepseq[0] must be '1; A '0 setting for these bits is illegal. 15'FFFFh: Ladder step (ladder_sel) goes 0, 1, 2, ?.15. 15'FFF1h: Ladder step goes 0, 4, 5, 6,?15; Steps 1, 2, 3 are skipped. 15'D555h: Ladder step goes 0, 2, 4, 6, 8, 10, 12, 14, 15; Steps 1, 3, 5, 7, 9, 11, 13 are skipped. 15'80001h: Ladder step goes 0, 15; Steps 1, 2, 3, 4, ?14 are skipped.

Slice 1 - 5 Power Down FSM control register with lock

SL15SPCPOWERDNFSMCTL - Slice 1 - 5 Power Down FSM control register with lock

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	24210h

DWord	Bit	Description
0	31	**power down control Lock** Access: R/W Lock _Custom_GTIReset: BUS 0 = Bits of Slice 1 POWERDNFSMCTL register are R/W 1 = All bits of Slice 1 POWERDNFSMCTL register are RO (including this lock bit) Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR.
	30:13	**Reserved** Access: RO Format: MBZ
	12	**Leave firewall disabled** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not firewall the gated domain for a power down flow. But it will pretend to complete the flow with PM Encodings: 0 = Default mode, i.e firewall gated domain to ungated domain crossing during power down flows 1 = Leave firewall disabled, i.e don't firewall the gated domain, but complete logical flow
	11	**Leave reset de-asserted** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not assert reset for power off flow. But it will pretend to complete the flow with PM Encodings: 0 = Default mode, i.e assert resets during power down flows 1 = Leave reset de-asserted mode, i.e don't assert reset, but complete logical flow
	10	**Leave CLKs ON** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not gate clks for power off flow. But it will pretend to complete the flow with PM Encodings:

SL15SPCPOWERDNFSMCTL - Slice 1 - 5 Power Down FSM control register with lock

		0 = Default mode, i.e gate clocks during power down flows 1 = Leave CLKS ON mode, i.e don't clock gate, but complete logical flow
	9	**Leave FET On** Access: R/W Lock _Custom_GTIReset: BUS When This bit is set SPC will not turn off the PFET even though it will complete the flow with PM Encodings: 0 = Default mode, i.e power off fets during power down flows 1 = Leave ON mode, i.e don't power off pfet, but complete logical flow
	8:6	**Power Down state 3** Default Value: 010b Access: R/W Lock _Custom_GTIReset: BUS This will be the 3rd state before power is turned OFF in the well Encodings: 000 = Assert Reset 001 = Firewall ON 010 = Gate clocks 1xx = Rsvd for future Default : Gate Clocks
	5:3	**Power Down state 2** Default Value: 001b Access: R/W Lock _Custom_GTIReset: BUS This will be the 2nd state before power is turned OFF in the well Encodings: 000 = Assert Reset 001 = Firewall ON 010 = Gate clocks 1xx = Rsvd for future Default :Firewall ON

SL15SPCPOWERDNFSMCTL - Slice 1 - 5 Power Down FSM control register with lock

	2:0	**Power Down state 1** Default Value: 000b Access: R/W Lock _Custom_GTIReset: BUS This will be the 1st state before power is turned OFF in the well Encodings: 000 = Assert Reset 001 = Firewall ON 010 = Gate clocks 1xx = Rsvd for future Default : Assert Reset

Slice 1 - 5 Power Gate Control Request

SLM Bank Hash

SLM_BANKHASH - SLM Bank Hash

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0E660h
Name:	SLM Bank Hash
ShortName:	SLM_BANKHASH

Description
Register for selecting number of SLM banks and setting XOR hashing in bank select bits.
Restriction : To avoid data corruption, this register can only be modified when no threads are running that access SLM. Data corruption can also occur if a mid-thread preemption image with saved SLM data is restored with a different setting.
Restriction : This register is a privileged register (not user-mode non-privileged) to ensure that one context changing it does not corrupt a simultaneously running context.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**64 Bank Mode** Format: U1 This bit selects the number of logical banks in SLM (64 or 65). Value 1h: B64 — 64 logical banks in SLM. Value 0h: B65 **[Default]** — 65 logical banks in SLM.
	14:12	**Reserved** Access: RO Format: MBZ
	11:10	**bit7 Hash** Access: R/W Format: U2 Programming this field is only valid when Bit[15] is set to 1 (64-bank mode). This field defines which address bit(s) will be XOR-ed with address bit[7] to produce new address bit[7]. Multiple bits can be set to XOR multiple address bit with bit[7]. Value 2h: A10 — When set, XOR address[7] with address[10] to produce new address[7]. Value 1h: A13 — When set, XOR address[7] with address[13] to produce new

SLM_BANKHASH - SLM Bank Hash

		address[7].
0h	No XOR **[Default]**	Address[7] is not XOR-ed with any other address bit.

9:8 **bit6 Hash**

Access:	R/W
Format:	U2

Programming this field is only valid when Bit[15] is set to 1 (64-bank mode). This field defines which address bit(s) will be XOR-ed with address bit[6] to produce new address bit[6]. Multiple bits can be set to XOR multiple address bit with bit[6].

Value	Name	Description
2h	A9	When set, XOR address[6] with address[9] to produce new address[6].
1h	A12	When set, XOR address[6] with address[12] to produce new address[6].
0h	No XOR **[Default]**	Address[6] is not XOR-ed with any other address bit.

7:6 **bit5 Hash**

Access:	R/W
Format:	U2

Programming this field is only valid when Bit[15] is set to 1 (64-bank mode). This field defines which address bit(s) will be XOR-ed with address bit[5] to produce new address bit[5]. Multiple bits can be set to XOR multiple address bit with bit[5].

Value	Name	Description
2h	A8	When set, XOR address[5] with address[8] to produce new address[5].
1h	A11	When set, XOR address[5] with address[11] to produce new address[5].
0h	No XOR **[Default]**	Address[5] is not XOR-ed with any other address bit.

5:4 **bit4 Hash**

Access:	R/W
Format:	U2

Programming this field is only valid when Bit[15] is set to 1 (64-bank mode). This field defines which address bit(s) will be XOR-ed with address bit[4] to produce new address bit[4]. Multiple bits can be set to XOR multiple address bit with bit[4].

Value	Name	Description
2h	A16	When set, XOR address[4] with address[16] to produce new address[4].
1h	A10	When set, XOR address[4] with address[10] to produce new address[4].

SLM_BANKHASH - SLM Bank Hash

0h	No XOR **[Default]**	Address[4] is not XOR-ed with any other address bit.

3:2 **bit3 Hash**

Access:	R/W
Format:	U2

Programming this field is only valid when Bit[15] is set to 1 (64-bank mode). This field defines which address bit(s) will be XOR-ed with address bit[3] to produce new address bit[3]. Multiple bits can be set to XOR multiple address bit with bit[3].

Value	Name	Description
2h	A15	When set, XOR address[3] with address[15] to produce new address[3].
1h	A9	When set, XOR address[3] with address[9] to produce new address[3].
0h	No XOR **[Default]**	Address[3] is not XOR-ed with any other address bit.

1:0 **bit2 Hash**

Access:	R/W
Format:	U2

Programming this field is only valid when Bit[15] is set to 1 (64-bank mode). This field defines which address bit(s) will be XOR-ed with address bit[2] to produce new address bit[2]. Multiple bits can be set to XOR multiple address bit with bit[2].

Value	Name	Description
2h	A14	When set, XOR address[2] with address[14] to produce new address[2].
1h	A8	When set, XOR address[2] with address[8] to produce new address[2].
0h	No XOR **[Default]**	Address[2] is not XOR-ed with any other address bit.

SNP_FILTER_Q_STATUS

SNP_FILTER_Q_STATUS - SNP_FILTER_Q_STATUS

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	000E8h

This register serves 2 purposes:
1) Support selection of SMI or SCI event source (SMISCISEL - bit15)
2) SCI Event trigger (GSSCIE - bit 0). To generate a SW SCI event, software should program bit 15 (SMISCISEL) to 1. This is typically programmed once (assuming SMIs are never triggered). On a "0" to "1" subsequent transition in bit 0 of this register (caused by a software write operation), a SCI message will be sent to cause the TCOSCI_STS bit in GPE0 register to be set to 1. The corresponding SCI event handler in BIOS is to be defined as a _Lxx method, indicating level trigger to the operating system. Once written as 1, software must write a "0" to this bit to clear it, and all other write transitions (1-0, 0-0, 1-1) will not cause a SCI message to be sent. To generate a SW SMI event, software should program bit 15 to 0 and trigger SMI via writes to SWSMI register (See SWSMI register for programming details).

DWord	Bit	Description
0	15	**SMI or SCI event select** Default Value: 0b Access: R/W _Custom_GTIReset: BUS 0 = SMI (default)1 = SCI If selected event source is SMI, SMI trigger and associated scratch bits accesses are performed via SWSMI register. If SCI event source is selected, the rest of the bits in this register provide SCI trigger capability and associated SW scratch pad area.
	14:1	**Software scratch bits** Default Value: 00000000000000b Access: R/W _Custom_GTIReset: BUS Read/write bits not used by hardware.
	0	**Software SCI Event** Default Value: 0b Access: R/W _Custom_GTIReset: BUS If SCI event is selected (SMISCISEL = 1), on a 0 to 1 transition of GSSCIE bit, a SCI message will be sent to cause the TCOSCI_STS bit in GPE0 register to be set to 1. Software must write a 0 to clear this bit.

Software SMI

SWSMI_0_2_0_PCI - Software SMI

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 000E0h

DWord	Bit	Description
0	15:8	**Software Scratch Bits** Default Value: 00000000b Access: R/W _Custom_GTIReset: BUS
	7:1	**Software Flag** Default Value: 0000000b Access: R/W _Custom_GTIReset: BUS Used to indicate caller and SMI function desired, as well as return result.
	0	**GMCH Software SMI Event** Default Value: 0b Access: R/W _Custom_GTIReset: BUS When Set this bit will trigger an SMI. Software must write a "0" to clear this bit.SMI will be triggered only if SWSCI[SMISCISEL] is set to select SMI.

SRD_CTL

SRD_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	60800h-60803h
Name:	Transcoder SRD Control
ShortName:	SRD_CTL_A
Reset:	soft
Address:	61800h-61803h
Name:	Transcoder SRD Control
ShortName:	SRD_CTL_B
Reset:	soft
Address:	62800h-62803h
Name:	Transcoder SRD Control
ShortName:	SRD_CTL_C
Reset:	soft
Address:	63800h-63803h
Name:	Transcoder SRD Control
ShortName:	SRD_CTL_D
Reset:	soft

Restriction : PSR needs to be enabled only when at least one plane is enabled.

Programming Notes

To use FBC modification tracking for idleness calculations when FBC is disabled, program FBC_CTL CPU Fence Enable, FBC_CONTROL_SA_REGISTER, FBC_CPU_FENCE_OFFSET_REGISTER, FBC_RT_BASE_ADDR_REGISTER, and BLITTER_TRACKING_REGISTER as they are programmed when FBC is enabled.

Cursor front buffer modifications are not tracked in hardware. If the cursor front buffer is modified, touch (write without changing) any cursor register to trigger the PSR idleness tracking.

Restriction

Only the SRD Enable and Single Frame Update Enable fields can be changed while SRD is enabled. The other fields must not be changed while SRD is enabled.

DWord	Bit	Description
0	31	**SRD Enable** This bit enables the Self Refreshing Display function. Updates will take place at the start of the next vertical blank. The port will send SRD VDMs while enabled. When idleness conditions have been met for the programmed number of idle frames, hardware will enter SRD (sleep) and can disable the link and stop fetching data from memory. When activity occurs, hardware will exit

SRD_CTL

SRD (wake) and re-enable the link and resume fetching data from memory.

Value	Name
0b	Disable
1b	Enable

Restriction
SRD must not be enabled when the PSR Setup time from DPCD 00071h is greater than the time for vertical blank minus one line.
SRD must not be enabled together with Interlacing, Black Frame Insertion (BFI), or audio on the same transcoder.

30 **Single Frame Update Enable**

Access:	Double Buffered

This field enables the single frame update mode where a plane flip will cause a single frame to be sent to the receiver. Updates to this field will take effect at the next vertical blank.

Value	Name
0b	Disable
1b	Enable

Programming Notes
Set register PIPE_MISC field Change Mask for Vblank Vsync Int to 1b (Masked) if vblank or vsync interrupts will be used together with single frame update.

Workaround
When Single Frame Update is enabled, the CRC must be disabled for panel compatibility.

Restriction
This mode should only be enabled with link standby.

29 **Context restore to PSR Active**

This field restores eDP context to PSR Active on a context restore.

Value	Name
0b	Disable
1b	Enable

Restriction
This field is used for hardware communication. Software must not change this field.

28 **Adaptive Sync Frame Update**

This field enables the Adaptive Sync Frame Update mode where a flip will cause a single frame to be sent to the receiver. Updates to this field will take effect at the next vertical blank. This field must be enabled with VRR enable.

SRD_CTL

Restriction : This mode should only be enabled with the SRD Link Disable mode. This mode does not support VRR Max Shift. However, normal and flipline VRR modes are supported.

Value	Name
0b	Disable
1b	Enable

Programming Notes
Set register PIPE_MISC field **Change Mask for Vblank Vsync Int** to 1b (Masked) if vblank or vsync interrupts will be used together with single frame update.

27 **Link Ctrl**

This field controls the behavior of the link when in SRD (sleeping). The timing generator and pixel data fetches are disabled when the link is disabled. Only pixel data fetches are disabled when the link is in standby.

This field is ignored by transcoder A/B/C since they only operate in standby.

Value	Name	Description
0b	Disable	Link is disabled when in SRD (sleeping)

26:25 **Reserved**

Access:	RO
Format:	MBZ

24:20 **Max Sleep Time**

Default Value:	00001b 1/8 second

This field is the maximum time to spend in SRD (sleeping). It is programmed in increments of approximately 1/8 a second. Programming all 1s gives ~3.875 seconds.

Restriction
Programming all 0s is invalid.

19:17 **Reserved**

Access:	RO
Format:	MBZ

16:14 **DSC CRC Last Byte**

This field selects the valid last byte of DSC data stream for SRD CRC calculation. Valid data byte for CRC engine can be from 0 to 5.

DSC CRC Last Byte = (Slice Per Line eDP* Bytes PerChunk * VActive) mod 6

Below is an example with 2 slices per line on each DSC.

SPL = Slices Per Line

Case	DSC A SPL	DSC C SPL	Slices Per Line eDP
CoG enable + VDSC enable (no Joiner)	2	2	2 (DSC A or DSC C)
VDSC enable + Joiner enable (no CoG)	2	2	4 (DSC A + DSC C)
VDSC standalone	0 or 2	2 or 0	2

SRD_CTL

	(no Joiner, no CoG)			

13 **Reserved**

12 **Reserved**

11 **TP2 TP3 Select**

This field controls whether TP1 is followed by TP2 or TP3 for training the link on exiting SRD (waking).

Value	Name	Description
0b	TP2	Use TP1 followed by TP2
1b	TP3	Use TP1 followed by TP3

Programming Notes
This bit impacts PSR2. Clear it before enabling PSR2 and do not set it while PSR2 is enabled.

10 **CRC Enable**

This field controls whether the PSR CRC value will be placed in the VSC packet.

Value	Name	Description
0b	Disable	Disable CRC output in VSC. VSC packet CRC value will be populated by VIDEO_DIP_DATA.
1b	Enable	Enable CRC output in VSC. VSC packet CRC value will be populated by the calculated CRC value.

Programming Notes
When CRC is enabled, the Max Sleep Timer should be disabled to provide additional power savings. Disable the Max Sleep Timer by setting register 0x6F860 bit 28 to 1. Re-enable the Max Sleep Timer by clearing register 0x6F860 bit 28 to 0.

Workaround
When Single Frame Update is enabled, the CRC must be disabled for panel compatibility.

9:8 **TP2 TP3 Time**

This field selects the TP2 or TP3 time when training the link on exiting SRD (waking).

Value	Name
00b	500us
01b	100us
10b	2.5ms
11b	0us Skip TP2/TP3

7:6 **TP4 time**

This field selects the TP4 time when training the link on exiting SRD (waking).
If this field is set to any value other than "11", TP4 pattern will be sent at PSR reentry.

Value	Name	Description
00b	500 us	

SRD_CTL

01b	100 us	
10b	2.5 ms	
11b	0 us	Skip TP4

Programming Notes
Always program TP4 to 11b.

5:4 **TP1 Time**

This field selects the TP1 time when training the link on exiting SRD (waking).

Value	Name	Description
00b	500us	
01b	100us	
10b	2.5ms	
11b	0us	Skip TP1

3:0 **Idle Frames**

Default Value:	0001b 1 idle frame

This field is the number of idle frames required before entering SRD (sleeping).

SRD_PERF_CNT

SRD_PERF_CNT	
Register Space:	MMIO: 0/2/0
Access:	Write/Read Status
Size (in bits):	32
Address:	60844h-60847h
Name:	Transcoder SRD Performance Counter
ShortName:	SRD_PERF_CNT_A

Reset:	soft
Address:	63844h-63847h
Name:	Transcoder SRD Performance Counter
ShortName:	SRD_PERF_CNT_D
Reset:	soft

DWord	Bit	Description
0	31:24	**Reserved** Access: RO Format: MBZ
	23:0	**SRD Perf Cnt** This field increments every millisecond while in SRD (sleeping) and the display CD clock is running. It will stop incrementing when out of SRD (awake), then resume when back in SRD (sleeping). The value is maintained while SRD is disabled, and counting will resume from the previous value when SRD is re-enabled. Writes to this register will set the count to the written value, then it will increment from that value onwards.

SRD_STATUS

SRD_STATUS

SRD_STATUS

Access:	RO
Format:	MBZ

27:26 Link Status

Access:	RO

This field indicates the live status of the link.

Value	Name	Description
00b	Full Off	Link is fully off
01b	Full On	Link is fully on
11b	Reserved	Reserved

25 Reserved

Access:	RO
Format:	MBZ

24:20 Max Sleep Time Counter

Access:	RO

This field provides the live status of the sleep time counter.

19:16 SRD Entry Count

Access:	RO

The value in this register represents the number of times SRD has been entered (gone to sleep). The count will increment with each entry. After reaching the maximum count value the counter will rollover and continue from 0.

15 Aux Error

Access:	RO

This field indicates an error on the last SRD AUX handshake.

Value	Name	Description
0b	No Error	AUX had no error
1b	Error	AUX error (receive error or timeout) occurred

14:13 Reserved

Access:	RO
Format:	MBZ

12 Sending Aux

Access:	RO

This field indicates if the SRD AUX handshake is currently being sent.

Value	Name	Description
0b	Not Sending	Not sending AUX handshake
1b	Sending	Sending AUX handshake

SRD_STATUS

11:10 Reserved

Access:	RO
Format:	MBZ

9 Sending Idle

Access:	RO

This field indicates if idles are currently being sent.

Value	Name	Description
0b	Not Sending	Not sending idle
1b	Sending	Sending idle

8 Sending TP2 TP3

Access:	RO

This field indicates if TP2 or TP3 is currently being sent.

Value	Name	Description
0b	Not Sending	Not sending TP2 or TP3
1b	Sending	Sending TP2 or TP3

7 Sending TP4

Access:	RO

This field indicates if TP4 is currently being sent.

Value	Name
0b	Not Sending
1b	Sending

6:5 Reserved

Access:	RO
Format:	MBZ

4 Sending TP1

Access:	RO

This field indicates if TP1 is currently being sent.

Value	Name	Description
0b	Not Sending	Not sending TP1
1b	Sending	Sending TP1

3:0 Idle Frame Counter

Access:	RO

This field provides the live status of the idle frame counter.

Programming Notes
The value of this field is not preserved across power down states such as DC5 and up.

	15:10	**Reserved** Access: RO Format: MBZ
	9	**Power context save request** Access: R/W Set _Custom_GTIReset: BUS Power Context Save Request 1'b0 : Power context save is not being requested 1'b1 : Power context save is being requested CPUnit self-clears this bit upon sampling.
	8:0	**Power Context Save request crdit count** Access: R/W _Custom_GTIReset: BUS QWord Credits for Power Context Save Request Minimum Credits = 1 : Unit may send 1 QWord pair (enough for first LRI at least) Maximum Credits = 511 : Unit may send 511 QWord pairs A QWord pair is defined as a 32-bit register address and the corresponding 32-bits of register data. Note that the LRI header and END commands are 64-bits each (32-bit command followed by 32-bit NOOP) and will consume one QWord credit. Only valid with PWRCTX_SAVE_REQ (Bit9).

Stream Output 0 Num Primitives Written Counter

SO0_NUM_PRIMS_WRITTEN - Stream Output 0 Num Primitives Written Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	05200h-05207h
Name:	Stream Output 0 Num Primitives Written Counter
ShortName:	SO0_NUM_PRIMS_WRITTEN

There is one 64-bit register for each of the 4 supported streams:

- 5200h-5207h SO_NUM_PRIMS_WRITTEN0 (for Stream Out Stream #0)
- 5208h-520Fh SO_NUM_PRIMS_WRITTEN1 (for Stream Out Stream #1)
- 5210h-5217h SO_NUM_PRIMS_WRITTEN2 (for Stream Out Stream #2)
- 5218h-521Fh SO_NUM_PRIMS_WRITTEN3 (for Stream Out Stream #3)

These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has successfully written to a particular "stream's" Streamed Vertex Output buffers, subject to buffer overflow detection. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

DWord	Bit	Description
0	31:0	**Num Prims Written Count 0** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) every time a GS thread outputs a DataPort Streamed Vertex Buffer Write message with the Increment Num Prims Written bit set in the message header (see the Geometry Shader and Data Port chapters in the 3D Volume.)
1	31:0	**Num Prims Written Count 1** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) every time a GS thread outputs a DataPort Streamed Vertex Buffer Write message with the Increment Num Prims Written bit set in the message header (see the Geometry Shader and Data Port chapters in the 3D Volume.)

Stream Output 0 Primitive Storage Needed Counter

SO0_PRIM_STORAGE_NEEDED - Stream Output 0 Primitive Storage Needed Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64

Address:	05240h-05247h
Name:	Stream Output 0 Primitive Storage Needed Counter
ShortName:	SO0_PRIM_STORAGE_NEEDED

There is one 64-bit register for each of the 4 supported streams:

- 5240h-5247h SO_PRIM_STORAGE_NEEDED0 (for Stream Out Stream #0)
- 5248h-524Fh SO_PRIM_STORAGE_NEEDED1 (for Stream Out Stream #1)
- 5250h-5257h SO_PRIM_STORAGE_NEEDED2 (for Stream Out Stream #2)
- 5258h-525Fh SO_PRIM_STORAGE_NEEDED3 (for Stream Out Stream #3)

These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has or would have written to a particular "stream's" Streamed Vertex Output buffers if all buffers had been large enough to accommodate the writes. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

DWord	Bit	Description
0	31:0	**Prim Storage Needed Count 0** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.
1	31:0	**Prim Storage Needed Count 1** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.

Stream Output 0 Write Offset

SO0_WRITE_OFFSET - Stream Output 0 Write Offset

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	05280h-05283h
Name:	Stream Output 0 Write Offset
ShortName:	SO0_WRITE_OFFSET

There is one R/W 32-bit register for each of the 4 supported stream output buffer slots:
5280h-5283h SO_WRITE_OFFSET0 (for Stream Out Buffer #0)
5284h-5287h SO_WRITE_OFFSET1 (for Stream Out Buffer #1)
5288h-528Bh SO_WRITE_OFFSET2 (for Stream Out Buffer #2)
528Ch-528Fh SO_WRITE_OFFSET3 (for Stream Out Buffer #3)
These registers are used to set and track a DWord-granular Write Offset for each of the 4 Stream Output Buffer slots. Software can directly write them via MI_LOAD_REGxxx commands. The SOL stage will increment them as part of stream output processing. Software can cause them to be written to memory via MI_STORE_REGxxx commands. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

Programming Notes

- Software must ensure that no HW stream output operations can be in process or otherwise pending at the point that the MI_LOAD/STORE commands are processed. This will likely require a pipeline flush.
- The SOL stage will effectively advance the write offset by the buffer's Surface Pitch after each vertex is written (assuming no overflow is detected in any targeted SO buffer). Under "normal" conditions one would expect software to initialize the WriteOffset to some (possibly zero) multiple of Surface Pitch in order to align vertex writes to the buffer's Base Address, though it is not required to do so.

DWord	Bit	Description
0	31:2	**Write Offset** Format: U30 _Custom_GTIReset: DEV This field contains a DWord offset from the corresponding SO buffer's Base Address value. The SOL stage uses this value as a write offset when performing writes to the buffer. The SOL stage will increment this value as a part of performing stream output to the buffer. Note that the SOL stage uses the buffer's Surface Pitch to advance the Write Offset, without regard to the buffer's Base Address (see Programming Notes above).
	1:0	**Reserved** Access: RO Format: MBZ

Stream Output 1 Num Primitives Written Counter

SO1_NUM_PRIMS_WRITTEN - Stream Output 1 Num Primitives Written Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	05208h-0520Fh
Name:	Stream Output 1 Num Primitives Written Counter
ShortName:	SO1_NUM_PRIMS_WRITTEN

There is one 64-bit register for each of the 4 supported streams:
5200h-5207h SO_NUM_PRIMS_WRITTEN0 (for Stream Out Stream #0)
5208h-520Fh SO_NUM_PRIMS_WRITTEN1 (for Stream Out Stream #1)
5210h-5217h SO_NUM_PRIMS_WRITTEN2 (for Stream Out Stream #2)
5218h-521Fh SO_NUM_PRIMS_WRITTEN3 (for Stream Out Stream #3)
These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has successfully written to a particular "stream's" Streamed Vertex Output buffers, subject to buffer overflow detection. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

DWord	Bit	Description
0	31:0	**Num Prims Written Count 0** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) every time a GS thread outputs a DataPort Streamed Vertex Buffer Write message with the Increment Num Prims Written bit set in the message header (see the Geometry Shader and Data Port chapters in the 3D Volume.)
1	31:0	**Num Prims Written Count 1** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) every time a GS thread outputs a DataPort Streamed Vertex Buffer Write message with the Increment Num Prims Written bit set in the message header (see the Geometry Shader and Data Port chapters in the 3D Volume.)

Stream Output 1 Primitive Storage Needed Counter

SO1_PRIM_STORAGE_NEEDED - Stream Output 1 Primitive Storage Needed Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	05248h-0524Fh
Name:	Stream Output 1 Primitive Storage Needed Counter
ShortName:	SO1_PRIM_STORAGE_NEEDED

There is one 64-bit register for each of the 4 supported streams:
5240h-5247h SO_PRIM_STORAGE_NEEDED0 (for Stream Out Stream #0)
5248h-524Fh SO_PRIM_STORAGE_NEEDED1 (for Stream Out Stream #1)
5250h-5257h SO_PRIM_STORAGE_NEEDED2 (for Stream Out Stream #2)
5258h-525Fh SO_PRIM_STORAGE_NEEDED3 (for Stream Out Stream #3)
These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has or would have written to a particular "stream's" Streamed Vertex Output buffers if all buffers had been large enough to accommodate the writes. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

DWord	Bit	Description
0	31:0	**Prim Storage Needed Count 0** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.
1	31:0	**Prim Storage Needed Count 1** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.

Stream Output 1 Write Offset

SO1_WRITE_OFFSET - Stream Output 1 Write Offset

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	05284h-05287h
Name:	Stream Output 1 Write Offset
ShortName:	SO1_WRITE_OFFSET

There is one R/W 32-bit register for each of the 4 supported stream output buffer slots:
5280h-5283h SO_WRITE_OFFSET0 (for Stream Out Buffer #0)
5284h-5287h SO_WRITE_OFFSET1 (for Stream Out Buffer #1)
5288h-528Bh SO_WRITE_OFFSET2 (for Stream Out Buffer #2)
528Ch-528Fh SO_WRITE_OFFSET3 (for Stream Out Buffer #3)
These registers are used to set and track a DWord-granular Write Offset for each of the 4 Stream Output Buffer slots. Software can directly write them via MI_LOAD_REGxxx commands. The SOL stage will increment them as part of stream output processing. Software can cause them to be written to memory via MI_STORE_REGxxx commands. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

Programming Notes

- Software must ensure that no HW stream output operations can be in process or otherwise pending at the point that the MI_LOAD/STORE commands are processed. This will likely require a pipeline flush.
- The SOL stage will effectively advance the write offset by the buffer's Surface Pitch after each vertex is written (assuming no overflow is detected in any targeted SO buffer). Under "normal" conditions one would expect software to initialize the WriteOffset to some (possibly zero) multiple of Surface Pitch in order to align vertex writes to the buffer's Base Address, though it is not required to do so.

DWord	Bit	Description
0	31:2	**Write Offset** Format: U30 _Custom_GTIReset: DEV This field contains a DWord offset from the corresponding SO buffer's Base Address value. The SOL stage uses this value as a write offset when performing writes to the buffer. The SOL stage will increment this value as a part of performing stream output to the buffer. Note that the SOL stage uses the buffer's Surface Pitch to advance the Write Offset, without regard to the buffer's Base Address (see Programming Notes above).
	1:0	**Reserved** Access: RO Format: MBZ

Stream Output 2 Num Primitives Written Counter

SO2_NUM_PRIMS_WRITTEN - Stream Output 2 Num Primitives Written Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	05210h-05217h
Name:	Stream Output 2 Num Primitives Written Counter
ShortName:	SO2_NUM_PRIMS_WRITTEN

There is one 64-bit register for each of the 4 supported streams:
5200h-5207h SO_NUM_PRIMS_WRITTEN0 (for Stream Out Stream #0)
5208h-520Fh SO_NUM_PRIMS_WRITTEN1 (for Stream Out Stream #1)
5210h-5217h SO_NUM_PRIMS_WRITTEN2 (for Stream Out Stream #2)
5218h-521Fh SO_NUM_PRIMS_WRITTEN3 (for Stream Out Stream #3)
These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has successfully written to a particular "stream's" Streamed Vertex Output buffers, subject to buffer overflow detection. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

DWord	Bit	Description
0	31:0	**Num Prims Written Count 0** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) every time a GS thread outputs a DataPort Streamed Vertex Buffer Write message with the Increment Num Prims Written bit set in the message header (see the Geometry Shader and Data Port chapters in the 3D Volume.)
1	31:0	**Num Prims Written Count 1** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) every time a GS thread outputs a DataPort Streamed Vertex Buffer Write message with the Increment Num Prims Written bit set in the message header (see the Geometry Shader and Data Port chapters in the 3D Volume.)

Stream Output 2 Primitive Storage Needed Counter

SO2_PRIM_STORAGE_NEEDED - Stream Output 2 Primitive Storage Needed Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	05250h-05257h
Name:	Stream Output 2 Primitive Storage Needed Counter
ShortName:	SO2_PRIM_STORAGE_NEEDED

There is one 64-bit register for each of the 4 supported streams:
5240h-5247h SO_PRIM_STORAGE_NEEDED0 (for Stream Out Stream #0)
5248h-524Fh SO_PRIM_STORAGE_NEEDED1 (for Stream Out Stream #1)
5250h-5257h SO_PRIM_STORAGE_NEEDED2 (for Stream Out Stream #2)
5258h-525Fh SO_PRIM_STORAGE_NEEDED3 (for Stream Out Stream #3)
These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has or would have written to a particular "stream's" Streamed Vertex Output buffers if all buffers had been large enough to accommodate the writes. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

DWord	Bit	Description
0	31:0	**Prim Storage Needed Count 0** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.
1	31:0	**Prim Storage Needed Count 1** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.

Stream Output 2 Write Offset

SO2_WRITE_OFFSET - Stream Output 2 Write Offset

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	05288h-0528Bh
Name:	Stream Output 2 Write Offset
ShortName:	SO2_WRITE_OFFSET

There is one R/W 32-bit register for each of the 4 supported stream output buffer slots:
5280h-5283h SO_WRITE_OFFSET0 (for Stream Out Buffer #0)
5284h-5287h SO_WRITE_OFFSET1 (for Stream Out Buffer #1)
5288h-528Bh SO_WRITE_OFFSET2 (for Stream Out Buffer #2)
528Ch-528Fh SO_WRITE_OFFSET3 (for Stream Out Buffer #3)
These registers are used to set and track a DWord-granular Write Offset for each of the 4 Stream Output Buffer slots. Software can directly write them via MI_LOAD_REGxxx commands. The SOL stage will increment them as part of stream output processing. Software can cause them to be written to memory via MI_STORE_REGxxx commands. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

Programming Notes

- Software must ensure that no HW stream output operations can be in process or otherwise pending at the point that the MI_LOAD/STORE commands are processed. This will likely require a pipeline flush.
- The SOL stage will effectively advance the write offset by the buffer's Surface Pitch after each vertex is written (assuming no overflow is detected in any targeted SO buffer). Under "normal" conditions one would expect software to initialize the WriteOffset to some (possibly zero) multiple of Surface Pitch in order to align vertex writes to the buffer's Base Address, though it is not required to do so.

DWord	Bit	Description
0	31:2	**Write Offset** Format: U30 _Custom_GTIReset: DEV This field contains a DWord offset from the corresponding SO buffer's Base Address value. The SOL stage uses this value as a write offset when performing writes to the buffer. The SOL stage will increment this value as a part of performing stream output to the buffer. Note that the SOL stage uses the buffer's Surface Pitch to advance the Write Offset, without regard to the buffer's Base Address (see Programming Notes above).
	1:0	**Reserved** Access: RO Format: MBZ

Stream Output 3 Num Primitives Written Counter

SO3_NUM_PRIMS_WRITTEN - Stream Output 3 Num Primitives Written Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	05218h-0521Fh
Name:	Stream Output 3 Num Primitives Written Counter
ShortName:	SO3_NUM_PRIMS_WRITTEN

There is one 64-bit register for each of the 4 supported streams:
5200h-5207h SO_NUM_PRIMS_WRITTEN0 (for Stream Out Stream #0)
5208h-520Fh SO_NUM_PRIMS_WRITTEN1 (for Stream Out Stream #1)
5210h-5217h SO_NUM_PRIMS_WRITTEN2 (for Stream Out Stream #2)
5218h-521Fh SO_NUM_PRIMS_WRITTEN3 (for Stream Out Stream #3)
These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has successfully written to a particular "stream's" Streamed Vertex Output buffers, subject to buffer overflow detection. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

DWord	Bit	Description
0	31:0	**Num Prims Written Count 0** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) every time a GS thread outputs a DataPort Streamed Vertex Buffer Write message with the Increment Num Prims Written bit set in the message header (see the Geometry Shader and Data Port chapters in the 3D Volume.)
1	31:0	**Num Prims Written Count 1** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) every time a GS thread outputs a DataPort Streamed Vertex Buffer Write message with the Increment Num Prims Written bit set in the message header (see the Geometry Shader and Data Port chapters in the 3D Volume.)

Stream Output 3 Primitive Storage Needed Counter

SO3_PRIM_STORAGE_NEEDED - Stream Output 3 Primitive Storage Needed Counter

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
Address:	05258h-0525Fh
Name:	Stream Output 3 Primitive Storage Needed Counter
ShortName:	SO3_PRIM_STORAGE_NEEDED

There is one 64-bit register for each of the 4 supported streams:
5240h-5247h SO_PRIM_STORAGE_NEEDED0 (for Stream Out Stream #0)
5248h-524Fh SO_PRIM_STORAGE_NEEDED1 (for Stream Out Stream #1)
5250h-5257h SO_PRIM_STORAGE_NEEDED2 (for Stream Out Stream #2)
5258h-525Fh SO_PRIM_STORAGE_NEEDED3 (for Stream Out Stream #3)
These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has or would have written to a particular "stream's" Streamed Vertex Output buffers if all buffers had been large enough to accommodate the writes. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

DWord	Bit	Description
0	31:0	**Prim Storage Needed Count 0** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.
1	31:0	**Prim Storage Needed Count 1** Format: U32 _Custom_GTIReset: DEV This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.

Stream Output 3 Write Offset

SO3_WRITE_OFFSET - Stream Output 3 Write Offset

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	0528Ch-0528Fh
Name:	Stream Output 3 Write Offset
ShortName:	SO3_WRITE_OFFSET

There is one R/W 32-bit register for each of the 4 supported stream output buffer slots:
5280h-5283h SO_WRITE_OFFSET0 (for Stream Out Buffer #0)
5284h-5287h SO_WRITE_OFFSET1 (for Stream Out Buffer #1)
5288h-528Bh SO_WRITE_OFFSET2 (for Stream Out Buffer #2)
528Ch-528Fh SO_WRITE_OFFSET3 (for Stream Out Buffer #3)
These registers are used to set and track a DWord-granular Write Offset for each of the 4 Stream Output Buffer slots. Software can directly write them via MI_LOAD_REGxxx commands. The SOL stage will increment them as part of stream output processing. Software can cause them to be written to memory via MI_STORE_REGxxx commands. (See the Stream Output section of the 3D pipeline volume).
These registers are part of the context save and restore.

Programming Notes

- Software must ensure that no HW stream output operations can be in process or otherwise pending at the point that the MI_LOAD/STORE commands are processed. This will likely require a pipeline flush.
- The SOL stage will effectively advance the write offset by the buffer's Surface Pitch after each vertex is written (assuming no overflow is detected in any targeted SO buffer). Under "normal" conditions one would expect software to initialize the WriteOffset to some (possibly zero) multiple of Surface Pitch in order to align vertex writes to the buffer's Base Address, though it is not required to do so.

DWord	Bit	Description
0	31:2	**Write Offset** Format: U30 _Custom_GTIReset: DEV This field contains a DWord offset from the corresponding SO buffer's Base Address value. The SOL stage uses this value as a write offset when performing writes to the buffer. The SOL stage will increment this value as a part of performing stream output to the buffer. Note that the SOL stage uses the buffer's Surface Pitch to advance the Write Offset, without regard to the buffer's Base Address (see Programming Notes above).

SubSlice unit Level Clock Gating override during rstflow 9540

SSMMISCCP9540 - SubSlice unit Level Clock Gating override during rstflow 9540		
Register Space: MMIO: 0/2/0 Size (in bits): 32		
Address: 09540h		
Unit Level Clock Gating Disable bits		
DWord	**Bit**	**Description**
0	31:0	**ECO Spare Bits** Access: R/W _Custom_GTIReset: BUS

Subsystem Identification

SID2_0_2_0_PCI - Subsystem Identification

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	0002Eh

This register is used to uniquely identify the subsystem where the PCI device resides.

DWord	Bit	Description
0	15:0	**Subsystem Identification** Default Value: 0000000000000000b Access: R/W _Custom_GTIReset: BUS This value is used to identify a particular subsystem. This field should be programmed by BIOS during boot-up.

Subsystem Vendor Identification

SVID2_0_2_0_PCI - Subsystem Vendor Identification

Register Space:	PCI: 0/2/0
Size (in bits):	16
Address:	0002Ch

This register is used to uniquely identify the subsystem where the PCI device resides.

DWord	Bit	Description
0	15:0	**Subsystem Vendor ID** Access: R/W _Custom_GTIReset: BUS This value is used to identify the vendor of the subsystem. Value: 0000000000000000b — Name: **[Default]**

Supported Page Sizes

SUPPORTED_PAGE_SIZES_0_2_0_PCI - Supported Page Sizes

Register Space: PCI: 0/2/0
Size (in bits): 32

Address: 0033Ch

DWord	Bit	Description
0	31:0	**SUPPORTED PAGE SIZES VALUE** Access: RO _Custom_GTIReset: BUS This field indicates the page sizes supported by the PF. This PF supports a page size of 2^(n+12) if bit n is Set. For example, if bit 0 is Set, the PF supports 4-KB page sizes. PFs are required to support 4-KB, 8-KB, 64-KB, 256-KB, 1-MB, and 4-MB page sizes. All other page sizes are optional, and not supported in this implementation. Value: 00000000000000000000010101010011b — Name: **[Default]**

SVG Debug Control

SVG_CTL - SVG Debug Control

Register Space: MMIO: 0/2/0
Size (in bits): 32

Address: 06400h-06403h

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:8	**Debug Output Mux Select** Controls which 32 bits of the debug data are returned

Value	Name
0	Return General State Base Address for the context that has debug enabled
1	Return Surface State Base Address for the context that has debug enabled
2	Return Indirect Object Base Address for the context that has debug enabled
3	Return General State Access Upper Bound for the context that has debug enabled
4	Return Indirect Object Access Upper Bound for the context that has debug enabled
5	Return Instruction base address for the context that has debug enabled
6	Return Instruction address upper bound for the context that has debug enabled
7	Return System Instruction Pointer for the context that has debug enabled
[8,255]	Reserved: MBZ

	7:0	**Reserved** Access: RO Format: MBZ

SVG Debug Return Data

SVG_RDATA - SVG Debug Return Data		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	06404h-06407h	
DWord	**Bit**	**Description**
0	31:0	**SVG Debug Data** Returns data based on debug output mux select.

SVL Barrier Done

SVL_BARRIER_DONE - SVL Barrier Done		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	07FF0h	
This register is used to send messages when a render barrier is done. This register may not be written from CPU.		
DWord	**Bit**	**Description**
0	31:16	**Reserved** Access: RO Format: MBZ
	15:8	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	7:0	**BarrierID**

SWF

SWF	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	4F000h-4F08Fh
Name:	Software Flags
ShortName:	SWF_*

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

DWord	Bit	Description
0	31:0	**Software Flags** Default Value: 00000000000000000000000000000000b Access: R/W _Custom_GTIReset: BUS Software flags

System Page Sizes

SYSTEM_PAGE_SIZES_0_2_0_PCI - System Page Sizes		
Register Space:	PCI: 0/2/0	
Size (in bits):	32	
Address:	00340h	
Defines the System Page Size chosen by the VMM.		
DWord	**Bit**	**Description**
0	31:0	**SYSTEM PAGE SIZES VALUE** Default Value: 00000000000000000000000000000001b Access: RO _Custom_GTIReset: BUS This field defines the page size the system will use to map the VFs memory addresses. Software must set the value of the System Page Size to one of the page sizes set in the Supported Page Sizes field (see Section 3.3.12). As with Supported Page Sizes, if bit nis Set in System Page Size, the VFs associated with this PF are required to support a page size of 2^(n+12). For example, if bit 1 is Set, the system is using an 8-KB page size. The results are undefined if System Page Size is zero. The results are undefined if more than one bit is set in System Page Size. The results are undefined if a bit is Set in System Page Size that is not Set in Supported Page Sizes. When System Page Size is set, the VF associated with this PF is required to align all BAR resources 20 on a System Page Size boundary. Each VF BARn or VF BARn pair (see Section 3.3.14) shall be aligned on a System Page Size boundary. Each VF BARn or VF BARn pair defining a non-zero address space shall be sized to consume an integer multiple of System Page Size bytes. All data structures requiring page size alignment within a VF shall be aligned on a System Page Size boundary. VF Enable must be zero when System Page Size is written. The results are undefined if System Page Size is written when VF Enable is Set. Default value is 1h (i.e., 4 KB), and that is the only value allowed for this implementation

Tailpointer delay counter

TP_DELAY_CNTR - Tailpointer delay counter	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	1C2DA0h-1C2DA3h
Name:	Tailpointer delay counter
ShortName:	TP_DELAY_CNTR_VDENC_REG0
Address:	1C6DA0h-1C6DA3h
Name:	Tailpointer delay counter
ShortName:	TP_DELAY_CNTR_VDENC_REG1
Address:	1D2DA0h-1D2DA3h
Name:	Tailpointer delay counter
ShortName:	TP_DELAY_CNTR_VDENC_REG2
Address:	1D6DA0h-1D6DA3h
Name:	Tailpointer delay counter
ShortName:	TP_DELAY_CNTR_VDENC_REG3
Address:	1E2DA0h-1E2DA3h
Name:	Tailpointer delay counter
ShortName:	TP_DELAY_CNTR_VDENC_REG4
Address:	1E6DA0h-1E6DA3h
Name:	Tailpointer delay counter
ShortName:	TP_DELAY_CNTR_VDENC_REG5
Address:	1F2DA0h-1F2DA3h
Name:	Tailpointer delay counter
ShortName:	TP_DELAY_CNTR_VDENC_REG6
Address:	1F6DA0h-1F6DA3h
Name:	Tailpointer delay counter
ShortName:	TP_DELAY_CNTR_VDENC_REG7

This register has stall counter for the VDENC. In an ideal case, this value should be zero

DWord	Bit	Description
0	31:0	**Tail pointer count delay** Access: R/W Hardware Clear

Thread Dispatched Count Register

TDL_THR_DISP_COUNT - Thread Dispatched Count Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0E4BCh

This register provides the count of threads dispatched/valid in the subslice.

DWord	Bit	Description
0	31:6	**Reserved** Access: RO Format: MBZ
	5:0	**Thread Count** Value: 0-56 — Name: Valid Range

Thread Faulted Count Register

TDL_THR_PF_COUNT - Thread Faulted Count Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	0E5BCh

This register provides the count of threads faulted in each subslice.

DWord	Bit	Description
0	31	**Canonical fault indication bit to CS** The bit is set when a canonical fault on data fetch is reported by EU.
	30:6	**Reserved** Access: RO Format: MBZ
	5:0	**Thread Count** Value: 0-56 — Name: Valid Range

Thread Fault Status Register 0

TDL_THR_PF_STATUS0 - Thread Fault Status Register 0			
Register Space:	MMIO: 0/2/0		
Access:	RO		
Size (in bits):	32		
Address:	0E6B8h		
This register provides the status of each thread in the SubSlice. A bit set indicates the thread in the specific thread slot is faulted.			
DWord	**Bit**	**Description**	
0	31:24	**Row0, EU3, [Reserved, T6-T0]**	
	23:16	**Row0, EU2, [Reserved, T6-T0]**	
	15:8	**Row0, EU1, [Reserved, T6-T0]**	
	7:0	**Row0, EU0, [Reserved, T6-T0]**	

Thread Fault Status Register 1

TDL_THR_PF_STATUS1 - Thread Fault Status Register 1	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	0E7B8h

This register provides the status of each thread in the SubSlice. A bit set indicates the thread in the specific thread slot is faulted.

DWord	Bit	Description
0	31:24	**Row1, EU3, [Reserved, T6-T0]**
	23:16	**Row1, EU2, [Reserved, T6-T0]**
	15:8	**Row1, EU1, [Reserved, T6-T0]**
	7:0	**Row1, EU0, [Reserved, T6-T0]**

Thread Load Status Register 0

TDL_THR_STATUS0 - Thread Load Status Register 0	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0E4B8h

This register provides the status of each thread in the SubSlice.

DWord	Bit	Description
0	31:0	**Reserved** Access: RO Format: MBZ

Thread Load Status Register 1

TDL_THR_STATUS1 - Thread Load Status Register 1	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0E5B8h

This register provides the status of each thread in the SubSlice. A bit set indicates a valid thread is loaded in the thread slot.

DWord	Bit	Description
0	31:24	**Row1, EU3, [Reserved, T6-T0]**
	23:16	**Row1, EU2, [Reserved, T6-T0]**
	15:8	**Row1, EU1, [Reserved, T6-T0]**
	7:0	**Row1, EU0, [Reserved, T6-T0]**

Thread Mode Register

FF_MODE - Thread Mode Register

Register Space: MMIO: 0/2/0
Access: R/W
Size (in bits): 32
_Custom_GTIReset: DEV

This register is used to program the FF shader Mode.

DWord	Bit	Description
0	31	**TE Autostrip Disable** Format: U1 Value / Name / Description: 0h / Enable **[Default]** / TE will generate "autostrip" primitives (if/where possible) during tessellation. 1h / Disable / TE will not generate "autostrip" primitives.
	30	**TDS external Cache Disable** Value / Name / Description: 0b / Enable **[Default]** / The external TDS Cache is enabled if there is enough handles to enable the cache. 1b / Disable / The external TDS Cache is disabled even if there is enough handles to enable the cache. Only the internal TDS Cache will be used.
	29:26	**DS Hit Max Value** Format: U4 If the number of hits reaches the DS Hit Max Value and there is a pending miss to be dispatched, the DS will dispatch the pending miss vertex as a single dispatch. Programming a value of 0 will disable the DS Hit Max counter logic and therefore partial dispatches will not be forced due to the number of hits seen during the accumulation of inputs for a thread dispatch. Value / Name: 15 / **[Default]** [0,15] /
	25:20	**VS Hit Max Value** Format: U6 If the number of hits reaches the VS Hit Max Value and there is a pending miss to be dispatched, the VS will dispatch the pending miss vertex as a single dispatch. Since VS Reference Count Full Force miss enable was removed, the value can be [1,63].

FF_MODE - Thread Mode Register

Value	Name
10	**[Default]**
[1,63]	

19 **Tessellation DOP gating Disable**

Format:	Disable

Value	Name	Description
0h	Enable **[Default]**	HS, TE, TETG, DS, GS and SOL units are DOP gated if all units are disabled
1h	Disable	DOP gating is disabled for HS, TE, TETG, DS, GS and SOL units

Programming Notes
Once this bit is set to a 1, it must not be cleared to a 0 until after a reset.

18 **TRI NOINSIDE Autostrip Cache Invalidate Disable**

Format:	Disable

This bit can be used to control the TRI NOINSIDE Autostrip Cache Invalidate feature. By default the invalidation is ENABLED (allowing higher performance).

Value	Name	Description
0h	Enable **[Default]**	TE will suppress the Autostrip cache invalidate for TRI NOINSIDE patches. This setting may improve performance.
1h	Disable	TE will not suppress the Autostrip cache invalidate for TRI NOINSIDE patches.

Programming Notes
The setting of this field impacts the selection of the "provoking vertex" for the center triangle of TRI domains (if a center triangle exists given the tessellation factors), and this will in turn impact the generated image if any PS attributes are enabled as "flat shaded" and that/those attributes are not identical on all 3 vertices of the triangle. Given the fact that the APIs do not impose requirements on the starting/provoking vertices of the tessellation-generated triangles, the selection of provoking vertices can be arbitrary as long as it is deterministic (i.e., repeated rendering the same patch will yield the same results). Note: If FF_mode.TE autostrip Disable is set to 1, then TRI NOINSIDE Autostrip Cache Invalidate will also be disabled.

17 **Thread fusing disable**

Value	Name	Description
1h	Disable	Fusing of threads will be disabled. Threads will not be fused.
0h	**[Default]**	Fusing of threads will be enabled. Threads will be fused if all conditions are met to fuse a thread.

FF_MODE - Thread Mode Register

	16:15	**Reserved** Format: PBC
	14:13	**Reserved** Format: PBC
	12	**Reserved** Default Value: 0h Format: PBC
	11:7	**Reserved** Format: PBC
	6:5	**Reserved** Format: PBC
	4	**Reserved** Default Value: 0h Format: PBC
	3	**Reserved** Format: PBC
	2	**TDS Tracking fifo wrap fix disable** Format: Disable **Value** / **Name** / **Description** 1h / / Disable the tds tracking fifo wrap fix. 0h / **[Default]** / Enable the tds tracking fifo wrap fix.
	1	**Reserved** Format: PBC
	0	**Reserved** Format: PBC

Thread Restart Control Register

TDL_THR_RESTART - Thread Restart Control Register		
Register Space:	MMIO: 0/2/0	
Access:	WO	
Size (in bits):	32	
Address:	0E450h	
This register provides control to restart page faulted and halted threads in each subslice.		
DWord	**Bit**	**Description**
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Restart All Faulted Threads** A write of 1 to this register restarts all threads that have halted due to page fault.

Tile Cache Control Register

TCCNTLREG - Tile Cache Control Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B138h
Name:	Tile Cache Control Register
ShortName:	TCCNTLREG
Address:	0B238h
ShortName:	TCCNTLREG_CCS0

DWord	Bit	Description
0	31:25	**Unified Tile Cache Pool** Access: R/W Number of ways allocated for the unified client pool. This is a combined pool for all streams. 00h **[Default]** When this field is non-zero, Z tile cache pool and C tile cache pool should be 0KB. [0h,68h]
	24:18	**Z Tile Cache Pool** Access: R/W Number of ways allocated for Z streams. 00h **[Default]** Note: This field must be 0KB if Unified Tile cache Pool is non-zero. [0h,68h]
	17:11	**C Tile Cache Pool** Access: R/W Number of ways allocated for Color Streams 00h **[Default]** Note: This field must be 0KB if Unified Tile cache Pool is non-zero. [0h,68h]
	10:4	**Command Streamer Allocation** Access: R/W Number of ways allocated for CS(Command Streamer) 00h **[Default]** [0h,68h]

TCCNTLREG - Tile Cache Control Register

	3	**Reserved** Access: RO Format: MBZ
	2	**L3 Data partial write merging enable** Default Value: 1 Format: Enable
	1	**Color/Z write partial write merging enable** Format: Enable **Value** / **Name** / **Description** 0 / **[Default]** / Partial write merging optimization (in SQDB) will be disabled for Color/Z bound cycles.
	0	**Reserved** Access: RO Format: MBZ

TILECTL

TILECTL - TILECTL		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	101000h	
Tile control and TLB control.		

DWord	Bit	Description
0	31:2	**Reserved** Access: RO Format: MBZ
	1	**TLBPF** Default Value: 0b Access: R/W _Custom_GTIReset: BUS Store multiple PTE enable. 0: Only one Page Table Entry is stored in the Translation Lookaside Buffer cache. 1: Multiple Page Table Entries (8) are stored in the Translation Lookaside Buffer cache.
	0	**SWZCTL** Default Value: 0b Access: R/W _Custom_GTIReset: BUS In order to spread DRAM accesses between multiple channels in the most efficient way, address bits can be used as a channel select. The Driver needs to obtain the need for memory address swizzling via DRAM configuration registers and set the following bits. x0b - No Address Swizzling x1b - Address bit [6] needs to be swizzled for tiled surfaces

TiledResources Invalid Tile Detection Register

TRINVTILEDETCT - TiledResources Invalid Tile Detection Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	04DECh
Name:	TiledResources Invalid Tile Detection Register
ShortName:	TRINVTILEDETCT

DWord	Bit	Description
0	31:0	**Invalid Tile Detection Value** Access: R/W _Custom_GTIReset: DEV **Value** / **Name** / **Description** 00000000h / **[Default]** / A 32-bit value programmed to enable h/w to perform a match of TR-VA TT entries to detect Invalid Tiles. Hardware will flag each entry and space behind it as Invalid Tile for matched entries.

TiledResources VA Detection Registers

TRVADR - TiledResources VA Detection Registers

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	04DF0h
Name:	TiledResources VA Detection Registers
ShortName:	TRVADR

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7:4	**TR - VA Mask Value** Default Value: 0000b Access: R/W _Custom_GTIReset: DEV 4bit MASK value that is mapped to incoming address bits[47:44] MASK bits are used to identify which address bits need to be considered for compare. If particular mask bit is "1", mapping address bit needs to be compared to DATA value provided. If "0", corresponding address bit is masked which makes it don't care for compare. (This field defaults to "0000" to disable detection.). Note: The only usage model for GFX driver to set this field to "1111". Behavior of h/w for any other setting is not defined. Note: GFX driver shall use same TRVA MASK value for all contexts.
	3:0	**TR- VA Data Value** Access: R/W _Custom_GTIReset: DEV Value / Name / Description: 0000b **[Default]** 4bit Data value that is mapped to incoming address bits[47:44]. Data bits are used to compare address values that are not filtered by the TRVAMV for match Note: GFX driver shall use same TRVA Data value for all contexts

Tiled Resources Wrapper Write Data Port arbitration

TRWRPARB - Tiled Resources Wrapper Write Data Port arbitration

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	04DF8h
Name:	Tiled Resources Wrapper Write Data Port arbitration
ShortName:	TRWRPARB

DWord	Bit	Description
0	31:13	**Reserved** Access: RO Format: MBZ
	12:10	**L3 Max Write Request Limit Count** Default Value: 100b Access: R/W _Custom_GTIReset: DEV This is the MAX number of Allowed writes from L3 before switching the priority to Z Requests Count - Minimum count value must be 1
	9	**Reserved** Access: RO Format: MBZ
	8:6	**Z Max Write Request Limit Count** Default Value: 010b Access: R/W _Custom_GTIReset: DEV This is the MAX number of Allowed writes from Z before switching the priority to C Requests Count - Minimum count value must be = 1
	5	**Reserved** Access: RO Format: MBZ
	4:2	**C Max Write Request Limit Count** Default Value: 010b Access: R/W _Custom_GTIReset: DEV This is the MAX number of Allowed writes from C before switching to L3 Request Count - Minimum count value = 1

TRWRPARB - Tiled Resources Wrapper Write Data Port arbitration

	1	**Reserved** Access: RO Format: MBZ
	0	**Fixed Arbitration enable** Default Value: 1b Access: R/W _Custom_GTIReset: DEV Fixed Arbitration enable when 1'b1 Programmable arbitration when 1'b0

TIMESTAMP_CTR

TIMESTAMP_CTR	
Register Space:	MMIO: 0/2/0
Access:	R/WC
Size (in bits):	32
Address:	44070h-44073h
Name:	Time Stamp Counter
ShortName:	TIMESTAMP_CTR
Reset:	global

The register is not reset by a FLR.

DWord	Bit	Description
0	31:0	**TIMESTAMP Counter** This field increments every microsecond. The value in this field is latched in the Pipe Flip TIMESTAMP registers when flips occur, and in the Pipe Frame TIMESTAMP registers at start of vertical blank. The register value will reset if any value is written to it. The register is not reset by a FLR.

TLBInvalidationRegister_BLT

BLT_TLB_INV_CR - TLBInvalidationRegister_BLT

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0CEE4h
Name:	BLT TLB Invalidation Register
ShortName:	BLT_TLB_INV_CR

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Invalidate TLBs on the corresponding Engine** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated engine and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. This bit is self clear.

TLBInvalidationRegister_GFX

GFX_TLB_INV_CR - TLBInvalidationRegister_GFX

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0CED8h
Name:	GFX TLB Invalidation Register
ShortName:	GFX_TLB_INV_CR

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Invalidate TLBs on the corresponding Engine** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated engine and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. This bit is self clear.

TLBInvalidationRegister_GUC

GUC_TLB_INV_CR - TLBInvalidationRegister_GUC

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
_Custom_GTIHardWiredEnable:	clr_reg_ga_cee8

Address:	0CEE8h
Name:	GUC TLB Invalidation Register
ShortName:	GUC_TLB_INV_CR
_Custom_GTIHardWiredEnable:	clr_reg_ga_cee8

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Invalidate TLBs on the corresponding Engine** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated engine and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. This bit is self clear.

TLBInvalidationRegister_OA

OA_TLB_INV_CR - TLBInvalidationRegister_OA

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0CEECh
Name:	OA TLB Invalidation Register
ShortName:	OA_TLB_INV_CR

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Invalidate TLBs on the corresponding Engine** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated engine and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs. This bit is self clear.

Top of Low Usable DRAM Register

TOLUD_REG - Top of Low Usable DRAM Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	108000h

This 32 bit register defines the Top of Low Usable DRAM. GT uses this to ensure no GT memory accesses occur between 4GB and TOLUD.

DWord	Bit	Description
0	31:20	**TOLUD** Default Value: 001h Access: R/W _Custom_GTIReset: BUS This register contains bits 31 to 20 of an address one byte above the maximum DRAM memory below 4G that is usable by the operating system. Address bits 31 down to 20 programmed to 01h implies a minimum memory size of 1MB. BIOS must set this value. Address bits 19:0 are assumed to be 0_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register.
	19:0	**Reserved** Access: RO Format: MBZ

TOUUD_LSB_REG

TOUUD_LSB_REG - TOUUD_LSB_REG

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	108080h

This 64 bit register defines the Top of Upper Usable DRAM. Address bits 19:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register and greater than or equal to 4GB. BIOS Restriction: Minimum value for TOUUD is 4GB.
All the bits in this register have SAI policy group protection.

DWord	Bit	Description
0	31:20	**TOUUD** Default Value: 001h Access: R/W _Custom_GTIReset: BUS This register contains the LSB portion (bits 31 to 20) of an address one byte above the maximum DRAM memory above 4G that is usable by the operating system. Address bits 19:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register and greater than 4GB.
	19:1	**Reserved** Access: RO Format: MBZ
	0	**SPARE** Default Value: 0b Access: R/W _Custom_GTIReset: BUS

TOUUD_MSB_REG

TOUUD_MSB_REG - TOUUD_MSB_REG		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SOC_Consumer:	BIOS	
Address:	108084h	
This is the most significant 32 bits of a 64 bit register that defines the Top of Upper Usable DRAM. BIOS Restriction: Minimum value for TOUUD is 4GB.		
DWord	**Bit**	**Description**
0	31:0	**TOUUD** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS This register contains bits 63 to 32 of an address one byte above the maximum DRAM memory above 4G that is usable by the operating system.

TRANS_CLK_SEL

TRANS_CLK_SEL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	46140h-46143h
Name:	Transcoder A Clock Select
ShortName:	TRANS_CLK_SEL_A
Reset:	soft
Address:	46144h-46147h
Name:	Transcoder B Clock Select
ShortName:	TRANS_CLK_SEL_B

TRANS_CONF

ShortName: TRANS_CONF_D

Reset: soft

DWord	Bit	Description
0	31	**Transcoder Enable** Setting this bit to the value of one, turns on this transcoder. Turning the transcoder off disables the timing generator and synchronization pulses to the display will not be maintained. Enabling the transcoder may be internally delayed for one frame while the display data buffers are re-configured. **Value** / **Name** 0b – Disable 1b – Enable **Restriction** Timing registers must contain valid values before this bit is enabled.
	30	**Transcoder State** Access: RO This read only bit indicates the actual state of the transcoder. **Value** / **Name** 0b – Disabled 1b – Enabled
	29:23	**Reserved** Access: RO Format: MBZ
	22:21	**Interlaced Mode** These bits control the transcoder interlaced mode. This field is ignored by WD. **Value** / **Name** / **Description** 00b – PF-PD – Progressive Fetch with Progressive Display 01b – PF-ID – Progressive Fetch with Interlaced Display 11b – IF-ID – Interlaced Fetch with Interlaced Display Others – Reserved – Reserved **Programming Notes** Progressive Fetch with Interlaced Display requires pipe scaling. **Restriction** VGA display modes do not work while in interlaced fetch mode. Progressive Fetch with Interlaced Display effectively down scales the vertical by 2X, which reduces the maximum supported pixel rate by half. Interlaced fetch mode is not supported with Y Tiling. Interlaced fetch mode is not supported

TRANS_CONF

		with 90/270 rotation. Interlaced fetch mode is not supported with scaling. Interlaced fetch mode is not supported with YUV 420 hybrid planar source pixel formats. In Interlaced mode, the plane height must be a minimum of 2 scanlines.
	20:12	**Reserved** Access: RO Format: MBZ
	11:8	**Reserved**
	7	**Reserved**
	6:0	**DP Audio Symbol Watermark** Default Value: 24h 36 entries This fields set the level to which the DP audio symbol RAM must fill before it starts to drain during horizontal blank. The minimum is 2 entries and the maximum is 64.

TRANS_DDI_FUNC_CTL

TRANS_DDI_FUNC_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B400h-6B403h
Name:	Transcoder DSI 0 DDI Function Control
ShortName:	TRANS_DDI_FUNC_CTL_DSI0
Reset:	soft

Reset:	soft
Address:	60400h-60403h
Name:	Transcoder DDI Function Control
ShortName:	TRANS_DDI_FUNC_CTL_A
Reset:	soft
Address:	61400h-61403h
Name:	Transcoder DDI Function Control
ShortName:	TRANS_DDI_FUNC_CTL_B
Reset:	soft
Address:	62400h-62403h
Name:	Transcoder DDI Function Control
ShortName:	TRANS_DDI_FUNC_CTL_C
Reset:	soft
Address:	63400h-63403h
Name:	Transcoder DDI Function Control
ShortName:	TRANS_DDI_FUNC_CTL_D
Reset:	soft

DWord	Bit	Description
0	31	**TRANS DDI Function Enable** This bit enables the transcoder DDI function. Value: 0b = Disable; 1b = Enable
	30:27	**DDI Select**

These bits determine which DDI port this transcoder will connect to. It is not valid to enable and direct more than one transcoder to one DDI, except when using DisplayPort multistreaming.

This field is ignored by the DSI transcoders since they have a fixed DDI mapping.

Value	Name
0000b	None
0001b	DDI A
0010b	DDI B
0011b	DDI C
0100b	DDI USBC1
0101b	DDI USBC2
0110b	DDI USBC3
0111b	DDI USBC4
1000b	DDI USBC5
1001b	DDI USBC6

Restriction
This field must not be changed while the function is enabled.

26:24 **TRANS DDI Mode Select**

This field determines the mode of operation. HDMI mode enables a null packet (32 bytes of a value of 0) to be sent when Vsync=1, and also enables preambles and guardbands prior to the null packets, in accordance with the HDMI specification. DVI mode will function as HDMI if DIP packets or audio are enabled.

This field does not apply to the DSI transcoder.

Value	Name	Description
000b	HDMI	Function in HDMI mode
001b	DVI	Function in DVI mode
010b	DP SST	Function in DisplayPort SST mode
011b	DP MST	Function in DisplayPort MST mode
Others	Reserved	Reserved

Restriction
This field must not be changed while the function is enabled. The DisplayPort mode (SST or MST) selected here must match the mode selected in the DisplayPort Transport Control register for the transport attached to this transcoder.
Trans DDI mode select should be programmed to MST in the same register write as MST transport select (field [11:10] in this register).

TRANS_DDI_FUNC_CTL

23 Reserved

Access:	RO
Format:	MBZ

22:20 Bits Per Color

This field selects the number of bits per color output on the DDI connected to this transcoder. Dithering should be enabled when selecting a pixel color depth higher or lower than the pixel color depth of the frame buffer.

This field does not apply to the DSI transcoder. The Pixel Format for the DSI transcoder is defined within the TRANS_DSI_FUNC_CONF register.

Value	Name	Description
000b	8 bpc	
001b	10 bpc	
010b	6 bpc	
011b	12 bpc	
Others	Reserved	Reserved

Restriction
This field must not be changed while the function is enabled.
6bpc not supported with HDMI.
6bpc not supported with VDSC.

19:18 Reserved

Access:	RO
Format:	MBZ

17:16 Sync Polarity

This field indicates the polarity of Hsync and Vsync.

Field ignored by the DSI transcoder

Value	Name	Description
00b	Low	VS and HS are active low (inverted)
01b	VS Low, HS High	VS is active low (inverted), HS is active high
10b	VS High, HS Low	VS is active high, HS is active low (inverted)
11b	High **[Default]**	VS and HS are active high

15 Reserved

Access:	RO
Format:	MBZ

TRANS_DDI_FUNC_CTL

14:12 DSI Input Select

These bits determine the input to transcoder DSI. These bits are ignored by the other transcoders.

Value	Name
000b	Pipe A
101b	Pipe B
110b	Pipe C
111b	Pipe D
Others	Reserved

Restriction
This field must not be changed while the function is enabled. It is not valid to have the same pipes driving multiple enabled transcoders.

11:10 MST Transport Select

This field selects which DP transport the DP data from this transcoder is sent to for MST stream combining. This field is ignored when MST is disabled.
Restriction : MST transport select should be programmed in the same register write as Trans DDI mode select (field [26:24] in this register).

Value	Name
00b	DPTP A
01b	DPTP B
10b	DPTP C
11b	DPTP D

Restriction
This field must not be changed while the function is enabled.

9 Reserved

8 DP VC Payload Allocate

This bit enables DisplayPort Virtual Channel payload allocation. This bit is ignored by transcoder EDP since it does not support multistreaming.
This bit is ignored by transcoder DSI since it does not support multistreaming

Value	Name
0b	Disable
1b	Enable

TRANS_DDI_FUNC_CTL

7 HDMI Scrambler CTS Enable

This bit enables Compliance Test Specification mode on the HDMI scrambler. This bit must be set before the scrambler is enabled.

This bit is ignored by transcoder DSI

Value	Name
0b	Disable
1b	True

6 HDMI Scrambler Reset frequency

This bit specifies the frequency at which the scrambler is reset when the HDMI Scrambler CTS Enable bit is set.

This bit must be set before or along with the HDMI Scrambler CTS Enable bit.

Value	Name	Description
0b	Every Line	SSCP sent on hsync of every line
1b	Every Other Line	SSCP sent on hsync of every other line

5 Reserved

4 High TMDS Char Rate

This field enables the high TMDS character rate. It must be enabled when the HDMI link symbol rate is greater than 340 MHz. It must be disabled when the HDMI link symbol rate is less than or equal to 340 MHz.

Value	Name	Description
0	Disable	TMDS Character Rate is less than or equal to 340 Mega-characters/second/channel
1	Enable	TMDS Character Rate is greater than 340 Mega-characters/second/channel

3:1 Port Width Selection

Description
This field selects the number of lanes to be enabled on the DDI link for DisplayPort and DSI. for DSI, this field specifies the number of Data lanes to use - the Clock lane is always enabled when the DSI function is enabled. This field is ignored for HDMI and DVI which always use all 4 lanes. The value selected here must match the value selected in the DDI Buffer Control register for the DDI attached to this pipe.

Value	Name	Description
000b	x1	x1 Mode
001b	x2	x2 Mode
010b	x3	[] x3 Mode (DSI only)
011b	x4	x4 Mode
Others	Reserved	Reserved

		Restriction This field must not be changed while the DDI is enabled.
	0	**HDMI Scrambling Enabled** Setting this bit enables scrambling over the HDMI link. Scrambling must be enabled when the HDMI link symbol rate is greater than 340 MHz. Scrambling should be enabled at lower frequencies if the receiver supports it at that speed. This must not changed while the port is enabled. **Value** / **Name** 0b / Disable 1b / Enable

TRANS_DDI_FUNC_CTL2

TRANS_DDI_FUNC_CTL2	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B404h-6B407h

Reset:	soft
Address:	63404h-63407h
Name:	Transcoder DDI Function Control2
ShortName:	TRANS_DDI_FUNC_CTL2_D
Reset:	soft

DWord	Bit	Description
0	31	**Genlock Enable** Value: 1b — Name: Enable Value: 0b — Name: Disable
	30:29	**Genlock Mode**

TRANS_DDI_FUNC_CTL2

Value	Name	Description
10b	Primary	Primary transcoder outputs frame sync for other transcoders to secondary to.
00b	Local Secondary	Local secondary transcoder secondaries to frame sync from a primary transcoder in the same device. The primary transcoder is selected by Port Sync Mode Primary Select.
01b	Remote Secondary	Remote secondary transcoder secondaries to frame sync from a primary transcoder in a different device.
11b	Reserved	

28 **Reserved**

Access:	RO
Format:	MBZ

27:9 **Reserved**

Access:	RO
Format:	MBZ

8 **Double Buffer Vactive**

Value	Name
0b	Normal Vactive
1b	Double Buffer Vactive

7:6 **Audio Mute Override**

This field overrides audio mutesignal in VBID.

Value	Name	Description
00b,01b	Do not override	
10b	Override and reset	Override audio mute bit to '0'.
11b	Override and set	Override audio mute bit to '1'.

5 **Dual Pipe Sync Enable**

This bit informs the DSI transcoder that while it is synchronized with another DSI transcoder, it will also be driven by a separate Pipe

Value	Name	Description
0b	Disabled	Both transcoders are being driven by a single Pipe (Dual Link - Single Pipe)
1b	Enabled	Each transcoder is being driven by a separate Pipe (Dual Link - Dual Pipe)

4 **Port Sync Mode Enable**

This field enables the DisplayPort port sync mode on this transcoder. This mode forces two or more transcoders to be in sync; with one transcoder primary and one or more transcoder secondaries. The primary is unaware that it is operating in this mode. Only the secondary is aware that it is operating in this mode. Port sync mode is only enabled in the secondary transcoder.

For DSI, this bit enables DSI Transcoder 1 to be a secondary to DSI Transcoder 0. DSI

TRANS_DDI_FUNC_CTL2

Transcoder 0 is unaware that it is the primary of DSI Transcoder 1

Value	Name
0b	Disable
1b	Enable

Restriction
Follow the instructions for enabling and disabling Sync Mode in the Display Mode Set Sequence - Sequence for DisplayPort. Port Sync Mode Primary Select must be programmed with a valid value when Port sync Mode is enabled. The secondary and primary transcoders and associated ports must have identical parameters and properties; same color format, link width (number of lanes enabled), resolution, refresh rate, PLL configuration, dot clock, TU size, M and N programming, etc. Spread spectrum clocking cannot be used when the ports use separate PLLs.
Port Sync Mode can be enabled with DisplayPort SST and with DisplayPort MST.

3 **Reserved**

Access:	RO
Format:	MBZ

2:0 **Port Sync Mode Primary Select**

Description
This field indicates which transcoder will be the primary to this transcoder when in port sync mode.
This field is ignored by the DSI transcoders since only DSI 0 can be the primary.
This field is also used for genlock for the local secondary transcoder to select a primary transcoder.

Value	Name
001b	Transcoder A
010b	Transcoder B
011b	Transcoder C
100b	Transcoder D

Restriction
A port cannot be secondaries to itself.
The DSI transcoders cannot be secondary to a non-DSI transcoder - field ignored by the DSI transcoder.

TRANS_DSI_FUNC_CONF

TRANS_DSI_FUNC_CONF

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6B030h-6B033h
Name:	Transcoder DSI 0 Function Configuration
ShortName:	TRANS_DSI_FUNC_CONF_0
Reset:	soft
Address:	6B830h-6B833h
Name:	Transcoder DSI 1 Function Configuration
ShortName:	TRANS_DSI_FUNC_CONF_1
Reset:	soft

This register defines the functional transcoder configuration that is specific to the DSI transcoders.

Restriction :
This register must be programmed before the DSI Transcoder function is enabled (i.e. TRANS DDI Function Enable)
The contents of this register must not be changed while the DSI Transcoder function is enabled

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:28	**Mode of Operation** Access: R/W This defines whether the DSI transcoder is in Video or Command mode. In addition to the main modes, there are two sub-modes per main mode. For the Command sub-modes, when in the "No Gate" mode, the transcoder will begin transmitting the frame pixels as soon as they are received from the Display Engine. When in the "TE Gate" mode, the transcoder will only start transmitting the frame pixels after a TE event is received. For the Video sub-modes, when in the Sync Event mode only Sync Start packets (VSS/HSS) are sent to the Periphery. When in the Sync Pulse mode, both Sync Start (VSS/HSS) and Sync End (VSE/HSE) packets are sent to the Periphery. Note that regardless of the programming of this field, until the Transcoder Enable bit is set within the TRANS_CONF_DSI register, the DSI transcoder will not generate any timing information to the Display Engine or timing packets to the Peripheral Value / Name: 00b — Command Mode (No Gate) 01b — Command Mode (TE Gate)

TRANS_DSI_FUNC_CONF

10b	Video Mode (Sync Event)
11b	Video Mode (Sync Pulse)

27 **TE Source**

Access:	R/W

This bit defines the source of the TE events from the Peripheral when the Transcoder is operating in Command Mode

Value	Name
0	In-band TE event source
1	Out-of-band TE event source (i.e. GPIO)

26 **TE Deglitch Enable**

Access:	R/W

When using the GPIO as the source of TE events in Command Mode, this bit will control whether the signaling from the GPIO pin is debounced or not.

Value	Name
0b	Disabled
1b	Enabled

25 **TE Accumulation**

This bit controls whether the TE events from two Panels are accumulated into a single event (usage would be for a Dual Link mode). The accumulated event will feed into the interrupt registers for each DSI transcoder pair (e.g. DSI0 and DSI1).

Value	Name
0b	Disabled
1b	Enabled

Programming Notes

1. This bit only affects the operation of the transcoder when it is operating in the Command Mode
2. It is the responsibility of Software to set this bit accordingly (i.e. it must ensure TE events are being received from both ports)
3. Even though the accumulated event is being fed to the interrupt registers of both transcoders, it is ultimately up to Software on how it enables the TE Interrupt across both transcoders
4. Hardware will automatically enable this feature (i.e. it will override the bit programming) when Periodic Frame Update and Port Sync Mode are enabled for both transcoders. Hardware will use the accumulated TE events to spawn the Frame Update Requests to each transcoder

24:21 **Reserved**

Access:	RO
Format:	MBZ

TRANS_DSI_FUNC_CONF

20 Link Ready

Access:	RO

This bit advertises whether the Link is ready to receive traffic from the DSI transcoder

Value	Name
0	Link is not ready to accept traffic
1	Link is ready to accept traffic

19 Reserved

Access:	RO
Format:	MBZ

18:16 Pixel Format

Access:	R/W

This field defines the pixel format the DSI Transcoder will be operating in

Value	Name
000b	16-bit RGB, 5-6-5
001b	18-bit RGB, 6-6-6 (Packed)
010b	18-bit RGB, 6-6-6 (Loose)
011b	24-bit RGB, 8-8-8
100b	30-bit RGB, 10-10-10
101b	36-bit RGB, 12-12-12
110b	Compressed
Others	Reserved

Restriction
When in the 18-bit RGB (Packed) pixel format, the H. Active Size must be a multiple of 4 pixels

15 BGR Transmission

Access:	R/W

This field will reverse the order of the RGB channels within the pixels received from the Display Engine

Value	Name
0	Transmit order is R-G-B
1	Transmit order is B-G-R

14 Reserved

Access:	RO
Format:	MBZ

13:12 Pixel Virtual Channel

Access:	R/W

This field defines the Virtual Channel that HW will bind to all DSI packets carrying pixel data

TRANS_DSI_FUNC_CONF

11:10 Pixel Buffer Threshold

Access:	R/W

This field defines the threshold of buffering needed within the Pixel Buffer before the transcoder will start internally processing the pixel stream.

Value	Name
00b	The Pixel Buffer will have to be 1/4 full
01b	The Pixel Buffer will have to be 1/2 full
10b	The Pixel Buffer will have to be 3/4 full
11b	The Pixel Buffer will have to be full

9:8 Continuous Clock

Access:	R/W

This field will control the behavior of the Clock Lane and whether it is allowed to enter the LP state.
Keeping the Clock Lane running while letting the Data Lanes go in and out of the LP state keeps the LP to HS turnaround latency to a minimum, but consumes more power.
Certain panels may also require the Clock Lane to continuously run

Value	Name
00b	Always enter LP after Data Lanes
10b	Opportunistically keep Clock in HS or LP
11b	Continuous HS Clock
Others	Reserved

7 LP Clock during LPM

When the Clock Lane is configured for Continuous HS Clock, this bit will control whether the DSI transcoder places the Clock Lane into the LP state along with the Data Lanes when the per frame LP mode (LPM) is performed.
This bit has no effect ont the Clock Lane for the other Continuous Clock settings.

Value	Name	Description
0b	Disabled	Clock Lane does not follow the Data Lanes
1b	Enable	Clock Lane follows the Data Lanes

6 Reserved

Access:	RO
Format:	MBZ

5:4 Link Calibration

Access:	R/W

This field will control the Link calibration of the DSI Transcoder

Value	Name
00b	Calibration Disabled
10b	Calibration Enabled - Initial only
11b	Calibration Enabled - Initial and Periodic

TRANS_DSI_FUNC_CONF

Others	Reserved

Restriction
Calibration can be enabled for any Link frequency, but it must be enabled when the Link frequency is operating above 1.5 Gbps

3 **Reserved**

Access:	RO
Format:	MBZ

2 **Blanking Packet during BLLP**

This bit will control whether the transcoder allows the link to enter the LP state during BLLP regions (assuming there is enough time), or whether it will keep the link in the HS state with a Blanking Packet

Value	Name	Description
0b	Disabled	LP allowed in BLLP regions
1b	Enabled	Blanking packets transmitted in BLLP regions

Programming Notes

1. This bit is only applicable when the transcoder is operating in the Video Mode
2. When this bit is set, then all BLLP regions will be filled with Blanking Packets regardless of where those regions are located (i.e. Vertical active or blank)
3. Regardless of the setting of this bit, if HW determines it cannot allow the link to enter the LP state between HS bursts, then it will automatically fill the region with a Blanking Packet
4. Regardless of the setting of this bit, HW will still ensure the link enters the LP state once per frame per the DSI spec

1 **S3D Orientation**

Access:	R/W

This bit controls the orientation encoding of the 3DMODE field of the Stereoscopic 3D control function sent to a Panel via the Vertical Source Sync (VSS) packet when in Video Mode.

Value	Name
0b	Portrait Orientation
1b	Landscape Orientation

Programming Notes

This bit will only be sampled by the transcoder when Stereoscopic 3D is enabled for the transcoder
This bit should be programmed before enabling Stereoscopic 3D for the transcoder (TRANS_STEREO3D_CTL)
If Software changes this bit, it must also perform a write to the TRANS_STEREO3D_CTL for the change to be sent within the next VSS

This bit is only applicable when the transcoder is operating in Video Mode. If the transcoder is operating in Command Mode, then Software will have to communicate the Stereoscopic 3D function information to the Panel through a set_3D_control DCS command using the DCS Long Write DSI packet type.

0 **EoTp Disabled**

Access:	R/W

When set, the DSI transcoder will not transmit an End of Transmission packet at the end of High Speed bursts

Value	Name
0	EoTp Enabled
1	EoTp Disabled

TRANS_EXITLINE

TRANS_EXITLINE	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	60018h-6001Bh
Name:	Transcoder DC3CO Exit Line
ShortName:	TRANS_EXITLINE_A
Reset:	soft
Address:	61018h-6101Bh

Address:	62008h-6200Bh
Name:	Transcoder Horizontal Sync
ShortName:	TRANS_HSYNC_C
Reset:	soft
Address:	63008h-6300Bh
Name:	Transcoder Horizontal Sync
ShortName:	TRANS_HSYNC_D
Reset:	soft

Restriction

This register should not be changed while the transcoder or port are enabled.
HSYNC is always programmed to an even number of pixel clock cycles for YUV 4:2:0 pixel format with 10bpc and 12bpc..
HSYNC timings must be even for HDMI operating on 10bpc (regardless of format)

DWord	Bit	Description	
0	31:30	**Reserved**	
		Access:	RO

TRANS_HSYNC

	Format:	MBZ
29:16	**Horizontal Sync End** This field specifies the Horizontal Sync End position relative to the horizontal active display start. It is programmed with HorizontalActive+FrontPorch+Sync-1 **Restriction** This value must be greater than the horizontal sync start and less than Horizontal Total. For the DSI transcoder this field is only relevant if the transcoder is operating in Video Mode (it is ignored in Command Mode). As such, please refer to the "Determining Minimum Horizontal Blanking Regions" section of the Transcoder DSI Function page for minimum programming allowed	
15:14	**Reserved**	
	Access:	RO
	Format:	MBZ
13:0	**Horizontal Sync Start** This field specifies the Horizontal Sync Start position relative to the horizontal active display start. It is programmed with HorizontalActive + FrontPorch - 1 **Restriction** This value must be greater than Horizontal Active for all non-DSI transcoders, or for DSI transcoders operating with non-compressed pixels in Video Mode. For DSI transcoders operating on a compressed pixel stream in Video Mode, this value should be greater than the Horizontal Active size divided by the Compression Ratio (H. Blank Start = H. Active / Compression Ratio). In HDMI modes the minimum gap between horizontal blank start and horizontal sync start is 16 pixels. For DSI transcoders, this field is only relevant if the transcoder is operating in Video Mode (it is ignored in Command Mode). When the DSI transcoder is in Video Mode, then please refer to the "Determining Minimum Horizontal Blanking Regions" section of the Transcoder DSI Function page for minimum programming allowed.	

TRANS_HTOTAL

TRANS_HTOTAL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6E000h-6E003h

Address:	62000h-62003h
Name:	Transcoder Horizontal Total
ShortName:	TRANS_HTOTAL_C
Reset:	soft
Address:	63000h-63003h
Name:	Transcoder Horizontal Total
ShortName:	TRANS_HTOTAL_D

TRANS_HTOTAL

Reset: soft

Programming Notes
For eDP CoG: $Htotal_{COG}$ = (active pixels per segment) + (overlap pixels * number of segments/2) + Original Horizontal Blanking

Restriction
This register should not be changed while the transcoder or port are enabled.
The following restriction applies only to HDMI 4:2:0. All horizontal timings should be a multiple of 4 for 8/12/16 bpc cases and multiple of 8 for 10 bpc case. This applies to full blend and bypass modes.
All horizontal timings must be even for HDMI operating on 10bpc (regardless of format)

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:16	**Horizontal Total** This field specifies Horizontal Total size. This field is programmed to the number of pixels desired minus one. This should be equal to the sum of the horizontal active and the horizontal blank sizes for all non-DSI transcoders, or for DSI transcoders operating with non-compressed pixels in Video Mode. For DSI transcoders operating with compressed pixels in Video Mode, this field should be equal to the sum of the compressed horizontal active size and the horizontal blank size (H. Total = (H. Active + H. Blank size) / Compression Ratio) For DSI transcoders operating in Command Mode, there are no restrictions on the programming of this field. This field is ignored by WD transcoders. **Restriction** This register must always be programmed to the same value as the Horizontal Blank End.
	15:14	**Reserved** Access: RO Format: MBZ

TRANS_HTOTAL		
	13:0	**Horizontal Active** This field specifies Horizontal Active Display size. The first horizontal active display pixel is considered pixel number 0. This field is programmed to the number of pixels desired minus one. **Restriction** The minimum horizontal active display size is 64 pixels. In HDMI modes the minimum is 256 pixels. This register must always be programmed to the same value as the Horizontal Blank Start. DSI requires a minimum Horizontal Active Display of, 256 pixels. Also, when transmitting an 18-bit RGB pixel format, the one-based size must be a multiple of 4 pixels

TRANS_MSA_MISC

TRANS_MSA_MISC	
Register Space:	MMIO: 0/2/0

This register selects what value will be sent in the DisplayPort Main Stream Attribute (MSA) Miscellaneous (MISC) fields. The MSA MISC fields are mostly used to indicate the color encoding format and need to be programmed to indicate color space, bits per color, etc.

Programming Notes

See the DisplayPort specification for the details on what to program in these fields.

DWord	Bit	Description
0	31:16	**MSA Unused** This field selects the value that will be sent in the DisplayPort MSA unused fields. **Programming Notes** This should be usually programmed with all 0s.
	15:8	**MSA MISC1** This field selects the value that will be sent in the DisplayPort MSA MISC1 field. When TRANS_STEREO3D_CTL bit FS_MSA_MISC1_Drive_En is enabled, hardware will drive MISC1 bits 2:1 (bits 10:9 of this register) with the field sequential stereo 3D left or right eye indication, and any value written to those bits here will be ignored.

TRANS_MSA_MISC		
	7:0	**MSA MISC0** This field selects the value that will be sent in the DisplayPort MSA MISC0 field. **Restriction** Before enabling DisplayPort, bit 0 should always be set to 1 to indicate link clock and stream clock are synchronous.

TRANS_MULT

Reset:	soft

This register is sampled one line before vertical blank.

DWord	Bit	Description
0	31	**Transcoder S3D Enable** **Description** This bit enables the stereo 3D modes on this transcoder. Updates will take place at the start of the next vertical blank.

TRANS_STEREO3D_CTL

Value	Name
0b	Disable
1b	Enable

Restriction
These modes are only for use with DisplayPort, HDMI, and DVI.HDMI/DVI: Stereo 3D can only be enabled with a mode set. It must be enabled before transcoder and port are enabled. It must be disabled after transcoder is disabled. DisplayPort: Stereo 3D can be enabled and disabled with a mode set, like HDMI and DVI, or it can be enabled after an enable mode set is complete and disabled prior to a disable mode set. VGA display modes, interlaced modes, SRD/PSR, WD, and frame buffer compression (FBC) do not work with stereo 3D.The left surface base address registers for the planes going to this transcoder must be programmed with valid addresses prior to enabling stereo 3D.

30:29 **Reserved**

Access:	RO
Format:	MBZ

28:27 **S3D Mode**

This field selects between the stereo 3D modes.
The stacked buffer mode combines both stereo 3D fields (left and right eye images) into a single tall frame with the left eye image on top, then a programmable space of black lines, then the right eye image on the bottom.
The field sequential mode sends one stereo 3D field (left or right eye image) out per frame. This mode is only for use with DisplayPort. Field sequential hardware controlled mode automatically toggles between left and right eye at the start of each vertical blank. The starting field is selected using the FS_Field_Ctl register bit. Field sequential software controlled mode will manually select left or right eye using the FS_Field_Ctl register bit.

Value	Name	Description
00b	FS HW Auto	Hardware controlled auto-toggle between left and right eye on each vertical blank.
01b	FS SW Manual	Software controlled selection between left and right eye
10b	Stacked	Stacked frame mode with both left and right eye images combined in a single tall frame
Others	Reserved	Reserved

Programming Notes
In the stacked frame mode, a vertical sync is not generated in the gap between left and right eye images, and the scan line count increments across the entire tall frame.

Restriction
This field should only be changed when stereo 3D is disabled.

TRANS_STEREO3D_CTL

26 **FS Field Ctl**

The operation of this bit depends on the S3D Mode setting. This field is ignored in the S3D stacked mode. In the field sequential software controlled mode this bit selects the field sequential stereo 3D field (left or right eye).In the field sequential hardware controlled mode this bit selects the field sequential stereo 3D starting field, the field used on the frame when field sequential stereo 3D is enabled. Hardware does not wait for a specific eye when disabling.

Value	Name
0b	Right Eye
1b	Left Eye **[Default]**

Restriction
The starting field must be set to the left eye for FS HW Auto usage.

25 **Reserved**

Access:	RO
Format:	MBZ

24 **S3D Current Field**

Access:	RO

This read only bit indicates the current stereo 3D field (left or right eye).This bit should be ignored when stereo 3D is not enabled.

Value	Name
0b	Right Eye
1b	Left Eye

23 **FS MSA MISC1 Drive En**

This bit enables hardware to drive the MSA MISC1 bits 2:1 with the internal field sequential stereo 3D left/right eye field indication. Hardware will drive 00 when field sequential 3D stereo mode is not enabled, 01 when enabled and the upcoming video frame is the right eye, 11 when enabled and the upcoming video frame is the left eye. This is based on the internal left/right indication which could be either generated by hardware in the HW auto mode or by software in the SW manual mode. FS_MSA_Drive_Invert can be programmed to invert the left and right eye selection in the MSA. When this bit is disabled, software may manually program TRANS_MSA_MISC to set MISC1 bits 2:1.

Value	Name	Description
0b	Disable	Disable hardware driving MSA MISC1 bits 2:1. Allow software to manually program MSA MISC1 bits 2:1 through TRANS_MSA_MISC.
1b	Enable	Enable hardware to drive MSA MISC1 bits 2:1 for stereo 3D.

Restriction
This field should only be changed when stereo 3D is disabled and should not be enabled for the stacked frame mode.

ShortName:	TRANS_VBLANK_D
Reset:	soft

Description
PSR ASU: This register is double buffered when Vactive double buffer bit (bit[8])is asserted in TRANS_DDI_FUNC_CTL2.
The transcoder will generate two Vertical Blanks to the Display Engine. A raw (or unmodified) V. Blank will be generated based off of the vertical timings defined within the TRANS_VTOTAL register (the raw V. Blank will assert after V.Active and de-asserted after V. Total). A delayed V. Blank will be generated from the vertical timings of this register. The delay is in terms of lines, and if this register is programmed with the same value as the TRANS_VTOTAL register (i.e. V. Blank Start = V. Active), then the delay will be zero.

TRANS_VBLANK

Programming Notes

This register is programmed in terms of lines and the values programmed should be zero-based (e.g. for the vertial blank to start on line 10, the Vertical Blank Start will be programmed to 9)

Restriction

This register should not be changed while the transcoder or port are enabled.

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:16	**Vertical Blank End** This field specifies Vertical Blank End position relative to the vertical active display start. **Restriction** 1. The minimum vertical blank size is 5 lines. With SRD/PSR and/or DisplayPort VDIP GMP the minimum is 8 lines 2. The V. Blank End must be programmed to the same value as V. Total in the TRANS_VTOTAL register 3. The V. Blank End must be greater than the V. Blank Start
	15:13	**Reserved** Access: RO Format: MBZ
	12:0	**Vertical Blank Start** This field specifies the Vertical Blank Start position relative to the vertical active display start. **Restriction** The V. Blank Start must be greater than or equal to the Vertical Active programming in TRANS_VTOTAL

DWord	Bit	Description
0	31	**VRR Enable** This bit enables/disables VRR feature on the fly, no mode set required. Value: 0b = Disable; 1b = Enable
	30	**Ignore Max Shift** This bit when set to '1' will ignore programmed Vblank max shift values (both INC and DEC), allowing Vblank to freely swing between Vmin and Vmax. Value: 1b = IGNORE; 0b = DO NOT IGNORE
	29	**Flip Line Enable** Description: This bit enables/disables Flip Line feature where frame start will be generated at flip line value for VRR. Updates to this field will take effect at the next vertical blank. This field must be

enabled before VRR enable.

Ignore Max Shift must be set to 1 when Flip Line is enabled

Value	Name
0b	Disable
1b	Enable

28:16 **Reserved**

Access:	RO
Format:	MBZ

15:11 **Reserved**

Access:	RO
Format:	MBZ

10:3 **FrameStart to Pipeline Full LineCount**

Default Value:	20h

This 8-bit line count allows a maximum of 255 scanlines (programming 255 gives 255 scanlines duration to fill the pipeline etc.).

Restriction
Always program this field to (Transcoder VRR Vmin - Transcoder Vertical Blank Start - 4) where VRR Vmin and Transcoder Vertical Blank Start are '0' based.

2:1 **Reserved**

Access:	RO
Format:	MBZ

0 **Pipeline Full Override**

This bit tells whether to depend on HW generated signal to start Vactive or to depend on the programmed Pipeline full line count.
Setting this bit assumes pipeline full line count is already programmed.

Value	Name
0b	HW generated Pipeline Full Line Count
1b	Programmed Pipeline Full Line Count

Restriction
SW programmed pipeline full line count must be used when flip line is enabled. This will ensure that Vblank always ends at the same point.

TRANS_VRR_FLIPLINE

This register defines vertical total size to execute a flip for VRR.

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ
	19:0	**VRR FLIPLINE** This field provides the vertical total size to execute flip for VRR. This is 0-based. So, value should be programmed as N-1.

TRANS_VRR_STATUS

TRANS_VRR_STATUS	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6042Ch-6042Fh
Name:	VRR Status Trans
ShortName:	TRANS_VRR_STATUS_A
Reset:	soft
Address:	6142Ch-6142Fh

This register provides VRR status and some additional information

DWord	Bit	Description
0	31	**Vmax Reached** Access: R/WC Sticky bit is set indicating no flip has occurred when Vmax is reached. This bit needs to be polled and cleared by software. Setting of this sticky bit will not result in any interrupt. 0b: Not Reached 1b: Reached
	30	**No flip till decision boundary** Access: R/WC This bit is asserted whenever frame decision boundary is reached without a flip. 0b: 1b:

TRANS_VRR_STATUS

	29	**Flip before decision boundary** Access: R/WC This bit is asserted whenever frame decision boundary is reached with a flip. 0b 1b
	28	**No flip frame** Access: R/WC This bit is asserted whenever current frame terminates without a flip. 0b 1b
	27	**VRR Enable Live** Access: RO This bit is asserted whenever pipe/plane logic is running with VRR enabled. 0b 1b
	26	**flips serviced** Access: R/WC This bit represents acknowledgement from pipe to transcoder indicating that processing for all flips in the current frame is complete and any subsequent flips will be handled in the next frame. 0b 1b
	25:23	**Reserved** Access: RO Format: MBZ
	22:20	**Current Region in Vblank** Access: RO This field indicates current status of VRR FSM.

Value	Name	Description
000b	IDLE	Timing generator disabled.
001b	WAIT_TILL_FDB	Wait till the flip decision boundary
010b	WAIT_TILL_FRAMESTART	After the decision boundary, wait for framestart
011b	WAIT_TILL_FLIP	Transition to this state when past the decision boundary, but no primary flip

TRANS_VRR_STATUS				
		100b	PIPELINE_FILL	State after framestart, waiting for a fixed num of lines
		101b	ACTIVE	
		110b	LEGACY_VBLANK	No VRR
	19:0	**Reserved**		
		Access:		RO
		Format:		MBZ

Name:	VRR Vmaxshift Trans
ShortName:	TRANS_VRR_VMAXSHIFT_D
Reset:	soft

This register defines VBLANK maximum shift allowed between successive frames.

Programming Notes

This register is not double buffered and the changed values are reflected immediately in VRR logic.
This register should not be updated while VRR mode is running.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:16	**Decrement** This register represents the maximum reduction.Smallest Vblank = Previous Frame Vblank End - Vblank Max Shift Decrement.
	15:14	**Reserved** Access: RO Format: MBZ

TRANS_VRR_VMAXSHIFT		
	13:0	**Increment** This register represents the maximum increase.Largest Vblank = Previous Frame Vblank End + Vblank Max Shift Increment.

TRANS_VRR_VMIN

TRANS_VRR_VMIN	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	60434h-60437h
Name:	VRR Vmin Transcoder
ShortName:	TRANS_VRR_VMIN_A
Reset:	soft

ShortName:	TRANS_VRR_VTOTAL_PREV_D
Reset:	soft

This register holds the Vtotal from previous frame and other VRR status bits. If VRR is not enabled, this register will hold software programmed Vtotal.

DWord	Bit	Description
0	31	**Flip Before Boundary** Access: RO This bit indicates that a push has occurred in either Active region or in Vblank before Flip Decision Boundary and will result in a Vblank which is Previous_Frame_Vblank - Vblank_Max_Shift_Dec.
	30	**Flip After Boundary** Access: RO This bit indicates that the first push has occurred after Flip Decision Boundary and will result in a Vblank which is between (Previous_Frame_Vblank - Vblank_Max_Shift_Dec) and (Previous_Frame_Vblank + Vblank_Max_Shift_Inc).
	29	**Flip After Double Buffer** Access: RO This bit indicates that the first push has occurred after the Double buffer update and will result in a Vblank which is (Previous_Frame_Vblank + Vblank_Max_Shift_Inc). This however will cause

TRANS_VRR_VTOTAL_PREV		
		the next frame Vblank to be (Previous_Frame_Vblank - Vblank_Max_Shift_Dec).
	28:20	**Reserved** Access: RO Format: MBZ
	19:0	**Vtotal Previous** Access: RO Vtotal from previous frame.

TRANS_VSYNC

Restriction
This register should not be changed while the transcoder or port are enabled.

DWord	Bit	Description
0	31:13	**Reserved** Access: RO Format: MBZ

TRANS_VSYNCSHIFT		
	12:0	**Second Field VSync Shift** This value specifies the vertical sync alignment for the start of the interlaced second field, expressed in terms of the absolute pixel number relative to the horizontal active display start. This value will only be used if the transcoder is programmed to an interlaced mode. Typically, the interlaced second field vertical sync should start one pixel after the point halfway between successive horizontal syncs, so the value of this register should be programmed = horizontal sync start - floor[horizontal total / 2]Calculate using the actual horizontal sync start and horizontal total values and not the minus one values programmed into the registers. This vertical sync shift only occurs during the interlaced second field. In all other cases the vertical sync start position is aligned with horizontal sync start.

TRANS_VTOTAL

TRANS_VTOTAL	
Register Space:	MMIO: 0/2/0

TRANS_VTOTAL

Reset: soft

Programming Notes

PSR ASU: This register is double buffered when Vactive double buffer bit (bit[8])is asserted in TRANS_DDI_FUNC_CTL2.

Restriction

This register should not be changed while the transcoder or port are enabled.

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:16	**Vertical Total** **Description** This field specifies Vertical Total size. This should be equal to the sum of the vertical active and the vertical blank sizes. For progressive display modes, this field is programmed to the number of lines desired minus one. For interlaced display modes, this field is programmed with the number of lines desired minus two. The vertical counter is incremented on the leading edge of the horizontal sync. Both even and odd vertical totals are supported. This field is ignored by WD transcoders. Vertical total is double buffered. It updates immediately when transcoder is off. Otherwise, it updates at VBLANK rising edge. **Restriction** This register must always be programmed to the same value as the Vertical Blank End.
	15:13	**Reserved** Access: RO Format: MBZ
	12:0	**Vertical Active** This field specifies Vertical Active Display size. The first vertical active display line is considered line number# 0. This field is always programmed to the number of lines desired minus one. Restriction : When using the internal panel fitting logic, the minimum vertical active area must be seven lines. This register must always be programmed to the same value as the Vertical Blank Start.

TRANS_WD_FUNC_CTL

TRANS_WD_FUNC_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6E400h-6E403h
Name:	Transcoder WD0 Function Control
ShortName:	TRANS_WD_FUNC_CTL_0
Reset:	soft
Address:	6EC00h-6EC03h
Name:	Transcoder WD1 Function Control
ShortName:	TRANS_WD_FUNC_CTL_1
Reset:	soft

DWord	Bit	Description
0	31	**WD Function Enable** This bit enables the WD function. Value: 0b = Disable; 1b = Enable
	30	**Triggered Capture Mode Enable** This field enables the triggered capture mode where a frame is only captured after the Start Trigger Frame bit is written with 1, and hardware will ignore the transcoder frame time. This must be set before or when WD Function Enable is set. When triggered capture mode is disabled hardware will periodically capture frames following the transcoder frame time. Value: 0b = Disable; 1b = Enable
	29	**Start Trigger Frame** Access: R/W Set Write a 1 to this field to start a software triggered frame capture when Triggered Capture Mode Enable is 1. Hardware will clear the field when the frame starts.
	28	**Stop Trigger Frame** Access: R/W Set Write a 1 to this field to stop a software triggered frame capture when Triggered Capture Mode Enable is 1. Hardware will clear the field when the frame stops. This is only intended for use in case of an error where capture is never completing and software times out. It must not be set at the same time as Start Trigger Frame. After a stop trigger, VDenc will be out of sync with WD and also need to be stopped. WD and

TRANS_WD_FUNC_CTL

VDenc then need to start from the same frame number.

27 Reserved

26 Chroma Filtering Enable

This field selects how U and V are downsampled from YUV 444 to 422. This field only applies to the YUV 422 formats.

Value	Name	Description
0	Drop	Drop U2 and V2
1	Filter **[Default]**	Use a 15-34-15 three tap filter

25:23 Reserved

Access:	RO
Format:	MBZ

22:20 WD Color Mode

This field selects the capture color format.

Value	Name	Description
000b	YUV 4:4:4	YUV 32-bit 4:4:4 packed (8:8:8:8 MSB-Y:U:X:V)
001b	YUV 4:2:2	YUV 16-bit 4:2:2 packed (8:8:8:8 MSB- Y1:U:Y2:V) Chroma downsampling is programmable according to the Chroma Filtering field.
010b	XYUV 4:4:4	YUV 32-bit 4:4:4 packed (8:8:8:8 MSB-X:Y:U:V)
011b	RGBX	RGBX 32-bit (8:8:8:8 MSB-X:B:G:R)
100b	Y410	YUV 444 10bpc (MSB-X:V:Y:U)
101b	YUY2 8b	8 bit YUV 422 (MSB-V:Y2:U:Y1) Chroma downsampling is programmable according to the Chroma Filtering field.
110b	RGB10	RGB1010102 (MSB-X:B:G:R)

Restriction
This field must not be changed while the function is enabled.

19:18 Control Pointers

This field controls which pointers are sent and followed. If the head pointer is ignored, then the transcoder captures frames without any pointer comparison to stall the capture.

Value	Name	Description
00b	Enable Tail and Head	Send tail pointer to GT. Follow head pointer from GT.
01b	Enable Tail, Disable Head	Send tail pointer to GT. Ignore head pointer from GT. Non-cacheable.
11b	Disable Tail and Head	Do not send tail pointer to GT. Ignore head pointer from GT. Non-cacheable.

TRANS_WD_FUNC_CTL

17:16 VDenc Session Select

This field selects the encode session. Each enabled WD transcoder must select a unique session. It is not valid to have multiple WD transcoders select the same session.

Value	Name
00b	0
01b	1
10b	2
11b	3

15 Reserved

Access:	RO
Format:	MBZ

14:12 WD Input Select

These bits determine the input to WD.

Value	Name
000b	Pipe A
101b	Pipe B
110b	Pipe C
111b	Pipe D
Others	Reserved

Restriction
This field must not be changed while the function is enabled. It is not valid to have the same pipes driving multiple enabled transcoders.

11:4 Reserved

3:0 Frame Number

SW provided frame number. This is sent in the tail pointer message to media, to be used for synchronizing the encode with the display frame.

TRNULLDETCT

REG_TEMPLATE - TRNULLDETCT	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	04DE8h
Name:	TiledResources Null Tile Detection Register
ShortName:	TRNULLDETCT

DWord	Bit	Description

uOS Full Hash High

UOS_FULL_HASH_HI - uOS Full Hash High	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	128

The Full Hash being generated for the uOS. This register is written by Shim hardware. The update happens as the Full Hash is being generated and compared during the GfxMem --> WOPCM DMA operation. IA Writes have no effect.

Programming Notes
This register is saved in the power context

DWord	Bit	Description
0..3	127:0	**Hash**

uOS Full Hash Low

UOS_FULL_HASH_LO - uOS Full Hash Low	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	128

The Full Hash being generated for the uOS. This register is written by Shim hardware. The update happens as the Full Hash is being generated and compared during the GfxMem --> WOPCM DMA operation. IA Writes have no effect.

Programming Notes
This register is saved in the power context

DWord	Bit	Description
0..3	127:0	**Hash**

URB Runtime ECC capture Register

URB_ECC_CAPTURE_REG - URB Runtime ECC capture Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B14Ch

This register shows the captured value of the ECC calculated by the internal logic for URB writes.

DWord	Bit	Description
0	31:20	**Reserved** Access: RO Format: MBZ
	19:0	**URB Latched ECC Value** Access: RO This field holds the value of the ECC generated by the URB pipeline for the preceeding write cycle.

URB Runtime ECC Test Control Register

URB_ECC_TEST_CTL - URB Runtime ECC Test Control Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0B148h

This register is used to control the run time testing of the ECC logic in the URB pipeline.

DWord	Bit	Description
0	31:22	**Reserved** Access: RO Format: MBZ
	21	**URB ECC Latch Enable** Access: R/W This bit enables the latching of the ECC value generated for any write access made to the URB. The latched value of the ECC can be read from the "URB Cache Runtime ECC capture Register". 0 – **[Default]** – Disable latching. 1 – Enable the latching
	20	**URB ECC Override Enable** Access: R/W This bit enables the overriding of the ECC value generated for any write access made to the URB. The value in the field below will be used to override the ECC internally generated. 0 – **[Default]** – Disable override of the ECC value 1 – Enable the override of the ECC value
	19:0	**URB ECC Override Value** Default Value: 00h Access: R/W This is the value to be used as the override for the ECC when enabled in the bit field above.

UTIL_PIN_BUF_CTL

UTIL_PIN_BUF_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	48404h-48407h
Name:	Utility Pin Buffer Control
ShortName:	UTIL_PIN_BUF_CTL
Reset:	soft

This register controls the display utility pin I/O buffer.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:28	**Hysteresis**
	27	**Reserved** Access: RO Format: MBZ
	26:24	**Spare**
	23:21	**Reserved** Access: RO Format: MBZ
	20:16	**Pulldown Strength**
	15:12	**Pulldown Slew**
	11:9	**Reserved** Access: RO Format: MBZ
	8:4	**Pullup Strength**
	3:0	**Pullup Slew**

UTIL_PIN_CTL

UTIL_PIN_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	48400h-48403h
Name:	Utility Pin Control
ShortName:	UTIL_PIN_CTL
Reset:	soft

This register controls the display utility pin. The maximum switching frequency is 100 KHz.

DWord	Bit	Description
0	31	**Util Pin Enable** This bit enables the utility pin. Value: 0b = Disable; 1b = Enable
	30:29	**Pipe Select** This bit selects which pipe will be used when the utility pin is outputting timing related signals. Value: 00b = Pipe A; 01b = Pipe B; 10b = Pipe C; 11b = Pipe D Restriction: The field should only be changed when the utility pin is disabled or not configured to use any timing signals.
	28	**Reserved** Access: RO Format: MBZ
	27:24	**Util Pin Mode** This bit configures the utility pin mode of operation for output. 0000b Data: Output the Util_Pin_Output_Data value. 0001b PWM: Output from the backlight PWM circuit. 0100b Vblank: Output the vertical blank. [] This is the pipe delayed vblank. 0101b Vsync: Output the vertical sync.

UTIL_PIN_CTL

0110b	framestart	Output the framestart
1000b	Right/Left Eye Level	Output the stereo 3D right/left eye level signal. Asserted for the left eye and de-asserted for the right eye.
Others	Reserved	Reserved

Restriction
The field should only be changed when the utility pin is disabled.

23 **Util Pin Output Data**

This bit selects what the value to drive as an output when in the data mode.

Value	Name
0b	0
1b	1

22 **Util Pin Output Polarity**

This bit inverts the polarity of the pin output.

Value	Name
0b	Not inverted
1b	Inverted

21:20 **Reserved**

Access:	RO
Format:	MBZ

19 **Util Pin Direction**

This bit selects whether the pin is used as an output or an input.

Value	Name
0b	Output
1b	Input

Restriction
The field should only be changed when the utility pin is disabled.

18:17 **Reserved**

Access:	RO
Format:	MBZ

16 **Util Pin Input Data**

Access:	RO

This bit gives the value received on the pin. This is only valid when the utility pin is enabled and the direction is input.

15:0 **Reserved**

Access:	RO
Format:	MBZ

UTIL2_PIN_BUF_CTL

UTIL2_PIN_BUF_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	4840Ch-4840Fh
Name:	Utility2 Pin Buffer Control
ShortName:	UTIL2_PIN_BUF_CTL
Reset:	soft

This register controls the display utility2 pin I/O buffer.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:28	**Hysteresis**
	27	**Reserved** Access: RO Format: MBZ
	26:24	**Spare**
	23:21	**Reserved** Access: RO Format: MBZ
	20:16	**Pulldown Strength**
	15:12	**Pulldown Slew**
	11:9	**Reserved** Access: RO Format: MBZ
	8:4	**Pullup Strength**
	3:0	**Pullup Slew**

UTIL2_PIN_CTL

UTIL2_PIN_CTL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	48408h-4840Bh
Name:	Utility2 Pin Control
ShortName:	UTIL2_PIN_CTL
Reset:	soft

This register controls the display utility2 pin.

DWord	Bit	Description
0	31	**Util Pin Enable** This bit enables the utility pin. Value: 0b = Disable; 1b = Enable
	30	**Util Pin Direction** This bit selects whether the pin is used as an output or an input. Value: 0b = Output; 1b = Input Restriction: The field should only be changed when the utility pin is disabled.
	29:0	**Reserved** Access: RO Format: MBZ

Valid Bit Vector 3 for RCC Register

CCTLB_VLD_3 - Valid Bit Vector 3 for RCC Register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
Address:	04DACh	
This register contains the valid bits for entries 0-31 of RCCTLB.		
DWord	**Bit**	**Description**
0	31:0	**Valid Bit Vector 3 for RCC** Default Value: 00000000h Access: RO _Custom_GTIReset: DEV Valid Bits per Entry.

VCS CSB

VCS_CSB - VCS CSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SW reads this offset to read the CSB entry at the top of the CSB fifo. Reads must occur in pairs to obtain a single 64 bit CSB entry. The second read pops the entry off the CSB fifo.		
DWord	**Bit**	**Description**
0	31:0	**Context Status Buffer DW** Access: RO This DW holds CSB bits[31:0] for the first read and CSB bits[63:32] for the second read.

VCS CSB Fifo Status Register

VCS_CSB_FSR - VCS CSB Fifo Status Register		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
This RO register holds status of the CSB fifo.		
DWord	**Bit**	**Description**
0	31	**Not Empty** Default Value: 000000000000000b Access: RO
	30:16	**Reserved** Access: RO Format: MBZ
	15:8	**FIFO Maximum Occupancy Count** This field is a read-only field. It reflects the depth of the FIFO, which is a static value for each product.
	7:0	**Fifo Occupancy Count** Access: RO

VDBox TLB Invalidation Register

VD_TLB_INV_CR - VDBox TLB Invalidation Register

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	0CEDCh

DWord	Bit	Description
0	31:16	**Mask Bits** Default Value: 0000000000000000b Access: R/W
	15:8	**Reserved** Access: RO Format: MBZ
	7	**Invalidate VDBox TLBs bit7** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated VDBox and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates VDBox[7:0] TLBs. No Effect on non-existent VDBoxs. These bits self clear.
	6	**Invalidate VDBox TLBs bit6** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated VDBox and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates VDBox[7:0] TLBs. No Effect on non-existent VDBoxs. These bits self clear.
	5	**Invalidate VDBox TLBs bit5** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated VDBox and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates VDBox[7:0] TLBs. No Effect on non-existent VDBoxs. These bits self clear.

VD_TLB_INV_CR - VDBox TLB Invalidation Register

	4	**Invalidate VDBox TLBs bit4** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated VDBox and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates VDBox[7:0] TLBs. No Effect on non-existent VDBoxs. These bits self clear.
	3	**Invalidate VDBox TLBs bit3** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated VDBox and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates VDBox[7:0] TLBs. No Effect on non-existent VDBoxs. These bits self clear.
	2	**Invalidate VDBox TLBs bit2** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated VDBox and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates VDBox[7:0] TLBs. No Effect on non-existent VDBoxs. These bits self clear.
	1	**Invalidate VDBox TLBs bit1** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated VDBox and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates VDBox[7:0] TLBs. No Effect on non-existent VDBoxs. These bits self clear.
	0	**Invalidate VDBox TLBs bit0** Default Value: 0b Access: R/W SW writes 1 to invalidate the TLBs for the associated VDBox and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses.

VD_TLB_INV_CR - VDBox TLB Invalidation Register		
		Otherwise HW cannot guarantee the proper invalidation for TLBs.Bit[7:0] invalidates VDBox[7:0] TLBs. No Effect on non-existent VDBoxs. These bits self clear.

Current frame row quality. Each bit in this register indicates the quality of current encoded bitstream. This is the status information derived based on Maximum QP used for any CU in the LCU row.

DWord	Bit	Description
0	31:0	**Current encoded bitstream quality vector** Access: RO

CUR_ENC_BITS_QUALITY - VDENC current encoded bitstream quality

		This register indicates the quality of current frame for 32 consecutive LCU rows starting from LCU row 0.
1	31:0	**Current encoded bitstream quality vector** Access: RO This register indicates the quality of current frame for 32 consecutive LCU rows starting from LCU row 32.
2	31:0	**Current encoded bitstream quality vector** Access: RO This register indicates the quality of current frame for 32 consecutive LCU rows starting from LCU row 64.
3	31:0	**Current encoded bitstream quality vector** Access: RO This register indicates the quality of current frame for 32 consecutive LCU rows starting from LCU row 96.

VDENC FPAK Tile completion message

VDENC_FPAK_TILE_CMPL_MSG - VDENC FPAK Tile completion message

Register Space:	MMIO: 0/2/0
Size (in bits):	32
_Custom_GTIReset:	BUS
Address:	1C2D98h-1C2D9Bh

A write to this register with a value of 1 would result in head pointer update to Display .

DWord	Bit	Description
0	31:1	**Frame num and time num for FPAK** Access: R/W Hardware Clear
	0	**Tile completion Msg to FPAK** Access: R/W Hardware Clear

VDENC_FPAK_TILE_CMPL_MSG - VDENC FPAK Tile completion message

<table>
<tr><th>Value</th><th>Name</th><th>Description</th></tr>
<tr><td>1</td><td></td><td>A write with 1 would result in Tile completion message to FPAK. Reading this register would result in zero.
Tile completion message happens through config write to address 2005_0530 for session id 0 and config write to address 2005_0630 for session id 1.
The data for the tile completion message uses the following format.
<table>
<tr><td>31:15</td><td>Zeros</td></tr>
<tr><td>14:9</td><td>Tile Number</td></tr>
<tr><td>8:5</td><td>Frame number</td></tr>
<tr><td>4</td><td>Reserved</td></tr>
<tr><td>3:0</td><td>Opcode
0001 - Tail pointer update
1000 - Start of frame indicator</td></tr>
</table>
</td></tr>
<tr><td>0</td><td>[Default]</td><td>A write with 0 is ignored.</td></tr>
</table>

VDENC X_Y_POS

VDENC_X_Y_POS - VDENC X_Y_POS

Vebox unit Level Clock Gating override during rstflow

VEMISCCP3F10 - Vebox unit Level Clock Gating override during rstflow

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	03F10h

Unit Level Clock Gating Disable bits

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**misccp Clock Gating Disable during rstflow** Default Value: 1b Access: R/W _Custom_GTIReset: BUS misccp Clock Gating Disable Control: '0' : Clock Gating Enabled during reset flows (i.e., clocks can be gated when they are not required to toggle for functionality, NOT Recommended) '1' : Clock Gating Disabled during reset flows. (i.e., clocks are toggling, always) Randomizing this bit will result in X flush not completing during the simulation

VECS CSB

VECS_CSB - VECS CSB		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
SW reads this offset to read the CSB entry at the top of the CSB fifo. Reads must occur in pairs to obtain a single 64 bit entry. The second read pops the entry off the CSB fifo.		
DWord	**Bit**	**Description**
0	31:0	**Context Status Buffer DW** Access: RO This DW holds CSB bits[31:0] for the first read and CSB bits[63:32] for the second read.

VECS CSB Fifo Status Register

VECS_CSB_FSR - VECS CSB Fifo Status Register

Register Space: MMIO: 0/2/0

Size (in bits): 32

This RO register holds status of the CSB fifo

DWord	Bit	Description
0	31	**Not Empty** Access: RO
	30:16	**Reserved** Access: RO Format: MBZ
	15:8	**Fifo Maximum Occupancy Count** This field is a read-only field. It reflects the depth of the FIFO, which is a static value for each product.
	7:0	**FIFO Occupancy Count** Access: RO

Vendor Identification

VID2_0_2_0_PCI - Vendor Identification		
Register Space:	PCI: 0/2/0	
Size (in bits):	16	
Address:	00000h	
This register combined with the Device Identification register uniquely identifies any PCI device.		
DWord	**Bit**	**Description**
0	15:0	**Vendor Identification Number** Default Value: 1000000010000110b Access: RO _Custom_GTIReset: BUS PCI standard identification for Intel.

0	31:24	**Pipe1 Motion History DV/Hold Maxcount**	
		Default Value:	0h
	23:16	**Pipe1 Pixel History DV/Hold Maxcount**	
		Default Value:	0h
	15:8	**Pipe0 Motion History DV/Hold Maxcount**	
		Default Value:	0h
	7:0	**Pipe0 Pixel History DV/Hold Maxcount**	
		Default Value:	0h

VEO DV Hold Register

VEO_DVHOLD - VEO DV Hold Register	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1CA05Ch
ShortName:	VEO_DVHOLD_01
Address:	1DA05Ch
ShortName:	VEO_DVHOLD_02
Address:	1EA05Ch
ShortName:	VEO_DVHOLD_03
Address:	1FA05Ch
ShortName:	VEO_DVHOLD_04
Datavalid/Hold signals for VEO interface	

DWord	Bit	Description
0	31	**vdn_p0_veo_pixel_dv** Default Value: 0h
	30	**veo_vdn_p0_pixel_hold** Default Value: 0h
	29	**vdn_p0_veo_mh_dv** Default Value: 0h
	28	**veo_vdn_p0_mh_hold** Default Value: 0h
	27	**vdn_p0_veo_bne_luma_dv** Default Value: 0h
	26	**veo_vdn_p0_bne_luma_hold** Default Value: 0h
	25	**vdn_p0_veo_bne_chroma_dv** Default Value: 0h
	24	**veo_vdn_p0_bne_chroma_hold** Default Value: 0h
	23	**vdi_p0_veo_pixel_dv** Default Value: 0h
	22	**veo_vdi_p0_pixel_hold** Default Value: 0h

VEO_DVHOLD - VEO DV Hold Register

	21	**vdi_p0_veo_stmm_dv** Default Value: 0h
	20	**veo_vdi_p0_stmm_hold** Default Value: 0h
	19	**vdi_p0_veo_fmd_dv** Default Value: 0h
	18	**veo_vdi_p0_fmd_hold** Default Value: 0h
	17	**iecp_p0_veo_dv** Default Value: 0h
	16	**veo_iecp_p0_hold** Default Value: 0h
	15	**vdn_p1_veo_pixel_dv** Default Value: 0h
	14	**veo_vdn_p1_pixel_hold** Default Value: 0h
	13	**vdn_p1_veo_mh_dv** Default Value: 0h
	12	**veo_vdn_p1_mh_hold** Default Value: 0h
	11	**vdn_p1_veo_bne_luma_dv** Default Value: 0h
	10	**veo_vdn_p1_bne_luma_hold** Default Value: 0h
	9	**vdn_p1_veo_bne_chroma_dv** Default Value: 0h
	8	**veo_vdn_p1_bne_chroma_hold** Default Value: 0h
	7	**vdi_p1_veo_pixel_dv** Default Value: 0h
	6	**veo_vdi_p1_pixel_hold** Default Value: 0h
	5	**vdi_p1_veo_stmm_dv** Default Value: 0h
	4	**veo_vdi_p1_stmm_hold** Default Value: 0h

VEO_DVHOLD - VEO DV Hold Register		
	3	**vdi_p1_veo_fmd_dv** Default Value: 0h
	2	**veo_vdi_p1_fmd_hold** Default Value: 0h
	1	**iecp_p1_veo_dv** Default Value: 0h
	0	**veo_iecp_p1_hold** Default Value: 0h

VEO IECP DV Count Register

VEO_IECP_DV_COUNT - VEO IECP DV Count Register	
Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1CA048h
ShortName:	VEO_IECP_DV_COUNT_01
Address:	1DA048h
ShortName:	VEO_IECP_DV_COUNT_02
Address:	1EA048h
ShortName:	VEO_IECP_DV_COUNT_03
Address:	1FA048h
ShortName:	VEO_IECP_DV_COUNT_04

DWord	Bit	Description
0	31:24	**IECP DV/Hold Maxcount** Default Value: 0h
	23:16	**DI/FMD DV/Hold Maxcount** Default Value: 0h
	15:8	**DI/STMM DV/Hold Maxcount** Default Value: 0h
	7:0	**DI Pixel DV/Hold Maxcount** Default Value: 0h

VEO Previous Pipe 0 XY Register

VEO_PREVIOUS0_XY - VEO Previous Pipe 0 XY Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1CA058h
ShortName:	VEO_PREVIOUS0_XY_01
Address:	1DA058h
ShortName:	VEO_PREVIOUS0_XY_02
Address:	1EA058h
ShortName:	VEO_PREVIOUS0_XY_03
Address:	1FA058h
ShortName:	VEO_PREVIOUS0_XY_04

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:16	**Previous Input Pipe 0 X** Default Value: 0h
	15	**Reserved** Access: RO Format: MBZ
	14:0	**Previous Input Pipe 0 Y** Default Value: 0h

VEO State Register

VEO_STATE - VEO State Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1CA040h
ShortName:	VEO_STATE_01
Address:	1DA040h
ShortName:	VEO_STATE_02
Address:	1EA040h
ShortName:	VEO_STATE_03
Address:	1FA040h
ShortName:	VEO_STATE_04

Data valids and holds for the statistics interface

DWord	Bit	Description
0	31	**iecp_p0_veo_his_dv** Default Value: 0h
	30	**iecp_p0_veo_skin_dv** Default Value: 0h
	29	**iecp_p0_veo_rgb_his_dv** Default Value: 0h
	28	**iecp_p0_veo_out_dist_dv** Default Value: 0h
	27	**iecp_p1_veo_his_dv** Default Value: 0h
	26	**iecp_p1_veo_skin_dv** Default Value: 0h
	25	**iecp_p1_veo_out_dist_dv** Default Value: 0h
	24	**veo_iecp_p0_rgb_his_hold** Default Value: 0h
	23	**Reserved** Access: RO Format: MBZ

VEO_STATE - VEO State Register

	22:19	**VSC_FSM_State** Default Value: 0h State of the VEO_VSC_CNTRL state machine
	18:16	**GAV Command Credit Count** Default Value: 4h
	15:12	**GAV Data Credit Count** Default Value: 8h
	11:8	**Reserved** Access: RO Format: MBZ
	7:0	**GAV Stall Clk Cnt Max** Default Value: 0h The longest stall from GAV since the beginning of the frame.

VE SFC Forced Lock Acknowledgement Register

VE_SFC_FORCED_LOCK_ACK - VE SFC Forced Lock Acknowledgement Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1CA018h
ShortName:	VE_SFC_FORCED_LOCK_ACK_VECS0
Address:	1DA018h
ShortName:	VE_SFC_FORCED_LOCK_ACK_VECS1
Address:	1EA018h
ShortName:	VE_SFC_FORCED_LOCK_ACK_VECS2
Address:	1FA018h
ShortName:	VE_SFC_FORCED_LOCK_ACK_VECS3

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**VE_SFC_FORCED_LOCK_ACK** Format: U1 This bit can only be set by hardware and it has to be clear by hardware as well. This bit is going to be polled by driver. This bit indicates that VE has received MFX_SFC_Forced_Lock from driver and it has sent that signal to SFC. Once this bit is set, it indicates SFC status (lock or unlock) will not be changed anymore. Driver will be safe to start the reset process after this bit is set. Hardware has to de-assert this bit after driver de-assert VE_SFC_Forced_Lock as well.

VE SFC Forced Lock Register

VE_SFC_FORCED_LOCK - VE SFC Forced Lock Register	
Register Space:	MMIO: 0/2/0
Access:	WO
Size (in bits):	32
Address:	1CA01Ch
ShortName:	VE_SFC_FORCED_LOCK_01
Address:	1DA01Ch
ShortName:	VE_SFC_FORCED_LOCK_02
Address:	1EA01Ch
ShortName:	VE_SFC_FORCED_LOCK_03
Address:	1FA01Ch
ShortName:	VE_SFC_FORCED_LOCK_04

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**VE_SFC_FORCED_LOCK** Format: U1 This bit can only be set by driver and it has to be clear by driver as well. Driver should set this bit before issuing the software (watchdog timer) reset. It tells VEBox that a software reset is going to happen. VE then issues a forced lock to SFC. If SFC is currently locked to VE, SFC should not unlock itself from VE. If SFC is NOT currently locked to VE, SFC should not accept the lock request from VE. Driver needs to clear this bit after the software reset sequence is complete.

VE VFW SFC Usage Register

VE_SFC_USAGE - VE VFW SFC Usage Register

Register Space:	MMIO: 0/2/0
Access:	RO
Size (in bits):	32
Address:	1CA014h
ShortName:	VE_SFC_USAGE_VECS0
Address:	1DA014h
ShortName:	VE_SFC_USAGE_VECS1
Address:	1EA014h
ShortName:	VE_SFC_USAGE_VECS2
Address:	1FA014h
ShortName:	VE_SFC_USAGE_VECS3

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**VE_SFC_USAGE** Format: U1 This bit can only be set by hardware and it has to be clear by hardware as well. This bit indicates SFC is currently locked to VE. This bit should be set after SFC accepts the lock request from VE. This bit should be clear once SFC finishes the workload and unlocked from VEBox. In case a reset happens on MFX, this bit must be reset once a new workload is received

VF_CAPABILITY_REGISTER

VF_CAP_REG - VF_CAPABILITY_REGISTER

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	1901F8h

This register is used to communicate information about the VF to the VM Drivers. The same offset (0x1901F8) is used for all VF and the PF.

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Virtual Function** Access: RO _Custom_GTIReset: BUS Value / Name: 0b – Physical Function **[Default]** 1b – Virtual Function

VF_SW_FLAG

VF_SW_FLAG	
Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	190240h
Name:	VF_SW_FLAG_0
ShortName:	VF_SW_FLAG_0
Address:	190244h
Name:	VF_SW_FLAG_1
ShortName:	VF_SW_FLAG_1
Address:	190248h
Name:	VF_SW_FLAG_2
ShortName:	VF_SW_FLAG_2
Address:	19024Ch
Name:	VF_SW_FLAG_3
ShortName:	VF_SW_FLAG_3

Each Virtual Function has 4x32bit Software Flag registers, which can be used as scratch registers.

DWord	Bit	Description
0	31:0	**Data** Default Value: 00000000h Access: R/W _Custom_GTIReset: BUS The format of this register is defined by Software.

VF BAR0 LDW

VF_BAR0_LDW_0_2_0_PCI - VF BAR0 LDW

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00344h

Lower DW of the BAR that defines the base Host Physical Address (HPA) of GTTMMADR for all VFs.
The HPA of the GTTMMADR for Virtual Function n = VF GTTMMADDR (Upper and Lower DW) + (n - 1) * (16MB * num Tiles)

DWord	Bit	Description
0	31:24	**VF GTTMMADDR Lower DW** Default Value: 00000000b Access: R/W Mask: VF GTTMMADDR Lower DW Mask Format: PhysicalAddress[31:24] _Custom_GTIReset: BUS VF GTTMMADDR Lower DW
	23:4	**VF GTTMMADDR Lower DW Mask** Default Value: 00000000000000000000000000b Access: RO _Custom_GTIReset: BUS VF GTTMMADDR Lower DW Mask
	3	**Prefetchable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Prefetchable
	2:1	**Type** Default Value: 10b Access: RO _Custom_GTIReset: BUS Type. Value 10 indicates 64 bit BAR

VF_BAR0_LDW_0_2_0_PCI - VF BAR0 LDW

	0	**Memory Space Indicator** Default Value: 0b Access: RO _Custom_GTIReset: BUS Memory space Indicator. Value 0 indicates memory space.

VF BAR0 UDW

VF_BAR0_UDW_0_2_0_PCI - VF BAR0 UDW		
Register Space:	PCI: 0/2/0	
Size (in bits):	32	
Address:	00348h	
Upper DW of the BAR that defines the base Host Physical Address of the GTTMMADR for all VFs		
DWord	**Bit**	**Description**
0	31:0	**VF GTTMMADDR Upper DWord** Default Value: 00000000000000000000000000000000b Access: R/W Format: GraphicsAddress[63:32] _Custom_GTIReset: BUS VF GTTMMADDR Upper DW

VF BAR1 LDW

VF_BAR1_LDW_0_2_0_PCI - VF BAR1 LDW

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	0034Ch

Lower DW of the BAR that defines the base Host Physical Address of GMADR for all VFs.

DWord	Bit	Description
0	31:29	**VF GMADDR Lower DW** Default Value: 000b Access: R/W Mask: VF GMADDR Lower DW Mask Format: PhysicalAddress[31:29] _Custom_GTIReset: BUS VF GMADDR Lower DW
	28:4	**VF GMADDR Lower DW Mask** Default Value: 00000000000000000000b Access: RO _Custom_GTIReset: BUS VF GMADDR Lower DW Mask
	3	**Prefetchable** Default Value: 1b Access: RO _Custom_GTIReset: BUS Prefetchable
	2:1	**Type** Default Value: 10b Access: RO _Custom_GTIReset: BUS Type. Value 10 indicates 64 bit BAR
	0	**Memory Space Indicator** Default Value: 0b Access: RO _Custom_GTIReset: BUS Memory space Indicator. Value 0 indicates memory space.

VF BAR1 UDW

VF_BAR1_UDW_0_2_0_PCI - VF BAR1 UDW		
Register Space: PCI: 0/2/0 Size (in bits): 32		
Address: 00350h		
Upper DW of the BAR that defines the base Host Physical Address of GMADR for all VFs		
DWord	**Bit**	**Description**
0	31:0	**VF GMADDR Upper DWord** Default Value: 00000000000000000000000000000000b Access: R/W Format: PhysicalAddress[63:32] _Custom_GTIReset: BUS VF GMADDR Upper DW

VF BAR2 LDW

VF_BAR2_LDW_0_2_0_PCI - VF BAR2 LDW		
Register Space:	PCI: 0/2/0	
Size (in bits):	32	
Address:	00354h	
Lower DW of Unused BAR		
DWord	**Bit**	**Description**
0	31:0	**Reserved Bar** Default Value: 00000000000000000000000000000000b Access: RO _Custom_GTIReset: BUS Reserved

VF BAR2 UDW

VF_BAR2_UDW_0_2_0_PCI - VF BAR2 UDW		
Register Space:	PCI: 0/2/0	
Size (in bits):	32	
Address:	00358h	
Upper DW of Unused BAR		
DWord	**Bit**	**Description**
0	31:0	**Reserved Bar** Default Value: 00000000000000000000000000000000b Access: RO _Custom_GTIReset: BUS Reserved

VF Device ID

VF_DEVICEID_0_2_0_PCI - VF Device ID

Register Space: PCI: 0/2/0
Size (in bits): 16

Address: 0033Ah

Defines the Device ID to be used by all Virtual Functions

DWord	Bit	Description
0	15:0	**VF DEVICE ID VALUE** Access: RO Variant _Custom_GTIReset: BUS Mirror the same device ID as the PF Value: 1001101001000000b — Name: **[Default]**

VF Migration State Array Offset

VF_MIGST_OFFSET_0_2_0_PCI - VF Migration State Array Offset

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	0035Ch

Defines offset from a PF BAR to the VF Migration State Array. VF Migration not supported in this implementation

DWord	Bit	Description
0	31:0	**Reserved bits** Default Value: 00000000000000000000000000000000b Access: RO _Custom_GTIReset: BUS Reserved

VF Scratch Pad

VFSKPD - VF Scratch Pad

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	083A8h-083ABh
Name:	VF Scratch Pad
ShortName:	VFSKPD_VFUNIT
Address:	16EA8h-16EABh
Name:	VF Scratch Pad
ShortName:	VFSKPD_VFRUNIT

DWord	Bit	Description
0	31:16	**Mask** Access: WO Format: Mask _Custom_GTIReset: DEV Must be set to modify corresponding bit in Bits 15:0. (All bits implemented)
	15	**Reserved** Access: RO Format: MBZ
	14	**Reserved** Access: R/W Format: PBC _Custom_GTIReset: DEV
	13	**Mid Object Preemption Topology Fix Disable** Access: R/W Format: Disable _Custom_GTIReset: DEV Value / Name / Description: 0h / Enable **[Default]** / VF replay topology fix is enabled - VF will output correct topology after Object Level Pre-emption. 1h / / VF replay topology fix is disabled
	12	**Index Buffer Fetch Enhancement Disable** Access: R/W Format: Disable

VFSKPD - VF Scratch Pad

_Custom_GTIReset:	DEV

Value	Name	Description
0h	Enable **[Default]**	The index buffer fetch enhancement is enabled. If the number of vertex per instance is less than the index buffer depth, VF will only fetch the indices from the index buffer on the first instance. All other instances will re-use the indices stored in the index buffer.
1h		The index fetch enhancement is disabled. All indices are always fetched.

11 **POLYGON PrimitiveID Fix Disable**

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

Value	Name	Description
0h	Enable **[Default]**	PrimitiveID is constant across all triangles of a POLYGON.
1h	Disable	PrimitiveID is incremented for each triangle of a POLYGON.

10 **VF POSH Starvation Disable**

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

Value	Name	Description
0h	Enable **[Default]**	The VF will inform OVR when it is starved for POSH token data.
1h	Disable	The VF will not inform OVR when it is starved for POSH token data.

9 **Partial Autostrip Disable**

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

Value	Name	Description
0h	Enable **[Default]**	The VF can generate "partial autostrip" primitives from TRILIST inputs (if/when possible).
1h	Disable	VF will not generate "partial autostrip" primitives

8 **Reserved**

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

VFSKPD - VF Scratch Pad

7 **Reserved**

Access:	R/W
Format:	PBC
_Custom_GTIReset:	DEV

6 **Autostrip Disable**

Access:	R/W
Format:	U1
_Custom_GTIReset:	DEV

Value	Name	Description
0h	Enable **[Default]**	The VF can generate "autostrip" primitives from TRILIST inputs (if/when possible).
1h	Disable	VF will not generate "autostrip" primitives.

5 **TLB Prefectch Enable**

Access:	R/W
Format:	U1
_Custom_GTIReset:	DEV

Value	Name	Description
0h	Disable **[Default]**	The VF will generate prefetch of TLB when it is fetching sequential vertex data and four or fewer vertex buffers are valid.
1h	Enable	VF will disable prefetch of TLB entries.

4 **4th Vertex Data Pipe Disable**

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

Value	Name	Description
0h	**[Default]**	The 4th Vertex Data Pipe is enabled.
1h		The 4th Vertex Data Pipe is disabled.

Programming Notes
This is only valid when there are 3 or more vertex data pipes.

3 **Nullprim early credit release disable**

Access:	R/W
_Custom_GTIReset:	DEV

VFSKPD - VF Scratch Pad

Value	Name	Description
0h	**[Default]**	The nullprim credit release will be returned to csunit when the upper pipe of vfunit is emtpy.
1h		The nullprim credit release will be returned to csunit when the upper pipe and the lower pipe of vfunit are emtpy.

2 **Vertex Cache Implicit Disable Inhibit**

Access:	R/W
Format:	U1
_Custom_GTIReset:	DEV

Value	Name	Description
0h	**[Default]**	Allow VF to disable VS0 when Sequential index or Prim ID is a valid Element.
1h		VF never implicitly disables the vertex cache. Software must disable the VS0 Cache when required.

1 **Disable Over Fetch Cache**

Access:	R/W
_Custom_GTIReset:	DEV

Value	Name	Description
0h	**[Default]**	Cache will check for data in cache before making a request to memory
1h		Always re-fetch new data from memory.

Programming Notes
Note that the Disable Multiple Miss Read squash bit must be cleared for Disable Over Fetch Cache to be set.

0 **Disable Multiple Miss Read squash**

Access:	R/W
Format:	Disable
_Custom_GTIReset:	DEV

Value	Name	Description
0h	**[Default]**	Allow VF to squash reads that are to the same cacheline for vertex buffer requests.
1h		Disallow VF from squashing reads that are to the same cacheline for vertex buffer requests.

VF Stride

VF_STRIDE_0_2_0_PCI - VF Stride		
Register Space:	PCI: 0/2/0	
Size (in bits):	16	
Address:	00336h	
Defines the stride of the function number from one VF to the next.		
DWord	**Bit**	**Description**
0	15:0	**VF STRIDE VALUE** Default Value: 0000000000000001b Access: RO _Custom_GTIReset: BUS Defines the Routing ID offset from one VF to the next one for all VFs associated with the PF that contains this Capability structure. The next VFs 16-bit Routing ID is calculated by adding the contents of this field to the Routing ID of the current VF, ignoring any carry, using unsigned 16-bit arithmetic. The value of this field is hardwired to 0001h.

VFW Credit Count Register

VFW_CREDIT_CNT - VFW Credit Count Register		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	1CA010h	
ShortName:	VFW_CREDIT_CNT_01	
Address:	1DA010h	
ShortName:	VFW_CREDIT_CNT_02	
Address:	1EA010h	
ShortName:	VFW_CREDIT_CNT_03	
Address:	1FA010h	
ShortName:	VFW_CREDIT_CNT_04	

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7:0	**Credit Count** Default Value: 4h The number of outstanding credits between VFW and GAV. If zero VEBOX cannot proceed due to GAV not releasing credits.

VGA_CONTROL

VGA_CONTROL

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	41000h-41003h
Name:	VGA Control
ShortName:	VGA_CONTROL
Reset:	global

Restriction

VGA requires panel fitting to be enabled. VGA is always connected to pipe A.VGA cannot be enabled while the display power well is powered down. VGA display should only be enabled if all display planes other than VGA are disabled.

DWord	Bit	Description
0	31	**VGA Display Disable** This bit will disable the VGA compatible display mode. It has no effect on VGA register or A0000-BFFFF memory aperture accesses which are controlled by the PCI configuration and VGA I/O register settings. **Value** / **Name** 0b – Enable 1b – Disable **[Default]** **Restriction** The VGA SR01 screen off bit must be programmed when enabling and disabling VGA. See the VGA Registers document.
	30:27	**Reserved** Access: RO Format: MBZ
	26	**VGA Border Enable** This bit determines if the VGA border areas are included in the active display area. The border will be scaled along with the pixel data. **Value** / **Name** 0b – Disable 1b – Enable
	25	**DBuf Clock Gate** Access: R/W The bit controls the Display buffer clocking when VGA is used. Software must set this bit to 0b before enabling VGA and set it to 1b after VGA gets disabled.

VGA_CONTROL

24	**Pipe CSC Enable** This bit enables pipe color space conversion and the pipe pre-CSC gamma for the VGA pixel data. **Value** / **Name** 0b / Disable 1b / Enable
23:21	**Reserved** Access: RO Format: MBZ
20	**Legacy 8Bit Palette En** This bit affects reads and writes to the palette through VGA I/O addresses. In the 6-bit mode, the 8-bits of data are shifted up two bits on the write (upper two bits are lost) and shifted two bits down on the read. This provides backward compatibility for original VGA programs as well as VESA VBE support for 8-bit palette. It does not affect palette accesses through the palette register MMIO path. **Value** / **Name** 0b / 6 bit DAC 1b / 8 bit DAC
19	**Reserved**
18	**Reserved**
17:16	**Reserved** Access: RO Format: MBZ
15:12	**Reserved**
11:8	**Reserved**
7:6	**Blink Duty Cycle** Controls the VGA text mode blink duty cycle relative to the VGA cursor blink duty cycle. **Value** / **Name** / **Description** 00b / 100% / 100% Duty Cycle, Full Cursor Rate 01b / 25% / 25% Duty Cycle, 1/2 Cursor Rate 10b / 50% / 50% Duty Cycle, 1/2 Cursor Rate 11b / 75% / 75% Duty Cycle, 1/2 Cursor Rate
5:0	**VSYNC Blink Rate** Controls the VGA blink rate in terms of the number of VSYNCs per on/off cycle. **Programming Notes** Program with (VSYNCs/cycle)/2-1

VIDEO_DIP_CTL

VIDEO_DIP_CTL

Reset:	soft

Each type of Video DIP will be sent once each frame while it is enabled.

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28	**DRM DIP enable** Access: R/W This bit enables the output of the DRM DIP. Value: 1b — Name: DRM DIP enable Value: 0b — Name: DRM DIP disable **Programming Notes** This needs to be enabled with HDMI only.

VIDEO_DIP_CTL

27 PSR PSR2 VSC bit 7

This bit manually sets PSR VSC bit for future specification changes.

Value	Name
0b	Do not set
1b	Set

26:25 VSC select

Select between hardware and software control of the VSC DIP data and header. When hardware controls it will send PSR1 header and data values when PSR1 is enabled, and PSR2 + Y-coordinate header and data values when PSR2 is enabled.

If PSR2/SU SDP without Y-coordinate is enabled SW must set the header bits of the VSC packet to the PSR2 without Y-coordinate value from the eDP standard.

Value	Name	Description
00b	Header and Data	Hardware controls all headers bytes. Hardware controls data bytes 0-13. Software controls data bytes 14+. Recommended for use when PSR is enabled and software is not using VSC for other types of data.
10b	Data Only	Software controls all headers bytes. Hardware controls data bytes 0-13. Software controls data bytes 14+. Recommended for use when software is sending data with VSC. If PSR is enabled, software must configure the header to include the PSR revision and byte count.
11b	None	Software controls all headers bytes. Software controls all data bytes. Not recommended for use.

24 VDIP Enable PPS

Access:	R/W

This field controls enable/disable of PPS DIP. It should be enabled prior to enabling VDSC.
SW should enable DSC hardware feature only after programming PPS.
Hardware still sends PPS once at the beginning of enable cycle in disable PPS case.
PPS DIP can only be enabled with DisplayPort.

Value	Name
0b	Disable
1b	Enable

23:22 Reserved

Access:	RO
Format:	MBZ

21 Reserved

Access:	RO
Format:	MBZ

VIDEO_DIP_CTL

20	**VDIP Enable VSC** Access: R/W This bit enables the output of the Video Stream Configuration DIP. Value: 0b — Disable VSC DIP Value: 1b — Enable VSC DIP **Restriction** VSC can only be enabled with DisplayPort. VSC should be enabled prior to enabling PSR or stereo 3D if VSC will be used to transmit stereo 3D related information.
19:17	**Reserved** Access: RO Format: MBZ
16	**VDIP Enable GCP** Access: R/W This bit enables the output of the General Control Packet (GCP) DIP.GCP is different from other DIPs in that much of the payload is automatically reflected in the packet, and therefore there is a VIDEO_DIP_GCP register instead of DIP data buffers for GCP. Value: 0b — Disable GCP DIP Value: 1b — Enable GCP DIP **Restriction** GCP is only supported with HDMI when the bits per color is not equal to 8. GCP must be enabled prior to enabling TRANS_DDI_FUNC_CTL for HDMI with bits per color not equal to 8 and disabled after disabling TRANS_DDI_FUNC_CTL
15:13	**Reserved** Access: RO Format: MBZ
12	**VDIP Enable AVI** Access: R/W This bit enables the output of the Auxiliary Video Information DIP. Value: 0b — Disable AVI DIP Value: 1b — Enable AVI DIP **Restriction** Only enable with HDMI.

VIDEO_DIP_CTL

11:9	**Reserved** Access: RO Format: MBZ
8	**VDIP Enable VS** Access: R/W This bit enables the output of the Vendor Specific (VS) DIP. **Value** / **Name** 0b – Disable VS DIP 1b – Enable VS DIP **Restriction** Only enable with HDMI.
7:5	**Reserved** Access: RO Format: MBZ
4	**VDIP Enable GMP** Access: R/W This bit enables the output of the Gamut Metadata Packet (GMP) DIP.GMP can be enabled with either DisplayPort or HDMI. **Value** / **Name** 0b – Disable GMP DIP 1b – Enable GMP DIP
3:1	**Reserved** Access: RO Format: MBZ
0	**VDIP Enable SPD** Access: R/W This bit enables the output of the Source Product Description (SPD) DIP. **Value** / **Name** 0b – Disable SPD DIP 1b – Enable SPD DIP **Restriction** Only enable with HDMI.

There are multiple instances of this register format per DIP type and per transcoder.

DWord	Bit	Description
0	31:0	**Video DIP DATA** Access: R/W This field contains the video DIP data to be transmitted. **Restriction** Data should be loaded before enabling the transmission through the DIP type enable bit.

There are multiple instances of this register format per DIP type and per transcoder.

DWord	Bit	Description
0	31:0	**Video DIP ECC** This field contains the video DIP ECC value for read back.

VIDEO_DIP_GCP

VIDEO_DIP_GCP	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	60210h-60213h
Name:	Transcoder Video Data Island Packet GCP
ShortName:	VIDEO_DIP_GCP_A
Reset:	soft
Address:	61210h-61213h
Name:	Transcoder Video Data Island Packet GCP

Reset:	soft
Address:	63210h-63213h
Name:	Transcoder Video Data Island Packet GCP
ShortName:	VIDEO_DIP_GCP_D
Reset:	soft

DWord	Bit	Description
0	31:3	**Reserved** Access: RO Format: MBZ
	2	**GCP color indication** Access: R/W Value / Name / Description: 0b / Don't Indicate / Don't indicate color depth. CD and PP bits in GCP set to zero. 1b / Indicate / Indicate color depth using CD bits in GCP. The color depth value comes from the TRANS_DDI_FUNC_CTL register. Restriction: This bit must be set when in HDMI deep color (>8 BPC) mode.

VIDEO_DIP_GCP

1 **GCP default phase enable**

Access:	R/W

GCP default phase indicates that video timings meet alignment requirements such that the following conditions are met:

1. Htotal is a multiple of the value given in the table below
2. Hactive is an even number
3. Front and back porches for Hsync are even numbers
4. Vsync always starts on an even-numbered pixel within a line in interlaced modes (starting counting with 0)

BPC	Color Format	Htotal Multiple Requirement
8	RGB	2
8	YUV420	4
10	RGB	4
10	YUV420	8
12	RGB	2
12	YUV420	4

Value	Name	Description
0b	Clear	Default phase bit in GCP is cleared.
1b	Set	Default phase bit in GCP is set.

Restriction
Do not set this bit if these requirements are not met.

0 **Reserved**

This represents 36 bytes of ECC over PPS DIP.

DWord	Bit	Description
0	31:0	**Video DIP PPS ECC** Access: RO ECC for PPS DIP.

Video BIOS ROM Base Address

ROMADR_0_2_0_PCI - Video BIOS ROM Base Address

Register Space:	PCI: 0/2/0
Size (in bits):	32
Address:	00030h

The IGD does not use a separate BIOS ROM, therefore this register is hardwired to 0s.

DWord	Bit	Description
0	31:18	**ROM Base Address** Default Value: 00000000000000b Access: RO _Custom_GTIReset: BUS Hardwired to 0's.
	17:11	**Address Mask** Default Value: 0000000b Access: RO _Custom_GTIReset: BUS Hardwired to 0s to indicate 256 KB address range.
	10:1	**Reserved** Access: RO Format: MBZ
	0	**ROM BIOS Enable** Default Value: 0b Access: RO _Custom_GTIReset: BUS Hardwired to 0 to indicate ROM not accessible.

VIRTUALIZATION CONTROL REGISTER

VIRTUAL_CTRL_REG - VIRTUALIZATION CONTROL REGISTER

Register Space:	MMIO: 0/2/0
Size (in bits):	32
SOC_Consumer:	BIOS
Address:	10108Ch

This register is used to identify which Virtual Function, if any, is allowed to access or configure the Global GTT Entry.

DWord	Bit	Description
0	31:9	**Reserved** Access: RO Format: MBZ
	8	**Guest Direct GGTT Update Enable** Access: R/W _Custom_GTIReset: BUS 1'b0 : Guest VM can't directly update GGTT Entries via GSM range within VF GTTMMADR 1'b1 : Guest VM can modify the physical address field of a GGTT Entry if the Function Number field of that entry matches the Function Number associated with the GTTMMADR range that was targeted by the access. No other field of the GGTT Entry can be modified by the Guest VM. A Guest VM Read to a GGTT Entry is allowed if the Function Number field matches, but the Function Number field itself will read as 0 (a Guest VM should not know which VF it has been assigned to). Value: 0b — **[Default]** Value: 1b
	7:0	**Reserved** Access: RO Format: MBZ

VSC_EXT_SDP_CONF

VSC_EXT_SDP_CONF

Reset:	soft

DWord	Bit	Description
0	31	**Chain done** Access: RO Read by software/DSB to know if it can start sending new chain. Chained metadata straddling 2 buffers need to know this status. Value 0b: HW sending previous chain Value 1b: HW completed sending previous chain
	30:25	**Reserved** Access: RO Format: MBZ
	24	**Reserved** Access: RO Format: MBZ

VSC_EXT_SDP_CONF

23 — SDP Active Error

Access:	R/WC

This bit represents an error condition that not all SDPs were read when video active region is reached.
HW will stop transmitting metadata once active region is reached.
This bit is set by HW and cleared by SW by writing '1'.
To avoid false indication of an error, SW can choose either of the following methods:

1. Avoid programming VSC_EXT registers and setting the buffer ready bit in VSC_EXT_SDP_CTL before vblank rises.
2. Program VSC_EXT registers and set the buffer ready bit in VSC_EXT_SDP_CTL anytime, but clear the SDP Active Error at the start of vblank, so that it can be rechecked at the end of vblank to indicate real issues.

Value	Name
0b	All SDPs transmitted in VBLANK
1b	All SDPs not transmitted in VBLANK

22 — Block mode

When this bit is set to 1, it is software responsibility to set Middle Of Chaining bit [23] and Packet sequence bits [28:24] in the header packet that it programs in metadata register.
HW does not support changing this field during transmission.

Value	Name
0b	Header values from Header register
1b	Header values from SW/DSB written buffer

21:10 — HBLANK early indication

In HW, this field is expressed in terms of pixels and not clocks.
It provides a guardband to stop the VSC_EXT_SDP transmission from going into Hblank region (for Audio).
For eg: If this field is programed to 20 pixels, then when horizontal counter reaches (HActive -20), VSC_EXT_SDP transmission stops.
If a packet is in the middle of transmission, then it completes before stopping. Transmission resumes on the next HActive.
In MST/DP2 this transmission can happen only when an MTP slot is available.
For all SST/MST/DP2 use cases, recommendation is to use 10% of HActive.

9:0 — Packets per chain

This field specifies the total number of packets (each packet has 32 bytes) in the chain.
= Number of bytes/32

VSC_EXT_SDP_CTL

VSC_EXT_SDP_CTL	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32

Name:	Transcoder VSD Extended SDP Control 1
ShortName:	VSC_EXT_SDP_CTL_1_D

VSC_EXT_SDP_CTL

Reset: soft

The VSC_EXT_VESA SDP allows a DP Source device to send video stream-related metadata aligned with the stream. A single VSC_EXT SDP is composed of four header bytes and 32 payload bytes. The VSC_EXT_VESA SDP maybe chained. Chaining framework enables a flexible metadata transportation framework to allow the transport of variable bytes of payload using a single VSC_EXT_VESA.

For transmitting frame synchronous metadata beyond 1KB, software must alternate between Buffer0 and Buffer1.

Metadata must be programmed in multiple of 32 bytes (8 dwords).

DWord	Bit	Description
0	31	**VSC extension SDP metadata enable** **NOTE:** This field is ignored on the register instance VSC_EXT_SDP_CTL_1. Value: 0b — Name: Disable Value: 1b — Name: Enable
	30:25	**Reserved** Access: RO Format: MBZ
	24	**Buffer Empty** Access: RO This field is set by hardware when buffer is empty and reset when buffer has metadata to be sent over the link. This field is read by software (or DSB) to know when it can start writing to the buffer (buffer reuse cases included). Value: 1b — Name: buffer empty **[Default]** Value: 0b — Name: buffer not empty
	23:17	**Reserved** Access: RO Format: MBZ
	16	**Buffer Ready** Access: Write/Read Status This field is set by software (or DSB) to indicate that the buffer is ready for hardware use. Hardware clears this field after the buffer processing is complete. SW can also clear this bit. Both SW clear and SW set will have higher priority over HW clear. Value: 1b — Name: Ready For HW Use Value: 0b — Name: Not ready for HW Use

VSC_EXT_SDP_CTL		
	15	**Reserved** Access: RO Format: MBZ
	14	**Index Auto Increment** This field controls the index auto increment.
	13:8	**Reserved** Access: RO Format: MBZ
	7:0	**Index Value** This field indicates the data location to be accessed through the data register. This value can be automatically incremented by a write to the data register if the index auto increment bit (14) is set. When automatically incrementing, the current automatically calculated index value can be read here, and the index will roll over to 0 after reaching the end of the allowed range. 8-bit index supports up to 1KB. Examples: 00h =Dword at location 0 FFh = Dword at location 255

VSC_EXT_SDP_DATA

Reset:	soft

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:24	**Packet sequence** Range is from 0 to 31. Shall be cleared to 0 on the first SDP of a new VSC_EXT packet sequence. When bit 6 of HB2 is set to 1, this field shall increment by 1 on each subsequent chained packet. This counter rolls over to 0 when it exceeds 31.
	23	**Middle Of Chaining** This bit specifies if there are any chained packets to follow. This bit has to be set if block mode(VSC_EXT_SDP_CONF[block mode]) is set. Value: 0b — Name: No chained packets to follow Value: 1b — Name: Chained packet(s) to follow.
	22	**Variable Packet Sequence Number** This bit specifies how the packed sequence field is used.

VSC_EXT_SDP_HEADER

		Value / **Name** 0b — Packet Sequence Field is fixed 1b — Packet Sequence field is incremented with chained packets
	21:18	**VSC EXT VESA SDP Framework Ver 1** Specifies the VSC EXT VESA SDP Framework Version, to be left at default '0'.
	17:16	**VSC EXT VESA SDP Framework Ver 0** Specifies the VSC EXT VESA SDP Framework Version, to be left at default '0'.
	15:8	**SDP Type** Specifies the Secondary Data Packet type. **Value** / **Name** 20h — VESA **[Default]** 21h — CEA
	7:0	**SDP ID** Specifies the Secondary Data Packet ID. Specific to stream (usually 00h).

VS Invocation Counter

VS_INVOCATION_COUNT - VS Invocation Counter	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	64
_Custom_GTIReset:	DEV
Address:	02320h-02327h
Name:	VS Invocation Counter
ShortName:	VS_INVOCATION_COUNT_RCSUNIT_BE_GEOMETRY
Address:	18320h-18327h
Name:	VS Invocation Counter
ShortName:	VS_INVOCATION_COUNT_POCSUNIT_BE_GEOMETRY

This register stores the value of the vertex count shaded by VS. This register is part of the context save and restore.

DWord	Bit	Description
0..1	63:32	**VS Invocation Count Report UDW** Number of vertices that are dispatched as threads by the VS stage. Updated only when **Statistics Enable** is set in VS_STATE (see the Vertex Shader Chapter in the 3D Volume.)
	31:0	**VS Invocation Count Report LDW** Number of vertices that are dispatched as threads by the VS stage. Updated only when **Statistics Enable** is set in VS_STATE (see the Vertex Shader Chapter in the 3D Volume.)

VSR_PUSH_CONSTANT_BASE

VSR_PUSH_CONSTANT_BASE - VSR_PUSH_CONSTANT_BASE

Register Space:	MMIO: 0/2/0
Size (in bits):	32
Address:	0E518h
Name:	VSR_PUSH_CONSTANT_BASE
ShortName:	VSR_PUSH_CONSTANT_BASE

DWord	Bit	Description
0	31:17	**Reserved** Access: RO Format: MBZ
	16:6	**VSR PUSH CONSTANT BASE** Default Value: 200h Access: R/W **Description** This is an 64 Byte aligned offset in to the URB indicating the base of the push constant allocation space for the push constant allocation space for VSR unit in POSH pipeline. The offset and size of the VSR allocation is relative to this base address.
	5:0	**Reserved** Access: RO Format: MBZ

VTd Status

VTD_STATUS_0_2_0_PCI - VTd Status

Register Space:	PCI: 0/2/0
Size (in bits):	8
Address:	0006Ch

This register contains indicator bits for Graphics VTd mode.

DWord	Bit	Description
0	7:1	**Reserved** Access: RO Format: MBZ
	0	**GFX VTd Active** Default Value: 0b Access: R/W _Custom_GTIReset: BUS Reflects GFX VTd Mode is active. 1 - if active, 0 if inactive. Acts as R/W register only during Punit restore - when iommu freeze bit is set. RO otherwise

Wait For Event and Display Flip Flags Register

SYNC_FLIP_STATUS - Wait For Event and Display Flip Flags Register

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	022D0h-022D3h
Name:	Wait For Event and Display Flip Flags Register
ShortName:	SYNC_FLIP_STATUS_RCSUNIT_DISP

Address:	222D0h-222D3h
Name:	Wait For Event and Display Flip Flags Register
ShortName:	SYNC_FLIP_STATUS_BCSUNIT_DISP

This register is the saved value of what wait for events are still valid. This register is part of context save and restore for RC6 feature.

Programming Notes

Programming Restriction: This register should NEVER be programmed by SW, this is for HW internal use only.

VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be exercised for reads or writes.

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30	**Display Plane 1 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 1 "Flip Pending" condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	29	**Display Plane 1 Syncronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 1 "Flip Pending" condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	28	**Display Plane 4 Syncronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 4 "Flip Pending" condition. If a flip

request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

27 **Reserved**

Access:	RO
Format:	MBZ

26 **Display Plane 2 Asyncronous Display Flip Pending**

Format:	Enable

This field enables a wait for the duration of a Display Plane 2 "Flip Pending" condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

25 **Display Plane 2 Syncronous Flip Display Pending**

Format:	Enable

This field enables a wait for the duration of a Display Plane 2 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

24 **Display Plane 5 Syncronous Flip Display Pending**

Format:	Enable

This field enables a wait for the duration of a Display Plane 5 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

23 **Display Plane 1 Asyncronous Performance Flip Pending Wait Enable**

Source:	RenderCS
Format:	Enable

This field enables a wait for the duration of a Display Plane 1 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

22 **Display Plane 1 Asyncronous Flip Pending Wait Enable**

Format:	Enable

This field enables a wait for the duration of a Display Plane 1 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending

SYNC_FLIP_STATUS - Wait For Event and Display Flip Flags Register

		Condition (in the Device Programming Interface chapter of MI Functions.
	21	**Display Plane 1 Syncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 1 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	20	**Display Plane 4 Syncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 4 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	19	**Reserved** Access: RO Format: MBZ
	18	**Display Pipe A Scan Line Wait Enable** Format: Enable This field enables a wait while a Display Pipe A Scan Line condition exists. This condition is defined as the the start of the scan line specified in the Pipe A Display Scan Line Count Range Compare Register. See Scan Line Event in the Device Programming Interface chapter of MI Functions.
	17	**Display Pipe A Vertical Blank Wait Enable** Format: Enable This field enables a wait until the next Display Pipe A Vertical Blank event occurs. This event is defined as the start of the next Display Pipe A vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event (See Programming Interface).
	16	**Reserved** Access: RO Format: MBZ
	15	**Display Plane 2 Asyncronous Performance Flip Pending Wait Enable** Source: RenderCS Format: Enable This field enables a wait for the duration of a Display Plane 2 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending

SYNC_FLIP_STATUS - Wait For Event and Display Flip Flags Register

		Condition (in the Device Programming Interface chapter of MI Functions.
	14	**Display Plane 2 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 2 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	13	**Display Plane 2 Syncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 2 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	12	**Display Plane 5 Syncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 5 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	11	**Reserved** Access: RO Format: MBZ
	10	**Display Pipe B Scan Line Wait Enable** Format: Enable This field enables a wait while a Display Pipe B Scan Line condition exists. This condition is defined as the the start of the scan line specified in the Pipe B Display Scan Line Count Range Compare Register. See Scan Line Event in the Device Programming Interface chapter of MI Functions.
	9	**Display Pipe B Vertical Blank Wait Enable** Format: Enable This field enables a wait until the next Display Pipe B Vertical Blank event occurs. This event is defined as the start of the next Display Pipe B vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event (See Programming Interface).
	8:0	**Reserved** Access: RO Format: MBZ

Wait For Event and Display Flip Flags Register 1

SYNC_FLIP_STATUS_1 - Wait For Event and Display Flip Flags Register 1

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	022D4h-022D7h
Name:	Wait For Event and Display Flip Flags Register 1
ShortName:	SYNC_FLIP_STATUS_1_RCSUNIT_DISP

Address:	222D4h-222D7h
Name:	Wait For Event and Display Flip Flags Register 1
ShortName:	SYNC_FLIP_STATUS_1_BCSUNIT_DISP

This register is the saved value of what wait for events are still valid. This register is part of context save and restore for RC6 feature.

Programming Notes

Programming Restriction: This register should NEVER be programmed by SW, this is for HW internal use only.

VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be exercised for reads or writes.

DWord	Bit	Description
0	31:27	**Reserved** Access: RO Format: MBZ
	26	**Display Plane 12 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 12 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	25	**Display Plane 12 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 12 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_1 - Wait For Event and Display Flip Flags Register 1

	24	**Display Plane 11 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 11 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	23	**Display Plane 11 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 11 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	22	**Display Plane 10 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 10 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	21	**Display Plane 10 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 10 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	20	**Display Plane 9 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 9 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	19	**Display Plane 9 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 9 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_1 - Wait For Event and Display Flip Flags Register 1

	18	**Display Plane 8 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 8 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	17	**Display Plane 8 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 8 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	16	**Display Plane 7 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 7 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	15	**Display Plane 7 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 7 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	14	**Display Pipe C Scan Line Event Pending** Format: Enable This field indicates scan line event operation is pending from Display Pipe C. This field gets set when MI_SCANLINE_INCL/EXCL command is parsed for Display Plane-C and gets reset on scan line event completion for Display Plane-C.
	13	**Display Pipe B Scan Line Event Pending** Format: Enable This field indicates scan line event operation is pending from Display Pipe B. This field gets set when MI_SCANLINE_INCL/EXCL command is parsed for Display Plane-B and gets reset on scan line event completion for Display Plane 3.

SYNC_FLIP_STATUS_1 - Wait For Event and Display Flip Flags Register 1

	12	**Display Pipe A Scan Line Event Pending** Format: Enable This field indicates scan line event operation is pending from Display Pipe A. This field gets set when MI_SCANLINE_INCL/EXCL command is parsed for Display Plane-A and gets reset on scan line event completion for Display Plane 1.
	11	**Reserved** Access: RO Format: MBZ
	10	**Display Plane 3 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 3 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	9	**Display Plane 3 Syncronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 3 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	8	**Display Plane 6 Syncronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 6 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	7	**Display Plane 3 Asyncronous Performance Flip Pending Wait Enable** Source: RenderCS Format: Enable This field enables a wait for the duration of a Display Plane 3 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_1 - Wait For Event and Display Flip Flags Register 1

	6	**Display Plane 3 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 3 "Flip Pending" condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	5	**Display Plane 3 Syncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 3 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	4	**Display Plane 6 Syncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 6 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	3	**Reserved** Access: RO Format: MBZ
	2	**Display Pipe C Scan Line Wait Enable** Format: Enable This field enables a wait while a Display Pipe C Scan Line condition exists. This condition is defined as the the start of the scan line specified in the Pipe C Display Scan Line Count Range Compare Register. See Scan Line Event in the Device Programming Interface chapter of MI Functions.
	1	**Display Pipe C Vertical Blank Wait Enable** Format: Enable This field enables a wait until the next Display Pipe C Vertical Blank event occurs. This event is defined as the start of the next Display Pipe C vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event (See Programming Interface).
	0	**Reserved** Access: RO Format: MBZ

Wait For Event and Display Flip Flags Register 2

SYNC_FLIP_STATUS_2 - Wait For Event and Display Flip Flags Register 2

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	022ECh-022EFh
Name:	Wait For Event and Display Flip Flags Register 2
ShortName:	SYNC_FLIP_STATUS_2_RCSUNIT_DISP

Address:	222ECh-222EFh
Name:	Wait For Event and Display Flip Flags Register 2
ShortName:	SYNC_FLIP_STATUS_2_BCSUNIT_DISP

This register is the saved value of what wait for events are still valid. This register is part of context save and restore for RC6 feature.

Programming Notes

Programming Restriction: This register should NEVER be programmed by SW, this is for HW internal use only.

VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be exercised for reads or writes.

DWord	Bit	Description
0	31:27	**Reserved** Access: RO Format: MBZ
	26	**Display Plane 12 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 12 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	25	**Display Plane 12 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 12 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_2 - Wait For Event and Display Flip Flags Register 2

	24	**Display Plane 12 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 12 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	23	**Display Plane 11 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 11 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	22	**Display Plane 11 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 11 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	21	**Display Plane 11 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 11 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	20	**Display Plane 10 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 10 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	19	**Display Plane 10 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 10 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_2 - Wait For Event and Display Flip Flags Register 2

	18	**Display Plane 10 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 10 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	17	**Display Plane 9 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 9 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	16	**Display Plane 9 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 9 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	15	**Display Plane 9 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 9 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	14	**Display Plane 8 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 8 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	13	**Display Plane 8 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 8 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_2 - Wait For Event and Display Flip Flags Register 2

	12	**Display Plane 8 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 8 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	11	**Display Plane 7 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 7 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	10	**Display Plane 7 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 7 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	9	**Display Plane 7 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 7 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	8	**Display Plane 6 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 6 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	7	**Display Plane 6 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 6 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_2 - Wait For Event and Display Flip Flags Register 2

	6	**Display Plane 6 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 6 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	5	**Display Plane 5 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 5 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	4	**Display Plane 5 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 5 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	3	**Display Plane 5 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 5 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	2	**Display Plane 4 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 4 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	1	**Display Plane 4 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 4 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_2 - Wait For Event and Display Flip Flags Register 2

	0	**Display Plane 4 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 4 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

Wait For Event and Display Flip Flags Register 3

SYNC_FLIP_STATUS_3 - Wait For Event and Display Flip Flags Register 3

ShortName:	SYNC_FLIP_STATUS_3_BCSUNIT_DISP

This register is the saved value of what wait for events are still valid. This register is part of context save and restore for RC6 feature.

Programming Notes

Programming Restriction: This register should NEVER be programmed by SW, this is for HW internal use only.

VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be exercised for reads or writes.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29	**Display Plane 18 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 18 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	28	**Display Plane 18 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 18 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_3 - Wait For Event and Display Flip Flags Register 3

	27	**Display Plane 18 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 18 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	26	**Display Plane 18 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 18 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	25	**Display Plane 18 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 18 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	24	**Display Plane 17 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 17 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	23	**Display Plane 17 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 17 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	22	**Display Plane 17 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 17 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_3 - Wait For Event and Display Flip Flags Register 3

	21	**Display Plane 17 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 17 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	20	**Display Plane 17 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 17 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	19	**Display Plane 16 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 1616 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	18	**Display Plane 16 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	17	**Display Plane 16 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 16 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	16	**Display Plane 16 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 16 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_3 - Wait For Event and Display Flip Flags Register 3

	15	**Display Plane 16 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 16 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	14	**Display Plane 15 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 15 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	13	**Display Plane 15 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 15 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	12	**Display Plane 15 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 15 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	11	**Display Plane 15 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 15 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	10	**Display Plane 15 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 15 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_3 - Wait For Event and Display Flip Flags Register 3

	9	**Display Plane 14 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 4 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	8	**Display Plane 14 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 14 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	7	**Display Plane 14 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 14 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	6	**Display Plane 14 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 14 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	5	**Display Plane 14 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 14 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	4	**Display Plane 13 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 13 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_3 - Wait For Event and Display Flip Flags Register 3

	3	**Display Plane 13 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 13 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	2	**Display Plane 13 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 13 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	1	**Display Plane 13 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 13 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	0	**Display Plane 13 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 13 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

Wait For Event and Display Flip Flags Register 4

SYNC_FLIP_STATUS_4 - Wait For Event and Display Flip Flags Register 4

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	022C0h-022C3h
Name:	SYNC_FLIP_STATUS_4
ShortName:	SYNC_FLIP_STATUS_4_RCSUNIT_DISP

Address:	222C0h-222C3h
Name:	SYNC_FLIP_STATUS_4
ShortName:	SYNC_FLIP_STATUS_4_BCSUNIT_DISP

This register is the saved value of what wait for events are still valid. This register is part of context save and restore for RC6 feature.

Programming Notes

Programming Restriction: This register should NEVER be programmed by SW, this is for HW internal use only.

VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be exercised for reads or writes.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29	**Display Plane 24 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 24 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	28	**Display Plane 24 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 24 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_4 - Wait For Event and Display Flip Flags Register 4

	27	**Display Plane 24 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 24 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	26	**Display Plane 24 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 24 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	25	**Display Plane 24 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 24 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	24	**Display Plane 23 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 23 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	23	**Display Plane 23 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 23 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	22	**Display Plane 23 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 23 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_4 - Wait For Event and Display Flip Flags Register 4

	21	**Display Plane 23 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 23 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	20	**Display Plane 23 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 23 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	19	**Display Plane 22 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 22 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	18	**Display Plane 22 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 22 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	17	**Display Plane 22 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 22 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	16	**Display Plane 22 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 22 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_4 - Wait For Event and Display Flip Flags Register 4

	15	**Display Plane 22 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 22 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	14	**Display Plane 21 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 21 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	13	**Display Plane 21 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 21 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	12	**Display Plane 21 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 21 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	11	**Display Plane 21 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 21 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	10	**Display Plane 21 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 21 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_4 - Wait For Event and Display Flip Flags Register 4

	9	**Display Plane 20 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 20 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	8	**Display Plane 20 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 20 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	7	**Display Plane 20 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 20 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	6	**Display Plane 20 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 20 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	5	**Display Plane 20 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 20 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	4	**Display Plane 19 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 19 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_4 - Wait For Event and Display Flip Flags Register 4

	3	**Display Plane 19 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 19 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	2	**Display Plane 19 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 19 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	1	**Display Plane 19 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 19 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	0	**Display Plane 19 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 19 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

Wait For Event and Display Flip Flags Register 5

SYNC_FLIP_STATUS_5 - Wait For Event and Display Flip Flags Register 5

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV
Address:	022C4h-022C7h
Name:	SYNC_FLIP_STATUS_5
ShortName:	SYNC_FLIP_STATUS_5_RCSUNIT_DISP
Address:	222C4h-222C7h
Name:	SYNC_FLIP_STATUS_5
ShortName:	SYNC_FLIP_STATUS_5_BCSUNIT_DISP

This register is the saved value of what wait for events are still valid. This register is part of context save and restore for RC6 feature.

Programming Notes

Programming Restriction: This register should NEVER be programmed by SW, this is for HW internal use only.

VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be exercised for reads or writes.

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29	**Display Plane 30 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 30 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	28	**Display Plane 30 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 30 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_5 - Wait For Event and Display Flip Flags Register 5

	27	**Display Plane 30 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 30 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	26	**Display Plane 30 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 30 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	25	**Display Plane 30 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 30 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	24	**Display Plane 29 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 29 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	23	**Display Plane 29 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 29 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	22	**Display Plane 29 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 29 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_5 - Wait For Event and Display Flip Flags Register 5

	21	**Display Plane 29 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 29 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	20	**Display Plane 29 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 29 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	19	**Display Plane 28 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 28 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	18	**Display Plane 28 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 28 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	17	**Display Plane 28 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 28 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	16	**Display Plane 28 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 28 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_5 - Wait For Event and Display Flip Flags Register 5

	15	**Display Plane 28 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 28 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	14	**Display Plane 27 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 27 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	13	**Display Plane 27 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 27 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	12	**Display Plane 27 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 27 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	11	**Display Plane 27 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 27 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	10	**Display Plane 27 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 27 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_5 - Wait For Event and Display Flip Flags Register 5

	9	**Display Plane 26 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 26 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	8	**Display Plane 26 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 26 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	7	**Display Plane 26 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 26 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	6	**Display Plane 26 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 26 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	5	**Display Plane 26 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 26 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	4	**Display Plane 25 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 25 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_5 - Wait For Event and Display Flip Flags Register 5

	3	**Display Plane 25 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 25 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	2	**Display Plane 25 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 25 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	1	**Display Plane 25 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 25 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	0	**Display Plane 25 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 25 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

Wait For Event and Display Flip Flags Register 6

SYNC_FLIP_STATUS_6 - Wait For Event and Display Flip Flags Register 6

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
_Custom_GTIReset:	DEV

Address:	021F8h-021FBh
Name:	SYNC_FLIP_STATUS_6
ShortName:	SYNC_FLIP_STATUS_6_RCSUNIT_DISP

Address:	221F8h-221FBh
Name:	SYNC_FLIP_STATUS_6
ShortName:	SYNC_FLIP_STATUS_6_BCSUNIT_DISP

This register is the saved value of what wait for events are still valid. This register is part of context save and restore for RC6 feature.

Programming Notes

Programming Restriction: This register should NEVER be programmed by SW, this is for HW internal use only.

VideoCS/VideoCS2/VideoEnhancementCS: This register functionality is not supported and must not be exercised for reads or writes.

DWord	Bit	Description
0	31:19	**Reserved** Access: RO Format: MBZ
	18	**Display Pipe D Scan Line Event Pending** Format: Enable This field indicates scan line event operation is pending from Display Pipe D. This field gets set when MI_SCANLINE_INCL/EXCL command is parsed for Display Pipe D and gets reset on scan line event completion for Display Plane-C.
	17	**Display Pipe D Scan Line Wait Enable** Format: Enable This field enables a wait while a Display Pipe D Scan Line condition exists. This condition is defined as the start of the scan line specified in the Pipe D Display Scan Line Count Range Compare Register. See Scan Line Event in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_6 - Wait For Event and Display Flip Flags Register 6

	16	**Display Pipe D Vertical Blank Wait Enable** Format: Enable This field enables a wait until the next Display Pipe D Vertical Blank event occurs. This event is defined as the start of the next Display Pipe D vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event (See Programming Interface).
	15:10	**Reserved** Access: RO Format: MBZ
	9	**Display Plane 32 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 32 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	8	**Display Plane 32 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 32 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	7	**Display Plane 32 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 32 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	6	**Display Plane 32 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 32 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

SYNC_FLIP_STATUS_6 - Wait For Event and Display Flip Flags Register 6

	5	**Display Plane 32 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 32 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	4	**Display Plane 31 Asyncronous Performance Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 31 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	3	**Display Plane 31 Asyncronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 31 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	2	**Display Plane 31 Asyncronous Display Flip Pending** Format: Enable This field enables a wait for the duration of a Display Plane 31 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions.
	1	**Display Plane 31 Synchronous Flip Pending Wait Enable** Format: Enable This field enables a wait for the duration of a Display Plane 31 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.
	0	**Display Plane 31 Synchronous Flip Display Pending** Format: Enable This field enables a wait for the duration of a Display Plane 31 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.

Watchdog Counter

PR_CTR - Watchdog Counter	
Register Space:	MMIO: 0/2/0

ShortName:	PR_CTR_CTL_CCSUNIT0

Programming Notes

Ring Buffer Mode of scheduling SW must enable and disable watch dog counter inline to a command sequence of any given workload within the same command buffer dispatch. Watch Dog counter once enabled doesn't stop unless it is explicitly disabled. SW must explicitly reset the watch dog counter by disabling it before enabling the watch dog counter for a new command sequence. Preemption could happen in a command sequence prior to watch dog counter getting disabled resulting in watch dog counter enabled following preemption. SW must explicitly take care of disabling the watch dog counter as part of the preemption sequence. Execution List Mode of Scheduling: SW must enable and disable watch dog counter inline to a command sequence of any given workload within the same command buffer dispatch. On a context switch Watch Dog Counter Control and Watch dog Threshold are context save restored, whereas watch dog counter gets reset to 0x0 and remains disabled until it gets enabled by another context during context restore or due to explicit programming. Watch dog counter value doesn't get accumulated across multiple submissions of a given context.

This register functionality is not supported and must not be programmed for Position command streamer.

DWord	Bit	Description
0	31	**Count Select** Format: U1 **Value / Name / Description** 0h **[Default]** Use eight times the time stamp base unit to increment the watch dog count. The granularity of the time stamp base unit is defined in the Time Stamp

PR_CTR_CTL - Watchdog Counter Control

				Bases subsection in Power Management chapter.
		1h		Use the fixed function clock (csclk) to increment the watchdog count
	30:0	**Counter Logic Op**		
		Default Value:		1h
		This field specifies the action to be taken by the clock counter to generate interrupts. Writing a Zero value to this register starts the counting. Writing a Value of 0000_0001 to this counter stops the counter.		

Watchdog Counter Threshold

PR_CTR_THRSH - Watchdog Counter Threshold	
Register Space:	MMIO: 0/2/0
Access:	R/W

Name:	Watchdog Counter Threshold
ShortName:	PR_CTR_THRSH_CCSUNIT0

Programming Notes
This register functionality is not supported and must not be programmed for Position command streamer.
This register must never be programmed with zero. This will cause the watchdog counter to exceed and not allow the engine to go into IDLE state.

DWord	Bit	Description
0	31:0	**Counter Logic Threshold** Default Value: 00145855h Format: U32 This field specifies the threshold that the hardware checks against for the value of the render clock counter before generating an interrupt. The counter in hardware generates an interrupt when the threshold is reached, rolls over and starts counting again. The interrupt generated is the "Media Hang Notify" interrupt since this watchdog timer is intended primarily to remedy VLD hangs on the main pipeline.

WD_27_M

WD_27_M

Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	6E524h-6E527h
Name:	WD0 27 MHz M

Reset:	soft

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:6	**WD Stride** This field specifies the stride bits 15:6.This value is used to determine the line to line increment for the capture data writes. This field is programmed in units of 64 bytes. **Programming Notes** The stride has to be at least large enough to encompass all the pixels in a line, and rounded up to 64 byte alignment. Stride bytes >= CEILING[(Horizontal Active * WD Color Mode bytes per pixel) / 64] * 64 **Restriction** The stride is limited to a maximum of 32K bytes.
	5:0	**Reserved** Access: RO Format: MBZ

WD_SURF

WD_SURF	
Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferUpdatePoint:	Start of capture sync or transcoder not enabled

Address:	6E514h-6E517h
Name:	WD0 Surface Base Address
ShortName:	WD_SURF_0
Reset:	soft

Address:	6ED14h-6ED17h
Name:	WD1 Surface Base Address
ShortName:	WD_SURF_1
Reset:	soft

Writes to this register arm WD registers.

DWord	Bit	Description
0	31:12	**WD Surface Base Address** Format: GraphicsAddress[31:12] This address specifies the surface base address bits 31:12. It is mapped to physical pages through the global GTT. **Programming Notes** The mapped pages must be located outside graphics data stolen memory. **Restriction** It must be at least 4KB aligned.It must use linear memory.
	11:0	**Reserved** Access: RO Format: MBZ

WD_TAIL_CFG

WD_TAIL_CFG

Register Space:	MMIO: 0/2/0
Access:	Double Buffered
Size (in bits):	32
_Custom_Display_DoubleBufferArmedBy:	Write to WD_SURF or WD not enabled
_Custom_Display_DoubleBufferUpdatePoint:	Start of capture sync or transcoder not enabled; after armed

Address:	6E520h-6E523h
Name:	WD0 Tail Pointer Config
ShortName:	WD_TAIL_CFG_0
Reset:	soft

Address:	6ED20h-6ED23h
Name:	WD1 Tail Pointer Config
ShortName:	WD_TAIL_CFG_1
Reset:	soft

DWord	Bit	Description
0 If Delay < Period; first tail pointer is sent at the next multiple of Period, after the Delay. If Delay Period; first tail pointer is set at the Period. The tail pointer is also sent at the end of the frame. If Delay or Period are greater than the vertical size, only the tail pointer at the end of the frame is sent.	31:28	**Reserved** Access: RO Format: MBZ
	27:16	**Tail Initial Update Delay** This field specifies the minimum number of scan lines that WD capture must wait for at the beginning of each frame before any tail pointer updates will be sent to media. This must be programmed smaller than the vertical active size.
	15:12	**Reserved** Access: RO Format: MBZ
	11:4	**Tail Update Period** Default Value: 01h 16 lines This field specifies the number of scan lines that the WD capture will write back to memory before sending each tail pointer message to media. This field is programmed in multiples of 16 scan lines. **Restriction** A value of 0 is not valid.

WD_TAIL_CFG		
	3:0	**Reserved** Access: RO Format: MBZ

WD_TAIL_CFG2

WD_TAIL_CFG2		
Register Space:	MMIO: 0/2/0	
Access:	Double Buffered	
Size (in bits):	32	
_Custom_Display_DoubleBufferArmedBy:	Write to WD_SURF or WD not enabled	
_Custom_Display_DoubleBufferUpdatePoint:	Start of capture sync or transcoder not enabled; after armed	
Address:	6E52Ch-6E52Fh	
Name:	WD0 Tail Pointer Config2	
ShortName:	WD_TAIL_CFG2_0	
Reset:	soft	
Address:	6ED2Ch-6ED2Fh	
Name:	WD1 Tail Pointer Config2	
ShortName:	WD_TAIL_CFG2_1	
Reset:	soft	

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:4	**Tail Pointer Offset** If during selective read/write we are compositing to smaller than a full resolution surface, this tail pointer offset is used to synchronize with the VDEnc relative to the full resolution surface. This field is programmed in multiples of 16 scan lines.
	3:0	**Reserved** Access: RO Format: MBZ

WIDI Session 0

WIDI_SESSION_0 - WIDI Session 0		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32	
_Custom_GTIReset:	BUS	
Address:	00ED0h	
DWord	**Bit**	**Description**
0	31:0	**Static Data** Default Value: 0b Access: R/W Scratch registers provided for Display/VDEnc/GUC WIDI Session access

WIDI Session 1

WIDI_SESSION_1 - WIDI Session 1		
Register Space:	MMIO: 0/2/0	
Size (in bits):	32

ShortName:	WIDI_VDENC_STALL_CNTR_VDENC_REG3
Address:	1E2D94h-1E2D97h
Name:	WiDi mode VDENC stall counter value
ShortName:	WIDI_VDENC_STALL_CNTR_VDENC_REG4
Address:	1E6D94h-1E6D97h
Name:	WiDi mode VDENC stall counter value
ShortName:	WIDI_VDENC_STALL_CNTR_VDENC_REG5
Address:	1F2D94h-1F2D97h
Name:	WiDi mode VDENC stall counter value
ShortName:	WIDI_VDENC_STALL_CNTR_VDENC_REG6
Address:	1F6D94h-1F6D97h
Name:	WiDi mode VDENC stall counter value
ShortName:	WIDI_VDENC_STALL_CNTR_VDENC_REG7

This register has stall counter for the VDENC. In an ideal case, this value should be zero.

DWord	Bit	Description
0	31:0	**WiDi Stall clock count** Access: RO

Window Hardware Generated Clear Value

WMHWCLRVAL - Window Hardware Generated Clear Value		
Register Space:	MMIO: 0/2/0	
Access:	RO	
Size (in bits):	32	
Address:	05524h	
DWord	**Bit**	**Description**
0	31:0	**WM HW Generated Clear Value** Format: MBZ This register stores HW generated Z clear value.

WM_LINETIME

WM_LINETIME		
Register Space:	MMIO: 0/2/0	
Access:	R/W	
Size (in bits):	32	
Address:	45270h-45273h	
Name:	Pipe Watermark Line Time

Address:	4527Ch-4527Fh	
Name:	Pipe Watermark Line Time	
ShortName:	WM_LINETIME_D	
Reset:	soft	

DWord	Bit	Description
0	31:9	**Reserved** Access: RO Format: MBZ
	8:0	**Line Time** This field specifies the line time for the current screen resolution in units of 0.125us. **Programming Notes** Line time in microseconds = Pipe horizontal total number of pixels / pixel rate in MHz. Multiply by 8 to get units of 0.125us and round to nearest integer. Program the smallest line time when using multiple refresh rates. **Restriction** The line time value must be programmed before enabling any display low power watermark. Maximum supported line time is 63.875us (111111111b).

WM_MISC

WM_MISC	
Register Space:	MMIO: 0/2/0
Access:	R/W
Size (in bits):	32
Address:	45260h-45263h
Name:	Watermark Miscellaneous
ShortName:	WM_MISC
Reset:	soft

DWord	Bit	Description

3DSTATE_AMFS_BODY

3DSTATE_AMFS_BODY

Source: RenderCS

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:6	**TS State Array Pointer** Format: GraphicsAddress[31:6] Specifies the 64-byte aligned offset of the TS_STATE_ARRAY, with entries per texel shader. This offset is relative to the **Dynamic State Base Address**.
	5	**Reserved**
	4:3	**AMFS mode** Format: U2 **Value** / **Name** / **Description** 0h / normal mode **[Default]** / AMFS shades unshaded texel blocks only, marks them as shaded, no special handling of out of memory condition other than setting indicator bit in CACHE_MODE1 bit[6] 1h / touch mode / forces out of memory operation, AMFS marks unshaded texel blocks as touched, texel shader dispatch is disabled 2h / backfill mode / AMFS shades only touched texel blocks, touched blocks get marked as shaded, originally unshaded and shaded are left unchanged 3h / fallback mode / AMFS shades unshaded texel blocks only, marks them as shaded, special handling of out of memory condition. When AMFS runs out of scratch space, texels are not shaded. Instead, they are marked as "touched". AMFS also sets indicator bit in CACHE_MODE1 bit[6] **Programming Notes** For backwards compatibility mode 0h acts the same as A0 AMFS. Mode 1h can be also used for functional validation of out of memory fallback condition
	2:0	**Num Valid Texel Shaders** Format: U3-1 Specifies number of valid texel shader entries in the TS_STATE_ARRAY using n-1 encoding (1..8 valid entries).

3DSTATE_BINDING_TABLE_POINTERS_BODY

3DSTATE_BINDING_TABLE_POINTERS_BODY

Source: RenderCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20:16	**Reserved** Access: RO Format: MBZ
	15:5	**Pointer to Binding Table** Format: SurfaceStateOffset[15:5]SW Generated BINDING_TABLE_STATE*256 When Binding Table Pool is disabled and HW Binding Table Alignment is not set to 256B alignment. Format: SurfaceStateOffset[16:6]SW Generated BINDING_TABLE_STATE*256 When Binding Table Pool is enabled and HW Binding Table Alignment is not set to 256B alignment. Format: SurfaceStateOffset[18:8]SW Generated BINDING_TABLE_STATE*256 When HW Binding Table Alignment is set to 256B alignment. Specifies an aligned address offset of the function's BINDING_TABLE_STATE. The offset's base and alignment differ depending on whether HW Binding Table is enabled and the setting of HW Binding Table Alignment field: If HW Binding Table Pool is **disabled** and the HW Binding Table Alignment is not set to 256B, the offset is relative to **Surface State Base Address** and the alignment is **32B**. If HW Binding Table Pool is **enabled** and the HW Binding Table Alignment is not set to 256B, the offset is relative to the **Binding Table Pool Base Address** and the alignment is **64B**. If HW Binding Table Pool is **disabled** and the HW Binding Table Alignment is set to 256B, the offset is relative to the **Surface State Base Address** and the alignment is **256B**. If HW Binding Table Pool is **enabled** and the HW Binding Table Alignment is set to 256B, the offset is relative to the **Binding Table Pool Base Address** and the alignment is **256B**.
	4:0	**Reserved** Access: RO Format: MBZ

3DSTATE_BLEND_STATE_POINTERS_BODY

3DSTATE_BLEND_STATE_POINTERS_BODY		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:6	**Blend State Pointer** Format: DynamicStateOffset[31:6]BLEND_STATE*8 Specifies the 64-byte aligned offset of the BLEND_STATE. This offset is relative to the **Dynamic State Base Address**.
	5:1	**Reserved** Access: RO Format: MBZ
	0	**Blend State Pointer Valid** Format: Enable This bit, if set, indicates that the BLEND_STATE pointer has changed and new state needs to be fetched.

3DSTATE_CC_STATE_POINTERS_BODY

3DSTATE_CC_STATE_POINTERS_BODY		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:6	**Color Calc State Pointer** Format: DynamicStateOffset[31:6]COLOR_CALC_STATE Specifies the 64-byte aligned offset of the COLOR_CALC_STATE. This offset is relative to the **Dynamic State Base Address**.
	5:1	**Reserved** Access: RO Format: MBZ
	0	**Color Calc State Pointer Valid** Format: Enable If set, the hardware will fetch the CC state. This bit is context saved and restored so the CC state is considered undefined once this bit is cleared due to the possibility of the CC state changing between context switches.

3DSTATE_CLEAR_PARAMS_BODY

RenderCS - 3DSTATE_CLEAR_PARAMS_BODY

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**Depth Clear Value** Format: IEEE_FLOAT32 This field defines the clear value that will be applied to the depth buffer if the Depth Buffer Clear field is enabled. It is valid only if Depth Buffer Clear Value Valid is set. **Programming Notes** The clear value must be between the min and max depth values (inclusive) defined in the CC_VIEWPORT. If the depth buffer format is D32_FLOAT, then values must be limited to the range of +0.0f and 1.0f inclusive; values outside this range are reserved.
1	31:1	**Reserved** Access: RO Format: MBZ
	0	**Depth Clear Value Valid** Format: Boolean This field enables the **Depth Clear Value**. If clear, the depth clear value is obtained from interpolated depth of an arbitrary pixel of the primitive rendered with **Depth Buffer Clear** set in WM_STATE or 3DSTATE_WM. If set, the depth clear value is obtained from the **Depth Clear Value** field of this command.

3DSTATE_CLIP_BODY

3DSTATE_CLIP_BODY

Source: RenderCS

Size (in bits): 96

Default Value: 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:21	**Reserved** Access: RO Format: MBZ
	20	**Force User Clip Distance Cull Test Enable Bitmask** Format: Enable This field provides a work around override for the computation of SOL_INT::Render_Enable Value / Name / Description 0h / Normal / Clip_INT::User Clip Distance Cull Test Enable Bitmask normally 1h / Force / Forces Clip_INT::User Clip Distance Cull Test Enable Bitmask to use the value in 3DSTATE_CLIP:: User Clip Distance Cull Test Enable Bitmask
	19	**Vertex Sub Pixel Precision Select** Format: U1 Selects the number of fractional bits maintained in the vertex data Value / Name / Description 0h / 8 Bit / 8 sub pixel precision bits maintained 1h / 4 Bit / 4 sub pixel precision bits maintained
	18	**Early Cull Enable** Format: Enable This field is used to enable/disable the EarlyCull function. When this bit is set triangles are checked if they are backface culled before proceeding through must clip function. **Programming Notes** Setting this bit must not impact functionality, this state only controls the performance of the must clip function. Vertex Sub Pixel Precision Select precision must be set to "8 bit" in order avoid precision issues.
	17	**Force User Clip Distance Clip Test Enable Bitmask** Format: Enable This field provides a work around override for the computation of SOL_INT::Render_Enable. Value / Name / Description 0b / Normal / Clip_INT:: User Clip Distance Clip Test Enable Bitmask normally 1b / Force / Forces Clip_INT:: User Clip Distance Clip Test Enable Bitmask to use the value in 3DSTATE_CLIP::User Clip Distance Clip Test Enable Bitmask

3DSTATE_CLIP_BODY

	16	**Force Clip Mode** Format: Enable This field provides a work around override for the computation of SOL_INT::Render_Enable. **Value** / **Name** / **Description** 0b / Normal / Clip_INT::Clip Mode is computed normally. 1b / Force / Forces Clip_INT::Clip Mode to use the value in 3DSTATE_CLIP::User Clip Mode.
	15:12	**Reserved** Access: RO Format: MBZ
	11:10	**Clipper Statistics Enable** This bit controls whether Clip-unit-specific statistics register(s) can be incremented. **Value** / **Name** / **Description** 00h / Disable / CL_INVOCATIONS_COUNT cannot increment 01h / Increment by one / CL_INVOCATIONS_COUNT can increment 03h / Reserved /
	9	**Reserved** Access: RO Format: MBZ
	8	**Reserved** Access: RO Format: MBZ
	7:0	**User Clip Distance Cull Test Enable Bitmask** Format: Enable[8] This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept determination needs to be made (does not cause a must clip).DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.
1	31	**Clip Enable** Format: Enable Specifies whether the Clip function is enabled or disabled (pass-through).
	30	**API Mode** Controls the definition of the NEAR clipping plane **Value** / **Name** / **Description** 0h / OGL / NEAR VP boundary == 0.0 (NDC)
	29	**Reserved** Access: RO Format: MBZ

3DSTATE_CLIP_BODY

28 Viewport XY Clip Test Enable

Format:	Enable

This field is used to control whether the Viewport X, Y extents [-1,1] are considered in VertexClipTest.
If both the Guardband and Viewport XY ClipTest are DISABLED, all vertices are considered "visible" with respect to the XY directions.

27 Reserved

Access:	RO
Format:	MBZ

26 Guardband Clip Test Enable

Format:	Enable

This field is used to control whether the Guardband X, Y extents are considered in VertexClipTest for non-point objects. If the Guardband ClipTest is DISABLED but the Viewport XY ClipTest is ENABLED, ClipDetermination operates as if the Guardband were coincident with the Viewport. If both the Guardband and Viewport XY ClipTest are DISABLED, all vertices are considered "visible" with respect to the XY directions.

25:24 Reserved

Access:	RO
Format:	MBZ

23:16 User Clip Distance Clip Test Enable Bitmask

Format:	Enable[8]

This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept / must clip determination needs to be made.DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.

15:13 Clip Mode

This field specifies a general mode of the CLIP unit, when the CLIP unit is ENABLED.

Value	Name	Description
0h	NORMAL	TrivialAccept objects are passed down the pipeline, MustClip objects Clipped in the Fixed Function Clipper HW, TrivialReject and BAD objects are discarded
1h	Reserved	
2h	Reserved	
3h	REJECT_ALL	All objects are discarded
4h	ACCEPT_ALL	All objects (except BAD objects) are trivially accepted. This effectively disables the clip-test/clip-determination function. Note that the CLIP unit will still filter out adjacency information, which may be required since the SF unit does not accept primitives with adjacency.
5h-7h	Reserved	

3DSTATE_CLIP_BODY

	12:10	**Reserved** Access: RO Format: MBZ
	9	**Perspective Divide Disable** Format: Disable This field disables the Perspective Divide function performed on homogeneous position read from the URB. This feature can be used by software to submit pre-transformed "screen-space" geometry for rasterization. This likely requires the W component of positions to contain "rhw" (aka 1/w) in order to support perspective-correct interpolation of vertex attributes. Likewise, the X, Y, Z components will likely be required to be X/W, Y/W, Z/W. Note that the device does not support clipping when perspective divide is disabled. Software must specify CLIPMODE_ACCEPT_ALL whenever it disables perspective divide. This implies that software must ensure that object positions are completely contained within the "guardband" screen-space limits imposed by the SF unit (e.g., by clipping in CPU SW before submitting the objects).
	8	**Non-Perspective Barycentric Enable** Format: Enable This field enables computation of non-perspective barycentric parameters in the clipper, which are sent to SF unit in the must clip case. This field must be enabled if any non-perspective interpolation modes are used in pixel shader. **Programming Notes** This field must be set whenever Enable bits 3 or 4 or 5 of 3DSTATE_WM:Barycentric Interpolation Mode is set. This indicates that one of the Non-perspective barycentric interpolation modes are used. This field must be set if the 3DSTATE_PS_EXTRA:Pixel Shader Requires Non-Perspective Bary Plane Coefficients is set.
	7:6	**Reserved** Access: RO Format: MBZ
	5:4	**Triangle Strip/List Provoking Vertex Select** Format: U2 enumerated type This field selects which vertex of a triangle (in a triangle strip or list primitive) is considered the "provoking vertex". **Value** / **Name** 0h / 0 1h / 1 2h / 2

3DSTATE_CLIP_BODY

	3h	Reserved

3:2 Line Strip/List Provoking Vertex Select

Format:	U2

enumerated type

This field selects which vertex of a line (in a line strip or list primitive) is considered the "provoking vertex".

Value	Name
0h	0
1h	1
2h	Reserved
3h	Reserved

1:0 Triangle Fan Provoking Vertex Select

Format:	U2

enumerated type

This field selects which vertex of a triangle (in a triangle fan primitive) is considered the "provoking vertex".

Value	Name
0h	0
1h	1
2h	2
3h	Reserved

2 31:28 Reserved

Access:	RO
Format:	MBZ

27:17 Minimum Point Width

Format:	U8.3

This value is used to clamp read-back PointWidth values.

16:6 Maximum Point Width

Format:	U8.3

This value is used to clamp read-back PointWidth values.

5 Force Zero RTA Index Enable

Format:	Enable

If set, the Clip unit will ignore the read-back RTAIndex and operate as if the value 0 was read-

		back. If clear, the read-back value is used.
	4	**Reserved** Access: RO Format: MBZ
	3:0	**Maximum VP Index** Format: U4-1 This field specifies the maximum valid VPIndex value, corresponding to the number of active viewports. If the source of the VPIndex exceeds this maximum value, a VPIndex value of 0 is passed down the pipeline. Note that this clamping does not affect a VPIndex value stored in the URB.

3DSTATE_CONSTANT_ALL_BODY

3DSTATE_CONSTANT_ALL_BODY		
Source:	RenderCS	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**

3DSTATE_CONSTANT_ALL_DATA

3DSTATE_CONSTANT_ALL_DATA

Source: RenderCS

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:5	**Pointer To Constant Buffer** Format: VIRTUAL_ADDR[63:5] The value of this field is the virtual address of the location of the push constant buffer. **Programming Notes** Constant buffers must be allocated in linear (not tiled) graphics memory.
	4:0	**Constant Buffer Read Length** Format: U5 This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of the read length fields for all pointers must be less than or equal to the size of 64 • Zero means there no data to fetch for this buffer pointer.

3DSTATE_CONSTANT_TS_POINTER_BODY

3DSTATE_CONSTANT_TS_POINTER_BODY		
Source:	RenderCS	
Size (in bits):	64	
Default Value:	0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..1	63:0	**Constant Body** Format: 3DSTATE_CONSTANT_ALL_DATA Specifies the 64-byte aligned graphics address and length of constant data to be pushed as Texel Shader payload. The push constant payload and its length is common to all Texel Shader slots.

3DSTATE_CONSTANT(Body)

3DSTATE_CONSTANT(Body)

Source: RenderCS

Size (in bits): 320

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:16	**Constant Buffer 1 Read Length** Format: U16 This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of all four read length fields must be less than or equal to the size of 64 • Setting the value of the register to zero will disable buffer 1. • If disabled, the **Pointer to Constant Buffer 1** must be programmed to zero.
	15:0	**Constant Buffer 0 Read Length** Format: U16 This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of all four read length fields must be less than or equal to the size of 64 • Setting the value of the register to zero will disable buffer 0. • If disabled, the **Pointer to Constant Buffer 0** must be programmed to zero.
1	31:16	**Constant Buffer 3 Read Length** Format: U16 This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of all four read length fields must be less than or equal to the size of 64 • Setting the value of the register to zero will disable buffer 3. • If disabled, the **Pointer to Constant Buffer 3** must be programmed to zero.
	15:0	**Constant Buffer 2 Read Length** Format: U16 This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of all four read length fields must be less than or equal to the size of 64 • Setting the value of the register to zero will disable buffer 2.

3DSTATE_CONSTANT(Body)

		• If disabled, the **Pointer to Constant Buffer 2** must be programmed to zero.
2..3	63:5	**Pointer To Constant Buffer 0** Format: VIRTUAL_ADDR[63:5] **Description** The value of this field is the virtual address of the location of the push constant buffer 0. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47]. **Programming Notes** Constant buffers must be allocated in linear (not tiled) graphics memory.
	4:0	**Reserved** Access: RO Format: MBZ
4..5	63:5	**Pointer To Constant Buffer 1** Format: VIRTUAL_ADDR[63:5] This field points to the location of Constant Buffer 1. If gather constants are enabled This field is an offset of constant Buffer1 from the Gather Pool BASE ADDRESS. If gather constants is disabled, the value of this field is the virtual address of the location of the push constant buffer. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47]. **Programming Notes** Constant buffers must be allocated in linear (not tiled) graphics memory.
	4:0	**Reserved** Access: RO Format: MBZ

3DSTATE_CPS_POINTERS_BODY

3DSTATE_CPS_POINTERS_BODY		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:5	**Coarse Pixel Shading State Array Pointer** Format: DynamicStateOffset[31:5] Specifies the 32-byte aligned address offset of the array of CPS_STATE states. Each CPS_STATE in the array corresponds to a Viewport index in the range [0..15]. SW must program all the CPS_STATES in the array corresponding to valid Viewport indices. This offset is relative to the Dynamic State Base Address. When 3DSTATE_PS:Pixel Shader Is Per Coarse Pixel is not set, HW does not fetch or depend on any CPS pointers to be valid. The hardware might not order pixels across viewports if multiple CPS_STATE entries map any(x,y) to different CPsizes.
	4:0	**Reserved** Access: RO Format: MBZ

3DSTATE_DEPTH_BOUNDS_BODY

3DSTATE_DEPTH_BOUNDS_BODY

Source: RenderCS

Size (in bits): 96

Default Value: 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:1	**Reserved** Access: RO Format: MBZ
	0	**Depth Bounds Test Enable** Enables the depth bounds test Value / Name / Description: 0 / Disabled / Depth Bounds test is disabled. 1 / Enabled / Depth Bounds test is enabled. If (Z Min Value) <= (Destination Z Value) <= (Z Max Value) the depth bounds test passes. Otherwise the depth bounds test fails and the sample is discarded. Value / Name: 0 / Disabled 1 / Enabled
1	31:0	**Depth Bounds Test Min Value** Format: IEEE_FLOAT This field specifies the minimum Z value to be used in the depth bounds test. This value should be in 32-bit Float. HW will clamp to min value of +0 if set to below +0.
2	31:0	**Depth Bounds Test Max Value** Format: IEEE_FLOAT This field specifies the maximum Z value to be used in the depth bounds test. This value should be in 32-bit Float. HW will clamp to max value of +1 if set to greater than +1.

3DSTATE_DS_BODY

3DSTATE_DS_BODY

Source: RenderCS

Size (in bits): 320

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:6	**Kernel Start Pointer** Format: InstructionBaseOffset[63:6] This field specifies the starting location of the kernel program run by threads spawned by this FF unit. It is specified as a 64-byte-granular offset from the Instruction Base Address. This field is ignored if DS Function Enable is DISABLED.
	5:0	**Reserved** Access: RO Format: MBZ
2	31	**Reserved** Access: RO Format: MBZ
	30	**Vector Mask Enable** Format: Enable Upon subsequent DS thread dispatches, this bit is loaded into the EU's Vector Mask Enable (VME, cr0.0[3]) thread state. Refer to EU documentation for the definition and use of VME state. **Value / Name / Description** 0h / Dmask / The EU will use the Dispatch Mask (supplied by the DS stage) for instruction execution. 1h / Vmask / The EU will use the Vector Mask (derived from the Dispatch Mask) for instruction execution. **Programming Notes** Under normal conditions SW shall specify DMask, as the DS stage will provide a Dispatch Mask appropriate to SIMD4x2 or SIMD8 thread execution (as a function of dispatch mode). E.g., for SIMD4x2 thread execution, the DS stage will generate a Dispatch Mask that is equal to what the EU would use as the Vector Mask. For SIMD8 execution there is no known usage model for use of Vector Mask (as there is for PS shaders).
	29:27	**Sampler Count** Format: U3 Specifies how many samplers (in multiples of 4) the kernel uses. Used only for prefetching the associated sampler state entries. This field is ignored if DS Function Enable is DISABLED.

3DSTATE_DS_BODY

Value	Name	Description
0h	No Samplers	No samplers used
1h	1-4 Samplers	between 1 and 4 samplers used
2h	5-8 Samplers	between 5 and 8 samplers used
3h	9-12 Samplers	between 9 and 12 samplers used
4h	13-16 Samplers	between 13 and 16 samplers used

26 **Reserved**

Access:	RO
Format:	MBZ

25:18 **Binding Table Entry Count**

Format:	U8

When HW Generated Binding Table is disabled: Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state. **Note:** For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache. This field is ignored if DS Function Enable is DISABLED.

When HW Generated Binding Table bit is enabled: This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched.

Value	Name
[0,255]	

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.

17 **Thread Dispatch Priority**

Format:	U1

Specifies the priority of the thread for dispatch: This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description
0h	Normal	Normal Priority
1h	High	High Priority

16 **Floating Point Mode**

Format:	U1

Specifies the initial floating point mode used by the dispatched thread. This field is ignored if DS Function Enable is DISABLED.

3DSTATE_DS_BODY

		Value / **Name** / **Description** 0h / IEEE-754 / Use IEEE-754 Rules 1h / Alternate / Use alternate rules
	15	**Reserved** Access: RO Format: MBZ
	14	**Accesses UAV** Format: Enable This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment. **Programming Notes** This field must not be set when DS Function Enable is disabled.
	13	**Illegal Opcode Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if DS Function Enable is DISABLED.
	12:11	**Reserved** Access: RO Format: MBZ
	10:8	**Reserved** Format: MBZ
	7	**Software Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[13] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if DS Function Enable is DISABLED.
	6:0	**Reserved** Access: RO Format: MBZ
3..4	63:32	**Reserved** Access: RO Format: MBZ
	31:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[31:10] Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The

computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if DS Function Enable is DISABLED.

9:4 **Reserved**

Access:	RO
Format:	MBZ

3:0 **Per-Thread Scratch Space**

Format:	U4

Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit. The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. This field is ignored if DS Function Enable is DISABLED.

Value	Name
[0,11]	indicating [1K Bytes, 2M Bytes]

Programming Notes
This amount is available to the kernel for information only. It will be passed verbatim (if not altered by the kernel) to the Data Port in any scratch space access messages, but the Data Port will ignore it.

5 31:25 **Reserved**

Access:	RO
Format:	MBZ

24:20 **Dispatch GRF Start Register For URB Data**

Format:	U5

Description
Specifies the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload. This field is ignored if DS Function Enable is DISABLED. When SIMD8_SINGLE_OR_DUAL_PATCH dispatch mode is selected, HW shall increment the GRF start register by 1 when a dual patch simd8 thread is dispatched AND 3DSTATE_DS::PrimitiveIDNotRequired is not set.

Value	Name	Description
[0,31]		indicating GRF [R0, R31]

19:18 **Reserved**

Access:	RO
Format:	MBZ

3DSTATE_DS_BODY

17:11 Patch URB Entry Read Length

Format:	U7

Specifies how much data (in 256-bit units) is to be read from the Patch URB entry and passed in the DS thread payload. This field is ignored if DS Function Enable is DISABLED.

Value	Name
[0,64]	

10 Reserved

Access:	RO
Format:	MBZ

9:4 Patch URB Entry Read Offset

Format:	U6

Specifies the offset (in 256-bit units) at which Patch URB data is to be read from the URB before being included in the thread payload. This field is ignored if DS Function Enable is DISABLED.

Value	Name
[0,63]	

3:0 Reserved

Access:	RO
Format:	MBZ

6 — 31 Reserved

Access:	RO
Format:	MBZ

30:21 Maximum Number of Threads

Format:	U10-1

Specifies the maximum number of simultaneous DS threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance. This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description
[0,545]		indicating thread count of [1,546]

20:11 Reserved

Access:	RO
Format:	MBZ

10 Statistics Enable

Format:	Enable

If ENABLED, this FF unit will engage in statistics gathering. Refer to the Statistics Gathering section.

If DISABLED, statistics information associated with this FF stage will be left unchanged.
This field is ignored if DS Function Enable is DISABLED.

9 **PrimitiveID Not Required**

Format:	Boolean

Description
Software shall set this bit whenever the active DS kernel(s) do not require PrimitiveID as input. When this bit is set, (a) the R1 PrimitiveID phase will not be included in the thread payload (DUAL_PATCH) and (b) the PrimitiveID field in the R0 payload (SINGLE_PATCH) will become UNDEFINED.

8:5 **Reserved**

Access:	RO
Format:	MBZ

4:3 **Dispatch Mode**

Format:	U2

This field specifies how the DS stage generates DS thread requests, and correspondingly impacts the DS thread payload. The setting of this field must agree with how the DS kernel was compiled.This field is ignored if DS Function Enable is DISABLED.

Value	Name	Description	Programming Notes
1h	SIMD8_SINGLE_PATCH	DS threads are passed one patch, up to 8 domain point inputs, and up to 8 output vertex handles. All the domain points are associated with the single input patch. The DS kernel (at KSP) is expected to run in SIMD8 execution mode. The DUAL_PATCH KSP is ignored.	
2h	SIMD8_SINGLE_OR_DUAL_PATCH	This mode enables use of both the KSP and the DUAL_PATCH KSP. The KSP kernel operates just like in SIMD8_SINGLE_PATCH mode. See DUAL_PATCH Thread Execution for a discussion of how the DUAL_PATCH KSP is used.	At least 2 HS URB handles must be allocated in order to enable this mode.
3h	Reserved		

Programming Notes
SIMD4X2 mode is no longer allowed.

3DSTATE_DS_BODY

	2	**Compute W Coordinate Enable** Format: Enable If ENABLED, the DS unit will (for each domain point) compute W = 1 - (U + V) and pass the result as a floating point value in the DS thread payload. If DISABLED, 0.0 will be passed. This field must only be ENABLED for the tessellation of TRI domains, where UVW coordinates are required. This field must be DISABLED for other domains (as they only require UV coordinates) otherwise the computed W coordinate is UNDEFINED. This field is ignored if DS Function Enable is DISABLED.
	1	**Cache Disable** Format: Disable This bit controls the operation of the DS Cache. This field is ignored if DS Function Enable is DISABLED. If the DS Cache is DISABLED and the DS Function is ENABLED, the DS Cache is not used and all incoming domain points will be passed to DS threads. If the DS Cache is ENABLED and the DS Function is ENABLED, incoming domain points that do not hit in the DS Cache will be passed to DS threads. The DS Cache is invalidated whenever the DS Cache becomes DISABLED , whenever the DS Function Enable toggles, and between patches.
	0	**Function Enable** Format: Enable If ENABLED, DS threads will be spawned to process incoming domain points which miss in the DS cache. If DISABLED, the DS stage goes into pass-through mode and performs no specific processing. This field is always used. **Programming Notes** The tessellation stages (HS, TE and DS) must be enabled/disabled as a group. I.e., draw commands can only be issued if all three stages are enabled or all three stages are disabled, otherwise the behavior is UNDEFINED.
7	31:27	**Reserved** Access: RO Format: MBZ
	26:21	**Vertex URB Entry Output Read Offset** Format: U6 Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB by SBE. Value: [0,63] — Name:
	20:16	**Vertex URB Entry Output Length** Format: U5 Specifies the amount of URB data written for each Vertex URB entry, in 256-bit register increments.

3DSTATE_DS_BODY

		Value / **Name**: [1,16] /
		Programming Notes: This length does not include the vertex header.
	15:8	**User Clip Distance Clip Test Enable Bitmask** Format: U8 This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept / must clip determination needs to be made.DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.
	7:0	**User Clip Distance Cull Test Enable Bitmask** Format: U8 This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept determination needs to be made (does not cause a must clip).DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.
8..9	63:6	**DUAL_PATCH Kernel Start Pointer** Format: InstructionBaseOffset[63:6] This field specifies the starting location of the DUAL_PATCH kernel program run by threads spawned by this FF unit.It is specified as a 64-byte-granular offset from the Instruction Base Address.This field is ignored if DS Function Enable is DISABLED. See DUAL_PATCH Thread Execution for a discussion of how the DUAL_PATCH KSP is used.
	5:0	**Reserved** Access: RO Format: MBZ

3DSTATE_GS_BODY

3DSTATE_GS_BODY

Source: RenderCS

Size (in bits): 288

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:6	**Kernel Start Pointer** Format: InstructionBaseOffset[63:6] This field specifies the starting location of the kernel program run by threads spawned by this FF unit. It is specified as a 64-byte-granular offset from the Instruction Base Address.
	5:0	**Reserved** Access: RO Format: MBZ
2	31	**Single Program Flow** Format: Enable Specifies the initial condition of the kernel program as either a single program flow (SIMDnxm with m = 1) or as multiple program flows (SIMDnxm with m > 1). See CR0 description in ISA Execution Environment. Value / Name / Description: 0h / Disable / Single Program Flow disabled 1h / Enable / Single Program Flow enabled
	30	**Vector Mask Enable** Format: Enable Upon subsequent GS thread dispatches, this bit is loaded into the EU's Vector Mask Enable (VME, cr0.0[3]) thread state. Refer to EU documentation for the definition and use of VME state. Value / Name / Description: 0h / Dmask / The EU will use the Dispatch Mask (supplied by the GS stage) for instruction execution. 1h / Vmask / The EU will use the Vector Mask (derived from Dispatch Mask) for instruction execution. **Programming Notes** Under normal conditions SW shall specify DMask, as the GS stage will provide a Dispatch Mask appropriate to SIMD4x2 or SIMD8 thread execution (as a function of dispatch mode). E.g., for SIMD4x2 execution, the GS stage will generate a Dispatch Mask that is equal to what the EU would use as the Vector Mask. For SIMD8 execution there is no known usage model for use of Vector Mask (as there is for PS shaders).

3DSTATE_GS_BODY

29:27 **Sampler Count**

Format:	U3

Specifies how many samplers (in multiples of 4) the geometry shader kernel uses. Used only for prefetching the associated sampler state entries.

Value	Name	Description
0h	No Samplers	No Samplers used
1h	1-4 Samplers	Between 1 and 4 samplers used
2h	5-8 Samplers	Between 5 and 8 samplers used
3h	9-12 Samplers	Between 9 and 12 samplers used
4h	13-16 Samplers	Between 13 and 16 samplers used
5h-7h	Reserved	

26 **Reserved**

Access:	RO
Format:	MBZ

25:18 **Binding Table Entry Count**

Format:	U8

When **HW Generated Binding Table** is disabled: Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state. Note: For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache. When **HW Generated Binding Table** bit is enabled: This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched.

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.

17 **Thread Dispatch Priority**

Specifies the priority of the thread for dispatch.

Value	Name	Description
0h	Normal	Normal thread dispatch priority
1h	High	High thread dispatch priority

16 **Floating Point Mode**

Specifies the initial floating point mode used by the dispatched thread.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 Rules
1h	Alternate	Use alternate rules

3DSTATE_GS_BODY

	15:14	**Reserved** Access: RO Format: MBZ
	13	**Illegal Opcode Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[12] (note the bit # difference). See *Exceptions and ISA Execution Environment*.
	12	**Accesses UAV** Format: Enable This field must be set when GS has a UAV access. **Programming Notes** This field must not be set when GS Function Enable is disabled.
	11	**Mask Stack Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[11]. See *Exceptions and ISA Execution Environment.*
	10:8	**Reserved** Format: MBZ
	7	**Software Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[13] (note the bit # difference). See *Exceptions and ISA Execution Environment.*
	6	**Reserved** Access: RO Format: MBZ
	5:0	**Expected Vertex Count** Format: U6 Specifies the number of vertices per input object expected by the GS thread. Input topologies not matching this expect value are discarded. Note that **DiscardAdjacency** is also considered (e.g., if the value programmed is 3 and DiscardAdjacency is set, TRILIST_ADJ and TRISTRIP_ADJ topologies are not discarded as they will pass 3 vertices/object to the GS threads). **Value** | **Name** [1,32] |
3..4	63:32	**Reserved** Access: RO Format: MBZ

3DSTATE_GS_BODY

	31:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[31:10] Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if VS Function Enable is DISABLED.
	9:4	**Reserved** Access: RO Format: MBZ
	3:0	**Per-Thread Scratch Space** Format: U4 Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit.The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. **Value** / **Name** / **Description** [0,11] / / indicating [1K Bytes, 2M Bytes]
5	31	**Reserved** Access: RO Format: MBZ
	30:29	**Dispatch GRF Start Register For URB Data [5:4]** Format: U2 Specifies bit [5:4] of the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload. The **Dispatch GRF Start Register For URB Data [3:0]** field is used to specify bits [3:0] of the starting GRF register number.
	28:23	**Output Vertex Size** Format: U6 [0,63] indicating [1,64] 16B units Specifies the size of each vertex stored in the GS output entry (following any Control Header data) as a number of 128-bit units (minus one). **Programming Notes** Programming Restrictions: The vertex size must be programmed as a multiple of 32B units with the following exception: Rendering is disabled (as per SOL stage state) and the vertex size output by the GS thread is 16B.If rendering is enabled (as per SOL state) the vertex size must be

3DSTATE_GS_BODY

		programmed as a multiple of 32B units. In other words, the only time software can program a vertex size with an odd number of 16B units is when rendering is disabled.
	22:17	**Output Topology** Format: 3D_Prim_Topo_Type This field specifies the topology type (3DPrimType) to be associated with GS-thread output vertices (if any).
	16:11	**Vertex URB Entry Read Length** Specifies the amount of URB data read and passed in the thread payload for each Vertex URB entry, in 256-bit register increments. **Programming Notes** Programming Restriction: This field must be a non-zero value if Include Vertex Handles is cleared to zero.
	10	**Include Vertex Handles** Format: Boolean If set, all the input Vertex URB handles are included in the payload. These are referred to as "pull model" URB handles, as the thread will use them to read from the URB. **Programming Notes** Programming Restriction: This field must be set if Vertex URB Entry Read Length is cleared to zero.
	9:4	**Vertex URB Entry Read Offset** Format: U6 Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB before being included in the thread payload. This offset applies to all Vertex URB entries passed to the thread.
	3:0	**Dispatch GRF Start Register For URB Data** Format: U4 Specifies the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload. The Dispatch GRF Start Register for URB Data [5:4] field is used to extend the range of the starting GRF register number to [0,63]. **Value** / **Name** / **Description** [0,15] / / indicating bits [3:0] of the GRF number **Programming Notes** If Include Vertex Handles is enabled (pull or hybrid handles case), then For simd4x2: For DUAL_OBJECT dispatch mode this field should be:

3DSTATE_GS_BODY

		(((2*numVerticesPerObject) + 8 - 1)/8) + 1 For SINGLE and DUAL_INSTANCE dispatch modes this field should be: ((numVerticesPerObject +8 - 1)/8) + 1 If Include Primitive ID is set, then add 1 to the value obtained by using the above
		If Include Vertex Handles is enabled (pull or hybrid handles case), then. simd8:For InstanceCount == 1:numVerticesPerObject 2For InstanceCount > 1:((numVerticesPerObject 8 - 1)/8) 2If Include Primitive ID is set, then add 1 to the value obtained by using the above
6	31:24	**Reserved** Access: RO Format: MBZ
	23:20	**Control Data Header Size** Format: U4 Specifies the number of 32B units of control data header located at the start of the GS URB entry. The value 0 indicates there is no control data header, and Control Data Format is ignored and neither Cut nor StreamID bits are defined. Software must ensure that the Control Data Header Size is sufficient to accommodate the maximum number of vertices possibly output by the GS thread. It is UNDEFINED for a GS thread to report more output vertices than can be accommodated in a non-zero-sized header.

Value	Name
[0,8]	32B Units

	19:15	**Instance Control** Format: U5-1 Specifies the number of instances (minus one) for each input object. To avoid confusion, this document uses the term **"InstanceCount"** to refer to InstanceControl+1, with a range of [1,32]If **InstanceCount>1**, DUAL_OBJECT mode is invalid. Software will likely want to use DUAL_INSTANCE mode for higher performance, but SINGLE mode is also supported. When **InstanceCount=1** (one instance per object), software can decide which dispatch mode to use. DUAL_OBJECT mode would likely be the best choice for performance, followed by SINGLE mode. DUAL_INSTANCE mode is not recommended but is supported.

Value	Name	Description
[0,31]		Indicating [1,31] instances

	14:13	**Default Stream Id** Format: U2 When the GS is enabled, unless the GS output entry contains StreamID bits in the control header, this field specifies the default StreamID associated with any GS-thread output vertices. When the GS is disabled, StreamID will be output as 0.
	12:11	**Dispatch Mode** Format: U2 This field specifies how the GS unit dispatches multiple instances and/or multiple objects.

Value	Name	Description	Programming Notes
3h	SIMD8	Each thread shades up to 8	The driver must send pipe control with a cs

3DSTATE_GS_BODY

		different objects or (if InstanceCount >1) 8 instances of a single object.	stall after a 3dstate_gs state change and the Dispatch Mode is simd8 and the number of handles allocated to gs is less than 16.

Programming Notes
The GS must be allocated at least two URB handles or behavior is UNDEFINED for Dual Instance or Dual Object mode.
The only valid Dispatch Mode is SIMD8.

10 **Statistics Enable**

Format:	Enable

This bit controls whether GS-unit-specific statistics register(s) can be incremented.

Value	Name	Description
0h	Disable	GS_INVOCATIONS_COUNT and GS_PRIMITIVES_COUNT cannot increment
1h	Enable	GS_INVOCATIONS_COUNT and GS_PRIMITIVES_COUNT can increment

9:5 **Invocations Increment Value**

Format:	U5

Specifies how much to increment the GS_INVOCATIONS_COUNT for each instance of each object. This control is provided to allow software to process multiple instances (from an API POV) in a single kernel invocation. In SINGLE dispatch mode, the counter will increment by this value for each dispatch (as it's only one instance of one object). In DUAL_INSTANCE mode, the counter will be incremented by the value if only one instance is included in the dispatch (i.e., the last odd instance), otherwise the counter will be incremented by twice this value.In DUAL_OBJECT dispatch mode, the counter will be incremented by the value if only one object is included in the dispatch (i.e., a forced dispatch of one object), otherwise the counter will be incremented by twice this value.

Value	Name	Description
[0,31]		indicating an increment of [1,32]

4 **Include Primitive ID**

Format:	Boolean

If set, R1 of the payload is written with Primitive ID value(s).If clear, these Primitive ID values are not included in the payload R1.

3 **Hint**

Format:	U1

This state bit is simply passed in GS thread payloads for use by the GS kernel - it has no other impact on hardware operation.

2 **Reorder Mode**

This bit controls how vertices of triangle objects resulting from TRISTRIP[_ADJ][_REV] topologies are [re]ordered when passed in the GS thread payload See Object Vertex Ordering table (below).

Value	Name	Description
0h	LEADING	Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the leading (first) vertices are in consecutive order starting at v0. A similar

3DSTATE_GS_BODY

				reordering is performed on alternating triangles in a TRISTRIP_REV.
		1h	TRAILING	Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the trailing (last) vertices are in consecutive order starting at v2. A similar reordering is performed on alternating triangles in a TRISTRIP_REV.

	1	**Discard Adjacency** Format: Enable When set, adjacent vertices will not be passed in the GS payload when objects with adjacency are processed. Instead, only the non-adjacent vertices will be passed inthe same fashion as the without-adjacency form of the primitive. Software should set this bit whenever a GS kernel is used that does not expect adjacent vertices. This allows both with-adjacency/without-adjacency variants of the primitive to be submitted to the pipeline (via 3DPRIMITIVE) - the GS unit will silently discard any adjacent vertices and present the GS thread with only the internal object. When clear, adjacent vertices will be passed to the GS thread, as dictated by the incoming primitive type. Software should only clear this bit when a GS kernel is used that does expect adjacent vertices. E.g., if the GS kernel is compiled to expect a TRIANGLE_ADJ object, software must clear this bit. Software should also clear this bit if the GS kernel expects a POINT or PATCHLIST_n object (which don't have with-adjacency variants). The only hardware assistance is to allow the submission of a with-adjacency variant of a primitive when operating with a GS kernel that expects the without-adjacency variant of the object. (E.g., when the GS kernel is compiled to expect a TRIANGLE object, software should set this bit just in case a TRILIST_ADJ is submitted to the pipeline.) Note that the GS unit is otherwise not aware of the object type that is expected by the GS kernel. It is up to software to ensure that the submitted primitive type (in 3DPRIMITIVE) is otherwise compatible with the object type expected by the GS kernel. (E.g., if the GS kernel expects a LINE_ADJ object, only LINELIST_ADJ or LINESTRIP_ADJ should be submitted, otherwise the GS kernel will produce unpredictable results.) Also note that it is possible to craft a GS kernel which can accept any object type that's thrown at it by first examining the PrimType passed in the payload and then using this info to correctly interpret the number of vertices passed in the payload.
	0	**Enable** Format: Enable Specifies whether the GS stage is enabled or disabled (pass-through).
7	31	**Control Data Format** Format: U1 This field specifies the format of the control data header (if any).

Value	Name	Description
0h	CUT	The control data header contains Cut bits.
1h	SID	The control data header contains StreamID bits. Output Topology must be set to POINTLIST, or behavior is UNDEFINED.

3DSTATE_GS_BODY

	30	**Static Output** Format: Enable Specifies whether the GS shader outputs a static number of vertices per invocation. If this bit is clear, the number of vertices output by each GS shader invocation is stored by the GS thread in Vertex Count at the very beginning of the output URB entry (see GS URB Entry description).
	29:27	**Reserved** Access: RO Format: MBZ
	26:16	**Static Output Vertex Count** Format: U11 If **GSEnable** is ENABLED and **StaticOutput** is ENABLED, this field specifies the total number of vertices output each GS shader invocation. If **GSEnable** is ENABLED and **StaticOutput** is DISABLED (i.e., variable GS output), the total number of vertices output by a GS shader invocation is stored by the thread at the very beginning of the output URB entry, and this field is ignored. (See GS URB Entry description). **Value** / **Name** [0,1024]
	15:9	**Reserved** Access: RO Format: MBZ
	8:0	**Maximum Number of Threads** Format: U9-1 Specifies the maximum number of simultaneous threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance. **Value** / **Name** / **Description** [0,335] / / indicating thread count of [1,336]
8	31:27	**Reserved** Access: RO Format: MBZ
	26:21	**Vertex URB Entry Output Read Offset** Format: U6 Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB by SBE. **Value** / **Name** [0,63]

3DSTATE_GS_BODY

	20:16	**Vertex URB Entry Output Length** Format: U5 Specifies the amount of URB data written for each Vertex URB entry, in 256-bit register increments. **Value** [1,16] **Name** **Programming Notes** This length does not include the vertex header.
	15:8	**User Clip Distance Clip Test Enable Bitmask** Format: Enable[8] This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept / must clip determination needs to be made.DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.
	7:0	**User Clip Distance Cull Test Enable Bitmask** Format: Enable[8] This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept determination needs to be made (does not cause a must clip).DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.

3DSTATE_HIER_DEPTH_BUFFER_BODY

3DSTATE_HIER_DEPTH_BUFFER_BODY

Source: RenderCS
Size (in bits): 128
Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:25	**Hierarchical Depth Buffer Object Control State** Format: MEMORY_OBJECT_CONTROL_STATE Specifies the memory object control state for the hierarchical depth buffer.
	24	**Reserved** Access: RO Format: MBZ
	23:22	**Tiled Mode** **Description** This field specifies the tiled resource mode. **Value** / **Name** / **Description** 0h / No tiled resource (Tile Y Mode) / 1h / TILEYF / 4KB tiled resources 2h / TILEYS / 64KB tiled resources 3h / Reserved / **Programming Notes** HZ buffer only supports Tile Y mode.
	21	**Reserved** Access: RO Format: MBZ
	20	**Write thru enable for Texture** **Description** This bit must be set if the Depth buffer is used as a texture. If this bit is set, HZ will force a write of non-clear values to the Depth buffer avoiding the need of a Depth resolve. This means that HZ will not write planes to the HZ$. **Value** / **Name** 1h / Enable 0h / Disable **[Default]**

3DSTATE_HIER_DEPTH_BUFFER_BODY

		Programming Notes For MSAA with multiple resolves, SW may set this bit after the first resolve with compression disabled to enforce HW to write-through to depth buffer as uncompressed data to save on future resolves. However the clears on a surface must be done with this bit reset for MSAA.
	19:18	**Reserved** Access: RO Format: MBZ
	17	**Reserved** Access: RO Format: MBZ
	16:0	**Surface Pitch** Format: U17-1 This field specifies the pitch of the hierarchical depth buffer in (#Bytes - 1). **Value** / **Name** [7Fh,1FFFFh] corresponding to [128B, 512KB] also restricted to a multiple of 128B **Programming Notes** Since this surface is tiled, the pitch specified must be a multiple of the tile pitch, in the range [128B, 128KB].
1..2	63:0	**Surface Base Address** Format: GraphicsAddress[63:0] This field specifies the address of the buffer in Graphics Memory. **Programming Notes** The Hierarchical Depth Buffer can only be mapped to Main Memory (uncached). If the surface is tiled, the base address must conform to the Per-Surface Tiling Alignment Rules as documented in TBD.
3	31:16	**Reserved** Access: RO Format: MBZ
	15	**Reserved** Access: RO Format: MBZ
	14:0	**Surface QPitch** Format: U17[16:2] The interpretation of this field is dependent on **Surface Type** as follows: • SURFTYPE_2D/CUBE: distance in *rows* between array slices

3DSTATE_HIER_DEPTH_BUFFER_BODY

Format:
`QPitch[16:2]`

Value	Name	Description
[1h,7FFFh]		in multiples of 4 (low 2 bits missing)

Programming Notes

This field must be set to an integer multiple of 16 (QPitch[3] MBZ) Software must ensure that this field is set to a value sufficiently large such that the array slices in the surface do not overlap. Refer to the Memory Data Formats section for information on how surfaces are stored in memory.

3DSTATE_HS_BODY

3DSTATE_HS_BODY

Source: RenderCS

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:30	**Reserved** Access: RO Format: MBZ
	29:27	**Sampler Count** Format: U3 Specifies how many samplers (in multiples of 4) the HS kernels use. Used only for prefetching the associated sampler state entries. Value / Name / Description: 0h / No Samplers / no samplers used 1h / 1-4 Samplers / between 1 and 4 samplers used 2h / 5-8 Samplers / between 5 and 8 samplers used 3h / 9-12 Samplers / between 9 and 12 samplers used 4h / 13-16 Samplers / between 13 and 16 samplers used 5h-7h / Reserved / Reserved
	26	**Reserved** Access: RO Format: MBZ
	25:18	**Binding Table Entry Count** Format: U8 When HW Generated Binding Table is disabled: Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state. Note: For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache. **Programming Notes** When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.
	17	**Thread Dispatch Priority** Specifies the priority of the thread for dispatch Value / Name / Description: 0h / Normal / Normal Priority 1h / High / High Priority

3DSTATE_HS_BODY

16 — Floating Point Mode

Specifies the initial floating point mode used by the dispatched thread.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 Rules
1h	alternate	Use alternate rules

15:14 — Reserved

Access:	RO
Format:	MBZ

13 — Illegal Opcode Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment.

12 — Software Exception Enable

Format:	Enable

This bit gets loaded into EU CRO1[13] (note the bit # difference). See Exceptions and ISA Execution Environment.

11 — Reserved

Access:	RO
Format:	MBZ

10:8 — Reserved

Format:	MBZ

7:4 — Reserved

Access:	RO
Format:	MBZ

3:0 — Reserved

Access:	RO
Format:	MBZ

1 — 31 — Enable

Format:	Enable

Specifies whether the HS function is enabled or disabled (pass-through). If ENABLED MI_TOPOLOGY_FILTER must be used to silently discard any topologies that the HS kernel is not expecting. E.g., if the HS kernel is expecting PATCHLIST_32 topologies, MI_TOPOLOGY_FILTER must be set to PATCHLIST_32 so only those topologies can reach the enabled HS.

Programming Notes
The tessellation stages (HS, TE and DS) must be enabled/disabled as a group. I.e., draw commands can only be issued if all three stages are enabled or all three stages are disabled, otherwise the behavior is UNDEFINED.

3DSTATE_HS_BODY

30 Reserved

Access:	RO
Format:	MBZ

29 Statistics Enable

Format:	Enable

This bit controls whether HS-unit-specific statistics register(s) will increment (for each patch).

28:17 Reserved

Access:	RO
Format:	MBZ

16:8 Maximum Number of Threads

Format:	U9-1

Specifies the maximum number of simultaneous threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance.

Value	Name	Description
[0,335]		indicating thread count of [1,336]

Programming Notes
The Maximum Number of Threads must be set to at least twice the setting of 3DSTATE_HS::**Instance Count.**

7:5 Reserved

Access:	RO
Format:	MBZ

4:0 Instance Count

Format:	U5-1

This field determines the number of threads (minus one) spawned per input patch. If the HS kernel uses a barrier function, software must restrict the **Instance Count** to the number of threads that can be simultaneously active within a subslice. Factors which must be considered includes scratch memory availability.

Value	Name	Description
[0,31]		representing [1,32] instances

2..3 63:6 Kernel Start Pointer

Format:	InstructionBaseOffset[63:6]

This field specifies the starting location of the kernel program run by threads spawned by this FF unit. It is specified as a 64-byte-granular offset from the Instruction Base Address.

3DSTATE_HS_BODY

	5:0	**Reserved** Access: RO Format: MBZ
4..5	63:32	**Reserved** Access: RO Format: MBZ
	31:10	**Scratch Space Base Pointer** Format: GeneralStateOffset[31:10] **Value** / **Name** / **Description** [0,31] / / Specifies the location of the scratch space area allocated to this FF unit, specified as a 1KB-granular offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space.
	9:4	**Reserved** Access: RO Format: MBZ
	3:0	**Per-Thread Scratch Space** Format: U4 Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit.The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. **Value** / **Name** / **Description** [0,11] / / Indicating[1K Bytes, 2M Bytes
6	31:29	**Reserved** Access: RO Format: MBZ
	28	**Dispatch GRF Start Register For URB Data [5]** Format: U1 Specifies bit [5] of the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload. The **Dispatch GRF Start Register For URB Data [4:0]** field is used to specify bits [4:0] of the starting GRF register number.
	27	**Single Program Flow** Format: Enable Specifies the initial condition of the kernel program as either a single program flow (SIMDnxm with m = 1) or as multiple program flows (SIMDnxm with m > 1). See CR0 description in *ISA Execution Environment*.

3DSTATE_HS_BODY

Value	Name	Description
0h	Reserved	
1h	Enable	Single Program Flow Enabled

26 **Vector Mask Enable**

Format:	Enable

Upon subsequent HS thread dispatches, this bit is loaded into the EU's Vector Mask Enable (VME, cr0.0[3]) thread state. Refer to the EU documentation for the definition and use of VME state.

Value	Name	Description
0h	Dmask	The EU will use the Dispatch Mask (supplied by the HS stage) for instruction execution.
1h	Vmask	The EU will use the Vector Mask (derived from the Dispatch Mask) for instruction execution.

Programming Notes
Under normal conditions SW shall specify DMask, as the HS stage will provide a Dispatch Mask appropriate to SIMD4x2 or SIMD8 thread execution (as a function of dispatch mode). E.g., for SIMD4x2 thread execution, the HS state will generate a Dispatch Mask that is equal to what the EU would use as a Vector Mask. For SIMD8 execution there is no known usage model for use of Vector Mask (as there is for PS shaders).

25 **Accesses UAV**

Format:	Enable

This field must be set when HS has a UAV access

Programming Notes
This field must not be set when HS Function Enable is disabled.

24 **Include Vertex Handles**

Format:	Boolean

If set, all the input Vertex URB handles are included in payloads. This field is ignored if **HS Function Enable** is DISABLED.

Programming Notes
Programming Restriction: This field must be set if value if **Vertex URB Entry Read Length** is cleared to zero.

23:19 **Dispatch GRF Start Register For URB Data**

Format:	U5

Specifies the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload. This field is ignored if **HS Function Enable** is DISABLED.
The Dispatch GRF Start Register for URB Data [5] field is used to extend the range of the starting GRF register number to [0,63].

3DSTATE_HS_BODY

Value	Name	Description
[0,31]		indicating bits [4:0] of the GRF number

Programming Notes
When Include Vertex Handles is set for non-instanced 8_PATCH dispatch of PATCHLIST_30..32 objects, pushed vertex data and/or pushed constants cannot be used as they would need to start in the payload beyond the range of this field (i.e., beyond R31). When Include PrimitiveID is also set, this issue extends to non-instanced 8_PATCH dispatch of PATCHLIST_29..32 objects.

18:17 **Dispatch Mode**

Format:	U2

This field is unused to set the current thread dispatch mode for the HS stage.

Value	Name	Description
2h	8_PATCH	HS threads are passed inputs and an output handle associated with (up to) 8 patches in SIMD8 fashion. See 8_PATCH Thread Payload.
3h	Reserved	

Programming Notes
DUAL_PATCH is not supported.

16:11 **Vertex URB Entry Read Length**

Format:	U6

Specifies the amount of URB data read and passed in the thread payload for each Vertex URB entry, in 256-bit register increments. This field is ignored if HS Function Enable is DISABLED.

Value	Name
[0,63]	

Programming Notes
Programming Restriction: This field must be a non-zero value if **Include Vertex Handles** is cleared to zero.

10 **Reserved**

Access:	RO
Format:	MBZ

9:4 **Vertex URB Entry Read Offset**

Format:	U6

Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB before being included in the thread payload. This offset applies to all Vertex URB entries passed to the thread. This field is ignored if HS Function Enable is DISABLED.

Value	Name
[0,63]	

3DSTATE_HS_BODY

	3:1	**Patch Count Threshold** Format: U3 Specifies the maximum number of patches that will be accumulated before a thread is dispatched. The dispatch of threads can (optionally) be forced before a full complement of eight patches have been accumulated. **Value** / **Name** / **Description** [1,7] / / This specifies the maximum number of patches that will be accumulated before a thread dispatch is forced. 0 / **[Default]** / Early thread dispatch due to the Patch Count Threshold is disabled. A full complement of 8 patches can be accumulated before a thread is dispatched.
	0	**Include Primitive ID** Format: Enable If set, R1 of the payload is written with Primitive ID value(s).If clear, these Primitive IDs are not included in the payload R1. **Programming Notes** This field is only used when DUAL_PATCH DispatchMode is specified. In SINGLE_PATCH, the single Primitive ID is always passed in R0.
7	31:0	**Reserved** Access: RO Format: MBZ

3DSTATE_INDEX_BUFFER_BODY

3DSTATE_INDEX_BUFFER_BODY

Source: RenderCS

Size (in bits): 128

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:12	**Reserved** Access: RO Format: MBZ
	11	**L3 Bypass Disable** Format: Disable **Description** When set, index data fetches are routed through the L3 and therefore that index data may be coherent with the L3 cache, as controlled by the Memory Object Control State (MOCS) value. I.e., if portions of the index buffer already reside in the L3 (e.g., were written or read by another L3 agent), reads from VF may hit in the L3 with the cached data returned to VF. If reads from VF miss in the L3 cache, the reads are directed to the next higher in the memory hierarchy, but the data returned is not placed in the L3 cache. The MOCS value must not be set to cache the data in L3. When clear, index data fetches bypass the L3 logic, therefore precluding the coherency of that data in the L3 cache. If the vertex buffer data can be cached in L3, the L3 cache must first be flushed to maintain vertex buffer data coherency.
	10	**Reserved** Access: RO Format: MBZ
	9:8	**Index Format** Format: U2 This field specifies the data format of the index buffer. All index values are UNSIGNED. Value / Name: 0h: BYTE 1h: WORD 2h: DWORD
	7	**Reserved** Access: RO Format: MBZ

3DSTATE_INDEX_BUFFER_BODY

	6:0	**Memory Object Control State** Format: MEMORY_OBJECT_CONTROL_STATE Specifies the memory object control state for this index buffer.
1..2	63:0	**Buffer Starting Address** Format: GraphicsAddress[63:0] **Description** VIRTUAL_ADDR[63:48] are ignored by the HW. This field contains the size-aligned (as specified by Index Format) Graphics Address of the first element of interest within the index buffer. Software must program this value with the combination (sum) of the base address of the memory resource and the byte offset from the base address to the starting structure within the buffer. **Programming Notes** Index Buffers can only be allocated in linear (not tiled) graphics memory.
3	31:0	**Buffer Size** Format: U32 This field specifies the size of the buffer in bytes. Index accesses which straddle or go past the end of the buffer will return 0..Note that BufferSize=0 indicates that there is no valid data in the buffer. **Value**: [0, FFFFFFFFh] **Name**:

3DSTATE_MULTISAMPLE_BODY

3DSTATE_MULTISAMPLE_BODY

Source: RenderCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:6	**Reserved** Access: RO Format: MBZ
	5	**Pixel Position Offset Enable** Format: Enable Enables the device to offset pixel positions by 0.5 both in horizontal and vertical directions. **Programming Notes** Setting this field along with setting the Pixel Location to upper left and number of multisamples to greater than one will cause the device to offset pixel positions by 0.5 both in horizontal and vertical directions. It is to be noted this is done to adjust the pixel co-ordinate system to DX9 like, so any WM_HZ_OP screen space rectangles (eg: legacy HiZ Clear, Resolve etc) generated internally by driver in this mode needs to be aware of this offset adjustment and send the rectangles according to alignment restriction taking this offset adjustment into consideration. SW can choose to set this bit only for DX9 API. DX10/OGL API's should not have any effect by setting or not setting this bit.
	4	**Pixel Location** Format: U1 This field specifies where the device evaluates "pixel" (vs. centroid or sample) values/attributes. Value / Name / Description: 0h / CENTER / Use the pixel center (0.5, 0.5 offset) 1h / UL_CORNER / Use the pixel upper-left corner **Programming Notes** The programming of this field is assumed to be a function of the API being supported. Specifically, it is expected that OpenGL and DX10+ APIs require CENTER selection, while DX9- APIs require UL_CORNER selection. When 3DSTATE_RASTER::**ForcedSampleCount** is other than NUMRASTSAMPLES_0, this field must be 0h.
	3:1	**Number of Multisamples** Format: U3 This field specifies how many samples/pixel exist in all RTs and the Depth Buffer, as log2(#samples). This field is valid regardless of the setting of **Multisample Rasterization Mode**.

3DSTATE_MULTISAMPLE_BODY

Value	Name	Description
0h	1	1 sample/pixel
1h	2	2 samples/pixel
2h	4	4 samples/pixel
3h	8	8 samples/pixel
4h	16	16 samples/pixel
5h-7h	Reserved	

Programming Notes
The setting of this field must match the **Number of Multisamples** field in SURFACE_STATE of all bound render targets.

0 **Reserved**

3DSTATE_PS_BLEND_BODY

3DSTATE_PS_BLEND_BODY		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31	**Alpha To Coverage Enable** Format: Enable If set, indicates that AlphaToCoverage is on RT[0], since this bit must be set the same for all RTs in the MRT case.
	30	**Has Writeable RT** Format: Enable When set indicates the there is at least one non-null RT w/ at least one channel write enabled
	29	**Color Buffer Blend Enable** Format: Enable When set indicates that RT[0] has color buffer blend enabled.
	28:24	**Source Alpha Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Indicates the "source factor" in alpha Color Buffer Blending stage for RT[0]
	23:19	**Destination Alpha Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Indicates the "destination factor" in alpha Color Buffer Blending stage for RT[0]
	18:14	**Source Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Indicates the "source factor" in Color Buffer Blending stage for RT[0]
	13:9	**Destination Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Indicates the "destination factor" in Color Buffer Blending stage for RT[0]
	8	**Alpha Test Enable** Format: Enable Indicates the AlphaTestEnable for RT[0]

3DSTATE_PS_BLEND_BODY		
	7	**Independent Alpha Blend Enable** Format: Enable Indicates the Independent Alpha Blend Enable for RT[0] When enabled, the other fields in this instruction control the combination of the alpha components in the Color Buffer Blend stage. When disabled, the alpha components are combined in the same fashion as the color components.
	6:0	**Reserved** Access: RO Format: MBZ

3DSTATE_PS_BODY

3DSTATE_PS_BODY

Source: RenderCS

Size (in bits): 352

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:6	**Kernel Start Pointer 0** Format: InstructionBaseOffset[63:6] Specifies the 64-byte aligned address offset of the first instruction in the kernel[0]. This pointer is relative to the **Instruction Base Address.**
	5:0	**Reserved** Access: RO Format: MBZ
2	31	**Single Program Flow** Single Program Flow (SPF) specifies the initial condition of the kernel program as either a single program flow (SIMDnxm with m = 1) or as multiple program flows (SIMDnxm with m > 1). See CR0 description in ISA Execution Environment. Value / Name / Description 0h / Multiple / Multiple Program Flows 1h / Single / Single Program Flows
	30	**Vector Mask Enable** Format: Enable When SPF=0, Vector Mask Enable (VME) specifies which mask to use to initialize the initial channel enables. When SPF=1, VME specifies which mask to use to generate execution channel enables. Value / Name / Description 0h / Dmask / Channels are enabled based on the dispatch mask 1h / Vmask / Channels are enabled based on the vector mask
	29:27	**Sampler Count** Specifies how many samplers (in multiples of 4) the vertex shader 0 kernel uses. Used only for prefetching the associated sampler state entries. Value / Name / Description [0,4] / / 0h / No Samplers / no samplers used 1h / 1-4 Samplers / between 1 and 4 samplers used 2h / 5-8 Samplers / between 5 and 8 samplers used

3h	9-12 Samplers	between 9 and 12 samplers used
4h	13-16 Samplers	between 13 and 16 samplers used
5h-7h		Reserved

26 **Single Precision Denormal Mode**

Specifies the single precision denormal mode used by the dispatched thread.

Value	Name	Description
0h	Flushed to Zero	Single Precision denormals are flushed to zero
1h	Retained	Single Precision denormals are retained

25:18 **Binding Table Entry Count**

Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state. **Note:** For kernels using a large number of binding table entries, it may be advantageous to set this field to zero to avoid prefetching too many entries and thrashing the state cache. This field is ignored if [PS Function Enable] is DISABLED.

When [HW Generated Binding Table] bit is enabled: This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched. See 3D Pipeline for more information.

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.

17 **Thread Dispatch Priority**

Specifies the priority of the thread for dispatch.

Value	Name	Description
0h	Normal	Normal Priority
1h	High	High Priority

16 **Floating Point Mode**

Specifies the floating point mode used by the dispatched thread.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 rules
1h	Alternate	Use alternate rules

15:14 **Rounding Mode**

Specifies the rounding mode used by the dispatched thread.

Value	Name	Description
0h	RTNE	Round to Nearest Even
1h	RU	Round toward +infinity
2h	RD	Round toward -infinity

3DSTATE_PS_BODY

3h	RTZ	Round toward zero

13 Illegal Opcode Exception Enable

Format:	MBZ

31:10 Scratch Space Base Pointer

Format:	GeneralStateOffset[31:10]

Specifies the 1k-byte aligned address offset to scratch space for use by the kernel. This pointer is relative to the General State Base Address.

Programming Notes

Scratch Space per slice is computed based on 4 sub-slices. SW must allocate scratch space enough so that each slice has 4 slices allowed.

9:4 Reserved

Access:	RO
Format:	MBZ

3DSTATE_PS_BODY

	3:0	**Per Thread Scratch Space** Format: U4 Specifies the amount of scratch space allowed to be used by each thread. The driver must allocate enough contiguous scratch space, pointed to by the Scratch Space Pointer, to ensure that the Maximum Number of Threads each get Per Thread Scratch Space size without exceeding the driver-allocated scratch space. **Value** / **Name** [0,11] indicating [1k bytes, 2M bytes] in powers of two
5	31:23	**Maximum Number of Fused Threads Per PSD** Format: U9-1 **Description** Specifies the maximum number of simultaneous virtual fused threads allowed to be active per Pixel Shader Dispatch(PSD). PSD serves a pair of subslices. This bit-field can be programmed in the range: [0,63] each integer in the range linearly maps to maximum number of virtual fused threads in the range: [1, 64]. The allowable range is larger than the maximum number of fused physical threads per PSD. It is advantageous for performance reasons to allow more virtual threads than physical threads to ensure maximum usage of compute resources. Each fused thread represents 2 threads. **Programming Notes** If this field is changed between 3DPRIMITIVE commands, a PIPE_CONTROL command with Stall at Pixel Scoreboard set is required to be issued. This note only applies to 2 pass AMFS approach where AMFS unit launches Texel Shaders. This deadlock workaround is not needed for 3 pass approach where evaluate message does not cause AMFS unit to spawn Texel Shaders. When Pixel Shader contains one or more evaluate message for Procedural Texture, and AMFS is expected to dispatch Texel Shaders, the maximum number of fused virtual threads must be programmed to be less than maximum number of fused physical threads possible per PSD. Maximum number of fused physical threads is device specific. (see device specific programming notes for this field)This ensures that AMFS unit never gets deadlocked by restricting PSD from using all available compute resources. For typical Procedural Texture usage model we can program one less than maximum physical fused threads.
	22	**Reserved** Access: RO Format: MBZ
	21	**Pixel Scoreboard Disable** Setting this bit disables the pixel shader scoreboard for ordering the RTs and ROVs on the same screen space coordinates. **Programming Notes** There are cases when ordering the render target outputs or ROV outputs from the shader, for example:

3DSTATE_PS_BODY

1) all blend functions are commutative, here are the most common cases:
BLEND_OP = ADD or MIN or MAXand both src and dst blend factors are constants= 1.0.
2) There is no over-draw in the render pass (for example full screen 3D PASS which accesses a pixel in the color buffer just once).
When HW detects the change in this bit, it implicitly performs the PS scoreboard stall before allowing the subsequent group of pixel shader threads.

When SIMD32 is enabled, this bit **must not be set**. Pixel Scoreboard must always be enabled when SIMD32 is enabled.

20 **Reserved**

Access:	RO
Format:	MBZ

19:12 **Clear/Resolve BTI for Render Target**

Description
When Color Clear or Resolve bit is set in this state packet, this bit field indicates BTI to be used to access the Render Target Surface that's being cleared/resolved.

11 **Push Constant Enable**

Format:	Enable

This field must be enabled if the sum of the **PS Constant Buffer [3:0] Read Length** fields in 3DSTATE_CONSTANT_PS is nonzero, and must be disabled if the sum is zero.

10 **3D Scoreboard Address Size select**

Select the granularity use for scoreboard address calculation.

Value	Name
0h	2x2
1h	4x2

Programming Notes
This bit field allows programmable pixel scoreboard granularity: 2X2 pixel block(value = 0) or 4X2 pixel block(value = 1). When the value of this bit field changes, HW detects the change and takes the action to either force thread-group dependency or stalls at the scoreboard (based on the MMIO(PSS_MODE2):Thread Group Dependency Control). When enabling fused-SIMD32 dispatch mode, HW implicitly sets the scoreboard size to 4X2 independent of the value of this bit-field.

9 **Overlapping Subspans Enable**

Format:	Enable

This field indicates if two subspans (from two objects) rasterized to same screen-space XY coordinates can be packed into a single EU thread payload or across fused threads.
The shader compiler must set this field to DISABLED when pixel shader code requires serialized execution on per-pixel basis; examples include pixel shader using RT reads or pixel sync.
This field must be set to DISABLED if kernel has any coding structures that can create possibility

of younger object (e.g. upper fused thread or upper SIMD8 of dual-SIMD8 pair) to issue message before older object in fused thread.
Examples include:

- SIMD16/dual-SIMD8 thread issuing 2 SIMD8 messages
- A message issued from within if-else. (if message else different message)
- 3DSTATE_PS_EXTRA:killpix is set and depth/stencil write is enabled
- 3DSTATE_PS_EXTRA:computed depth/stencil is set and depth/stencil write is enabled
- Read and write to same UAV or RT

Programming Notes
When 3DSTATE_PS:Pixel Scoreboard Disable is set, this field **must be set**. The intent of scoreboard disable is to allow overlapping primitives in the shader stage and therefore disabling overlapping pixels defeats the purpose of this optimization.

8 **Render Target Fast Clear Enable**

Format:	Enable

This field is set to enable fast clear of the bound render targets. See "**Render Target Fast Clear**" and "**MCS/CCS Buffers for Render Targets**" for restrictions on enabling this field.
A general programming sequence for doing the Render Target Fast Clear requires:
-- setting up the Render Target State with RT that needs to be cleared as well as clear value is stored at the Clear Value Address in the RT State
-- Provide the BTI for that RT in this state packet
-- set this bit in the state packet provided the fast clear guidelines described in the Fast Clear section
-- DRAW command with a rectangle (scaled appropriately) as a primitive

Programming Notes
For PoSH based Tiled Rendering, Color Fast clear operation is recommended to be performed outside of tile pass, for performance reasons. After Fast clear, render cache flush is required.
For PoSH based Tiled Rendering, Color Fast clear can be inside the tile pass without significant performance penalty and it does not require render cache flush after fast clear of color.
When this bit is set, corresponding BTI for the render target that is being cleared must be equal to 0.
When this bit is set, RENDER_SURFACE_STATE type must not be NULL.
3D/Volumetric surfaces do not support Fast Clear operation.

7:6 **Render Target Resolve Type**

Format:	U2

Specifies what type of Render Target Resolve is needed for the surface to be consumed properly by the end Client. Programming notes below.

Value	Name	Description	Programming Notes
0h	RESOLVE_DISABLED	No Resolve Needed	
1h	RESOLVE_PARTIAL	Partial resolve is for resolving RT for clear values i.e. it leaves	Display engine does not support unresolved clear values in the

3DSTATE_PS_BODY

		no cache lines at implied clear value.	display buffer, hence this resolve is required before binding any compressed RT to the display via flip commands.
2h	FAST_CLEAR_0	Fast Clear to 0 during Clear Pass; Used to Initialize CCS Buffer with 0s to support Lossless Compressed Without Clear.	This state has to be programmed only with Render Target Fast Clear Enable described above. If the Render Target Fast Clear = 0, this Field Cannot be programmed to 2h.
3h	RESOLVE_FULL	Full Resolve is for Resolving RT for Clear/Compressed to Uncompressed State	

Programming Notes
When this bit is set, corresponding BTI for the render target that is being resolved must be equal to 0.
When this bit is set, RENDER_SURFACE_STATE type must not be NULL.
For multisample render target, this field must beRESOLVE_DISABLED.
3D/Volumetric surfaces do not support in-place resolve pass operation.

5 **Dual-SIMD8 Dispatch Enabled**

Format:	Enable

This field determines type of pixel shader enabled by**8 Pixel Dispatch or Dual-8 Pixel Dispatch Enable** field.
If DISABLED, the pixel shader kernel receives SIMD8 payload (8 pixels from 1 object).
If ENABLED, the pixel shader kernel receives dual-SIMD8 payload (8 pixels from 1st object and 8 pixels from 2nd object)

4:3 **Position XY Offset Select**

Format:	U2

This field specifies if/what Position XY Offset values are passed in the PS payload. Note that these are per-slot (pixel|sample) offsets, and therefore separate from the subspan XY coordinates passed in R1.

Value	Name	Description
0h	POSOFFSET_NONE	No Position XY Offsets are included in the PS payload.
1h	Reserved	
2h	POSOFFSET_CENTROID	Position XY Offsets will be passed in the PS payload, and these will reflect the Centroid position(s).
3h	POSOFFSET_SAMPLE	Position XY Offsets will be passed in the PS payload, and these will reflect the multisample position(s).

		Programming Notes SW Recommendation: If the PS kernel needs the Position Offsets to compute a Position XY value, this field should match Position ZW Interpolation Mode to ensure a consistent position.xyzw computation If the PS kernel does not need the Position XY Offsets to compute a Position Value, then this field should be programmed to POSOFFSET_NONE, as the PS kernel should be using the various barycentric inputs to evaluate other-than-position attributes. However, this field can be used to pass Centroid or Sample offsets in the payload for special test modes (e.g., where barycentric coordinates are computed in the PS vs. being HW-generated and passed in the payload). MSDISPMODE_PERSAMPLE is required in order to select POSOFFSET_SAMPLE.
	2	**32 Pixel Dispatch Enable** Format: Enable Enables the Windower to dispatch 8 subspans in one payload. Variable Pixel Dispatch in Section: Pixel Grouping (Dispatch size) control for valid pixel dispatch combinations. **Programming Notes** When NUM_MULTISAMPLES = 16 or FORCE_SAMPLE_COUNT = 16, SIMD32 Dispatch must not be enabled for PER_PIXEL dispatch mode. Must not be enabled when dispatch rate is sample AND NUM_MULTISAMPLES > 1. SIMD32 may only be enabled if SIMD16 or (dual)SIMD8 is also enabled. Must not be enabled when dispatch rate is coarse.
	1	**16 Pixel Dispatch Enable** Format: Enable Enables the Windower to dispatch 4 subspans in one payload. Variable Pixel Dispatch in Section: Pixel Grouping (Dispatch size) control for valid pixel dispatch combinations.
	0	**8 Pixel Dispatch Enable** Format: Enable **Description** Enables the Windower to dispatch 2 subspans from 1 object (polygon) in one payload. Variable Pixel Dispatch in Section: Pixel Grouping (Dispatch size) control for valid pixel dispatch combinations. If Dual-SIMD8 Dispatch Enabled, kernel pointer referenced by this field isDual-SIMD8 kernel pointer instead of SIMD8 kernel pointer.Dual-SIMD8 and SIMD8 modes are mutually exclusive and use the same kernel pointer entry. If Dual-SIMD8 Dispatch Enabled, the Widower packs 2 subspans from one object followed by 2 subspans from another object into one PS thread payload. **Programming Notes** When Render Target Fast Clear Enable is ENABLED or Render Target Resolve Type =

3DSTATE_PS_BODY

		RESOLVE_PARTIAL or RESOLVE_FULL, this bit must be DISABLED.
6	31:23	**Reserved** Access: RO Format: MBZ
	22:16	**Dispatch GRF Start Register For Constant/Setup Data 0** Format: U7 Specifies the starting GRF register number for the Constant/Setup portion of the thread payload for kernel[0]. Value: [0,127] — Name:
	15	**Reserved** Access: RO Format: MBZ
	14:8	**Dispatch GRF Start Register For Constant/Setup Data 1** Format: U7 Specifies the starting GRF register number for the Constant/Setup portion of the thread payload for kernel[1]. Value: [0,127] — Name:
	7	**Reserved** Access: RO Format: MBZ
	6:0	**Dispatch GRF Start Register For Constant/Setup Data 2** Format: U7 Specifies the starting GRF register number for the Constant/Setup portion of the thread payload for kernel[2]. Value: [0,127] — Name:
7..8	63:6	**Kernel Start Pointer 1** Format: InstructionBaseOffset[63:6] Specifies the 64-byte aligned address offset of the first instruction in kernel[1]. This pointer is relative to the Instruction Base Address.
	5:0	**Reserved** Access: RO Format: MBZ

3DSTATE_PS_BODY		
9..10	63:6	**Kernel Start Pointer 2** Format: InstructionBaseOffset[63:6] Specifies the 64-byte aligned address offset of the first instruction in kernel[2]. This pointer is relative to the **Instruction Base Address**.
	5:0	**Reserved** Access: RO Format: MBZ

3DSTATE_PS_EXTRA_BODY

3DSTATE_PS_EXTRA_BODY

Source: RenderCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Pixel Shader Valid** Format: Enable When set indicates a valid pixel shader. When this bit clear the rest of this command should also be clear.
	30	**Pixel Shader Does not write to RT** Format: Enable When set indicates the pixel shader does not write to render target. **Programming Notes** When Pixel Shader writes to UAV but does not write to RT, a dummy render target write is required to convey EOT to the PS dispatch function. Hence, this bit must be reset in this case. If there is no RT or a NULL RT, Pixel Shader Kills Pixel is reset, and there is no UAV output from PS, SW must set this bit. When Pixel Shader has evaluate message present, i.e. '3DSTATE_PS_EXTRA:PS has Evaluate Message' is enabled, this bit field must be reset.
	29	**oMask Present to Render Target** Format: Enable This bit is inserted in the PS payload header and made available to the DataPort (either via the message header or via header bypass) to indicate that oMask data from the shader (one or two phases) is included in Render Target Write messages. If present, the oMask data is used to mask off samples.
	28	**Pixel Shader Kills Pixel** Format: Enable This bit, if ENABLED, indicates that the PS kernel has the ability to kill (discard) pixels or samples, other than due to depth or stencil testing. This bit is required to be ENABLED in the following situations: • The API pixel shader program contains "killpix" or "discard" instructions, or other code in the pixel shader kernel that can cause the final pixel mask to differ from the pixel mask received on dispatch.
	27:26	**Pixel Shader Computed Depth Mode** Format: U2 This field specifies the computed depth mode for the pixel shader.

3DSTATE_PS_EXTRA_BODY

Value	Name	Description
0h	PSCDEPTH_OFF	Pixel shader does not compute depth
1h	PSCDEPTH_ON	Pixel shader computes depth with no guarantee as to its value
2h	PSCDEPTH_ON_GE	
3h	PSCDEPTH_ON_LE	Pixel shader computes depth and guarantees that oDepth <= SourceDepth If the Position ZW interpolation mode in 3DSTATE_WM does not match the DX Multisample Rasterization mode in 3DSTATE_RASTER, HW will internally convert to PSCDEPTH_ON.

Programming Notes
If this field is set to any value other than PSCDEPTH_OFF, a multi-phase shader (i.e. dispatch RATE_COARSE or RATE_PIXEL with pixel/sample loops or sample loop respectively) must output depth and render targets only at the last phase.
When PS dispatch rate is COARSE_RATE, this field must be programmed to PSCDEPTH_OFF.

25 **Force Computed Depth**

Format:	Enable

Programming Notes
This field should be left DISABLED. This field should not be tested for functional validation.

24 **Pixel Shader Uses Source Depth**

Format:	Enable

This bit, if ENABLED, indicates that the PS kernel requires the source depth value (vPos.z) to be passed in the payload. The source depth value is interpolated according to the Position ZW Interpolation Mode state.

Programming Notes
This bit cannot be enabled when dispatch rate is RATE_COARSE

23 **Pixel Shader Uses Source W**

Format:	Enable

This bit, if ENABLED, indicates that the PS kernel requires the interpolated source W value (vPos.w) to be passed in the payload. The W value is interpolated according to the Position ZW Interpolation Mode state.

22 **Pixel Shader Requires Requested Coarse Pixel Shading Size**

Format:	Enable

This bit, if ENABLED, indicates that the PS kernel requires values of requested coarse pixel shading size to be passed in the payload for each 2x2 coarse pixel quad. Note: Actual coarse pixel shading rate is always delivered (constant across thread slot). This bit can only be set when dispatch rate is RATE_COARSE.

3DSTATE_PS_EXTRA_BODY

	21	**Pixel Shader Requires Source Depth and/or W Plane Coefficients** Format: Enable This bit, if ENABLED, indicates that the PS kernel requires the source depth and/or W plane equations to be passed in the payload. Note: both attributes are always delivered in same message phase, even if only one is used.
	20	**Pixel Shader Requires Perspective Bary Plane Coefficients** Format: Enable This bit, if ENABLED, indicates that the PS kernel requires the perspective plane coefficients to be passed in the payload.
	19	**Pixel Shader Requires Non-Perspective Bary Plane Coefficients** Format: Enable This bit, if ENABLED, indicates that the PS kernel requires the non-perspective plane coefficients to be passed in the payload.
	18	**Pixel Shader Requires Subpixel Sample Offsets** Format: Enable This bit, if ENABLED, indicates that the PS kernel requires the sub-pixel sample offsets to be passed in the payload.
	17	**Reserved** Format: MBZ
	16:12	**Reserved** Format: MBZ
	11	**PS has Evaluate Message** Format: Enable **Description** This bit indicates if Pixel Shader has Evaluate Message typically used in conjunction with AMFS. **Value** / **Name** 0 – Disable **[Default]** 1 – Enable **Programming Notes** This bit must be reset if 3DSTATE_PS_EXTRA:PS Valid bit is not set. This bit must be reset if Cache Mode Register 1 [6] is set , ie Shader Independent AMFS is enabled

3DSTATE_PS_EXTRA_BODY

10:9	**Reserved** Access: RO Format: MBZ
8	**Attribute Enable** Format: Enable **Description** This field must be enabled if the Number of SF Output Attributes field in 3DSTATE_SBE is nonzero, and must be disabled if that field is zero.
7	**Pixel Shader Disables Alpha To Coverage** Format: Enable When set indicates the pixel shader AlphaToCoverage should be disabled due to oMask output. The setting of this bit is API dependent.
6	**Pixel Shader Is Per Sample** Format: Enable This bit, when ENABLED, indicates that the pixel shader is dispatched at the per sample shading rate. If this bit is DISABLED, the dispatch rate is determined by the value of Pixel Shader Is Per Coarse Pixel. If this bit is ENABLED, Pixel Shader Is Per Coarse Pixel bit must be DISABLED.
5	**Pixel Shader Computes Stencil** Format: Enable This field when set indicates that the pixel shader computes the stencil reference value. **Programming Notes** If this field is ENABLED,a multi-phase shader (i.e. dispatch RATE_COARSE or RATE_PIXEL with pixel/sample loops or sample loop respectively) must output stencil and render targets only at the last phase. WhenPixel Shader is at COARSE_RATE, this field must not be set.
4	**Pixel Shader Is Per Coarse Pixel** Format: Enable If Pixel Shader Is Per Sample is DISABLED and this bit is ENABLED, the pixel shader is dispatched at the per coarse pixel shading rate. If Pixel Shader Is Per Sample is DISABLED and this bit is DISABLED, the pixel shader is dispatched at the per pixel shading rate. If Pixel Shader Is Per Sample is ENABLED, this bit must be DISABLED. **Restriction** SIMD32 kernel version cannot be configured when this bit is ENABLED.
3	**Pixel Shader Pulls Bary** Format: Enable This bit indicates if Pixel Shader uses Pull Bary i.e. PI message. If this bit is reset, PS does not do Pull Bary.

3DSTATE_PS_EXTRA_BODY

2 **Pixel Shader Has UAV**

Format:	Enable
Format:	U1 Enumerated Type

This field when set indicates that the pixel shader has a UAV attached to it.

1:0 **Input Coverage Mask State**

Format:	U2

This field indicates the type of input coverage mask that the PS kernel requires to be passed in the payload.

Value	Name	Description	Programming Notes
0h	NONE	Pixel shader does not use input coverage masks.	
1h	NORMAL	Input Coverage masks based on outer conservatism and factors in SAMPLE_MASKs. If Pixel is conservatively covered, all samples are enabled.	
2h	INNER_CONSERVATIVE	Input Coverage masks based on inner conservatism. If Pixel is conservatively fully covered all samples are enabled else none of the samples are covered.	When PS Dispatch Rate is at Coarse Pixel, requesting this Input Coverage Mask mode is illegal and not supported by HW. Input converage masks based on inner consevatism incorrectly ANDs SAMPLE_MASK in HW. Therefore, PS must retrieve the INNER coverage mask per pixel by bit-wise OR operation. [] Input converage masks based on inner consevatism incorrectly ANDs SAMPLE_MASK in HW. Therefore, PS must retrieve the INNER coverage mask per pixel by bit-wise OR operation. [] Input converage masks based on inner consevatism incorrectly ANDs SAMPLE_MASK in HW. Therefore, PS must retrieve the INNER coverage mask

3DSTATE_PS_EXTRA_BODY					
					per pixel by bit-wise OR operation.
		3h	DEPTH_COVERAGE	Input coverage masks are computed after factoring depth/stencil test results, only if Early Depth Stencil Test is enabled. If Early Depth Stencil Test is not enabled, HW uses NORMAL Input Coverage Masks.	

3DSTATE_PTBR_MARKER_BODY

0	31:29	**Reserved** Access: RO Format: MBZ
	28:27	**Reserved** Access: RO Format: MBZ
	26	**Viewport Z Far Clip Test Enable** Format: Enable This field is used to control whether the Viewport Z Far extent is considered in VertexClipTest.
	25	**Reserved** Access: RO Format: MBZ
	24	**Conservative Rasterization Enable** Format: Enable This field when set enables conservative rasterization rules for all primitives except rectangles, points and lines. For rectangle, points and lines, setting this bit is ignored by hardware. **Programming Notes** This bit must not be set for primitives with poly-stippling enabled or native rectlist. When this bit is set, sampling mode must be set to "Centre" sampling i.e 3DSTATE_MULTISAMPLE::Pixel Location set to CENTER
	23:22	**API Mode** Software sets this field according to the API's version. These bits are set for DX9 or OGL/DX10.0/DX10.1+/DX11.1 per the following values. Value / Name / Description 0h / DX9/OGL / 1h / DX10.0 / 2h / DX10.1+ / This is used for DX10.1+ and Vulkan API 3h / Reserved /
	21	**Front Winding** Determines whether a triangle object is considered "front facing" if the screen space vertex positions, when traversed in the order, result in a clockwise (CW) or counter-clockwise (CCW)

winding order. Does not apply to points or lines.

Value	Name	Description
0h	Clockwise	FRONTWINDING_CW
1h	Counter Clockwise **[Default]**	FRONTWINDING_CCW

20:18 **Forced Sample Count**

Format:	U3

This field specifies how many samples/pixel exist for RT Independent Rasterization

Value	Name	Description
0h	NUMRASTSAMPLES_0	No RT Independent Rasterization
1h	NUMRASTSAMPLES_1	1 rast-sample/pixel
2h	NUMRASTSAMPLES_2	2 rast-samples/pixel
3h	NUMRASTSAMPLES_4	4 rast-samples/pixel
4h	NUMRASTSAMPLES_8	8 rast-samples/pixel
5h	NUMRASTSAMPLES_16	16 rast-samples/pixel
6h-7h	Reserved	

Programming Notes
When 3DSTATE_MULTISAMPLE::Number of Multisamples !=NUMSAMPLES_1, this field must be either NUMRASTSAMPLES_0 or NUMRASTSAMPLES_1. When 3DSTATE_MULTISAMPLE::Number of Multisamples == NUMSAMPLES_1, this field must not be NUMRASTSAMPLES_1.

17:16 **Cull Mode**

Controls removal (culling) of triangle objects based on orientation. The cull mode only applies to triangle objects and does not apply to lines, points or rectangles.

Value	Name	Description
0h	CULLMODE_BOTH	All triangles are discarded (i.e., no triangle objects are drawn)
1h	CULLMODE_NONE **[Default]**	No triangles are discarded due to orientation
2h	CULLMODE_FRONT	Triangles with a front-facing orientation are discarded
3h	CULLMODE_BACK	Triangles with a back-facing orientation are discarded

Programming Notes
Orientation determination is based on the setting of the Front Winding state.

15 **Reserved**

Access:	RO
Format:	MBZ

3DSTATE_RASTER_BODY

14 Force Multisampling

This field provides a work around override for the computation of SF_INT::Multisample Rasterization Mode and WM_INT::Multisample Rasterization Mode.

Value	Name	Description
0h	Normal	Multisampling mode is computed by HW according to formula for signal SF_INT::Multisample Rasterization Mode and WM_INT::Multisample Rasterization Mode in vol2a.11 3D Pipeline Windower > Windower Pipelined State > 3DSTATE_WM > 3DSTATE_WM.
1h	Force	Forces the DX Multisampling mode to be used directly

13 Smooth Point Enable

Format:	Enable

Software sets this according to API. When OGL and smooth point rasterization is required, this bit must be set. HW ignores this bit for primitives other than points.

12 DX Multisample Rasterization Enable

Format:	Enable

Software sets this according to the API's multisample enable

Programming Notes
This state only effects how the SF_INT/WM_INT::Multisample Rasterization Mode are set depending on some other states. This state mainly modifies the how the line rendering is done by setting SF_INT/WM_INT::Multisample Rasterization Mode to either OFF* or ON* . Please refer to table under SF_INT::Multisample Rasterization Mode.

11:10 DX Multisample Rasterization Mode

Format:	U2

This field determines whether multisample rasterization is turned on/off, and how the pixel sample point(s) are defined. Software sets this according to the API's multisample state setting (if any)

Value	Name
0h	MSRASTMODE_ OFF_PIXEL
1h	MSRASTMODE_ OFF_PATTERN
2h	MSRASTMODE_ ON_PIXEL
3h	MSRASTMODE_ ON_PATTERN

Programming Notes
This field is used to directly set the SF_INT/WM_INT::Multisample Rasterization Mode when DX Multisample Rasterization Enable is set. Please refer to equation of SF_INT::Multisample Rasterization Mode.

9 Global Depth Offset Enable Solid

Format:	Enable

Enables computation and application of Global Depth Offset for SOLID objects.

3DSTATE_RASTER_BODY

	8	**Global Depth Offset Enable Wireframe** Format: Enable Enables computation and application of Global Depth Offset when triangles are rendered in WIREFRAME mode.
	7	**Global Depth Offset Enable Point** Format: Enable Enables computation and application of Global Depth Offset when triangles are rendered in POINT mode.
	6:5	**Front Face Fill Mode** Format: U2 This state controls how front-facing triangle and rectangle objects are rendered.

Value	Name	Description
0h	SOLID	Any triangle or rectangle object found to be front-facing is rendered as a solid object. This setting is required when rendering rectangle (RECTLIST) objects.
1h	WIREFRAME	Any triangle object found to be front-facing is rendered as a series of lines along the triangle boundaries (as determined by the topology type and controlled by the vertex EdgeFlags).
2h	POINT	Any triangle object found to be front-facing is rendered as a set of point primitives at the triangle vertices (as determined by the topology type and controlled by the vertex EdgeFlags).
3h	Reserved	

	4:3	**Back Face Fill Mode** Format: U2 This state controls how back-facing triangle and rectangle objects are rendered.

Value	Name	Description
0h	SOLID	Any triangle or rectangle object found to be back-facing is rendered as a solid object. This setting is required when rendering rectangle (RECTLIST) objects.
1h	WIREFRAME	Any triangle object found to be back-facing is rendered as a series of lines along the triangle boundaries (as determined by the topology type and controlled by the vertex EdgeFlags).
2h	POINT	Any triangle object found to be back-facing is rendered as a set of point primitives at the triangle vertices (as determined by the topology type and controlled by the vertex EdgeFlags).
3h	Reserved	

3DSTATE_RASTER_BODY

	2	**Antialiasing Enable** Format: Enable This field enables "alpha-based" line antialiasing. **Programming Notes** This field must be disabled if any of the render targets have integer (UINT or SINT) surface format.
	1	**Scissor Rectangle Enable** Format: Enable Enables operation of Scissor Rectangle.
	0	**Viewport Z Near Clip Test Enable** Format: Enable This field is used to control whether the Viewport Z Near extent is considered in VertexClipTest.
1	31:0	**Global Depth Offset Constant** Format: IEEE_FLOAT Specifies the constant term in the Global Depth Offset function.
2	31:0	**Global Depth Offset Scale** Format: IEEE_FLOAT Specifies the scale term used in the Global Depth Offset function.
3	31:0	**Global Depth Offset Clamp** Format: IEEE_FLOAT Specifies the clamp term used in the Global Depth Offset function.

3DSTATE_SAMPLE_MASK_BODY

3DSTATE_SAMPLE_MASK_BODY

Source: RenderCS

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Sample Mask** Format: Enable[16] A per-multisample-position mask state variable that is immediately and unconditionally ANDed with the sample coverage mask as part of the rasterization process. This mask is applied prior to centroid selection. This mask must be ignored for centroid selection when RTIR is enabled i.e. Forced_Sample_Count > 0. **Programming Notes** • If **Number of Multisamples** is NUMSAMPLES_1, bits 15:1 of this field will be zeroed by HW. • If **Number of Multisamples** is NUMSAMPLES_2, bits 15:2 of this field will be zeroed by HW. • If **Number of Multisamples** is NUMSAMPLES_4, bits 15:4 of this field will be zeroed by HW. • If **Number of Multisamples** is NUMSAMPLES_8, bits 15:8 of this field will be zeroed by HW. When pixel shader writes to UAV but does not have actual render target write (i.e. no RT is bound to pixel shader, even though, RT write message is sent for EOT), appropriate SAMPLE_MASK must be all set depending on Number of Multisamples.

3DSTATE_SAMPLER_STATE_POINTERS_BODY

3DSTATE_SAMPLER_STATE_POINTERS_BODY		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:5	**Pointer to Sampler State** Format: DynamicStateOffset[31:5]SAMPLER_STATE*16 Specifies the 32-byte aligned address offset of the function's SAMPLER_STATE table. This offset is relative to the Dynamic State Base Address.
	4:0	**Reserved** Access: RO Format: MBZ

3DSTATE_SBE_BODY

3DSTATE_SBE_BODY

Source: RenderCS

Size (in bits): 160

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30	**Reserved** Access: RO Format: MBZ
	29	**Force Vertex URB Entry Read Length** Format: Enable This field provides a work around override for the computation of SBE_INT::Vertex URB Entry Read Length. If asserted, 3DSTATE_SBE::Vertex URB Entry Read Length is be used directly. Otherwise, SBE_INT::Vertex URB Entry Read Length is computed normally.
	28	**Force Vertex URB Entry Read Offset** Format: Enable This field provides a work around override for the computation of SBE_INT::Vertex URB Entry Read Offset. If asserted, 3DSTATE_SBE::Vertex URB Entry Read Offset is be used directly. Otherwise, SBE_INT::Vertex URB Entry Read Offset is computed normally.
	27:22	**Number of SF Output Attributes** Format: U6 Specifies the number of vertex attributes passed from the SF stage to the WM stage (does not include Position). Value: [0,32] — Name:
	21	**Attribute Swizzle Enable** Format: Enable Enables the SF to perform swizzling on (up to the first 16) vertex attributes. If DISABLED, all vertex attributes are passed through.
	20	**Point Sprite Texture Coordinate Origin** This state controls how Point Sprite Texture Coordinates are generated (when enabled on a per-attribute basis by Point Sprite Texture Coordinate Enable).

3DSTATE_SBE_BODY

Value	Name	Description
0h	UPPERLEFT	Top Left = (0,0,0,1)Bottom Left = (0,1,0,1)Bottom Right = (1,1,0,1)
1h	LOWERLEFT	Top Left = (0,1,0,1)Bottom Left = (0,0,0,1)Bottom Right = (1,0,0,1)

19 **Primitive ID Override Component W**

Format:	Enable

If set, the W component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.

18 **Primitive ID Override Component Z**

Format:	Enable

If set, the Z component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.

17 **Primitive ID Override Component Y**

Format:	Enable

If set, the Y component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.

16 **Primitive ID Override Component X**

Format:	Enable

If set, the X component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.

15:11 **Vertex URB Entry Read Length**

Format:	U5

Specifies the amount of URB data read for each Vertex URB entry, in 256-bit register increments.

Value	Name
[1,16]	

Programming Notes

It is UNDEFINED to set this field to 0 indicating no Vertex URB data to be read. This field should be set to the minimum length required to read the maximum source attribute. The maximum source attribute is indicated by the maximum value of the enabled Attribute # Source Attribute if Attribute Swizzle Enable is set, Number of Output Attributes-1 if enable is not set.
read_length = ceiling((max_source_attr+1)/2)

10:5 **Vertex URB Entry Read Offset**

Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB.

4:0 **Primitive ID Override Attribute Select**

Specifies which attribute is overridden w/ the Primitive ID

3DSTATE_SBE_BODY

		Programming Notes Set all Primitive ID Override Component Select X/Y/Z/W to 0 to indicate there is no Primitive ID override.
1	31:0	**Point Sprite Texture Coordinate Enable** Format: Enable[32] When processing point primitives, the attributes from the incoming point vertex are typically copied to the point object corner vertices. However, if a bit is set in this field, the corresponding Attribute is selected as a Point Sprite Texture Coordinate, in which case each corner vertex is assigned a pre-defined texture coordinate as defined by the Point Sprite Texture Coordinate Origin state bit. Bit 0 corresponds to output Attribute 0.
2	31:0	**Constant Interpolation Enable** Format: Enable[32] This field is a bitmask containing a Constant Interpolation Enable bit for each corresponding attribute. If a bit is set, that attribute will undergo constant interpolation, and the corresponding WrapShortest Enable bits (if defined) will be ignored. If a bit is clear, components which are not enabled for WrapShortest interpolation (if defined) will be linearly interpolated.
3	31:30	**Attribute 15 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 15 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	29:28	**Attribute 14 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 14 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	27:26	**Attribute 13 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 13 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	25:24	**Attribute 12 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 12 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

3DSTATE_SBE_BODY

	23:22	**Attribute 11 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 11 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	21:20	**Attribute 10 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 10 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	19:18	**Attribute 9 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 9 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	17:16	**Attribute 8 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 8 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	15:14	**Attribute 7 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 7 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	13:12	**Attribute 6 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 6 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	11:10	**Attribute 5 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 5 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

3DSTATE_SBE_BODY		
	9:8	**Attribute 4 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 4 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	7:6	**Attribute 3 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 3 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	5:4	**Attribute 2 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 2 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	3:2	**Attribute 1 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 1 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	1:0	**Attribute 0 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 0 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
4	31:30	**Attribute 31 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 31 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	29:28	**Attribute 30 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 30 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

3DSTATE_SBE_BODY

	27:26	**Attribute 29 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 29 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	25:24	**Attribute 28 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 28 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	23:22	**Attribute 27 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 27 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	21:20	**Attribute 26 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 26 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	19:18	**Attribute 25 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 25 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	17:16	**Attribute 24 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 24 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	15:14	**Attribute 23 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 23 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

3DSTATE_SBE_BODY

	13:12	**Attribute 22 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 22 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	11:10	**Attribute 21 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 21 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	9:8	**Attribute 20 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 20 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	7:6	**Attribute 19 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 19 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	5:4	**Attribute 18 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 18 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	3:2	**Attribute 17 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 17 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.
	1:0	**Attribute 16 Active Component Format** Format: **Attribute_Component_Format** This state indicates which components of Attribute 16 are being used by the pixel shader Kernel. SBE will not perform attribute delta calculations for any disabled components. Operation is UNDEFINED if kernel uses attribute vertex delta for any disabled component.

3DSTATE_SCISSOR_STATE_POINTERS_BODY

3DSTATE_SCISSOR_STATE_POINTERS_BODY		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:5	**Scissor Rect Pointer** Format: DynamicStateOffset[31:5]SCISSOR_RECT*16 Specifies the 32-byte aligned address offset of the SCISSOR_RECT state. This offset is relative to the **Dynamic State Base Address**.
	4:0	**Reserved** Access: RO Format: MBZ

3DSTATE_SF_BODY

3DSTATE_SF_BODY		
Source:	RenderCS	
Size (in bits):	96	
Default Value:	0x00000000, 0x00000000, 0x00000800	
DWord	**Bit**	**Description**
0	31:30	**Reserved** Access: RO Format: MBZ
	29:12	**Line Width** Format: U11.7 Range: [0.0, 2047.9921875] Controls width of line primitives. Setting a Line Width of 0.0 specifies the rasterization of the "thinnest" (one-pixel-wide), non-antialiased lines. Note that this effectively overrides the effect of AAEnable (though the AAEnable state variable is not modified). **Programming Notes** Software must not program a value of 0.0 when running in MSRASTMODE_ON_xxx modes - zero-width lines are not available when multisampling rasterization is enabled.
	11	**Legacy Global Depth Bias Enable** Format: Enable Enables the SF to use the Global Depth Offset Constant state unmodified. If this bit is not set, the SF will scale the Global Depth Offset Constant as described in section Error! Reference source not found. of this document. **Programming Notes** This bit should be set whenever non zero depth bias (Slope, Bias) values are used. Setting this bit may have some degradation of performance for some workloads.
	10	**Statistics Enable** Format: Enable If ENABLED, this FF unit will increment CL_PRIMITIVES_COUNT on behalf of the CLIP stage. If DISABLED, CL_PRIMITIVES_COUNT will be left unchanged. **Programming Notes** This bit should be set whenever clipping is enabled and the Statistics Enable bit is set in CLIP_STATE. It should be cleared if clipping is disabled or Statistics Enable in CLIP_STATE is clear.
	9:2	**Reserved** Access: RO Format: MBZ

3DSTATE_SF_BODY

	1	**Viewport Transform Enable** Format: Enable This bit controls the Viewport Transform function.
	0	**Reserved** Access: RO Format: MBZ
1	31	**Reserved** Access: RO Format: MBZ
	30:29	**Deref Block Size** Format: U2 Set the EODB batch size

Value	Name	Description
0h	Default Mode. Block deref size 32 **[Default]**	Block deref size of 32
1h	Per Poly Deref Mode when VS/DS have minimal handles.	Per Poly. Deref mode when VS/DS have minimal handles.
2h	Block deref size 8	8 handles mode, block size.
3h	Reserved	

Programming Notes

Deref Block size depends on the last enabled shader and number of handles programmed for that shader
1) For GS last shader enabled cases, the deref block is always set to a per poly(within hardware) If the last enabled shader is VS or DS.
1) If DS is last enabled shader then if the number of DS handles is less than 324, need to set per poly deref.
2) If VS is last enabled shader then if the number of VS handles is less than 192, need to set per poly deref

	28	**Reserved**
	27:18	**Reserved** Access: RO Format: MBZ

	11:0	**Reserved** Access: RO Format: MBZ
2	31	**Last Pixel Enable** Format: Enable If ENABLED, the last pixel of a diamond line will be lit. This state will only affect the rasterization of Diamond lines (will not affect wide lines or anti-aliased lines). **Programming Notes** Last pixel is applied to all lines of a LINELIST, and only the last line of a LINESTRIP.
	30:29	**Triangle Strip/List Provoking Vertex Select** Format: U2 Selects which vertex of a triangle (in a triangle strip or list primitive) is considered the "provoking vertex". Used for flat shading of primitives. Does current implementation send provoking vertex first? **Value** / **Name** 0h / 0 1h / 1 2h / 2 3h / Reserved
	28:27	**Line Strip/List Provoking Vertex Select** Format: U2 Selects which vertex of a line (in a line strip or list primitive) is considered the "provoking vertex". **Value** / **Name** / **Description** 0h / 0 / Vertex 0 1h / 1 / Vertex 1 2h / Reserved / Reserved 3h / Reserved / Reserved

3DSTATE_SF_BODY

26:25 Triangle Fan Provoking Vertex Select

Format:	U2

Selects which vertex of a triangle (in a triangle fan primitive) is considered the "provoking vertex".

Value	Name
0h	0
1h	1
2h	2
3h	Reserved

24:15 Reserved

Access:	RO
Format:	MBZ

14 AA Line Distance Mode

Format:	U1

This bit controls the distance computation for antialiased lines.

Value	Name	Description
1h	AALINEDISTANCE_TRUE	True distance computation. This is the normal setting which should yield WHQL compliance.

13 Smooth Point Enable

Format:	Enable
_Custom_Display_DoubleBufferArmedBy:	Enables logic to draw smooth OGL Points

Programming Notes
If Enabled, SF will treat points in the same fashion that AA lines are processed

12 Vertex Sub Pixel Precision Select

Format:	U1

Selects the number of fractional bits maintained in the vertex data

Value	Name	Description
0h	8	8 sub pixel precision bits maintained
1h	4	4 sub pixel precision bits maintained

Programming Notes
When Conservative Rasterization is enabled, this bit must be programmed to 0.

11 Point Width Source

Controls whether the point width passed on the vertex or from state is used for rendering point primitives.

Value	Name	Description
0h	Vertex	Use Point Width on Vertex

3DSTATE_SF_BODY				
		1h	State **[Default]**	Use Point Width from State
	10:0	**Point Width** Format: U8.3 Range: [0.125, 255.875] pixels This field specifies the size (width) of point primitives in pixels. This field is overridden (though not overwritten) whenever point width information is passed in the FVF		

3DSTATE_SO_BUFFER_INDEX_BODY

3DSTATE_SO_BUFFER_INDEX_BODY

Source: RenderCS

Size (in bits): 224

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31	**SO Buffer Enable** Format: Enable If set, stream output to SO Buffer is enabled, , if 3DSTATE_STREAMOUT::SO Function ENABLE is also enabled..If clear, the SO Buffer is considered "not bound" and effectively treated as a zero-length buffer for the purposes of SO output and overflow detection. If an enabled stream's Stream to Buffer Selects includes this buffer it is by definition an overflow condition. That stream will cause no writes to occur, and only SO_PRIM_STORAGE_NEEDED[<stream>] will increment.
	30:29	**Reserved** Access: RO Format: MBZ
	28:22	**SO Buffer Object Control State** Format: MEMORY_OBJECT_CONTROL_STATE Specifies the memory object control state for the SO buffer.
	21	**Stream Offset Write Enable** Format: Enable When set, this field allows the hardware to write SO_WRITE_OFFSET[n] as specified in the Stream Offset field. **Programming Notes** The field is operates irrespective of whether SO Buffer Enable is set or clear.
	20	**Stream Output Buffer Offset Address Enable** Format: Enable When set, this field allows the hardware to read/write the stream output buffer offset as specified in the "Stream Output Buffer Offset Address" field. **Programming Notes** The field is operates irrespective of whether SO Buffer Enable is set or clear.
	19:0	**Reserved** Access: RO Format: MBZ

3DSTATE_SO_BUFFER_INDEX_BODY

1..2	63:2	**Surface Base Address** Format: VIRTUAL_ADDR[63:2] **Description** VIRTUAL_ADDR[63:48] are ignored by the HW This field specifies the starting address of the buffer in Graphics Memory.
	1:0	**Reserved** Access: RO Format: MBZ
3	31:30	**Reserved** Access: RO Format: MBZ
	29:0	**Surface Size** Format: U30-1 This field specifies the size of buffer in number DWords minus 1 of the buffer in Graphics Memory.
4..5	63:2	**Stream Output Buffer Offset Address** Format: VIRTUAL_ADDR[63:2] **Description** VIRTUAL_ADDR[63:48] are ignored by the HW This field specifies the starting address of the buffer in Graphics Memory where the Stream Output Buffer Offset is stored when all the data has been written. It is also used to fetch the stream Output buffer Offset when needed.
	1:0	**Reserved** Access: RO Format: MBZ
6	31:0	**Stream Offset** This field specifies the Offset in stream output buffer to start at, or whether to append to the end of an existing buffer. The Offset must be DWORD aligned. If Stream Offset is equal to 0xFFFFFFFF then load the value at the Stream Output Buffer Offset address into SO_WRITE_OFFSET[Buffer#]. Otherwise, SO_WRITE_OFFSET[n] = Stream Offset.

3DSTATE_STENCIL_BUFFER_BODY

3DSTATE_STENCIL_BUFFER_BODY

Source: RenderCS

Size (in bits): 224

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:29	**Surface Type** 0h Reserved 1h SURFTYPE_2D — Defines a 2-dimensional map or array of maps 2h Reserved 3h SURFTYPE_CUBE — Defines a cube map 4h-6h Reserved 7h SURFTYPE_NULL — Defines a null surface **Programming Notes** The Surface Type of the Stencil buffer must be the same as the Surface Type of the 1. Render target(s) (defined in SURFACE_STATE), unless either the stencil buffer or render targets are SURFTYPE_NULL 2. Depth buffer (defined in 3DSTATE_DEPTH_BUFFER) unless either the depth buffer or Stencil buffer surf_type are SURFTYPE_NULL. If stencil is enabled with 1D render target, stencil surface type needs to be set to 2D surface type and height set to 1. For this case only, the Surface Type of the stencil buffer can be 2D while the Surface Type of the render target(s) are 1D, representing an exception to a programming note above. Issue Semi pipelined flush not back pressuring when stencil buffer state is enabling thread dispatch. Workaround **Astep only** An **additional pipe control with post-sync = store dword** operation would be required.(w/a is to have an **additional** pipe control after the stencil state whenever the surface state bits of this state is changing).
	28	**Stencil Write Enable** Format: Enable This field enables stencil writes to the Stencil buffer surface. Both this field and the Stencil Buffer Write Enable field in DEPTH_STENCIL_STATE must be enabled in order for stencil writes to occur.
	27	**Null Page Coherency Enable** Format: Enable This field is used for enabling NULL coherency as defined under Tiled Resources.

3DSTATE_STENCIL_BUFFER_BODY

Value	Name
1	Enable
0	Disable **[Default]**

Programming Notes
SW must enable this bit only if Tiled Resource is enabled

26 **Reserved**

Access:	RO
Format:	MBZ

25 **Stencil Compression Enable**

if enabled, indicates that Stencil Buffer Compression is Enabled
When enabled, Stencil Buffer needs to be initialized via stencil clear (HZ_OP) before any renderpass.

Programming Notes
SW must set this bit if the Stencil Control surface enable is also set. The Stencil surface control enable is in Bit[24] of this DWORD.

24 **Control Surface Enable**

If set to 1, it indicates if the common control surface is present. The read and write transaction opcodes sent by the clients (HZ, Z, STC) to the fabric are different depending on the control surface. If the control surface is not present, the reads and writes are in legacy mode. If the control surface is present, the reads and write opcodes will be either UNCOMPRESSED_TYP for uncompressible transactions or COMPRESSED_TYP for compressible transactions.

Programming Notes
SW must set this bit to "1", if the common control surface is present in the system.

23 **Corner Texel Mode**

Format:	Enable

This field, when ENABLED, indicates when a surface is using corner texel-mode for stencil surface. This bit changes how the size of each MIP when calculating the offset within a surface.

Value	Name	Description
0h	Disable **[Default]**	Corner Texel mode is not enabled.
1h	Enable	Corner Texel Mode is enabled.

Programming Notes
Corner texel mode for the stencil buffer must be the same as the Corner texel mode of the 1. Render target(s) (defined in SURFACE_STATE), unless either the stencil buffer or render targets are SURFTYPE_NULL 2. Depth buffer (defined in 3DSTATE_DEPTH_BUFFER) unless either the depth buffer or Stencil buffer surf_type are SURFTYPE_NULL

3DSTATE_STENCIL_BUFFER_BODY

22:18 Reserved

Access:	RO
Format:	MBZ

17 Reserved

Access:	RO
Format:	MBZ

16:0 Surface Pitch

Format:	U17-1

For TileYF and TileYS surfaces, the range is dependent on the Cu parameter (refer to *Memory Data Formats* section for the definition of the Cu parameter depending on the case). The range in bytes is [2^{Cu}-1,262143] -> [(2^{Cu})B,256KB] = [1 tile, 256KB/(2^{Cu}) tiles]

Value	Name	Description
[7Fh,1FFFFh]		corresponding to [128B, 256KB] also restricted to a multiple of 128B

Programming Notes

The pitch specified must be a multiple of the tile pitch, in the range [128B, 128KB].
The minimum pitch should be calculated as per the formula given below.
The minimum pitch should be calculated based on Cu, Cv, W_L.
The Cu, Cv are the tile constants and $W_L$is the aligned width adjusted for MSAA.
use this for pitch formula :
Minimum_pitch =(ceiling((W_0 pixel_size) / (1 « Cu)) *(1 « Cu)) 1 ; //$W_0$is the aligned width for the largest LOD (i.e LOD 0)*
(1 « Cu) = tile width in bytes
(1 « Cv) = tile height in lines
Pixel_size = 1 (for STC buffer)

1..2 63:0 Surface Base Address

Format:	GraphicsAddress[63:0]

This field specifies address of the buffer in mapped Graphics Memory. Graphics Address [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] = [47].

Programming Notes

The stencil Buffer can only be mapped to Main Memory (uncached). If the surface is tiled, the base address must conform to the Per-Surface Tiling Alignment. If the buffer is linear, the surface must be 64-byte aligned.

If the buffer is linear, the surface must be 64-byte aligned.

3 31 Reserved

Access:	RO
Format:	MBZ

3DSTATE_STENCIL_BUFFER_BODY

30:17 **Height**

Format:	U14-1

This field specifies the height of the surface. If the surface is MIP-mapped, this field contains the height of the base MIP level.

Value	Name	Description	Exists If
[0,16383]	Legal Range	Height of surface - 1 (y/v dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')
[0,16383]	Legal Range	y/v dimension	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE')

Programming Notes

The Height of the stencil buffer must be the same as the
1. Height of the render target(s) (defined in SURFACE_STATE), unless Surface Type is SURFTYPE_2D with Depth = 0 (non-array) and LOD = 0 (non-mip mapped).
2.Depth buffer (defined in 3DSTATE_DEPTH_BUFFER) unless either the depth buffer or Stencil buffer surf_typeare SURFTYPE_NULL

16 **Reserved**

Access:	RO
Format:	MBZ

15 **Reserved**

Access:	RO
Format:	MBZ

14:1 **Width**

Format:	U14-1

This field specifies the width of the surface. If the surface is MIP-mapped, this field specifies the width of the base MIP level. The width is specified in units of pixels.

Value	Name	Description	Exists If
[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')
[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE')

Programming Notes

The Width specified by this field must be less than or equal to the surface pitch (specified in bytes via the Surface Pitch field). For cube maps, Width must be set equal to Height.
1. The Width of the stencil buffer must be the same as the Width of the render target(s) (defined in SURFACE_STATE), unless Surface Type is SURFTYPE_1D or SURFTYPE_2D with Depth = 0 (non-array) and LOD = 0 (non-mip mapped).
2.Depth buffer (defined in 3DSTATE_DEPTH_BUFFER) unless either the depth buffer or Stencil buffer surf_typeare SURFTYPE_NULL

3DSTATE_STENCIL_BUFFER_BODY

0 — Reserved

Access:	RO
Format:	MBZ

4 — 31 — Reserved

Access:	RO
Format:	MBZ

4 — 30:20 — Depth

Format:	U11-1

This field specifies the total number of levels for a volume texture or the number of array elements allowed to be accessed starting at the Minimum Array Element for arrayed surfaces. If the volume texture is MIP-mapped, this field specifies the depth of the base MIP level.

Value	Name	Description	Exists If
[0,2047]	Legal Range	Number of array elements - 1	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')
[0,0]	Legal Range	Must be zero	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE')

Programming Notes

The Depth of the Stencil buffer must be the same as
1. The Depth of the render target(s) (defined in SURFACE_STATE).
2.Depth buffer (defined in 3DSTATE_DEPTH_BUFFER) unless Depth buffer surf_type is SURFTYPE_NULL

4 — 19 — Reserved

Access:	RO
Format:	MBZ

4 — 18:8 — Minimum Array Element

Format:	U11

For 2D Surfaces: This field indicates the minimum array element that can be accessed as part of this surface. The delivered array index is added to this field before being used to address the surface. For Other Surfaces This field is ignored

Value	Name	Exists If
[0,2047]	SURFTYPE_2D	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_1D'|Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')

Programming Notes

Minimum array element of the Stencil buffer must be the same as the Surface Type of the
1. Render target(s) (defined in SURFACE_STATE), unless either the Stencil buffer or render targets are SURFTYPE_NULL
2. Depth buffer (defined in 3DSTATE_DEPTH_BUFFER) unless either the depth buffer or Stencil

3DSTATE_STENCIL_BUFFER_BODY

buffer surf_type are SURFTYPE_NULL

7 Reserved

Access:	RO
Format:	MBZ

6:0 Stencil Buffer Object Control State

Format:	MEMORY_OBJECT_CONTROL_STATE

Specifies the memory object control state for the stencil buffer.

5 31:30 Tiled Mode

For stencil Buffer Surfaces: This field specifies the tiled mode. For other surfaces: This field is ignored.

Value	Name	Description
0h	NONE	No tiled modes (TileYf, TileYs). Use Standard TileY
1h	TILEYF	4KB tiled mode
2h	TILEYS	64KB tiled mode
3h	Reserved	

Programming Notes

If **Tile Mode** is not set to TILEMODE_YMAJOR, this field must be set to TRMODE_NONE.

29:26 Mip Tail Start LOD

Format:	U4

For Sampling Engine, Render Target, and Typed Surfaces: This field indicates which LOD is the first one in the MIP tail if **Tiled Mode** is not TRMODE_NONE. The MIP tail has a different layout than the rest of the surface. Refer to the *Memory Data Formats* section for more details.
For other surfaces: This field is ignored.

Programming Notes

This field must be zero if the **Surface Format** is MONO8.
This field is ignored if **Tiled Mode** is TRMODE_NONE unless **Surface Type**is SURFTYPE_1D.

If Tiled Mode is not TRMODE_NONE, this field must be set to ensure that mips within the mip tail do not overlap given the storage algorithms given in the Memory Data Formats section. The following table indicates the maximum size of the mip that is set to be the Mip Tail Start LOD for various cases:

Tiling Mode	Slot Size in Bytes	8-bit Size
2D TIleYs 1x	32KB	(128, 256)
2D TileYf 1x	2KB	(32, 64)

25:6 Reserved

Access:	RO
Format:	MBZ

3DSTATE_STENCIL_BUFFER_BODY

	5:0	**Reserved** Access: RO Format: MBZ
6	31:21	**Render Target View Extent** Format: U11-1 **Value** / **Name** / **Description** / **Exists If** [0,2047] / Legal Range / Number of array elements- 1 / (Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D') [0,0] / Legal Range / Must be zero / (Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE') **Programming Notes** Render Target View Extof the stencil buffer must be the same as the Surface Type of the 1. Render target(s) (defined in SURFACE_STATE), unless either the depth buffer or render targets are SURFTYPE_NULL 2. Depth buffer (defined in 3DSTATE_DEPTH_BUFFER) unless either the depth buffer or Stencil buffer surf_type are SURFTYPE_NULL
	20	**Reserved** Access: RO Format: MBZ
	19:16	**Surf LOD** Format: U4 LOD units **Value** / **Name** [0-14] **Programming Notes** Surf LOD of the stencil buffer must be the same as the Surface Type of the 1. Render target(s) (defined in SURFACE_STATE), unless either the stencil buffer or render targets are SURFTYPE_NULL 2. Depth buffer (defined in 3DSTATE_DEPTH_BUFFER) unless either the depth buffer or Stencil buffer surf_type are SURFTYPE_NULL
	15	**Reserved** Access: RO Format: MBZ

3DSTATE_STENCIL_BUFFER_BODY

14:0 **Surface QPitch**

Format:	U17[16:2]

The interpretation of this field is dependent on **Surface Type** as follows:

- SURFTYPE_2D/CUBE: distance in *rows* between array slices.

Other surface types: field is ignored

Format:

```
QPitch[16:2]
```

Value	Name	Description
[1h,7FFFh]		in multiples of 4 (low 2 bits missing)

Programming Notes

For 2D Surfaces: This field must be set to an integer multiple of 8. Software must ensure that this field is set to a value sufficiently large that array slices in the surface do not overlap. Refer to the Memory Data Formats section for information on how surfaces are stored.
TYS/TYF QPitch is valid only for 2D array surfaces and represents the tile-padded total number of texels(lines) in a single array slice.
Height of each LOD:
HL = AlignToTileHeight(MSAA_height_factor * (**height**»L) > 0?**height**»L : 1), where AlignToTileHeight(x) is (ceiling((x) / (1 « Cv)) *(1 « Cv))
Height of all LODs is a sum:
H = H0+H1+..Hn,
N is number of mip levels.
If surface has MIP tail, equation stops at Hn where n=MipTailStartLOD. MipTail is single tile.
QPitch is multiple of tile height (1 « Cv) and should be equal or greater H computed above.

3DSTATE_STREAMOUT_BODY

3DSTATE_STREAMOUT_BODY		
Source:	RenderCS	
Size (in bits):	128	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0	31	**SO Function Enable** Format: U1 If set, the SO function is enabled. Vertex data will be streamed out to memory (subject to overflow detection) as controlled by the various SO-related state variables. If clear, the SO function is disabled, and therefore no vertex data will be streamed out to memory. However, the Rendering Disable and Render Stream Select fields will still be used to determine which vertices (if any) are forwarded down the pipeline for (possible) rendering.
	30	**API Rendering Disable** Format: U1 If set, Indicates the API wants the SO stage not to forward any topologies down the pipeline. If clear, Indicates the API wants the SO stage to forward topologies associated with **Render Stream Select** down the pipeline. This bit is used even if **SO Function Enable** is DISABLED. **Programming Notes** The SOL unit generates an SOL_INT::Render_Enable which ultimately controls whether rendering occurs or not.
	29	**Reserved** Access: RO Format: MBZ
	28:27	**Render Stream Select** Format: U2 This field specifies which stream has been selected to be forwarded down the pipeline for possible rendering. Topologies from other streams will not be passed down the pipeline. If Rendering Disable is set, this field is ignored, as no topologies are sent down the pipeline. SO Function Enable must also be ENABLED in order for this field to select a stream for rendering. When **SO Function Enable** is DISABLED and Rendering Disable is cleared (i.e., rendering is enabled), StreamID is ignored downstream of the SO stage, allowing any stream to be rendered.
	26	**Reorder Mode** This bit controls how vertices of triangle objects in TRISTRIP[_ADJ] and TRISTRIP_REV are reordered for the purposes of stream-out only (does not impact rendering). See table in Input Buffering.

3DSTATE_STREAMOUT_BODY

Value	Name	Description
0h	LEADING	Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the leading (first) vertices are in consecutive order starting at v0. A similar reordering is performed on alternating triangles in a TRISTRIP_REV.
1h	TRAILING	Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the trailing (last) vertices are in consecutive order starting at v2. A similar reordering is performed on alternating triangles in a TRISTRIP_REV.

25 **SO Statistics Enable**

Format:	Enable

This bit controls whether StreamOutput statistics register(s) can be incremented.

Value	Name	Description
0h	Disable	SO_NUM_PRIMS_WRITTEN[0..3] and SO_PRIM_STORAGE_NEEDED[0..3] registers cannot increment.
1h	Enable	SO_NUM_PRIMS_WRITTEN[0..3] and SO_PRIM_STORAGE_NEEDED[0..3] registers can increment.

24:23 **Force Rendering**

This field provides a work around override for the computation of SOL_INT::Render_Enable

Value	Name	Description
0h	Normal	SOL_INT::Render_Enable is computed normally
1h	Resreved	
2h	Force_Off	Forces the rendering to be disabled.
3h	Force_on	Forces the rendering to be enabled.

20 Tessellation Factor Format

Value	Name	Description
0h	FLOAT32	The tessellation factors in the patch header are in a FLOAT32 format.
1h	FLOAT16	The tessellation factors in the patch header are in a FLOAT16 format. The tessellation factors still occupy the same DWORD as with the FLOAT32 format, but occupy only bits [15:0] of the DWORD.

19 Tessellation Scale Factor Enable

Format:	Enable

If ENABLED, the tessellation factors will be multiplied by the Tessellation Scale Factor.

Programming Notes
Note that if ENABLED, the Tessellation Factor Format must be FLOAT16.

18:17 Reserved

Access:	RO
Format:	MBZ

16 Reserved

Access:	RO
Format:	MBZ

15:14 Reserved

Access:	RO
Format:	MBZ

13:12 Partitioning

Format:	U2

This field specifies how edges are partitioned based on tessellation factor.

Value	Name	Description
0h	INTEGER	Outside/inside edges are divided into an integer number of equal-sized segments.
1h	ODD_FRACTIONAL	Outside/inside edges are divided into an odd number of possibly-unequal-sized segments.
2h	EVEN_FRACTIONAL	Outside/inside edges are divided into an even number of possibly-unequal-sized segments.
3h	POW2	Outside/inside edges are divided into a power of 2 number of equal-sized segments.

11:10 Reserved

Access:	RO
Format:	MBZ

3DSTATE_TE_BODY

9:8 Output Topology

Format:	U2

This field specifies which primitive types are to be output.

Value	Name	Description
0h	POINT	Points are output (as POINTLIST topologies)
1h	LINE	Lines are output (as LINESTRIP topologies). Only valid if ISOLINE domain is selected.
2h	TRI_CW	Clockwise-ordered triangles are output (either as TRISTRIP, TRISTRIP_REV or TRILIST topologies). Not valid if ISOLINE domain is selected.
3h	TRI_CCW	Count-clockwise-ordered triangles are output (either as TRISTRIP, TRISTRIP_REV or TRILIST topologies). Not valid if ISOLINE domain is selected.

7:6 Reserved

Access:	RO
Format:	MBZ

5:4 TE Domain

Format:	U2

This field specifies which type of domain is to be tessellated.

Value	Name	Description
0h	QUAD	2D (U, V) domain is tessellated
1h	TRI	Triangular (U, V, W) domain is tessellated
2h	ISOLINE	2D (U, V) domain is tessellated.

3 Reserved

Access:	RO
Format:	MBZ

2:1 TE Mode

Format:	U2

When TE Enable is ENABLED, this field specifies the overall operation of the TE stage. This field is ignored if TE Enable is DISABLED.

Value	Name	Description
0h	HW_TESS	Normal HW Tessellation Mode. The TessFactors are read from the patch URB entry, and are used to perform fixed-function hardware tessellation of the specified domain.

3DSTATE_TE_BODY

	0	**TE Enable** Format: Enable If ENABLED, the TE stage will perform tessellation processing on incoming patch primitives. The TE Mode field determines how this tessellation operation proceeds. If DISABLED, the TE goes into pass-through mode. All other state fields are ignored. **Programming Notes** The tessellation stages (HS, TE and DS) must be enabled/disabled as a group. I.e., draw commands can only be issued if all three stages are enabled or all three stages are disabled, otherwise the behavior is UNDEFINED.
1	31:0	**Maximum Tessellation Factor Odd** Format: IEEE_FLOAT This field specifies the maximum TessFactor for ODD_FRACTIONAL partitioning when in HW_TESS mode. **Value** / **Name** / **Description** [3F800000h,427C0000h] / [1,63] / Value can be set between [1,63]. Value must be a IEEE_Float representation of an odd integer. **Programming Notes** Note that ISOLINE's LineDensity TF is always subjected to INTEGER partitioning regardless of the Partitioning state.
2	31:0	**Maximum Tessellation Factor Not Odd** Format: IEEE_FLOAT This field specifies the maximum TessFactor for EVEN_FRACTIONAL, INTEGER or POW2 partitioning when in HW_TESS mode. **Value** / **Name** / **Description** [40000000h,42800000h] / [2,64] / Value can be set between [2,64]. Value must be a IEEE_Float representation of an even integer. **Programming Notes** Note that ISOLINE's LineDensity TF is always subjected to INTEGER partitioning regardless of the Partitioning state. If Partioning is set to POW2, this field must be programmed to a power of 2 number.
3	31:0	**Tessellation Scale Factor** Format: IEEE_FLOAT If Tessellation Scale Factor Enable is ENABLED, the tessellation factors in the patch header will be multiplied by this value. **Programming Notes** This FLOAT32 value will be converted to a FLOAT16 value by hardware prior to scaling. This FLOAT32 value must **NOT** be negative, zero, denormal, infinite, or a NaN.

3DSTATE_URB_ALLOC_DS_BODY

3DSTATE_URB_ALLOC_DS_BODY

Source: RenderCS

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:21	**DS URB Starting Address SliceN** Format: U8 This field specifies the offset (from the start of the URB memory in additional slices) of the DS URB allocation, specified in multiples of 8 KB. For each additional, enabled slice, HW will increase the DS URB Starting Address by the value specified, resulting in an DS URB Starting Address within the total URB space. Value: [0,127] Name: Programming Notes: This field is ignored by HW as there is only one slice in the device.
	20:18	**Reserved** Access: RO Format: MBZ
	17:10	**DS URB Starting Address Slice0** Format: U8 This field specifies the offset (from the start of Slice0 URB memory) of the DS URB Handle allocation for Slice0, specified in multiples of 8 KB. This address must account for any Push Constant allocations, as those allocations begin at offset 0 in URB memory. Value: [0,127] Programming Notes: The DS URB Starting Address Slice 0 must be greater than the render and posh push constant space allocated using3DSTATE_PUSH_CONSTANT_ALLOC_VS,3DSTATE_PUSH_CONSTANT_ALLOC_HS,3DSTATE_PUSH_CONSTANT_ALLOC_DS,3DSTATE_PUSH_CONSTANT_ALLOC_GS,3DSTATE_PUSH_CONSTANT_ALLOC_PS and VSR_PUSH_CONSTANT_BASE.
	9:0	**DS URB Entry Allocation Size** Format: U10-1 Specifies the size, count of 512-bit units, of each URB entry owned by DS.

3DSTATE_URB_ALLOC_DS_BODY

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:21	**VS URB Starting Address SliceN** Format: U8 This field specifies the offset (from the start of the URB memory in additional slices) of the VS URB allocation, specified in multiples of 8 KB. For each additional, enabled slice, HW will increase the VS URB Starting Address by the value specified, resulting in a Starting Address within the total URB space. Value: [0,127] Name: **Programming Notes** This field is ignored by HW as there is only one slice in the device.
	20:18	**Reserved** Access: RO Format: MBZ
	17:10	**VS URB Starting Address Slice0** Format: U8 This field specifies the offset (from the start of Slice0 URB memory) of the VS URB allocation, specified in multiples of 8 KB. This allocation must account for any Push Constant allocations, as those allocations begin at offset 0 in Slice0 URB memory. Value: [0,127] Programming Notes: The VS URB Starting Address Slice 0 must be greater than the render and posh push constant space allocated using3DSTATE_PUSH_CONSTANT_ALLOC_VS,3DSTATE_PUSH_CONSTANT_ALLOC_HS,3DSTATE_PUSH_CONSTANT_ALLOC_DS,3DSTATE_PUSH_CONSTANT_ALLOC_GS,3DSTATE_PUSH_CONSTANT_ALLOC_PS and VSR_PUSH_CONSTANT_BASE.
	9:0	**VS URB Entry Allocation Size** Format: U10-1 Specifies the length, count of 512-bit units, of each URB entry owned by VS. This field is always used (even if VS Function Enable is DISABLED).

3DSTATE_URB_ALLOC_VS_BODY

Value	Name
[0,511]	

Programming Notes
As the VS URB entry serves as both the per-vertex input and output of the VS shader, the VS URB Allocation Size shall be sized to the maximum of the vertex input and output structures.

1 — 31:16 — VS Number of URB Entries SliceN

Format:	U16

This field specifies the number of URB entries in slices beyond Slice0 to be allocated to VS. SW shall ensure that the total Number of Entries does not exceed the relevant ValidValue range listed below.

Value	Name	
[64,3576]		RenderCS
[64,1280]		PositionCS

Programming Notes
This field is ignored by HW as there is only one slice in the device.
VS URB entries shall be allocated even if VS Function Enable is DISABLED.
VS Number of URB Entries must be divisible by 8 if the VS URB Entry Allocation Size is less than 9 512-bit URB entries."2:0" = reserved "000b"

15:0 — VS Number of URB Entries Slice0

Format:	U16

This field specifies the number of URB entries in Slice0 URB memory to be allocated to VS. SW shall ensure that the total Number of Entries does not exceed the relevant ValidValue range listed below.

Value	Name	
[64,3576]		RenderCS
[64,1280]		PositionCS

Programming Notes
VS URB entries shall be allocated even if VS Function Enable is DISABLED.
VS Number of URB Entries must be divisible by 8 if the VS URB Entry Allocation Size is less than 9 512-bit URB entries."2:0" = reserved "000b"

3DSTATE_URB_DS_BODY

3DSTATE_URB_DS_BODY

Source: RenderCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:25	**DS URB Starting Address** Format: U7 Offset from the start of the URB memory where DS starts its allocation, specified in multiples of 8 KB. Value: [0,127] — Name: **Programming Notes** If CTXT_SR_CTL::POSH_Enable is set and Push Constants are required or Device[SliceCount] GT 1, the lower limit is 8. If CTXT_SR_CTL::POSH_Enable is clear and Push Constants are required or Device[SliceCount] GT 1, the lower limit is 4. If Push Constants are not required and Device[SliceCount] == 1, the lower limit is 0.
	24:16	**DS URB Entry Allocation Size** Format: U9-1 Specifies the length, count of 512-bit units, of each URB entry owned by DS. This field is always used (even if DS Function Enable is DISABLED).
	15:0	**DS Number of URB Entries** Specifies the number of URB entries that are used by DS, based on only 1 slice enabled. When multiple slices are enabled, HW will multiply the value programmed by the number of slices in order to determine the total number of entries. SW shall ensure that the total number of entries does not exceed the relevant ValidValue range listed below. This field is always used (even if DS Function Enable is DISABLED). If Domain Shader Thread Dispatch is Enabled then the minimum number of handles that must be allocated is 34 URB entries. Value: [0,3576] — Name: **Programming Notes** DS Number of URB Entries must be divisible by 8 if the DS URB Entry Allocation Size is programmed to a value less than 9, which is 10 512-bit URB entries. "2:0" = reserved "000"

3DSTATE_VF_INSTANCING_BODY

Source: RenderCS

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0	31:10	**Reserved** Access: RO Format: MBZ
	9	**Instance Stride Enable** Format: Enable **Value / Name / Description** 0h / Disabled / The Instance Stride value is neither defined nor used. For this vertex element, VF will access the Vertex Buffer as a simple 1D array using the Vertex Buffer Pitch as a stride. 1h / Enable / For this vertex element, VF will access the Vertex Buffer as a 2D array. The Instance Advancement State field defines the stride between instances. The Vertex Buffer Pitch defines the stride between vertices within a given instance. **Programming Notes** This field must be DISABLED when Instancing Enable is ENABLED.
	8	**Instancing Enable** Format: Enable **Value / Name / Description / Programming Notes** 0h / Disabled / This vertex element is not instanced and therefore vertices within instances can each receive different data for this vertex element. Within each instance, the source vertex data for this vertex element is determined according the Vertex Access Type of the 3DPRIMITIVE command. There is no Instance Data Step Rate state defined for this vertex element. / 1h / Enabled / This vertex element is instanced and therefore vertices within instances will receive the same data for this vertex element. The source pointer for this particular vertex element will be (a) initialized at the start of 3DPRIMITIVE processing, (b) held constant for all vertices within an instance, and (c) advanced between instances as a function of Instance Data Step Rate. / The Instance Advancement State field provides the Instance Data Step Rate.

3DSTATE_VF_INSTANCING_BODY

		Programming Notes This field must be DISABLED when Instance Stride Enable is ENABLED.
	7:6	**Reserved** Access: RO Format: MBZ
	5:0	**Vertex Element Index** Format: U6 This field identifies which vertex element state is to be modified by this command. **Value** [0,33] — **Name**
1	31:0	**Instance Advancement State** If Instancing Enable is ENABLED, this field determines the rate at which data for this particular vertex element is changed between instances. Only after the number of instances specified by this field is generated is new (sequential) vertex element data provided. This process continues for each group of instances defined in the 3DPRIMTIVE command. For example, a value of 1 in this field causes new data to be supplied for this vertex element with each sequential (instance) group of vertices. A value of 2 causes every other instance group of vertices to be provided with new vertex element data. The special value of 0 causes all vertices of all instances generated by the 3DPRIMITIVE command to be provided with the same data for this vertex element. (The same effect can be achieved by setting this field to its maximum value.) If Instance Stride Enable is ENABLED, this field determines the stride in BYTES from one instance to the next. An InstanceStride of 0 means there is only one set of instance data (a degenerate 2D array with an instance dimension of 1). For this vertex element, VF will access the vertex buffer data sequentially for each vertex within first instance, and then return to the start of the vertex buffer for the vertices in the next instance, and so on. **Programming Notes** The interpretation/use of this field depends on whether the Instancing Enable or Instance Stride Enable state bit is ENABLED. Software shall not concurrently ENABLE both of those state bits. If both state bits are DISABLED, this field is ignored.

3DSTATE_VF_SGVS_2_BODY

21:16 XP1 Element Offset

Format:	U6

If XP1 Enable is ENABLED, this field specifies the VUE element offset of the 128-bit element where it is to be inserted. The XP1 Component Number specifies where in the specified element it is to be inserted.

Value	Name
[0,33]	

15 XP0 Enable

Format:	Boolean

Value	Name	Description
0h	Disabled	XP0 is not inserted
1h	Enabled	XP0 (as defined by XP0 Source Select) is inserted

14:13 XP0 Component Number

If XP0 Enable is ENABLED, this field specifies the 32-bit component location (within the 4-component VUE) where it is inserted. If XP0 Enable is DISABLED, this field is ignored.

Value	Name	Description
0	COMP_0	If enabled, XP0 is inserted in component 0 (.x)
1	COMP_1	If enabled, XP0 is inserted in component 1 (.y)
2	COMP_2	If enabled, XP0 is inserted in component 2 (.z)
3	COMP_3	If enabled, XP0 is inserted in component 3 (.w)

12 XP0 Source Select

If XP0 Enable is ENABLED, this field selects between the available sources for the XP0 SGV to be inserted.

If XP0 Enable is DISABLED, this field is ignored.

Value	Name	Description
1h	VERTEX_LOCATION	The XP0 value is sourced from one of the two Vertex Location parameters passed in 3DPRIMITIVE. If Vertex Access Mode is SEQUENTIAL, the Start Vertex Location value is used. If Vertex Access Mode is RANDOM, the Base Vertex Location value is used.
0h	XP0_PARAMETER	The XP0 value is sourced from the XP0 parameter as defined by 3DPRIMITIVE.

	5:0	**Reserved** Access: RO Format: MBZ

3DSTATE_VS_BODY

3DSTATE_VS_BODY

Source: RenderCS

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:6	**Kernel Start Pointer** Format: InstructionBaseOffset[63:6] This field specifies the starting location of the kernel program run by threads spawned by the VS pipeline stage. It is specified as a 64-byte-granular offset from the Instruction Base Address. This field is ignored if VS Function Enable is DISABLED.
	5:0	**Reserved** Access: RO Format: MBZ
2	31	**Reserved** Access: RO Format: MBZ
	30	**Vector Mask Enable** Format: Enable Upon subsequent VS thread dispatches, this bit is loaded into the EUs **Vector Mask Enable** (VME, cr0.0[3]) thread state. Refer to EU documentation for the definition and use of VME state. **Value / Name / Description** 0h / Dmask / The EU will use the Dispatch Mask (supplied by the VS stage) for instruction execution. 1h / Vmask / The EU will use the Vector Mask (derived from the Dispatch Mask) for instruction execution. **Programming Notes** Under normal conditions SW shall specify DMask, as the VS stage will provide a Dispatch Mask appropriate to SIMD4x2 or SIMD8 thread execution (as a function of SIMD8 Dispatch Enable). E.g., for SIMD4x2 thread execution, the VS stage will generate a Dispatch Mask that is equal to what the EU would use as the Vector Mask. For SIMD8 execution there is no known usage model for use of Vector Mask (as there is for PS shaders).

3DSTATE_VS_BODY

29:27 **Sampler Count**

Format:	U3

This field specifies (in multiples of 4)the number of sets of sampler state that will be prefetched for use by the VS kernel. While the prefetching of sampler state is optional and does not impact functionality, it may improve performance.
This field is ignored if the Function Enable state is set to DISABLED.

Value	Name	Description
0h	No Samplers	no samplers used
1h	1-4 Samplers	between 1 and 4 samplers used
2h	5-8 Samplers	between 5 and 8 samplers used
3h	9-12 Samplers	between 9 and 12 samplers used
4h	13-16 Samplers	between 13 and 16 samplers used

26 **Reserved**

Access:	RO
Format:	MBZ

25:18 **Binding Table Entry Count**

Format:	U8

Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state. Note: For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache. This field is ignored if VS Function Enable is DISABLED.

When HW Generated Binding Table bit is enabled: This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched.

Value	Name
[0,255]	

Programming Notes
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.

17 **Thread Dispatch Priority**

Format:	U1

Specifies the priority of the thread for dispatch: This field is ignored if VS Function Enable is DISABLED.

Value	Name	Description
0h	Normal	Normal Priority
1h	High	High Priority

3DSTATE_VS_BODY

16 Floating Point Mode

Format:	U1

Specifies the initial floating point mode used by the dispatched thread. This field is ignored if VS Function Enable is DISABLED.

Value	Name	Description
0h	IEEE-754	Use IEEE-754 Rules
1h	Alternate	Use Alternate Rules

15 Reserved

Access:	RO
Format:	MBZ

14 Reserved

Access:	RO
Format:	MBZ

13 Illegal Opcode Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if VS Function Enable is DISABLED.

12 Accesses UAV

Format:	Enable

This field must be set when VS has a UAV access.

Programming Notes
This field must not be set when VS Function Enable is disabled.
This bit shall not be set when the command is executed in the PCS pipeline.

11 Reserved

Access:	RO
Format:	MBZ

10:8 Reserved

7 Software Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[13] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if VS Function Enable is DISABLED.

6:0 Reserved

Access:	RO
Format:	MBZ

3DSTATE_VS_BODY

3..4 | 63:32 | Reserved

Access:	RO
Format:	MBZ

31:10 | Scratch Space Base Pointer

Format:	GeneralStateOffset[31:10]

Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if VS Function Enable is DISABLED. In 64b OS all pointers need to be seen by SW as 48b. HW does not support a Scratch Space Base Pointer larger than 32b, therefore SW must ensure Bits<63:32> are set to 0's.

Programming Notes

The scratch spaces allocated to the POCS VSR stage and RCS VS stage shall not overlap with each other or the scratch space allocations of any other enabled stage in the RCS pipeline.

9:4 | Reserved

Access:	RO
Format:	MBZ

3:0 | Per-Thread Scratch Space

Format:	U4

Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit.The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. This field is ignored if VS Function Enable is DISABLED.

Value	Name	Description
[0,11]		Indicating [1K Bytes, 2M Bytes]

Programming Notes

This amount is available to the kernel for information only. It will be passed verbatim (if not altered by the kernel) to the Data Port in any scratch space access messages, but the Data Port will ignore it.

5 | 31:25 | Reserved

Access:	RO
Format:	MBZ

3DSTATE_VS_BODY

24:20 Dispatch GRF Start Register For URB Data

Format:	U5

Specifies the starting GRF number for the URB portion (URB constants and vertices) of the thread payload.
This field is ignored if VS Function Enable is DISABLED.

Value	Name	Description
[0,31]		indicating GRF [R0, R31]

19:17 Reserved

Access:	RO
Format:	MBZ

16:11 Vertex URB Entry Read Length

Format:	U6

Specifies the number of pairs of 128-bit vertex elements to be passed into the payload for each vertex. This field is ignored if VS Function Enable is DISABLED. For SIMD4x2 dispatch, each vertex element requires one GRF of payload data, therefore the number of GRFs with vertex data will be double the value programmed in this field. For SIMD8 dispatch, each vertex element requires 4 GRFs of payload data, therefore the number of GRFs with vertex data will be 8 times the value programmed in this field. The EU limit of 128 GRFs imposes a maximum limit of 30 elements per vertex pushed into the payload, though the practical limit may be lower. If input vertices exceed the practical limit, software must decide between resorting to pulling elements during thread execution or dropping back to SIMD4x2 dispatch. Note that the VUE is used for both input and output, so when using the pull-model software must ensure inputs are not overwritten before last use.

Value	Name	Description
[1,63]		if SIMD8 dispatch disabled
[0,15]		if SIMD8 dispatch enabled

10 Reserved

Access:	RO
Format:	MBZ

9:4 Vertex URB Entry Read Offset

Format:	U6

Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB before being included in the thread payload. This offset applies to all Vertex URB entries passed to the thread. This field is ignored if VS Function Enable is DISABLED.

Value	Name
[0,63]	

3:0 Reserved

Access:	RO
Format:	MBZ

3DSTATE_VS_BODY

6 — 31:22 — Maximum Number of Threads

Format:	U10-1

Specifies the maximum number of simultaneous threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance. This field is ignored if VS Function Enable is DISABLED.

Value	Name	Description
[0,191]		indicating thread count of [1,192]
[0,545]		indicating thread count of [1,546]

21:11 — Reserved

Access:	RO
Format:	MBZ

10 — Statistics Enable

Format:	Enable

If ENABLED, the VS stage will perform statistics gathering. See the Statistics Gathering subsection.
If DISABLED, statistics information associated with the VS stage will be left unchanged.

Programming Notes
When a 3DPRIMITIVE command with POSH Enable set is executed from the RCS command stream, VS statistics gathering is inhibited for that command.

9 — SIMD8 Single Instance Dispatch Enable

Format:	Enable

This field is used to specify whether vertices from different instances can be combined in a single SIMD8 dispatch. This bit is ignored if SIMD4x2 dispatches are enabled (i.e., SIMD8 Dispatch Enable is DISABLED).
If ENABLED, SIMD8 VS thread dispatches will not combine vertices from different instances. This allows the VS kernel to handle instance-specific operations (e.g., read constants indexed by the InstanceID) in a global fashion, as these operations pertain to all vertices of the dispatch.
If DISABLED, SIMD8 VS thread dispatches can combine vertices from different instances. The VS kernel must determine if instance-specific operations can be handled globally (vs. per-vertex). E.g., it can examine the Single Instance payload bit.

Programming Notes
SIMD8 Single Instance Dispatch Enable is not supported for HPCXTs.

8:3 — Reserved

Access:	RO
Format:	MBZ

3DSTATE_VS_BODY

	2	**SIMD8 Dispatch Enable** Format: Enable This field determines how VS threads are dispatched and how the thread payloads are generated. The setting of this field must agree with how the VS kernel was compiled. If ENABLED, SIMD8 VS thread dispatches are performed. The **Single Vertex Dispatch** field is ignored. If DISABLED, SIMD4x2 thread dispatches are performed. The **Single Vertex Dispatch** field can be used to force single-vertex dispatches. **Programming Notes** The only supported mode is SIMD8 Dispatch Enable set to Enable (1).
	1	**Vertex Cache Disable** Format: Disable This bit controls the operation of the Vertex Cache. This field is always used. If the Vertex Cache is DISABLED and the VS Function is ENABLED, the Vertex Cache is not used and all incoming vertices will be passed to VS threads. If the Vertex Cache is ENABLED and the VS Function is ENABLED, only incoming vertices that do not hit in the Vertex Cache will be passed to VS threads. If the Vertex Cache is ENABLED and the VS Function is DISABLED, input vertices that miss in the Vertex Cache will be assembled and written to the URB (by the VF stage), and subsequently passed through the VS stage unmodified (i.e, no VS threads are spawned). The Vertex Cache is invalidated whenever the Vertex Cache becomes DISABLED, whenever the VS Function Enable toggles, between 3DPRIMITIVE commands and between instances within a 3DPRIMITIVE command. **Programming Notes** See the Vertex Caching subsection for details on implicit Vertex Cache disabling.
	0	**Function Enable** Format: Enable This bit determines whether or not the VS stage spawns VS threads, which comprises the bulk of the VS stage functionality. If ENABLED, VS threads may be spawned to process VF-generated vertices before the resulting vertices are passed down the pipeline. If DISABLED, VF-generated vertices will pass thru the VS function and are sent down the pipeline unmodified. The Vertex Cache (if enabled) is still available.
7	31:27	**Reserved** Access: RO Format: MBZ

3DSTATE_VS_BODY

26:21 Vertex URB Entry Output Read Offset

Format:	U6

Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB by the Setup Back-End (SBE) function. The offset programmed will specify the start of Attribute 0 to be passed in subsequent Pixel Shader thread payloads. Refer to the Attribute Interpolator Setup documentation.

Value	Name
[0,63]	

Programming Notes
As the vertex header data located at the start of the Vertex URB entry is typically only used by 3D pipeline FFs (i.e., Clipper, Setup FrontEnd) and not required as interpolated attributes in PIxel Shader threads, it is expected that SW will program this Start Offset skip over the vertex header. This offset value is ignored if SBE's Number of SF Attributes state is programmed to 0 (i.e., no attributes are defined beyond the position read from the Vertex Header)

20:16 Vertex URB Entry Output Length

Format:	U5

Specifies the amount of Vertex Attribute URB data to be read by the Setup Back-End function for each Vertex URB entry, in 256-bit units. The attribute data will be read starting at the offset specified by the Vertex URB Entry Output Read Offset state.

Value	Name
[1,16]	

Programming Notes
This length value is ignored if SBE's Number of SF Attributes state is programmed to 0 (i.e., no attributes are defined beyond the position read from the Vertex Header).

15:8 User Clip Distance Clip Test Enable Bitmask

Format:	U8

This 8 bit mask field selects which of the 8 Clip Distance Values (if any) are to be included in the Clip stage's trivial reject / trivial accept / must clip determination function.
The ClipDistance Values (if present) are located in DW8-15 of the VUE Vertex Header located at the beginning of VUE URB entries. Bit 0 of this field corresponds to Clip Distance Value 0.

7:0 User Clip Distance Cull Test Enable Bitmask

Format:	U8

This 8 bit mask field selects which of the 8 Clip Distance Values (if any) are to be included in the Clip stage's trivial reject / trivial accept determination function. Note that must clip determination is not included in this function.
The ClipDistance Values (if present) are located in DW8-15 of the VUE Vertex Header located at the beginning of VUE URB entries. Bit 0 of this field corresponds to Clip Distance Value 0.

3DSTATE_WM_BODY

3DSTATE_WM_BODY

Source: RenderCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Statistics Enable** Format: Enable If ENABLED, the Windower and pixel pipeline will engage in statistics gathering. If DISABLED, statistics information associated with this FF stage will be left unchanged. See Statistics Gathering. **Programming Notes** This bit must be disabled if any of these bits is set: 3DSTATE_WM::**Legacy Depth Buffer Clear**, 3DSTATE_WM::**Legacy Hierarchical Depth Buffer Resolve Enable** or 3DSTATE_WM::**Legacy Depth Buffer Resolve Enable**.
	30:27	**Reserved** Access: RO Format: MBZ
	26	**Legacy Diamond Line Rasterization** Format: Enable This bit, if ENABLED, indicates that the Windower will rasterize zero width lines using the DX9 rasterization rules. If DISABLED, the Windower will rasterize zero width lines using the DX10 rasterization rules (see Strips Fans chapter).
	25:23	**Reserved** Access: RO Format: MBZ
	22:21	**Early Depth/Stencil Control** Format: U2 This field specifies the behavior of early depth/stencil test.

Value	Name	Description
0h	NORMAL	Depth/Stencil Test/Write behaves as if it happens post-shader, however the pixel shader is not necessarily executed if the pixel fails depth or stencil test (this is the legacy behavior)
1h	PSEXEC	Depth/Stencil Test/Write behaves as if it happens post-shader, and the pixel shader is executed if the pixel fails depth or stencil test (although pre-shader actions such as primitive inclusion, stipple, etc. will still cause the shader not to execute)
2h	PREPS	Depth/Stencil Test/Write behaves as if it happens pre-shader. The pixel shader is not executed if the pixel fails depth or stencil test. Depth and stencil

		writes occur even if the pixel is killed by the shader or post-shader by alpha test, etc. Depth output by the pixel shader is ignored.
3h	Reserved	

Programming Notes
The Early Depth/Stencil Control field cannot be set to PREPS (value = 2h) if ForceKillpix = ForceON or Forced Thread Dispatch = ForceON

20:19 **Force Thread Dispatch Enable**

Value	Name	Description
0h	Normal	WM_INT::ThreadDispatchEnable is computed normally
1h	ForceOff	Forces WM_INT::ThreadDispatchEnable Off
2h	ForceON	Forces WM_INT::ThreadDispatchEnable On
3h	Reserved	

Programming Notes
This should must always be set to Normal. This field should not be tested for functional validation

18:17 **Position ZW Interpolation Mode**

Format:	U2

This field elects "interpolation mode" associated with the Position Z (source depth) and W coordinates passed in the PS payload when the PS requires Position as input. This field does not determine whether these coordinates are actually included in the payload (see Pixel Shader Requires Depth, Pixel Shader Requires W).

Value	Name	Description
0h	INTERP_PIXEL	`Evaluate Z & W at the pixel center or UL corner (as specified by Pixel Location of 3DSTATE_MULTISAMPLE)`
1h	Reserved	
2h	INTERP_CENTROID	
3h	INTERP_SAMPLE	

Programming Notes
WM_INT::RT Independent Rasterization Enable must be disabled in order to select INTERP_SAMPLE.
MSDISPMODE_PERSAMPLE is required in order to select INTERP_SAMPLE.

16:11 **Barycentric Interpolation Mode**

Format:	Enable[6]

Controls which barycentric interpolation terms must be passed into the pixel shader kernel.
Bit 0: Perspective Pixel Location barycentric is required
Bit 1: Perspective Centroid barycentric is required
Bit 2: Perspective Sample barycentric is required

3DSTATE_WM_BODY

Bit 3: Non-perspective Pixel Location barycentric is required
Bit 4: Non-perspective Centroid barycentric is required
Bit 5: Non-perspective Sample barycentric is required

Programming Notes

If contiguous dispatch modes are enabled, only bit 3 (non-perspective pixel location) can be set, all other bits in this field must be zero. Pixel Location below refers to either the upper left corner or pixel center depending on the **Pixel Location** state of 3DSTATE_MULTISAMPLING).MSDISPMODE_PERSAMPLE is required in order to select Perspective Sample or Non-perspective Sample barycentric coordinates.

10 **Reserved**

Access:	RO
Format:	MBZ

9:8 **Line End Cap Antialiasing Region Width**

Format:	U2

This field specifies the distances over which the coverage of anti-aliased line end caps are computed.

Value	Name	Description
0h	0.5 pixels	0.5 pixels
1h	1.0 pixels	1.0 pixels
2h	2.0 pixels	2.0 pixels
3h	4.0 pixels	4.0 pixels

7:6 **Line Antialiasing Region Width**

Format:	U2

This field specifies the distance over which the anti-aliased line coverage is computed.

Value	Name	Description
0h	0.5 pixels	0.5 pixels
1h	1.0 pixels	1.0 pixels
2h	2.0 pixels	2.0 pixels
3h	4.0 pixels	4.0 pixels

5 **Reserved**

Access:	RO
Format:	MBZ

4 **Polygon Stipple Enable**

Format:	Enable

Enables the Polygon Stipple function.

3 **Line Stipple Enable**

Format:	Enable

Enables the Line Stipple function.

3DSTATE_WM_BODY

2 **Point Rasterization Rule**

This field specifies the rasterization rules to be applied whenever the edges of a point primitive fall exactly on a pixel sampling point.

Value	Name	Description
0h	RASTRULE_UPPER_LEFT	To match "normal" upper left rules for surface primitives
1h	RASTRULE_UPPER_RIGHT	To match OpenGL point rasterization rules (round to + infinity, where this is the upper right direction wrt OpenGL screen origin of lower left).

1:0 **Force Kill Pixel Enable**

Value	Name	Description
0h	Normal	WM_INT:: Pixel Shader Kill Pixel is computed normally
1h	ForceOff	Forces WM_INT:: Pixel Shader Kill Pixel Off
2h	ForceON	Forces WM_INT:: Pixel Shader Kill Pixel On
3h	Reserved	

Programming Notes
This should must always be set to Normal. This field should not be tested for functional validation

DWord	**Bit**	**Description**
0	31:29	**Stencil Fail Op** Format: **3D_Stencil_Operation** This field specifies the operation to perform on the Stencil Buffer when the (front face) stencil test fails. **Programming Notes** if all three stencil ops (Stencil Fail, Stencil Pass Depth Fail, and Stencil Pass Depth Pass) are KEEP, ZERO, or REPLACE, the stencil buffer is not read.
	28:26	**Stencil Pass Depth Fail Op** Format: **3D_Stencil_Operation** This field specifies the operation to perform on the Stencil Buffer when the (front face) stencil test passes but the depth pass fails.
	25:23	**Stencil Pass Depth Pass Op** Format: **3D_Stencil_Operation** This field specifies the operation to perform on the Stencil Buffer when the (front face) stencil test passes but the depth test passes.
	22:20	**Backface Stencil Test Function** Format: **3D_Compare_Function**
	19:17	**Backface Stencil Fail Op** Format: **3D_Stencil_Operation**
	16:14	**Backface Stencil Pass Depth Fail Op** Format: **3D_Stencil_Operation** This field specifies the operation to perform on the Stencil Buffer when the stencil test passes but the depth pass fails.
	13:11	**Backface Stencil Pass Depth Pass Op** Format: **3D_Stencil_Operation** This field specifies the operation to perform on the Stencil Buffer when the stencil test passes and the depth pass passes (or is disabled).
	10:8	**Stencil Test Function** Format: **3D_Compare_Function** This field specifies the comparison function used in the (front face) StencilTest function.

3DSTATE_WM_DEPTH_STENCIL_BODY

7:5 Depth Test Function

Format:	3D_Compare_Function

Specifies the comparison function used in DepthTest function.

Programming Notes
If the Depth Test Function is ALWAYS or NEVER, the depth buffer is not read.

4 Double Sided Stencil Enable

Format:	Enable

Enable doubled sided stencil operations.

Value	Name	Description
0h	False	Double Sided Stencil Disabled
1h	True	Double Sided Stencil Enabled

Programming Notes
• Back-facing primitives have a vertex winding order opposite to the currently selected Front Winding state. • Culling of primitives is not affected by the double sided stencil state • Back-facing primitives will be rendered, honoring all current device state, as though it were a front-facing primitive with no implicitly overloaded state.

3 Stencil Test Enable

Format:	Enable

Enables StencilTest function of the Pixel Processing pipeline.

Programming Notes
If any of the render targets are YUV format, this field must be disabled.

2 Stencil Buffer Write Enable

Format:	Enable

Enables writes to the Stencil Buffer.

Programming Notes
If this field is enabled, Stencil Test Enable must also be enabled.

1 Depth Test Enable

Format:	Enable

Enables the DepthTest function of the Pixel Processing pipeline.

Value	Name
0h	Disable
1h	Enable

Programming Notes
If any of the render targets are YUV format, this field must be disabled.

3DSTATE_WM_DEPTH_STENCIL_BODY

	0	**Depth Buffer Write Enable** Format: Enable Enables writes to the Depth Buffer. **Programming Notes** A Depth Buffer must be defined before enabling writes to it, or operation is UNDEFINED. This bit must not be set when WM_INT::RT Independent Rasterization Enable is true.
1	31:24	**Stencil Test Mask** Format: U8 This field specifies a bit mask applied to stencil test values. Both the stencil reference value and value read from the stencil buffer will be logically ANDed with this mask before the stencil comparison test is performed.
	23:16	**Stencil Write Mask** Format: U8 This field specifies a bit mask applied to stencil buffer writes. Only those stencil buffer bits corresponding to bits set in this mask will be modified.
	15:8	**Backface Stencil Test Mask** Format: U8 This field specifies a bit mask applied to backface stencil test values. Both the stencil reference value and value read from the stencil buffer will be logically ANDed with this mask before the stencil comparison test is performed.
	7:0	**Backface Stencil Write Mask** Format: U8 This field specifies a bit mask applied to backface stencil buffer writes. Only those stencil buffer bits corresponding to bits set in this mask will be modified.
2	31:16	**Reserved** Access: RO Format: MBZ
	15:8	**Stencil Reference Value** Format: U8 This field specifies the stencil reference value to compare against in the (front face) StencilTest function.
	7:0	**Backface Stencil Reference Value** Format: U8 This field specifies the stencil reference value to compare against in the StencilTest function.

3DSTATE_WM_HZ_OP_BODY

3DSTATE_WM_HZ_OP_BODY

Source: RenderCS

Size (in bits): 128

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31	**Stencil Buffer Clear Enable** Format: Enable When set, the stencil buffer is initialized. **Programming Notes** If this field is enabled, 1. the **Depth Buffer Resolve Enable (full or partial)** and **Hierarchical Depth Buffer Resolve Enable** fields must both be disabled. 2. 3DSTATE_DEPTH_BUFFER::Stencil Write Enable must be set if 3DSTATE_STENCIL_BUFFER::Stencil buffer enable is set. When this field is enabled, Stencil Buffer Resolve Enable should be disabled
	30	**Depth Buffer Clear Enable** Format: Enable When set, the depth buffer is initialized. **Programming Notes** If this field is enabled, 1. the **Depth Buffer Resolve Enable**(full or partial) and **Hierarchical Depth Buffer Resolve Enable** fields must both be disabled. 2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set.
	29	**Scissor Rectangle Enable** Format: Enable Enables operation of Scissor Rectangle. **Programming Notes** In order get the functionality right if this bit is disabled, driver must clip the clear rectangle to scissor rectangle if scissor test is enabled before clearing.

3DSTATE_WM_HZ_OP_BODY

28 **Depth Buffer Resolve Enable**

Format:	Enable

When set, the depth buffer is made to be consistent with the hierarchical depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer is to be used as a surface outside of the 3D rendering operation. The Depth buffer will be in uncompressed state after this operation.

Programming Notes

If this field is enabled,

1. the **Depth Buffer Clear** and **Hierarchical Depth Buffer Resolve Enable** fields must both be disabled.
2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set.
3. Depth Buffer Partial Resolve Enable field should be disabled.

For validation reasons, the need to resolve an area smaller than the whole depth buffer can occur. See the programming notes for X/Y Min and X/Y Max

27 **Hierarchical Depth Buffer Resolve Enable**

Format:	Enable

When set, the hierarchical depth buffer is made to be consistent with the depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer has been modified outside of the 3D rendering operation.

Programming Notes

If this field is enabled,

1. the **Depth Buffer Clear** and **Depth Buffer Resolve Enable (full or partial)** fields must both be disabled.
2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set.
3. Stencil Buffer Resolve Enable must be disabled.

Doing a Hierarchical Depth Buffer resolve (HZ resolve) on a partial HZ buffer is not permitted. The HZ resolve operation must be done on the entire HZ buffer.
Performance Note: expect the hierarchical depth buffer's impact on performance to be reduced for some period of time after this operation is performed, as the hierarchical depth buffer is initialized to a state that makes it ineffective. Further rendering will tend to bring the hierarchical depth buffer back to a more effective state.

3DSTATE_WM_HZ_OP_BODY

26	**Pixel Position Offset Enable** Format: Enable Enables the device to offset pixel positions by 0.5 both in horizontal and vertical directions. **Programming Notes** Setting this field along with setting the Pixel Location to upper left and number of multisamples to greater than one will cause the device to offset pixel positions by 0.5 both in horizontal and vertical directions. It is to be noted this is done to adjust the pixel co-ordinate system to DX9 like, so any WM_HZ_OP screen space rectangles (eg: legacy HiZ Clear, Resolve etc) generated internally by driver in this mode needs to be aware of this offset adjustment and send the rectangles according to alignment restriction taking this offset adjustment into consideration. SW can choose to set this bit only for DX9 API. DX10/OGL API's should not have any effect by setting or not setting this bit.
25	**Full Surface Depth and Stencil Clear** Format: Enable **Programming Notes** Setting this field to "1" along with "Depth buffer clear" will cause all the pixels/samples in an the HZ and Stencil CLs to be cleared. Software must set this only when the APP requires the entire Depth surface to be cleared. Setting this field to "1" for STC-buffer only clear without "depth buffer clear" will cause all the pixels/samples in the STC-CL to get the stc-ref value.
24	**Stencil Buffer Resolve Enable** When set, the stencil buffer is filled with the true stencil values. This is intended to be used when the stencil buffer is to be used as a surface outside of the 3D rendering operation. When this is enabled, Stencil Buffer Clear Enable field should be disabled. **Programming Notes** The STC buffer is required to be done only if the "compression bit" in the 3DSTATE_STENCIL_BUFFER is enabled. If STC buffer compression is enabled, then the STC buffer will hold compressed data. To get the true stencil values for all the pixels, a stencil resolve operation is required. Issue The stencil resolve bit in WM_HZ_OP state is not being

3DSTATE_WM_HZ_OP_BODY

		considered by WM in the right pipeline stage Workaround **Astep only** W/a is to have a pipe control with thread_dispatch set to OFF before the WM_HZ_OP with stencil buffer resolve is required(bit 24 below). 1) Setting the force thread dispatch enable(bits 20:19) in the 3dstate_WM_body state to be set to Force_OFF (value of 1) before the first WM_HZ_OP state cycle 2) Before second WM_HZ_OP state which is required by programming sequencing to complete the HZ_OP operation, reprogram the 3dstate_WM_body to set to NORMAL(value of 0). 3DSTATE_WM.ForceThreadDispatchEnable = 1(ForceOff) PIPE_CONTROL commit the above state before HZ_OP 3DSTATE_WM_HZ_OP (stencil resolve bit set) PIPE_CONTROL 3DSTATE_WM.ForceThreadDispatchEnable = 0(Normal) 3DSTATE_WM_HZ_OP (empty, no bits set)
	23:16	**Stencil Clear Value** Format: U8.0 This field specifies the stencil clear value.
	15:13	**Number of Multisamples** Format: U3 This field specifies how many samples/pixel exist in the Depth Buffer and Stencil buffers, as log2(#samples).

Value	Name	Description
0h	1	1 sample/pixel
1h	2	2 samples/pixel
2h	4	4 samples/pixel
3h	8	8 samples/pixel
4h	16	16 samples/pixel
5h-7h	Reserved	

	12:9	**Reserved** Access: RO Format: MBZ
	8:0	**Reserved** Access: RO Format: MBZ

3DSTATE_WM_HZ_OP_BODY

1
Programming Notes:
The Clear/Resolve rectangle X and Y Min values must be shifted by the LOD level; i.e. the hardware does not include the LOD in this function. Hence to clear any particular X, Y from the base level, to clear the contents at level "LOD" use (X»LOD) and (Y»LOD).
The final X and Y Min values, after LOD adjustment described above, have to be manually 8x4 or 8x8 aligned for Depth and HZ Resolve passes only. For Clears see "Full Surface Depth and Stencil Clear" field in this command instead.
For multisample set to 1X together with Z format set to16 bpp:
resolve_aligned_y_min = (y_min & ~0x7) //round down to last multiple of 8
resolve_aligned_x_min = (x_min & ~0x7) //round down to last multiple of 8
All other cases:
resolve_aligned_y_min = (y_min & ~0x3) //round down to last multiple of 4
resolve_aligned_x_min = (x_min & ~0x7) //round down to last multiple of 8
	31:16	**Clear Rectangle Y Min**
		Format: U16
		Specifies Ymin value of (inclusive) of clear rectangle with the Depth Buffer, used for clipping. Pixels with Y coordinates less than Ymin will not be affected.

	15:0	**Clear Rectangle X Min** Format: U16 Specifies Xmin value of (inclusive) of clear rectangle with the Depth Buffer, used for clipping. Pixels with X coordinates less than or equal to Xmin will not be affected.
2 **Programming Notes:** See the programming note in the previous DWORD for the Min values. The Clear/Resolve rectangleX and YMax values must be shifted by the LOD level; i.e. the hardware does not include the LOD in this function. Hence to clear any particular X, Y from the base level, to clear the contents at level "LOD" use (X»LOD) and (Y»LOD). The final X and Y Max values, after LOD adjustment described above, have to be manually 8x4 or 8x8 aligned for Depth and HZ Resolve passes only. For	31:16	**Clear Rectangle Y Max** Format: U16 Specifies Ymax value of (exclusive) of clear rectangle with the Depth Buffer, used for clipping. Pixels with Y coordinates greater than Ymax will be not be cleared.
	15:0	**Clear Rectangle X Max** Format: U16 Specifies Xmax value of (exclusive) of clear rectangle with the Depth Buffer, used for clipping. Pixels with X coordinates greater than or equal to Xmax will be not be affected.

3DSTATE_WM_HZ_OP_BODY

Clears see "Full Surface Depth and Stencil Clear" field in this command instead.
For multisample set to 1X together with Z format set to16 bpp:
resolve_aligned_y_max= (y_max & ~0x7) + ((y_max & 0x7 == 0) ? 0 : 8) //round up to next multiple of 8
resolve_aligned_x_max= (x_max & ~0x7) + ((x_max & 0x7 == 0) ? 0 : 8) //round up to next multiple of 8
All other cases:
resolve_aligned_y_max= (y_max & ~0x3) + ((y_max & 0x3 == 0) ? 0 : 4) //round up to next multiple of 4
resolve_aligned_x_max= (x_max & ~0x7) + ((x_max & 0x7 == 0) ? 0 : 8) //round up to next multiple of 8		

3	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Sample Mask** Format: `Right-justified bitmask (Bit 0 = Sample0). Number of bits that are used is determined by Num Multisamples (3DSTATE_WM_HZ_OP)` A per-multisample-position mask state variable that is immediately and unconditionally ANDed with the sample coverage mask as part of the rasterization process. This mask is applied prior to centroid selection. **Programming Notes** If Number of Multisamples is NUMSAMPLES_1, bits 15:1 of this field will be zeroed by HW.If Number of Multisamples is NUMSAMPLES_2, bits 15:2 of this field will be zeroed by HW.If Number of Multisamples is NUMSAMPLES_4, bits 15:4 of this field will be zeroed by HW.If Number of Multisamples is NUMSAMPLES_8, bits 15:8 of this field will be zeroed by HW.

A32 Buffer Base Address Message Header Control

MHC_A32_BBA - A32 Buffer Base Address Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:10	**Buffer Base Address Offset** Format: GeneralStateOffset[31:10] Specifies the base address offset page [31:10] for A32 stateless messages. **Restriction** When using stateless A32 Data Port messages, General State Base Address[47:12] + Buffer Base Address[31:10] must be less than 2^48. It is illegal for this to be greater or equal than 2^48.
	9:0	**Reserved** Access: RO Format: MBZ

A32 Scaled Header Present Message Descriptor Control Field

MDC_A32_MHP - A32 Scaled Header Present Message Descriptor Control Field

Size (in bits): 1

Default Value: 0x00000000

DWord	Bit	Description
0	0	**Message Header Present** Format: Boolean Specifies if the message uses the optional message header to modify the A32 address calculation, in combination with the MDC_A32_SSO field. **Value / Name / Description** 0h / No **[Default]** / Message header is not present. 1h / Yes / Message header is present. **Programming Notes** The access is Out-of-bounds if the SideB and Offset is enabled when the Message Header is not present.

A32 Sideband Scale and Offset Enable Message Descriptor Control Field

MDC_A32_SBSO - A32 Sideband Scale and Offset Enable Message Descriptor Control Field

Size (in bits): 8

Default Value: 0x00000000

DWord	Bit	Description
0	7	**Sideband Offset Enable** Format: MBO Must be set for a scaled SLM access. The 16-bit offset from the Sideband is added to all the offsets in the Address Payload for the SLM access. The 16-bit Sideband Offset is specified in the extended function control field in the SEND instruction.
	6:0	**Scale** Format: U7 Specifies the scale pitch to be used for SLM messages as (#bytes-1).

A64 Data Size Message Descriptor Control Field

MDC_A64_DS - A64 Data Size Message Descriptor Control Field

Size (in bits): 2

Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**Data Size** Specifies the number of data elements to be read or written

Value	Name	Description
00h	DE1	1 data element (B, DW, QW)
01h	DE2	2 data elements (B, DW, QW)
02h	DE4	4 data elements (B, DW, QW)

Restriction
The number of elements is constrained by SIMD Mode and Data Width. The max data payload limit is 256B: 2 elements SIMD16 QW, 4 elements SIMD16 DW, or 4 elements SIMD8 QW.

A64 Hword Block Message Header

MH_A64_HWB - A64 Hword Block Message Header

Source:	EuSubFunctionDataPort1
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:0	**BlockOffset** Format: U64 Specifies the U64 byte offset of Oword block. **Programming Notes** If the BlockOffset is not in the 48-bit canonical address range, the access is Out-of-Bounds. **Restriction** The byte offset must be aligned to the message's data type. Dwords have [1:0] = 0, Qwords have [2:0] = 0, and Hwords have [4:0] = 0.
2..4	95:0	**Reserved** Access: RO Format: MBZ
5	31:0	**Reserved** Access: RO Format: MBZ
6..7	63:0	**Reserved** Access: RO Format: MBZ

A64 Hword Data Blocks Message Descriptor Control Field

MDC_A64_DB_HW - A64 Hword Data Blocks Message Descriptor Control Field

Size (in bits): 3

Default Value: 0x00000001

DWord	Bit	Description
0	2:0	**Data Blocks** Specifies the number of Hwords to be read or written

Value	Name	Description
01h	HW1 **[Default]**	1 Hword block
02h	HW2	2 Hword blocks
03h	HW4	4 Hword blocks
04h	HW8	8 Hword blocks
Others	Reserved	Ignored

A64 Oword Block Message Header

MH_A64_OWB - A64 Oword Block Message Header		
Source:	EuSubFunctionDataPort1	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..1	63:0	**BlockOffset** Format: U64 Specifies the U64 byte offset of Oword block. **Programming Notes** If the BlockOffset is not in the 48-bit canonical address range, the access is Out-of-Bounds. **Restriction** The byte offset must be aligned to the message's data type. Dwords have [1:0] = 0, Qwords have [2:0] = 0, and Hwords have [4:0] = 0.
2..7	191:0	**Reserved** Access: RO Format: MBZ

A64 Oword Data Blocks Message Descriptor Control Field

MDC_A64_DB_OW - A64 Oword Data Blocks Message Descriptor Control Field

Size (in bits): 3

Default Value: 0x00000000

DWord	Bit	Description
0	2:0	**Data Blocks** Specifies the number of Oword blocks to be read or written

Value	Name	Description
00h	OW1L	1 Oword, read into or written from the low 128 bits of the destination register
01h	Reserved	Reserved
02h	OW2	2 Owords
03h	OW4	4 Owords
04h	OW8	8 Owords
Others	Reserved	Ignored

A64 Scaled Header Present Message Descriptor Control Field

MDC_A64_MHP - A64 Scaled Header Present Message Descriptor Control Field

Size (in bits): 1

Default Value: 0x00000000

DWord	Bit	Description
0	0	**Message Header Present** Specifies if the message uses the optional message header to modify the A64 address calculation, in combination with MDC_A64_SSO field. **Value / Name / Description** 0h / No / Message header is not present 1h / Yes / Message header is present **Programming Notes** The access is Out-of-Bounds if the SideBand Offset is enabled when the Message Header is not present.

AddrSubRegNum

AddrSubRegNum

Source: EuIsa

Size (in bits): 4

Default Value: 0x00000000

Address Subregister Number This field provides the subregister number for the address register. The address register contains 8 sub-registers. The size of each subregister is one word. The address register contains the register address of the operand, when the operand is in register-indirect addressing mode. This field applies to the destination operand and the source operands. It is ignored (or not present in the instruction word) for an immediate source operand. This field is present if the operand is in register-indirect addressing mode; it is not present if the operand is directly addressed. An address subregister used for indirect addressing is often called an index register.

DWord	Bit	Description
0	3:0	**Address Subregister Number** Value: 0-15 — Name: Address Subregister Number

Any Binding Table Index Message Descriptor Control Field

MDC_BTS_SLM_A32 - Any Binding Table Index Message Descriptor Control Field

Size (in bits): 8

Default Value: 0x00000000

DWord	Bit	Description
0	7:0	**Binding Table Index** Specifies the surface for the message, which can be Surface State Model, SLM or Stateless.

Value	Name	Description
00h-0EFh	BTS	Index of Binding Table State Surfaces
F0h-0FBh	Reserved	Reserved for future use
0FCh	SSO	Specifies a Surface State Offset supplied by the extended message descriptor
0FEh	SLM	Specifies an SLM access
0FFh	A32_A64	Specifies a A32 or A64 Stateless access that is locally coherent (coherent within a thread group)
0FDh	A32_A64_NC	Specifies a A32 or A64 Stateless access that is non-coherent (coherent within a thread).

Restriction
When using A32_A64_NC, SW must ensure that 2 threads do not both access the same cache line (64B)

Atomic Float Binary Operation Message Descriptor Control Field

MDC_FOP2 - Atomic Float Binary Operation Message Descriptor Control Field

Size (in bits): 3

Default Value: 0x00000001

DWord	Bit	Description
0	2:0	**Atomic Float Operation Type** Specifies the atomic float binary operation to be performed

Value	Name	Description	Programming Notes
01h	AOP_FMAX **[Default]**	new_dst = fmax(old_dst, src0)	The fmax operation implements the IEEE specification, which differs slightly from the DX and OCL specifications when a source operand is a sNaN. fmax(x,qNaN) = fmax(qNaN,x) = x fmax(x,sNaN) = fmax(sNaN,x) = quietize(sNaN) fmax(sNaN,sNaN) = fmax(sNaN,qNaN) = fmax(qNan,sNaN) = quietize(sNaN) fmax(qNaN,qNan) = qNaN fmax(-0, +0) = fmax(+0, -0) = +0 Fmax with sNaN operand returns sNaN instead of quietize(sNaN)
02h	AOP_FMIN	new_dst = fmin(old_dst, src0)	The fmin operation implements the IEEE specification, which differs slightly from the DX and OCL specifications when a source operand is a sNaN. fmin(x,qNaN) = fmin(qNaN,x) = x fmin(x,sNaN) = fmin(sNaN,x) = quietize(sNaN) fmin(sNaN,sNaN) = fmin(sNaN,qNaN) = fmin(qNan,sNaN) = quietize(sNaN) fmin(qNaN,qNan) = qNaN fmin(+0, -0) = fmin(-0, +0) = -0 Fmin with sNaN operand returns sNaN instead of quietize(sNaN) [] Fmin(+0,-0) returns +0. Should be -0, to match EU Fmin instruction.

Atomic Float Operation Message Descriptor Control Field

MDC_FOP - Atomic Float Operation Message Descriptor Control Field

Size (in bits): 3

Default Value: 0x00000000

DWord	Bit	Description
0	2:0	**Atomic Float Operation Type** Specifies the atomic float operation to be performed.

Value	Name	Description	Programming Notes
01h	AOP2_FMAX	new_dst = fmax(old_dst, src0) (default binary opcode)	The fmax operation implements the IEEE specification, which differs slightly from the DX and OCL specifications when a source operand is a sNaN. fmax(x,qNaN) = fmax(qNaN,x) = x fmax(x,sNaN) = fmax(sNaN,x) = quietize(sNaN) fmax(sNaN,sNaN) = fmax(sNaN,qNaN) = fmax(qNan,sNaN) = quietize(sNaN) fmax(qNaN,qNan) = qNaN fmax(-0, +0) = fmax(+0, -0) = +0 Fmax with sNaN operand returns sNaN instead of quietize(sNaN)
02h	AOP2_FMIN	new_dst = fmin(old_dst, src0)	The fmin operation implements the IEEE specification, which differs slightly from the DX and OCL specifications when a source operand is a sNaN. fmin(x,qNaN) = fmin(qNaN,x) = x fmin(x,sNaN) = fmin(sNaN,x) = quietize(sNaN) fmin(sNaN,sNaN) = fmin(sNaN,qNaN) = fmin(qNan,sNaN) = quietize(sNaN) fmin(qNaN,qNan) = qNaN fmin(+0, -0) = fmin(-0, +0) = -0 Fmin with sNaN operand returns sNaN instead of quietize(sNaN) [] Fmin(+0,-0) returns +0. Should be -0, to match EU Fmin instruction.
03h	AOP3_FCMPWR	new_dst = (src0 == old_dst) ? src1 : old_dst (default ternary opcode)	The fcmpwr operation performs the comparison using IEEE specification rules, and performs the store as a raw move (so SNaN is not quietized).fcmpwr(NaN,x,y) = NaNfcmpwr(x, NaN,y) = xfcmpwr(x,x, NaN) = NaN
Others	Reserved	Ignored	

Programming Notes
Binary opcodes AOP2_FMAX, AOP2_FMIN, AOP2_FADD, AOP2_FSUB, AOP2_FADD_64b, and AOP2_FSUB_64b have one source data payload. Ternary opcode AOP3_FCMPWR has two source data payloads.

Atomic Float Ternary Operation Message Descriptor Control Field

MDC_FOP3 - Atomic Float Ternary Operation Message Descriptor Control Field

Size (in bits): 3

Default Value: 0x00000003

DWord	Bit	Description
0	2:0	**Atomic Float Operation Type** Specifies the atomic float ternary operation to be performed

Value	Name	Description	Programming Notes
03h	AOP_FCMPWR **[Default]**	new_dst = (src0 == old_dst) ? src1 : old_dst	The fcmpwr operation performs the comparison using IEEE specification rules, and performs the store as a raw move (so SNaN is not quietized).fcmpwr(NaN,x,y) = NaNfcmpwr(x, NaN,y) = xfcmpwr(x,x, NaN) = NaN
Others	Reserved	Ignored	

Programming Notes
When Return Data Control is set, old_dst is returned.

Atomic Half Float Binary Operation Message Descriptor Control Field

MDC_HFOP2 - Atomic Half Float Binary Operation Message Descriptor Control Field

Source: BSpec
Size (in bits): 3
Default Value: 0x00000001

DWord	Bit	Description
0	2:0	**Atomic Float Operation Type** Specifies the atomic float binary operation to be performed

Value	Name	Description	Programming Notes
01h	AOP_FMAX **[Default]**	new_dst = fmax(old_dst, src0)	The fmax operation implements the IEEE specification, which differs slightly from the DX and OCL specifications when a source operand is a sNaN. fmax(x,qNaN) = fmax(qNaN,x) = x fmax(x,sNaN) = fmax(sNaN,x) = quietize(sNaN) fmax(sNaN,sNaN) = fmax(sNaN,qNaN) = fmax(qNan,sNaN) = quietize(sNaN) fmax(qNaN,qNan) = qNaN fmax(-0, +0) = fmax(+0, -0) = +0 Fmax with sNaN operand returns sNaN instead of quietize(sNaN)
02h	AOP_FMIN	new_dst = fmin(old_dst, src0)	The fmin operation implements the IEEE specification, which differs slightly from the DX and OCL specifications when a source operand is a sNaN. fmin(x,qNaN) = fmin(qNaN,x) = x fmin(x,sNaN) = fmin(sNaN,x) = quietize(sNaN) fmin(sNaN,sNaN) = fmin(sNaN,qNaN) = fmin(qNan,sNaN) = quietize(sNaN) fmin(qNaN,qNan) = qNaN fmin(+0, -0) = fmin(-0, +0) = -0 Fmin with sNaN operand returns sNaN instead of quietize(sNaN) [] Fmin(+0,-0) returns +0. Should be -0, to match EU Fmin instruction.

Atomic Integer Operation Message Descriptor Control Field

MDC_AOP - Atomic Integer Operation Message Descriptor Control Field

Size (in bits): 4

Default Value: 0x00000000

DWord	Bit	Description
0	3:0	**Atomic Integer Operation Type** Specifies the atomic integer operation to be performed.

Value	Name	Description
05h	AOP1_INC	new_dst = old_dst + 1 (default unary opcode)
06h	AOP1_DEC	new_dst = old_dst - 1
0Fh	AOP1_PREDEC	new_dst = old_dst - 1
01h	AOP2_AND	new_dst = old_dst AND src0 (default binary opcode)
02h	AOP2_OR	new_dst = old_dst | src0
03h	AOP2_XOR	new_dst = old_dst ^ src0
04h	AOP2_MOV	new_dst = src0
07h	AOP2_ADD	new_dst = old_dst + src0
08h	AOP2_SUB	new_dst = old_dst - src0
09h	AOP2_REVSUB	new_dst = src0 - old_dst
0Ah	AOP2_IMAX	new_dst = imax(old_dst, src0)
0Bh	AOP2_IMIN	new_dst = imin(old_dst, src0)
0Ch	AOP2_UMAX	new_dst = umax(old_dst, src0)
0Dh	AOP2_UMIN	new_dst = umin(old_dst, src0)
00h	AOP3_CMPWR_2W	new_dst = (src0_2W == old_dst_2W) ? src1_2W : old_dst_2W
0Eh	AOP3_CMPWR	new_dst = (src0 == old_dst) ? src1 : old_dst (default ternary opcode)
Others	Reserved	Ignored

Programming Notes
For Unary Opcodes, when Return Data Control is set, new_dst is returned by AOP_PREDEC and otherwise old_dst is returned. For Binary and Ternary Opcodes, when Return Data Control is set, old_dst is returned.
Unary Opcodes AOP1_* do not have a source data payload. Binary Opcodes AOP2_* have one source data payload. Ternary Opcodes AOP3_* have two source data payloads.

Atomic Integer Ternary Operation Message Descriptor Control Field

MDC_AOP3 - Atomic Integer Ternary Operation Message Descriptor Control Field

Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15	**Reserved** Access: RO Format: MBZ
	14	**Coefficient level out-of-bound Error** This flag indicates the coded coefficient level SEs in the bit-stream is out-of-bound.
	13:12	**Reserved** Access: RO Format: MBZ
	11	**Temporal Direction Motion Vector Out-of-Bound Error** This flag indicates motion vectors calculated from Temporal Direct Motion Vector is larger than the allowed range specified by the AVC spec.
	10	**Reserved** Access: RO Format: MBZ
	9	**Motion Vector Delta SE Out-of-Bound Error** This flag indicates inconsistent Motion Vector Delta SEs coded in the bit-stream.
	8	**Reference Index SE Out-of-Bound Error** This flag indicates inconsistent Reference Index SEs coded in the bit-stream.
	7	**MacroBlock QpDelta Error** This flag indicates out-of-bound MB QP delta SEs coded in the bit-stream.
	6	**Motion Vector Delta SE Error** This flag indicates out-of-bound motion vector delta SEs coded in the bit-stream.
	5	**Reference Index SE Error** This flag indicates out-of-bound Refidx SEs coded in the bit-stream.
	4	**Residual Error** This flag indicates out-of-bound absolute coefficient level SEs coded in the bit-stream.
	3	**Slice end Error** This flag indicates a pre-matured slice_end SE or inconsistent slice end on the last MB of a slice.
	2	**Chroma Intra prediction Mode Error** This flag indicates inconsistent Chroma Intra prediction mode SEs coded in the bit-stream.
	1	**Luma Intra prediction Mode Error** This flag indicates inconsistent luma Intra prediction mode SE coded in the bit-stream.

AVC CABAC		
	0	**MB Concealment Flag** Each pulse from this flag indicates one MB is concealed by hardware.

AVC CAVLC

AVC CAVLC		
Source:	VideoCS	
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15	**Total Zero out-of-bound Error** This flag indicates the Total zero SE count exceed the max number of coeffs allowed in an intra16x16 AC block.
	14	**Coefficient level out-of-bound Error** This flag indicates the coded coefficient level SEs in the bit-stream is out-of-bound.
	13	**RunBefore out-of-bound Error** This flag indicates the coded RunBefore SE value is larger than the remaining zero block count.
	12	**Total coefficient Out-of-bound Error** This flag indicates the coded total coeff SE count exceed the max number of coeffs allowed in an intra16x16 AC block.
	11	**Temporal Direction Motion Vector Out-of-Bound Error** This flag indicates motion vectors calculated from Temporal Direct Motion Vector is larger than the allowed range specified by the AVC spec.
	10	**Reserved** Access: RO Format: MBZ
	9	**Motion Vector Delta SE Out-of-Bound Error** This flag indicates inconsistent Motion Vector Delta SEs coded in the bit-stream.
	8	**Reference Index SE Out-of-Bound Error** This flag indicates inconsistent Reference Index SEs coded in the bit-stream.
	7	**RunBefore/TotalZero Error** This flag indicates one or more inconsistent RunBefore or TotalZero SEs coded in the bit-stream.
	6	**Exponential Golomb Error** This flag indicates hardware detects more than 18 leadzero for skip and more than 19 for other SEs from the Exponential Golomb Logic
	5	**Total Coeff SE Error** This flag indicates one or more inconsistent total coeff SEs coded in the bit-stream.
	4	**Macroblock Coded Block Pattern Error** This flag indicates inconsistent CBP SEs coded in the bit-stream.
	3	**Mbytpe/submbtype Error** This flag indicates inconsistent MBtype/SubMBtype SEs coded in the bit-stream.
	2	**Chroma Intra prediction Mode Error** This flag indicates inconsistent Chroma Intra prediction mode SEs coded in the bit-stream.

AVC CAVLC		
	1	**Luma Intra prediction Mode Error** This flag indicates inconsistent luma Intra prediction mode SE coded in the bit-stream.
	0	**MB Concealment Flag** Each pulse from this flag indicates one MB is concealed by hardware.

AVP_PAK_INSERT_OBJECT_INDIRECT_PAYLOAD

AVP_PAK_INSERT_OBJECT_INDIRECT_PAYLOAD		
Source:	VideoCS	
Size (in bits):	128	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Indirect Payload Data Size in bits** Format: U32 Number of bits to be inserted. Not including those skipped bytes in the beginning.
1..2	63:0	**Indirect Payload Base Address** Format: SplitBaseAddress64ByteAligned 48-bit address of the indirect payload data in memory buffer. **Programming Notes** Payload must begin in a byte position, but the payload can be ended in a bit position.
3	31:0	**Indirect Payload Base Address** Format: MemoryAddressAttributes

AVP_REF_LIST_ENTRY_OLD

AVP_REF_LIST_ENTRY_OLD		
Source:	VideoCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:15	**Reserved** Access: RO Format: MBZ
	14:0	**Reference Picture Frame ID[i]** Format: U15 This array corresponding to the array **Reference Picture Address (RefAddr[0-7])**defined in the AVP_PIPE_BUF_ADDR_STATE command. Frame ID is in decoding order (not display order). Frame ID is a unique number identifying a reference frame. It is 15-bit quantity and wraps around after 2^15-1

Barrier Data Payload

MDP_Barrier - Barrier Data Payload

Source:	EuSubFunctionGateway
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:0	**Reserved** Access: RO Format: MBZ
2	31	**Reserved** Access: RO Format: MBZ
	30:24	**Barrier ID** Format: U7 This field indicates which barrier state is updated. Range = [0,63]
	23	**Predicate Mask Enable** Format: Enable This bit indicates that the barrier is a predicated barrier and the SIMD channels passing the predicate should be summed. All threads sending this message to the same barrier should have an identical value for this field, and must specify a response length of 1 for the predicate sum response. Note that Global Barriers must not have the Predicate Mask Enable bit set. **Programming Notes** This control is intended only for GPGPU or Media threads. This control must not be set if the barrier is for a Hull Shader thread.
	22:16	**Reserved** Access: RO Format: MBZ
	15	**Barrier Count Enable** Format: Enable Allows the message to reprogram the terminating barrier count. If set, the stored value of the terminating barrier count is set to the value of Barrier Count field (below), and used for this barrier operation. If clear, the stored value of the terminating barrier count is not modified and the stored value is used for this barrier operation. **Programming Notes** This control is intended only for Hull Shader threads. This control must not be set if the barrier is allocated by a GPGPU or Media thread.

MDP_Barrier - Barrier Data Payload

	14:8	**Barrier Count** Format: U7 If Barrier Count Enable is set, this field specifies the terminating barrier count. Otherwise this field is ignored. All threads that belong to a single barrier must deliver the same value for this field for a particular barrier iteration.
	7:0	**Reserved** Access: RO Format: MBZ
3	31:0	**Predicate Mask** Format: U32 This field has a bit set per SIMD channel that passes the predicate. For SIMD8 and SIMD16 the rest of the bits must be 0. This field is ignored for non-predicated barriers.
4..7	127:0	**Reserved** Access: RO Format: MBZ

BaseAddress4KByteAligned

BaseAddress4KByteAligned		
Size (in bits):	64	
Default Value:	0x00000000, 0x00000000	
Specifies a 64-bit (48-bit canonical) 4K-byte aligned memory base address.		
DWord	**Bit**	**Description**
0..1	63:12	**Base Address** Format: VIRTUAL_ADDR[63:12]
	11:0	**Reserved** Access: RO Format: MBZ

Batch Buffer Stack Structure

BATCH_BUFFER_STACK_STRUCTURE - Batch Buffer Stack Structure		
Size (in bits):	192	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..5	191:0	**Batch Stack Entries** Format: **BATCH_STACK_ENTRY[3]** Stack containing details of the batch buffers currently in execution. The top of stack is determined by the Batch Buffer Stack Pointer.

Batch Stack Entry

BATCH_STACK_ENTRY - Batch Stack Entry

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:62	**Reserved** Access: RO Format: MBZ
	61:60	**Reserved** Access: RO Format: MBZ
	59	**POSH Start** Exists If: //POCS
	58	**POSH Enable** Exists If: //RCS, POCS This bit reflects the POSH Enable value programmed by the active MI_BATCH_BUFFER_START command.
	57	**Address Space Indicator** Format: U1 This field reflects the effective address space indicator security level and may not be the same as the Address Space Indicator written using MI_BATCH_BUFFER_START. Value / Name / Description 0h / GGTT **[Default]** / This Batch buffer is located in GGTT memory and is privileged. 1h / PPGTT / This Batch buffer is located in PPGTT memory and is non-privileged.
	56	**Reserved**
	55:48	**Reserved** Access: RO Format: MBZ
	47:2	**Batch Buffer Head Pointer** Format: GraphicsAddress[47:2]
	1:0	**Reserved** Access: RO Format: MBZ

BCS Hardware-Detected Error Bit Definitions

BCS Hardware-Detected Error Bit Definitions

Source: BlitterCS
Size (in bits): 16
Default Value: 0x00000000

DWord	Bit	Description
0	15:12	**Reserved** Access: RO Format: MBZ
	11	**Reserved** Access: RO Format: MBZ
	10:3	**Reserved** Access: RO Format: MBZ
	2	**Command Privilege Violation Error** This bit is set if a command classified as privileged is parsed in a non-privileged batch buffer. The command will be converted to a NOOP and parsing will continue.
	1	**Reserved** Access: RO Format: MBZ
	0	**Instruction Error** This bit is set when the Renderer Instruction Parser detects an error while parsing an instruction. Instruction errors include: • Client ID value (Bits 31:29 of the Header) is not supported (only MI, 2D and 3D are supported). • Defeatured MI Instruction Opcodes: Value: 1 — Name: — Description: Instruction Error detected **Programming Notes** This error indications cannot be cleared except by reset (i.e., it is a fatal error).

BINDING_TABLE_EDIT_ENTRY

BINDING_TABLE_EDIT_ENTRY		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:24	**Reserved** Access: RO Format: MBZ
	23:16	**Binding Table Index** Format: U8 This field specifies the index of binding table entry that will be updated.
	15:0	**Surface State Pointer** Format: SurfaceStateOffset[21:6]RENDER_SURFACE_STATE Surface State Pointer. This address points to a surface state block. This pointer is relative to the Surface State Base Address.

Bit Definition for Interrupt Control Registers - Media

Bit Definition for Interrupt Control Registers - Media

Source: VideoCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:12	**Reserved** Access: RO Format: MBZ
	11	**Wait on Semaphore** Exec-List Scheduling: Set when MI_SEMAPHORE_WAIT command is un-successful and when "Inhibit Synchronous Context Switch" is set. Scheduler can use this interrupt to preempt the context waiting on semaphore wait. Ring Buffer Scheduling: Set when MI_SEMAPHORE_WAIT command is un-successful.
	10	**Reserved** Access: RO Format: MBZ
	9	**Reserved**
	8	**Context Switch Interrupt** Set when a context switch has just occurred. **Execlist Enable bit** needs to be set for this interrupt to occur.
	7	**Reserved** Access: RO Format: MBZ
	6	**Timeout Counter Expired** Set when the VCS timeout counter has reached the timeout thresh-hold value.
	5	**Reserved**
	4	**MI_FLUSH_DW Notify Interrupt** The Pipe Control packet (Fences) specified in 3D pipeline document may optionally generate an Interrupt. The Store QW associated with a fence is completed ahead of the interrupt.
	3	**Video Command Parser Error** When this status bit is set, it indicates that the hardware has detected an error. It is set by the device upon an error condition and cleared by a CPU write of a one to the appropriate bit contained in the Error ID register followed by a write of a one to this bit in the IIR. Further information on the source of the error comes from the "Error Status Register" which along with the "Error Mask Register" determine which error conditions will cause the error status bit to be set and the interrupt to occur. **Page Table Error:** Indicates a page table error. **Instruction Parser Error:** The Blitter Instruction Parser encounters an error while parsing an

Bit Definition for Interrupt Control Registers - Media		
		instruction.
	2:1	**Reserved** Access: RO Format: MBZ
	0	**Video Command Parser User Interrupt** This status bit is set when an MI_USER_INTERRUPT instruction is executed on the Video Command Parser. Note that instruction execution is not halted and proceeds normally. A mechanism such as an MI_STORE_DATA instruction is required to associate a particular meaning to a user interrupt.

BLEND_STATE_ENTRY

BLEND_STATE_ENTRY

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63	**Logic Op Enable** Format: Enable Enables the LogicOp function of the Pixel Processing pipeline. **Programming Notes** Enabling LogicOp and Color Buffer Blending at the same time is UNDEFINED
	62:59	**Logic Op Function** Format: 3D_Logic_Op_Function This field specifies the function to be performed (when enabled) in the Logic Op stage of the Pixel Processing pipeline. Note that the encoding of this field is one less than the corresponding "R2_" ROP code defined in WINGDI.H, and is a rather contorted mapping of the OpenGL LogicOp encodings. However, this field was defined such that, when the 4 bits are replicated to 8 bits, they coincide with the ROP codes used in the Blter. Note: if the Logic Op Function does not depend on "D", the dest buffer is not read.
	58:37	**Reserved** Access: RO Format: MBZ
	36	**Pre-Blend Source Only Clamp Enable** Format: Enable This field specifies whether the source(s) are clamped prior to blending, regardless of whether blending is enabled. If DISABLED, no clamping is performed prior to blending. If ENABLED, only source0 and source 1, if dual source is enabled, are clamped prior to the blend to the range specified by Color Clamp Range.

Value	Name	Description
0	Disabled	No clamping is performed prior to blending.
1	Enabled	Only Source(s) are clamped prior to blend function. Other inputs to blend must be clamped according to the behavior specified for "pre-blend color clamp disable" in the pre-blend color clamping table .

Programming Notes

This field is ignored (treated as DISABLED) for UINT and SINT RT surface formats. Blending is not supported for those RT surface formats. **When this bit is enabled Pre-Blend Color Clamp Enable must be disabled.**

BLEND_STATE_ENTRY

35:34 **Color Clamp Range**

Specifies the clamped range used in Pre-Blend and Post-Blend Color Clamp functions if one or both of those functions are enabled. Note that this range selection is shared between those functions.

Value	Name	Description
0	COLORCLAMP_UNORM	Clamp Range [0,1]
1	COLORCLAMP_SNORM	Clamp Range [-1,1]
2	COLORCLAMP_RTFORMAT	Clamp to the range of the RT surface format (Note: The Alpha component is clamped to FLOAT16 for R11G11B10_FLOAT format). Unsigned Floating Point components are clamped to positive zero.
3	Reserved	Reserved

Programming Notes
See table in Pre-Blending Color Clamp subsection for programming restrictions as a function of Blending and Pre-Blend Color Clamp.

33 **Pre-Blend Color Clamp Enable**

Format:	Enable

This field specifies whether the source, destination and constant color channels are clamped prior to blending, regardless of whether blending is enabled.If DISABLED, no clamping is performed prior to blending.If ENABLED, all inputs to the blend function are clamped prior to the blend to the range specified by Color Clamp Range.

Value	Name	Description
0	Disabled	No clamping is performed prior to blending.
1	Enabled	All inputs to the blend function are clamped prior to the blend to the range specified by Color Clamp Range.

Programming Notes
See table in Pre-Blending Color Clamp subsection for programming restrictions as a function of RT format. This field is ignored (treated as DISABLED) for UINT and SINT RT surface formats. Blending is not supported for those RT surface formats. The device will automatically clamp source color channels to the respective RT surface range.

32 **Post-Blend Color Clamp Enable**

Format:	Enable

Regardless of whether this clamping is enabled, the blending output channels will be clamped to the RT surface format just prior to being written.

Programming Notes
This field is ignored (treated as DISABLED) for UINT and SINT RT surface formats. Blending is not supported for those RT surface formats. Post Blend Clamp Enable must be programmed identical to Pre Blend Clamp Enable. The device will automatically clamp source color channels to the respective RT surface range. **When this bit is enabled Pre-Blend Source Only Clamp**

BLEND_STATE_ENTRY

	Enable must be disabled.
31	**Color Buffer Blend Enable** Format: Enable Enables the ColorBufferBlending (nee "alpha blending") function of the Pixel Processing Pipeline for this render target. **Programming Notes** Enabling LogicOp and ColorBufferBlending at the same time is UNDEFINED
30:26	**Source Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Controls the "source factor" in the ColorBufferBlending function.Refer to Source Alpha Blend Factor for encodings.
25:21	**Destination Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Controls the "destination factor" in the ColorBufferBlending function. Refer to Source Alpha Blend Factor for encodings.
20:18	**Color Blend Function** Format: 3D_Color_Buffer_Blend_Function This field specifies the function used to combine the color components in the ColorBufferBlending function of the Pixel Processing Pipeline. If Independent Alpha Blend Enable is disabled, this field will also control the blending of the alpha components in the ColorBufferBlending function.
17:13	**Source Alpha Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Controls the "source factor" in alpha Color Buffer Blending stage.Note: For the source/destination alpha blend factors, the encodings indicating "COLOR" are the same as the encodings indicating "ALPHA", as the alpha component of the color is selected.
12:8	**Destination Alpha Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Controls the "destination factor" in alpha Color Buffer Blending stage. Refer to Source Alpha Blend Factor for encodings.
7:5	**Alpha Blend Function** Format: 3D_Color_Buffer_Blend_Function This field specifies the function used to combine the alpha components in the Color Buffer blend stage of the Pixel Pipeline when the IndependentAlphaBlend state is enabled.
4	**Reserved** Access: RO Format: MBZ
3	**Write Disable Alpha** Format: Disable This field controls the writing of the alpha component into the Render Target.

BLEND_STATE_ENTRY

Value	Name	Description
0b	Enabled	Alpha component can be overwritten
1b	Disabled	Writes to the color buffer will not modify Alpha.

Programming Notes
For YUV surfaces, this field must be set to 0B (enabled).

2 **Write Disable Red**

Format:	Disable

This field controls the writing of the red component into the Render Target.

Value	Name	Description
0b	Enabled	Red component can be overwritten
1b	Disabled	Writes to the color buffer will not modify Red.

Programming Notes
For YUV surfaces, this field must be set to 0B (enabled).

1 **Write Disable Green**

Format:	Disable

This field controls the writing of the green component into the Render Target.

Value	Name	Description
0b	Enabled	Green component can be overwritten
1b	Disabled	Writes to the color buffer will not modify Green.

Programming Notes
For YUV surfaces, this field must be set to 0B (enabled).

0 **Write Disable Blue**

Format:	Disable

This field controls the writing of the Blue component into the Render Target.

Value	Name	Description
0b	Enabled	Blue component can be overwritten
1b	Disabled	Writes to the color buffer will not modify Blue.

Programming Notes
For YUV surfaces, this field must be set to 0B (enabled).

BLEND_STATE

BLEND_STATE

Size (in bits): 544

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

The blend state is stored as a structure containing a common DWORD that applies to all RTs and an array of up to 8 elements, each of which contains the two DWords for each. The start of each element is spaced 2 DWords apart. The blend state is aligned to a 64-byte boundary, which is pointed to by a field in 3DSTATE_BLEND_STATE_POINTERS. The 3-bit Render Target Index field in the Render Target Write data port message header is used to select which of the 8 elements from BLEND_STATE that is used on the current message.

DWord	Bit	Description
0	31	**Alpha To Coverage Enable** Format: Enable If set, Source0 Alpha is converted to a temporary 1/2/4-bit coverage mask and the mask bit corresponding to the sample# ANDed with the sample mask bit. If set, sample coverage is computed based on src0 alpha value. Value of 0 disables all samples and value of 1 enables all samples for that pixel. The same coverage needs to apply to all the RTs in MRT case. Further, any value of src0 alpha between 0 and 1 monotonically increases the number of enabled pixels.The field is applied to all the RTs in MRT case.
	30	**Independent Alpha Blend Enable** Format: Enable When enabled, the other fields in this instruction control the combination of the alpha components in the Color Buffer Blend stage. When disabled, the alpha components are combined in the same fashion as the color components.The field is applied to all the RTs in MRT case.
	29	**Alpha To One Enable** Format: Enable If set, Source0 Alpha is set to 1.0f after (possibly) being used to generate the AlphaToCoverage coverage mask.If Dual Source Blending is enabled, this bit must be disabled.The field is applied to all the RTs in MRT case.
	28	**Alpha To Coverage Dither Enable** Format: Enable If set, sample coverage is computed based on src0 alpha value and it modulates the sample coverage based on screen coordinates. Value of 0 disables all samples and value of 1 enables all samples for that pixel. The same coverage needs to apply to all the RTs in MRT case. Further, any value of src0 alpha between 0 and 1 monotonically increases the number of enabled pixels. If AlphaToCoverage is disabled, AlphaToCoverage Dither does not have any impact.The field is applied to all the RTs in MRT case.

BLEND_STATE

	27	**Alpha Test Enable** Format: Enable Enables the AlphaTest function of the Pixel Processing pipeline. The field is applied to all the RTs in MRT case. **Programming Notes** Alpha Test can only be enabled if Pixel Shader outputs a float alpha value. Alpha Test is applied independently on each render target by comparing that render target's alpha value against the alpha reference value. If the alpha test fails, the corresponding pixel write will be supressed only for that render target. The depth/stencil update will occur if alpha test passes for any render target.
	26:24	**Alpha Test Function** Format: 3D_Compare_Function This field specifies the comparison function used in the AlphaTest function The field is applied to all the RTs in MRT case.
	23	**Color Dither Enable** Format: Enable Enables dithering of colors (including any alpha component) before they are written to the Color Buffer. The field is applied to all the RTs in MRT case. **Programming Notes** For YUV render target formats, this field must be programmed to 0.
	22:21	**X Dither Offset** Format: U2 Specifies offset to apply to pixel X coordinate LSBs when accessing dither table. The field is applied to all the RTs in MRT case.
	20:19	**Y Dither Offset** Format: U2 Specifies offset to apply to pixel Y coordinate LSBs when accessing dither table. The field is applied to all the RTs in MRT case.

BR00 - BLT Opcode and Control

BR00 - BLT Opcode and Control

Source: BlitterCS

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31	**BLT Engine Busy** This bit indicates whether the BLT Engine is busy (1) or idle (0). This bit is replicated in the SETUP BLT Opcode and Control register. Value: 0 — Name: Idle **[Default]** Value: 1 — Name: Busy
	30	**Setup Instruction Instruction** Default Value: 0 The current instruction performs clipping (1).
	29	**Setup Monochrome Pattern** This bit is decoded from the Setup instruction opcode to identify whether a color (0) or monochrome (1) pattern is used with the SCANLINE_BLT instruction. Value: 0 — Name: Color **[Default]** Value: 1 — Name: Monochrome
	28:22	**Instruction Target (Opcode)** Default Value: 0000000b This is the contents of the Instruction Target field from the last BLT instruction. This field is used by the BLT Engine state machine to identify the BLT instruction it is to perform. The opcode specifies whether the source and pattern operands are color or monochrome.
	21:20	**32bpp Byte Mask** This field is only used for 32bpp. Value: 00b — Name: **[Default]** Value: 1xb — Name: Write Alpha Channel Value: x1b — Name: Write RGB Channel
	19:17	**Monochrome Source Start** Default Value: 000b This field indicates the starting monochrome pixel bit position within a byte per scan line of the source operand. The monochrome source is word aligned which means that at the end of the scan line all bits should be discarded until the next word boundary.

BR00 - BLT Opcode and Control

16 Bit/Byte Packed

Byte packed is for the NT driver.

Value	Name
0b	Bit **[Default]**
1b	Byte

15 Src Tiling Enable

Value	Name
0b	Tiling Disabled (Linear) **[Default]**
1b	Tiling enabled: Tile-X or Tile-Y

14:12 Horizontal Pattern Seed

Default Value:	0b

This field indicates the pattern pixel position which corresponds to X = 0.

11 Dest Tiling Enable

When set to '1', this means that Blitter is executing in Tiled mode. If '0' it means that Blitter is in Linear mode. Pre-Dev Blitter never executes in Tiled-Y mode, DevGT+ Blitter supports both Tile-X and Tile-Y modes. On reset, this bit will be '0'. This definition applies to only X, Y Blits.

Value	Name
0b	Tiling Disabled (Linear blit) **[Default]**
1b	Tiling enabled: Tile-X or Tile-Y

10:8 Transparency Range Mode

These bits control whether or not the byte(s) at the destination corresponding to a given pixel will be conditionally written, and what those conditions are. This feature can make it possible to perform various masking functions in order to selectively write or preserve graphics data already at the destination.

Value	Name	Description
xx0b	**[Default]**	No color transparency mode enabled. This causes normal operation with regard to writing data to the destination.
001b		[Source color transparency] The Transparency Color Low: (Pixel Greater or Equal) (source background register) and the Transparency Color High: (Pixel Less or Equal) (source foreground register) are compared to the source pixels. The range comparisons are done on each component (R, G, B) and then logically ANDed. If the source pixel components are not within the range defined by the Transparency Color registers, then the byte(s) at the destination corresponding to the current pixel are written with the result of the bit-wise operation.
011b		[Source and Alpha color transparency] The Transparency Color Low: (Pixel Greater or Equal) (source background register) and the Transparency Color High: (Pixel Less or Equal) (source foreground register) are compared to the source pixels. The range comparisons are done on each component (A, R, G, B) and then logically ANDed. If the source pixel components are not within

				the range defined by the Transparency Color registers, then the byte(s) at the destination corresponding to the current pixel are written with the result of the bit-wise operation."
		101b		[Destination and Alpha color transparency] The Transparency Color Low: (Pixel Greater or Equal) (source background register) and the Transparency Color High: (Pixel Less or Equal) (source foreground register) are compared to the destination pixels. The range comparisons are done on each component (A, R, G, B) and then logically ANDed. If the destination pixels are within the range, then the byte(s) at the destination corresponding to the current pixel are written with the result of the bit-wise operation.
		111b		[Destination color transparency] The Transparency Color Low: (Pixel Greater or Equal) (source background register) and the Transparency Color High: (Pixel Less or Equal) (source foreground register) are compared to the destination pixels. The range comparisons are done on each component (R, G, B) and then logically ANDed. If the destination pixels are within the range, then the byte(s) at the destination corresponding to the current pixel are written with the result of the bit-wise operation.

7:5	**Pattern Vertical Seed** Default Value: 000b This field specifies the pattern scan line which corresponds to Y=0.
4	**Destination Read Modify Write** Default Value: 0b This bit is decoded from the last instruction's opcode field and Destination Transparency Mode to identify whether a Destination read is needed.
3	**Color Source** Default Value: 0b This bit is decoded from the last instructions opcode field to identify whether a color (1) source is used.
2	**Monochrome Source** Default Value: 0b This bit is decoded from the last instructions opcode field to identify whether a monochrome (1) source is used.
1	**Color Pattern** Default Value: 0b This bit is decoded from the last instructions opcode field to identify whether a color (1) pattern is used.

BR00 - BLT Opcode and Control		
	0	**Monochrome Pattern** Default Value: 0b This bit is decoded from the last instructions opcode field to identify whether a monochrome (1) pattern is used.

BR01 - Setup BLT Raster OP, Control, and Destination Offset

BR01 - Setup BLT Raster OP, Control, and Destination Offset

Source: BlitterCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Solid Pattern Select** This bit applies only when the pattern data is monochrome. This bit determines whether or not the BLT Engine actually performs read operations from the frame buffer in order to load the pattern data. Use of this feature to prevent these read operations can increase BLT Engine performance, if use of the pattern data is indeed not necessary. The BLT Engine is configured to accept either monochrome or color pattern data via the opcode field.

Value	Name	Description
0b	**[Default]**	This causes normal operation with regard to the use of the pattern data. The BLT Engine proceeds with the process of reading the pattern data, and the pattern data is used as the pattern operand for all bit-wise operations.
1b		The BLT Engine forgoes the process of reading the pattern data, the presumption is made that all of the bits of the pattern data are set to 0, and the pattern operand for all bit-wise operations is forced to the background color specified in the Color Expansion Background Color Register.

0b	**[Default]**
1b	

DWord	Bit	Description
	29	**Monochrome Source Transparency Mode** This bit applies only when the source data is in monochrome. This bit determines whether or not the byte(s) at the destination corresponding to the pixel to which a given bit of the source data also corresponds will actually be written if that source data bit has the value of 0. This feature can make it possible to use the source as a transparency mask. The BLT Engine is configured to accepted either monochrome or color source data via the opcode field.

Value	Name	Description
0b	**[Default]**	This causes normal operation with regard to the use of the source data. Wherever a bit in the source data has the value of 0, the color specified in the background color register is used as the source operand in the bit-wise operation for the pixel corresponding to the source data bit, and the bytes at the destination corresponding to that pixel are written with the result.
1b		Wherever a bit in the source data has the value of 0, the byte(s) at the destination corresponding to the pixel to which the source data bit also corresponds are simply not written, and the data at those byte(s) at the destination are allowed to remain unchanged.

BR01 - Setup BLT Raster OP, Control, and Destination Offset

28	**Monochrome Pattern Transparency Mode** This bit applies only when the pattern data is monochrome. This bit determines whether or not the byte(s) at the destination corresponding to the pixel to which a given bit of the pattern data also corresponds will actually be written if that pattern data bit has the value of 1. This feature can make it possible to use the pattern as a transparency mask. The BLT Engine is configured to accepted either monochrome or color pattern data via the opcode field.

Value	Name	Description
0b	**[Default]**	This causes normal operation with regard to the use of the pattern data. Wherever a bit in the pattern data has the value of 0, the color specified in the background color register is used as the pattern operand in the bit-wise operation for the pixel corresponding to the pattern data bit, and the bytes at the destination corresponding to that pixel are written with the result.
1b		Wherever a bit in the pattern data has the value of 0, the byte(s) at the destination corresponding to the pixel to which the pattern data bit also corresponds are simply not written, and the data at those byte(s) at the destination are allowed to remain unchanged.

27:26	**32bpp Byte Mask** This bit applies only when the pattern data is monochrome. This bit determines whether or not the byte(s) at the destination corresponding to the pixel to which a given bit of the pattern data also corresponds will actually be written if that pattern data bit has the value of 1. This feature can make it possible to use the pattern as a transparency mask. The BLT Engine is configured to accepted either monochrome or color pattern data via the opcode field.

Value	Name
00b	**[Default]**
1xb	Write Alpha Channel
x1b	Write RGB Channel

25:24	**Color Depth**

Value	Name
00b	8 Bit Color Depth **[Default]**
01b	16 Bit Color Depth
10b	Alternate 16 Bit Color Depth
11b	32 Bit Color Depth

23:16	**Raster Operation Select** These 8 bits are used to select which one of 256 possible raster operations is to be performed by the BLT Engine.
15:0	**Destination Pitch (Offset)** For non-XY Blits, the signed 16bit field allows for specifying up to + 32Kbytes signed pitches in bytes (same as before). For X, Y Blits with tiled-X surfaces, the pitch for Destination will be 512Byte aligned and should be programmable up to + 128Kbytes. For X, Y Blits with tiled-Y surfaces, the pitch for Destination will be 128Byte aligned and should be programmable upto + 128Kbytes. In this case, this 16bit signed pitch field is used to specify up to + 32KDWords. For X, Y blits with nontiled surfaces (linear surfaces), this 16bit field can be programmed to byte

BR01 - Setup BLT Raster OP, Control, and Destination Offset		
		specification of up to + 32Kbytes (same as before). These 16 bits store the signed memory address offset value by which the destination address originally specified in the Destination Address Register is incremented or decremented as each scan line's worth of destination data is written into the frame buffer by the BLT Engine, so that the destination address will point to the next memory address to which the next scan line's worth of destination data is to be written. If the intended destination of a BLT operation is within on-screen frame buffer memory, this offset is normally set so that each subsequent scan line's worth of destination data lines up vertically with the destination data in the scan line, above. However, if the intended destination of a BLT operation is within off-screen memory, this offset can be set so that each subsequent scan line's worth of destination data is stored at a location immediately after the location where the destination data for the last scan line ended, in order to create a single contiguous block of bytes of destination data at the destination.

BR05 - Setup Expansion Background Color

BR05 - Setup Expansion Background Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Setup Expansion Background Color Bits** These bits provide the one, two, or four bytes worth of color data that select the background color to be used in the color expansion of monochrome pattern or source data for either the SCANLINE_BLT or TEXT_BLT instructions. BR05 is also used as the solid pattern for the PIXEL_BLT instruction. Whether one, two, or three bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR06 - Setup Expansion Foreground Color

BR06 - Setup Expansion Foreground Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Setup Expansion Foreground Color Bits** These bits provide the one, two, or four bytes worth of color data that select the foreground color to be used in the color expansion of monochrome pattern or source data for either the SCANLINE_BLT or TEXT_BLT instructions. Whether one, two, or three bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR07 - Setup Blit Color Pattern Address Lower Order Address bits

BR07 - Setup Blit Color Pattern Address Lower Order Address bits

Source:	BlitterCS
Size (in bits):	32
Default Value:	0x00000000

DWord	Bit	Description
0	31:6	**Setup Blit Color Pattern Address** Format: GraphicsAddress[31:6] Lower 32bits of the 48bit addressing. These 26 bits specify the starting address of the (8X8) pixel color **pattern from the SETUP_BLT instruction.** This register works identically to the Pattern Address register (BR15), but this version is **only used with the SCANLINE_BLT instruction execution** (the actual programming for this, is done in XY_SETUP_BLT command). The pattern data must be located in linear memory. The pattern data must be located on a pattern-size boundary. The pattern is always of 8x8 pixels, and therefore, its size is dependent upon its pixel depth. The pixel depth may be 8, 16, or 32 bits per pixel if the pattern is in color (the pixel depth of a color pattern must match the pixel depth to which the graphics system has been set). Monochrome patterns require 8 bytes and is supplied through the instruction. Color patterns of 8, 16, and 32 bits per pixel color depth must start on 64-byte, 128-byte and 256-byte boundaries, respectively. The Pattern Base Address programmed, must always be Cache Line (64byte) aligned.
	5:0	**Reserved** Access: RO Format: MBZ

BR09 - Destination Address Lower Order Address Bits

BR09 - Destination Address Lower Order Address Bits		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Destination Address Bits** Format: GraphicsAddress[31:0] When tiling is enabled for XY-blits, this base address should be limited to 4KB. when tiling is disabled for XY-blits, this base address should be CL (64byte) aligned. These lower 32bits of the 48bit address, which specify the starting pixel address of the destination data. This register is also the working destination address register for the lower 32bits of the address, and changes as the BLT Engine performs the accesses. Used as the scan line address (Destination Y Address and Destination Y1 Address) for BLT instructions: PIXEL_BLT, SCANLINE_BLT, and TEXT_BLT. In this case the address points to the first pixel in a scan line and is compared with the ClipRect Y1 and Y2 address registers to determine whether the scan line should be written or not. The Destination Y1 address is the top scan line to be written for text. Note that for non-XY blits (COLOR_BLT, SRC_COPY_BLT), this address points to the first byte to be written. Note: Some instructions affect only one scan line (requiring only one coordinate); other instructions affect multiple scan lines and need both coordinates.

BR11 - BLT Source Pitch (Offset)

BR11 - BLT Source Pitch (Offset)		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:16	**Reserved**
	15:0	**Source Pitch (Offset)** For non-XY Blits with color source operand (SRC_COPY_BLT), the signed 16bit field allows for specifying up to + 32Kbytes signed pitch in bytes (same as before). For X, Y Blits with tiled-X surfaces, the pitch for Color Source will be 512Byte aligned and should be programmable up to + 128Kbytes. For X, Y Blits with tiled-Y surfaces, the pitch for Color Source will be 128Byte aligned and should be programmable upto + 128Kbytes. In this case, this 16bit signed pitch field is used to specify up to + 32KDWords. For X, Y blits with nontiled color source surfaces (linear surfaces), this 16bit field can be programmed to byte specification of up to + 32Kbytes (same as before). When the color source data is located within the frame buffer or AGP aperture, these signed 16 bits store the memory address offset (pitch) value by which the source address originally specified in the Source Address Register is incremented or decremented as each scan line's worth of source data is read from the frame buffer by the BLT Engine, so that the source address will point to the next memory address from which the next scan line's worth of source data is to be read. Note that if the intended source of a BLT operation is within on-screen frame buffer memory, this offset is normally set to accommodate the fact that each subsequent scan line's worth of source data lines up vertically with the source data in the scan line, above. However, if the intended source of a BLT operation is within off-screen memory, this offset can be set to accommodate a situation in which the source data exists as a single contiguous block of bytes where in each subsequent scan line's worth of source data is stored at a location immediately after the location where the source data for the last scan line ended.

BR12 - Source Address Lower order Address bits

BR12 - Source Address Lower order Address bits

Source:	BlitterCS
Size (in bits):	32
Default Value:	0x00000000

DWord	Bit	Description
0	31:0	**Source Address Bits** Format: GraphicsAddress[31:0] Lower 32bits of the 48bit addressing. When tiling is enabled for XY-blits with Color source surfaces, this base address should be aligned to 4KB. When tiling is disabled for XY-blits, this base address should be CL (64byte) aligned. Note that for non-XY blit with Color Source (SRC_COPY_BLT), this address points to the first byte to be read. These lower 32bits of the 48bit address, specify the starting pixel address of the color source data. The lower 3 bits are used to indicate the position of the first valid byte within the first Quadword of the source data. If this Source happens to be a Monosource surface, then this Monosource Base Address programmed, must always be Cache Line (64byte) aligned.

BR13 - BLT Raster OP, Control, and Destination Pitch

BR13 - BLT Raster OP, Control, and Destination Pitch

25:24 **Color Depth**

Value	Name
00b	8 Bit Color Depth **[Default]**
01b	16 Bit Color Depth
10b	24 Bit Color Depth
11b	Reserved

23:16 **Raster Operation Select**

Default Value:	00000000b

These 8 bits are used to select which one of 256 possible raster operations is to be performed by the BLT Engine.

15:0 **Destination Pitch(Offset)**

These 16 bits store the signed memory address offset value by which the destination address originally specified in the Destination Address Register is incremented or decremented as each scan line's worth of destination data is written into the frame buffer by the BLT Engine, so that the destination address will point to the next memory address to which the next scan line's worth of destination data is to be written. If the intended destination of a BLT operation is within on-screen frame buffer memory, this offset is normally set so that each subsequent scan line's worth of destination data lines up vertically with the destination data in the scan line, above. However, if the intended destination of a BLT operation is within off-screen memory, this offset can be set so that each subsequent scan line's worth of destination data is stored at a location immediately after the location where the destination data for the last scan line ended, in order to create a single contiguous block of bytes of destination data at the destination.

BR14 - Destination Width and Height

BR14 - Destination Width and Height

Source:	BlitterCS
Size (in bits):	32
Default Value:	0x00000000

BR14 contains the values for the height and width of the data to be BLT. If these values are not correct, such that the BLT Engine is either expecting data it does not receive or receives data it did not expect, the system can hang.

DWord	Bit	Description
0	31:29	**Reserved** Access: RO Format: MBZ
	28:16	**Destination Height** These 13 bits specify the height of the destination data in terms of the number of scan lines. This is a working register.
	15:13	**Reserved** Access: RO Format: MBZ
	12:0	**Destination Byte Width** These 13 bits specify the width of the destination data in terms of the number of bytes per scan line. The number of pixels per scan line into which this value translates depends upon the color depth to which the graphics system has been set.

BR15 - Color Pattern Address Lower order Address bits

BR15 - Color Pattern Address Lower order Address bits

Source:	BlitterCS
Size (in bits):	32
Default Value:	0x00000000

DWord	Bit	Description
0	31:6	**Color Pattern Address** Format: GraphicsAddress[31:6] Lower 32bits of the 48bit addressing. There is no change to the Color Pattern address specification due to Non-Power-of-2 change. It remains the same as before. The pattern data must be located in linear memory. These 26 bits specify the starting address of the (8X8) pixel color pattern. The pattern data must be located on a pattern-size boundary. The pattern is always of 8x8 pixels, and therefore, its size is dependent upon its pixel depth. The pixel depth may be 8, 16, or 32 bits per pixel if the pattern is in color (the pixel depth of a color pattern must match the pixel depth to which the graphics system has been set). Monochrome patterns require 8 bytes and are applied through the instruction. Color patterns of 8, 16, and 32 bits per pixel color depth must start on 64-byte, 128-byte and 256-byte boundaries, respectively. The Pattern Base Address programmed, must always be Cache Line (64byte) aligned.
	5:0	**Reserved** Access: RO Format: MBZ

BR16 - Pattern Expansion Background and Solid Pattern Color

BR16 - Pattern Expansion Background and Solid Pattern Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Pattern Expansion Background Color Bits** These bits provide the one, two, or four bytes worth of color data that select the background color to be used in the color expansion of monochrome pattern data during BLT operations. Whether one, two, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR17 - Pattern Expansion Foreground Color

BR17 - Pattern Expansion Foreground Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Pattern Expansion Background Color Bits** These bits provide the one, two, or four bytes worth of color data that select the foreground color to be used in the color expansion of monochrome pattern data during BLT operations. Whether one, two, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR18 - Source Expansion Background and Destination Color

BR18 - Source Expansion Background and Destination Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Source Expansion Background Color Bits** These bits provide the one, two, or four bytes worth of color data that select the background color to be used in the color expansion of monochrome source data during BLT operations. This register is also used to support destination transparency mode and Solid color fill. Whether one, two, three, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR19 - Source Expansion Foreground Color

BR19 - Source Expansion Foreground Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Pattern/Source Expansion Foreground Color Bits** These bits provide the one, two, or four bytes worth of color data that select the foreground color to be used in the color expansion of monochrome source data during BLT operations. Whether one, two, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR27 - Destination Higher Order Address

BR27 - Destination Higher Order Address

Source:	BlitterCS
Size (in bits):	32
Default Value:	0x00000000

Upper 32 bits of the starting pixel address for the destination data. This structure is also the working location for the upper bits of the destination address, and changes as the BLT Engine performs the accesses. See BR09 for the lower 32 bits. When tiling is enabled for XY-blits, this base address should be limited to 4KB. Otherwise for XY blits, there is no restriction and it is same as before.
Used as the scan line address (Destination Y Address and Destination Y1 Address) for BLT instructions: PIXEL_BLT, SCANLINE_BLT, and TEXT_BLT. In this case the address points to the first pixel in a scan line and is compared with the ClipRect Y1 and Y2 address registers to determine whether the scan line should be written or not. The Destination Y1 address is the top scan line to be written for text.
Note that for non-XY blits (COLOR_BLT, SRC_COPY_BLT), the destination address points to the first byte to be written. This structure is always the last location written for a BLT drawing instruction. Writing to BR27 starts the BLT engine execution. Note: Some instructions affect only one scan line (requiring only one coordinate); other instructions affect multiple scan lines and need both coordinates.
GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The uppermost reserved bits are ignored and MBZ.

DWord	Bit	Description
0	31:25	**Reserved** Access: RO Format: MBZ

Byte Masked Media Block Message Header

MH_MBBM - Byte Masked Media Block Message Header

Source: EuSubFunctionDataPort1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**X Offset** Format: S31 X offset (in bytes) of the upper left corner of the block into the surface. **Programming Notes** Must be DWord aligned (Bits 1:0 MBZ) for the write form of the message.
1	31:0	**Y Offset** Format: S31 Y offset (in rows) of the upper left corner of the block into the surface.
2	31:0	**Media Block Message Control** Format: MHC_MBBM_CONTROL Specifies the Byte Masked message subtype and its additional input parameters.
3	31:0	**Byte Mask** Format: U32 Specifies the Byte Mask for writes when Message Mode field is BYTE_MASK. **Programming Notes** The Byte mask applies horizontally to each row of output: bit 0 for byte 0, through bit 31 for byte 31.
4	31:0	**FFTID** Format: MHC_FFTID Fixed Function Thread ID
5..7	95:0	**Reserved** Access: RO Format: MBZ

Byte Masked Media Block Message Header Control

MHC_MBBM_CONTROL - Byte Masked Media Block Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:30	**Message Mode** Specifies the Media Block Write Message subtype is Byte Masked. Value / Name / Description: 02h / BYTE_MASK / The Block Height and Block Width fields are specified in this Dword. The Byte Mask qualifies which bytes are written. Others / Reserved / Reserved.
	29	**Reserved** Access: RO Format: MBZ
	28:24	**Sub-Register Offset** Format: U5 This field is ignored (reserved) for Media Block Write message.
	23:22	**Reserved** Access: RO Format: MBZ
	21:16	**Block Height** Format: U6 Height in rows of block being accessed. Range = [0,63] representing 1 to 64 rows Restriction: If Block Width (bytes), then Maximum Block Height (rows) is constrained by (# Dwords width) * (# rows) <= 64 Dwords.
	15:10	**Reserved** Access: RO Format: MBZ
	9:8	**Register Pitch Control** Format: U2 This field is ignored (reserved) for a Media Block Write message.

MHC_MBBM_CONTROL - Byte Masked Media Block Message Header Control

	7:6	**Reserved** Access: RO Format: MBZ
	5:0	**Block Width** Format: U6 Width in bytes of the block being accessed. Range = [0,31] representing 1 to 32 Bytes. **Programming Notes** Must be DWord aligned for Media Block Write message.

CC_VIEWPORT

CC_VIEWPORT

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

The viewport state is stored as an array of up to 16 elements, each of which contains the DWords described here. The start of each element is spaced 2 DWords apart. The first element of the viewport state array is aligned to a 32-byte boundary. The Minimum and Maximum Depth legal value ranges are dependent on the depth buffer format.

DWord	Bit	Description
0	31:0	**Minimum Depth** Format: IEEE_FLOAT Indicates the minimum depth. The interpolated or computed depth is clamped to this value prior to the depth test. **Programming Notes** The Minimum depth value must be less-than-or-equal to the Maximum depth value. The Minimum depth value cannot be NAN (Not-A-Number). For All depth formats:Minimum depth value must not be less than 0.0, also it may not be -0.0 (negative zero)
1	31:0	**Maximum Depth** Format: IEEE_FLOAT Indicates the maximum depth. The interpolated or computed depth is clamped to this value prior to the depth test. **Programming Notes** The Maximum depth value cannot be smaller than Minimum depth value. The Maximum depth value cannot be NAN (Not-A-Number). For all depth formats: The Maximum depth value must be between +0.0to +1.0.

Channel Mask Message Descriptor Control Field

MDC_CMASK - Channel Mask Message Descriptor Control Field

Size (in bits): 4

Default Value: 0x00000000

DWord	Bit	Description
0	3:0	**Mask** For the read message, indicates that which channels are read from the surface and included in the writeback message. For the write message, indicates which channels are included in the message payload and written to the surface.

Value	Name	Description
00h	RGBA **[Default]**	Red, Green, Blue, and Alpha are included
01h	GBA	Green, Blue, and Alpha are included
02h	RBA	Red, Blue, and Alpha are included
03h	BA	Blue and Alpha are included
04h	RGA	Red, Green, and Alpha are included
05h	GA	Green and Alpha are included
06h	RA	Red and Alpha are included
07h	A	Alpha is included
08h	RGB	Red, Green, and Blue are included
09h	GB	Green and Blue are included
0Ah	RB	Red and Blue are included
0Bh	B	Blue is included
0Ch	RG	Red and Green are included
0Dh	G	Green is included
0Eh	R	Red is included
0Fh	Reserved	Ignored

Channel Mode Message Descriptor Control Field

MDC_CMODE - Channel Mode Message Descriptor Control Field

Size (in bits): 1

Default Value: 0x00000000

DWord	Bit	Description
0	0	**Channel Mode** Format: Boolean Two modes of channel-enable are provided: a SIMD8 or SIMD16 Dword channel serial view of a register, and a SIMD4x2 view of a register. Value / Name / Description: 0 / Oword / All 4 Dwords are read or written if one or more of these channels are enabled 1 / Dword / Each Dword is read or written only if its corresponding channel is enabled.

Clear Color

CLEAR_COLOR - Clear Color		
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0 **Programming Notes:** Software shall write the Raw Clear Color channels such that the channel order matches the SURFACE_STATE.Shader Channel Select programming. Software shall write the converted Depth Clear to this dword	31:0	**Raw Clear Color : Red** Format: IEEE_FLOAT Format: U32 Format: S31 Format: **U24_X8** []
1 **Programming Notes:** Software shall write the Raw Clear Color channels such that the channel order matches the SURFACE_STATE.Shader Channel Select programming.	31:0	**Raw Clear Color: Blue** Format: IEEE_FLOAT Format: U32 Format: S31
2 **Programming Notes:** Software shall write the Raw Clear Color channels such that the channel order matches the SURFACE_STATE.Shader Channel Select programming.	31:0	**Raw Clear Color : Green** Format: IEEE_FLOAT Format: U32 Format: S31
3 **Programming Notes:** Software shall write the Raw Clear Color channels such that the channel order matches the SURFACE_STATE.Shader Channel Select programming.	31:0	**Raw Clear Color : Alpha** Format: IEEE_FLOAT Format: U32 Format: S31
4	31:0	**Converted Clear Color and Clear Depth** This DWORD stores the format converted clear color. If bits per pixel are 32, entire pixel's clear value is stored in this DWORD. If bits per pixel are 64, lower DOWRD is stored in this field. If bits per pixel are 128, this field is not used to store clear value. This field is packed according to the RT format

CLEAR_COLOR - Clear Color

5	31:0	**Converted Clear Color** This DWORD stores the format converted clear color. If bits per pixel are 64, upper DOWRD is stored in this field If bits per pixel are 32 or 128, this field is not used to store clear value. The field is packed according to the RT format
6	31:1	**Reserved** Access: RO Format: MBZ
	0	**Color Discard Enable** **Description** When this bit is set for a Render Target Surface, SW indicates HW that this surface's cachelines from on-chip caches do not need to be written back to memory after a complete Render Pass (aka Tile Pass). This bit applies to both the main and the associated AUX surfaces. **Programming Notes** This bit must be programmed before binding a surface to a Render Pass (Tile Pass). This bit must not be changed during the Tile Pass.
7	31:1	**Reserved** Access: RO Format: MBZ
	0	**Reserved** Access: RO Format: MBZ

Clock Gating Disable Format

Clock Gating Disable Format		
Size (in bits):	1	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	0	**Clock_Gate_Disable**

Value	Name	Description
0b	Enable	Clock gating controlled by unit logic
1b	Disable	Disable clock gating function

COLOR_CALC_STATE

COLOR_CALC_STATE

Size (in bits): 192

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This definition applies to devices. It is pointed to by a field in 3DSTATE_CC_STATE_POINTERS, and stored at a 64-byte aligned boundary.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**Round Disable Function Disable** Format: Disable Disables the round-disable function of the color calculator. Value 0 – Name: Cancelled – Description: Dithering is cancelled based on the data used by blend to avoid drift. Value 1 – Name: Not Cancelled – Description: Dithering is NOT cancelled.
	14:1	**Reserved** Access: RO Format: MBZ
	0	**Alpha Test Format** This field selects the format for Alpha Reference Value and the format in which Alpha Test is performed. Value 0h – Name: ALPHATEST_UNORM8 – Description: UNorm8 Value 1h – Name: ALPHATEST_FLOAT32 – Description: Float32 **Programming Notes** Alpha-test format is independent of RT format. When PS outputs UNIT/SINT alpha-value, it will be treated as IEEE 32bit float number for the purpose of alpha-test.
1	31:0	**Alpha Reference Value As FLOAT32** Exists If: [Alpha Test Format] == 'ALPHATEST_FLOAT32' Format: IEEE_FLOAT This field specifies the alpha reference value to compare against in the Alpha Test function. **Programming Notes** This field should not be programmed to NaN.

COLOR_CALC_STATE

	7:0	**Alpha Reference Value As UNORM8** Exists If: [Alpha Test Format] == 'ALPHATEST_UNORM8' Format: UNORM8 This field specifies the alpha reference value to compare against in the Alpha Test function.
2	31:0	**Blend Constant Color Red** Format: IEEE_FLOAT This field specifies the Red channel of the Constant Color used in Color Buffer Blending.
3	31:0	**Blend Constant Color Green** Format: IEEE_FLOAT This field specifies the Green channel of the Constant Color used in Color Buffer Blending.
4	31:0	**Blend Constant Color Blue** Format: IEEE_FLOAT This field specifies the Blue channel of the Constant Color used in Color Buffer Blending.
5	31:0	**Blend Constant Color Alpha** Format: IEEE_FLOAT This field specifies the Alpha channel of the Constant Color used in Color Buffer Blending.

COLOR_PROCESSING_STATE - ACE State

COLOR_PROCESSING_STATE - ACE State

Size (in bits): 416

Default Value: 0x00000068, 0x4C382410, 0x9C887460, 0xEBD8C4B0, 0x604C3824, 0xB09C8874, 0x0000D8C4, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This state structure contains the ACE state used by the color processing function. It corresponds to DW29..DW41 of the Color Processing State.

DWord	Bit	Description
0	31:7	**Reserved** Access: RO Format: MBZ
	6:2	**Skin Threshold** Format: U5 Used for Y analysis (min/max) for pixels which are higher than skin threshold. Value / Name 1-31 26 **[Default]**
	1	**Full Image Histogram** Default Value: 0 Format: Enable Used to ignore the area of interest for full image histogram.
	0	**ACE Enable** Format: Enable
1	31:24	**Y3** Default Value: 76 Format: U8 The value of the y_pixel for point 3 in PWL.
	23:16	**Y2** Default Value: 56 Format: U8 The value of the y_pixel for point 2 in PWL.

	26:16	**S9** Format: U1.10 The value of the slope for point 9 in PWL. The default is 1024/1024.
	15:11	**Reserved** Access: RO Format: MBZ
	10:0	**S8** Format: U1.10 The value of the slope for point 8 in PWL. The default is 1024/1024.
12	31:11	**Reserved** Access: RO Format: MBZ
	10:0	**S10** Format: U1.10 The value of the slope for point 10 in PWL. The default is 1024/1024.

COLOR_PROCESSING_STATE - PROCAMP State

COLOR_PROCESSING_STATE - PROCAMP State

Size (in bits): 64

Default Value: 0x00020001, 0x01000000

This state structure contains the PROCAMP state used by the color processing function. It corresponds to DW53..DW54 of the Color Processing State.

DWord	Bit	Description
0	31:28	**Reserved** Access: RO Format: MBZ
	27:17	**Contrast** Default Value: 1 Format: U4.7 Contrast magnitude.
	16:13	**Reserved** Access: RO Format: MBZ
	12:1	**Brightness** Default Value: 0 Format: S7.4 Brightness magnitude.
	0	**PROCAMP Enable** Default Value: 1 Format: Enable
1	31:16	**Cos_c_s** Default Value: 256 Format: S7.8 UV multiplication cosine factor.
	15:0	**Sin_c_s** Default Value: 0 Format: S7.8 UV multiplication sine factor.

COLOR_PROCESSING_STATE - STD/STE State

COLOR_PROCESSING_STATE - STD/STE State

Size (in bits): 928

Default Value: 0x9A6E39F0, 0x400C0000, 0x00001180, 0xFE2F2E00, 0x000000FF, 0x00140000, 0xD82E0000, 0x8285ECEC, 0x00008282, 0x00000000, 0x02117000, 0xA38FEC96, 0x00008CC8, 0x00000000, 0x01478000, 0x0007C300, 0x00000000, 0x00000000, 0x1C180000, 0x00000000, 0x00000000, 0x00000000, 0x0007CF80, 0x00000000, 0x00000000, 0x1C080000, 0x00000000, 0x00000000, 0x00000000

This state structure contains the STD/STE state used by the color processing function.

DWord	Bit	Description
0	31:24	**V_Mid** Default Value: 154 Format: U8 Rectangle middle-point V coordinate
	23:16	**U_Mid** Default Value: 110 Format: U8 Rectangle middle-point U coordinate
	15:10	**Hue Max** Default Value: 14 Format: U6 Rectangle half width
	9:4	**Sat Max** Default Value: 31 Format: U6 Rectangle half length.
	3	**Reserved** Access: RO Format: MBZ
	2	**Output Control** 0 – Output Pixels **[Default]** 1 – Output STD Decisions

COLOR_PROCESSING_STATE - STD/STE State

	1	**STE Enable** Format: Enable
	0	**STD Enable** Format: Enable
1	31	**Reserved** Access: RO Format: MBZ
	30:28	**Diamond Margin** Default Value: 4 Format: U3
	27:21	**Diamond du** Default Value: 0 Format: S6 Rhombus center shift in the sat-direction, relative to the rectangle center.
	20:18	**HS Margin** Default Value: 3 Format: U3
	17:10	**Cos(Î±)** Format: S0.7 The default is 79/128
	9:8	**Reserved** Access: RO Format: MBZ
	7:0	**Sin(Î±)** Format: S0.7 The default is 101/128
2	31:21	**Reserved** Access: RO Format: MBZ
	20:13	**Diamond Alpha** Format: U2.6 1 / tan() The default is 100/64

COLOR_PROCESSING_STATE - STD/STE State

	12:7	**Diamond Th** Default Value: 35 Format: U6 Half length of the rhombus axis in the sat-direction.
	6:0	**Diamond dv** Default Value: 0 Format: S6
3	31:24	**Y_point_3** Default Value: 254 Format: U8 Third point of the Y piecewise linear membership function.
	23:16	**Y_point_2** Default Value: 47 Format: U8 Second point of the Y piecewise linear membership function.
	15:8	**Y_point_1** Default Value: 46 Format: U8 First point of the Y piecewise linear membership function.
	7	**VY_STD_Enable** Format: Enable Enables STD in the VY subspace.
	6:0	**Reserved** Access: RO Format: MBZ
4	31:18	**Reserved** Access: RO Format: MBZ
	17:13	**Y_Slope_2** Format: U2.3 Slope between points Y3 and Y4. The default is 31/8.

COLOR_PROCESSING_STATE - STD/STE State

	12:8	**Y_Slope_1** Format: U2.3 Slope between points Y1 and Y2. The default is 31/8.
	7:0	**Y_point_4** Default Value: 255 Format: U8 Fourth point of the Y piecewise linear membership function
5	31:16	**INV_skin_types_margin** Format: U0.16 1/(2* Skin_types_margin) Value / Name / Description: 20 / **[Default]** / Skin_Type_margin
	15:0	**Inverse Margin VYL** Format: U0.16 1 / Margin_VYL The default is 3300/65536
6	31:24	**P1L** Default Value: 216 Format: U8 Y Point 1 of the lower part of the detection PWLF.
	23:16	**P0L** Default Value: 46 Format: U8 Y Point 0 of the lower part of the detection PWLF.
	15:0	**Inverse Margin VYU** Format: U0.16 1 / Margin_VYU The default is 1600/65536.
7	31:24	**B1L** Default Value: 130 Format: U8 V Bias 1 of the lower part of the detection PWLF.

COLOR_PROCESSING_STATE - STD/STE State		
	23:16	**B0L** Default Value: 133 Format: U8 V Bias 0 of the lower part of the detection PWLF.
	15:8	**P3L** Default Value: 236 Format: U8 Y Point 3 of the lower part of the detection PWLF.
	7:0	**P2L** Default Value: 236 Format: U8 Y point 2 of the lower part of the detection PWLF.
8	31:27	**Reserved** Access: RO Format: MBZ
	26:16	**S0L** Format: S2.8 Slope 0 of the lower part of the detection PWLF. The default is -5/256.
	15:8	**B3L** Default Value: 130 Format: U8 V Bias 3 of the lower part of the detection PWLF.
	7:0	**B2L** Default Value: 130 Format: U8 V Bias 2 of the lower part of the detection PWLF.
9	31:22	**Reserved** Access: RO Format: MBZ
	21:11	**S2L** Format: S2.8 Slope 2 of the lower part of the detection PWLF. The default is 0/256.

COLOR_PROCESSING_STATE - STD/STE State

	10:0	**S1L** Format: S2.8 Slope 1 of the lower part of the detection PWLF. The default is 0/256.
10	31:27	**Reserved** Access: RO Format: MBZ
	26:19	**P1U** Default Value: 66 Format: U8 Y Point 1 of the upper part of the detection PWLF.
	18:11	**P0U** Default Value: 46 Format: U8 Y Point 0 of the upper part of the detection PWLF.
	10:0	**S3L** Format: S2.8 Slope 3 of the lower part of the detection PWLF. The default is 0/256.
11	31:24	**B1U** Default Value: 163 Format: U8 V Bias 1 of the upper part of the detection PWLF.
	23:16	**B0U** Default Value: 143 Format: U8 V Bias 0 of the upper part of the detection PWLF.
	15:8	**P3U** Default Value: 236 Format: U8 Y Point 3 of the upper part of the detection PWLF.

COLOR_PROCESSING_STATE - STD/STE State		
	7:0	**P2U** Default Value: 150 Format: U8 Y Point 2 of the upper part of the detection PWLF.
12	31:27	**Reserved** Access: RO Format: MBZ
	26:16	**S0U** Format: S2.8 Slope 0 of the upper part of the detection PWLF. The default is 256/256.
	15:8	**B3U** Default Value: 140 Format: U8 V Bias 3 of the upper part of the detection PWLF.
	7:0	**B2U** Default Value: 200 Format: U8 V Bias 2 of the upper part of the detection PWLF.
13	31:22	**Reserved** Access: RO Format: MBZ
	21:11	**S2U** Format: S2.8 Slope 2 of the upper part of the detection PWLF. The default is -179/256.
	10:0	**S1U** Format: S2.8 Slope 1 of the upper part of the detection PWLF. The default is -113/256.
14	31:28	**Reserved** Access: RO Format: MBZ

COLOR_PROCESSING_STATE - STD/STE State

	27:20	**Skin Types Margin** Default Value: 20 Format: U8 Skin types Y margin.
	19:12	**Skin Types Thresh** Default Value: 120 Format: U8 Skin types Y threshold.
	11	**Skin Type Enable** Format: Enable Treat differently bright and dark skin types. Value / Name / Description 0 / **[Default]** / Disable
	10:0	**S3U** Format: S2.8 Slope 3 of the upper part of the detection PWLF. The default is 0/256.
15	31	**Reserved** Access: RO Format: MBZ
	30:21	**SATB1** Format: S7.2 First bias for the saturation PWLF (bright skin). The default is -8/4.
	20:14	**SATP3** Default Value: 31 Format: S6 Third point for the saturation PWLF (bright skin).
	13:7	**SATP2** Default Value: 6 Format: S6 Second point for the saturation PWLF (bright skin).
	6:0	**SATP1** Format: S6 First point for the saturation PWLF (bright skin). The default is -6.

COLOR_PROCESSING_STATE - STD/STE State

16	31	**Reserved** Access: RO Format: MBZ
	30:20	**SATS0** Format: U3.8 Zeroth slope for the saturation PWLF (bright skin). The default is 297/256.
	19:10	**SATB3** Format: S7.2 Third bias for the saturation PWLF (bright skin). The default is 124/4.
	9:0	**SATB2** Format: S7.2 Second bias for the saturation PWLF (bright skin). The default is 8/4.
17	31:22	**Reserved** Access: RO Format: MBZ
	21:11	**SATS2** Format: U3.8 Second slope for the saturation PWLF (bright skin). The default is 297/256.
	10:0	**SATS1** Format: U3.8 First slope for the saturation PWLF (bright skin). The default is 85/256.
18	31:25	**HUEP3** Default Value: 14 Format: S6 Third point for the hue PWLF (bright skin)
	24:18	**HUEP2** Default Value: 6 Format: S6 Second point for the hue PWLF (bright skin)
	17:11	**HUEP1** Format: S6 First point for the hue PWLF (bright skin). The default is -6.

COLOR_PROCESSING_STATE - STD/STE State		
	10:0	**SATS3** Format: U3.8 Thrid slope for the saturation PWLF (bright skin). The default is 256/256.
19	31:30	**Reserved** Access: RO Format: MBZ
	29:20	**HUEB3** Format: S7.2 Third bias for the hue PWLF (bright skin). The default is 56/4.
	19:10	**HUEB2** Format: S7.2 Second bias for the hue PWLF (bright skin). The default is 8/4.
	9:0	**HUEB1** Format: S7.2 First bias for the hue PWLF (bright skin). The default is -8/4.
20	31:22	**Reserved** Access: RO Format: MBZ
	21:11	**HUES1** Format: U3.8 First slope for the hue PWLF (bright skin) The default is 85/256.
	10:0	**HUES0** Format: U3.8 Zeroth slope for the hue PWLF (bright skin) The default is 384/256.
21	31:22	**Reserved** Access: RO Format: MBZ
	21:11	**HUES3** Format: U3.8 Third slope for the hue PWLF (bright skin) The default is 256/256.

COLOR_PROCESSING_STATE - STD/STE State		
	10:0	**HUES2** Format: U3.8 Second slope for the hue PWLF (bright skin) The default is 384/256.
22	31	**Reserved** Access: RO Format: MBZ
	30:21	**SATB1_DARK** Format: S7.2 First bias for the saturation PWLF (dark skin) The default is 0/4.
	20:14	**SATP3_DARK** Default Value: 31 Format: S6 Third point for the saturation PWLF (dark skin)
	13:7	**SATP2_DARK** Default Value: 31 Format: S6 Second point for the saturation PWLF (dark skin)
	6:0	**SATP1_DARK** Format: S6 First point for the saturation PWLF (dark skin). The default is -11.
23	31	**Reserved** Access: RO Format: MBZ
	30:20	**SATS0_DARK** Format: U3.8 Zeroth slope for the saturation PWLF (dark skin). The default is 397/256.
	19:10	**SATB3_DARK** Format: S7.2 Third bias for the saturation PWLF (dark skin). The default is 124/4.
	9:0	**SATB2_DARK** Format: S7.2 Second bias for the saturation PWLF (dark skin). The default is 124/4.

COLOR_PROCESSING_STATE - STD/STE State

24	31:22	**Reserved** Access: RO Format: MBZ
	21:11	**SATS2_DARK** Format: U3.8 Second slope for the saturation PWLF (dark skin). The default is 256/256.
	10:0	**SATS1_DARK** Format: U3.8 First slope for the saturation PWLF (dark skin). The default is 189/256.
25	31:25	**HUEP3_DARK** Default Value: 14 Format: S6 Third point for the hue PWLF (dark skin).
	24:18	**HUEP2_DARK** Default Value: 2 Format: S6 Third point for the hue PWLF (dark skin).
	17:11	**HUEP1_DARK** Default Value: 0 Format: S6 Third point for the hue PWLF (dark skin).
	10:0	**SATS3_DARK** Format: U3.8 Third slope for the saturation PWLF (dark skin). The default is 256/256.
26	31:30	**Reserved** Access: RO Format: MBZ
	29:20	**HUEB3_DARK** Format: S7.2 Third bias for the hue PWLF (dark skin). The default is 56/4.

COLOR_PROCESSING_STATE - STD/STE State		
	19:10	**HUEB2_DARK** Format: S7.2 Second bias for the hue PWLF (dark skin). The default is 0/4.
	9:0	**HUEB1_DARK** Format: S7.2 First bias for the hue PWLF (dark skin). The default is 0/4.
27	31:22	**Reserved** Access: RO Format: MBZ
	21:11	**HUES1_DARK** Format: U3.8 First slope for the hue PWLF (dark skin). The default is 0/256.
	10:0	**HUES0_DARK** Format: U3.8 Zeroth slope for the hue PWLF (dark skin). The default is 256/256.
28	31:22	**Reserved** Access: RO Format: MBZ
	21:11	**HUES3_DARK** Format: U3.8 Third slope for the hue PWLF (dark skin). The default is 256/256.
	10:0	**HUES2_DARK** Format: U3.8 Second slope for the hue PWLF (dark skin). The default is 299/256.

COLOR_PROCESSING_STATE - TCC State

COLOR_PROCESSING_STATE - TCC State

Size (in bits): 352

Default Value: 0xDCDCDC00, 0xDCDCDC00, 0x1E34CC91, 0x3E3CCE91, 0x02E80195, 0x0197046B, 0x01790174, 0x00096000, 0x00000000, 0x03030000, 0x009201C0

This state structure contains the TCC state used by the color processing function. It corresponds to DW42..DW52 of the Color Processing State.

DWord	Bit	Description
0	31:24	**SatFactor3** Default Value: 220 Format: U1.7 The saturation factor for yellow.
	23:16	**SatFactor2** Default Value: 220 Format: U1.7 The saturation factor for red.
	15:8	**SatFactor1** Default Value: 220 Format: U1.7 The saturation factor for magenta.
	7	**TCC Enable** Format: Enable
	6:0	**Reserved** Access: RO Format: MBZ
1	31:24	**SatFactor6** Default Value: 220 Format: U1.7 The saturation factor for blue.
	23:16	**SatFactor5** Default Value: 220 Format: U1.7 The saturation factor for cyan.

COLOR_PROCESSING_STATE - TCC State

	15:8	**SatFactor4** Default Value: 220 Format: U1.7 The saturation factor for green.
	7:0	**Reserved** Access: RO Format: MBZ
2	31:30	**Reserved** Access: RO Format: MBZ
	29:20	**Base Color 3** Default Value: 483 Format: U10
	19:10	**Base Color 2** Default Value: 307 Format: U10
	9:0	**Base Color 1** Default Value: 145 Format: U10
3	31:30	**Reserved** Access: RO Format: MBZ
	29:20	**Base Color 6** Default Value: 995 Format: U10
	19:10	**Base Color 5** Default Value: 819 Format: U10
	9:0	**Base Color 4** Default Value: 657 Format: U10
4	31:16	**Color Transit Slope 23** Default Value: 744 Format: U0.16 The calculation result of 1 / (BC3 - BC2) [1/62]

COLOR_PROCESSING_STATE - TCC State

	15:0	**Color Transit Slope 12** Default Value: 405 Format: U0.16 The calculation result of 1 / (BC2 - BC1) [1/57]
5	31:16	**Color Transit Slope 45** Default Value: 407 Format: U0.16 The calculation result of 1 / (BC5 - BC4) [1/57]
	15:0	**Color Transit Slope 34** Default Value: 1131 Format: U0.16 The calculation result of 1 / (BC4 - BC3) [1/61]
6	31:16	**Color Transit Slope 61** Default Value: 377 Format: U0.16 The calculation result of 1 / (BC1 - BC6) [1/62]
	15:0	**Color Transit Slope 56** Default Value: 372 Format: U0.16 The calculation result of 1 / (BC6 - BC5) [1/62]
7	31:22	**Color Bias 3** Default Value: 0 Format: U2.8 Color bias for BaseColor3.
	21:12	**Color Bias 2** Default Value: 150 Format: U2.8 Color bias for BaseColor2.
	11:2	**Color Bias 1** Default Value: 0 Format: U2.8 Color bias for BaseColor1.

COLOR_PROCESSING_STATE - TCC State

	1:0	**Reserved** Access: RO Format: MBZ
8	31:22	**Color Bias 6** Default Value: 0 Format: U2.8 Color bias for BaseColor6.
	21:12	**Color Bias 5** Default Value: 0 Format: U2.8 Color bias for BaseColor5.
	11:2	**ColorBias4** Default Value: 0 Format: U2.8 Color bias for BaseColor4.
	1:0	**Reserved** Access: RO Format: MBZ
9	31	**Reserved** Access: RO Format: MBZ
	30:24	**UV Threshold** Default Value: 3 Format: U7 Low UV threshold.
	23:19	**Reserved** Access: RO Format: MBZ
	18:16	**UV Threshold Bits** Default Value: 3 Format: U3 Low UV transition width bits.

COLOR_PROCESSING_STATE - TCC State

	15:13	**Reserved** Access: RO Format: MBZ
	12:8	**STE Threshold** Default Value: 0 Format: U5 Skin tone pixels enhancement threshold.
	7:3	**Reserved** Access: RO Format: MBZ
	2:0	**STE Slope Bits** Default Value: 0 Format: U3 Skin tone pixels enhancement slope bits.
10	31:16	**Inverse UVMax Color** Default Value: 146 Format: U0.16 1 / UVMaxColor. Used for the SFs2 calculation.
	15:9	**Reserved** Access: RO Format: MBZ
	8:0	**UVMax Color** Default Value: 448 Format: U9 The maximum absolute value of the legal UV pixels. Used for the SFs2 calculation.

Color Calculator State Pointer Message Header Control

MHC_RT_CCSP - Color Calculator State Pointer Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:6	**Color Calculator State Pointer** Format: GeneralStateOffset[31:6] Specifies the 64-byte aligned point to the color calculator state. This pointer is relative to the General State Base Address.
	5:0	**Reserved** Access: RO Format: MBZ

Color Code Message Header Control

MHC_RT_CC - Color Code Message Header Control		
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:10	**Reserved** Access: RO Format: MBZ
	9:8	**Color Code** Format: U2 This ID is assigned by the Windower unit and is used to track synchronizing events. Reserved for HW implementation use
	7:0	**FFTID** Format: U8 This ID is assigned by the fixed function unit and is a unique identifier for the thread. It is used to free up resources used by the thread upon thread completion.

COMPRESSION_PAIR_BIT

COMPRESSION_PAIR_BIT		
Size (in bits):	2	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	1:0	**COMPRESSION PAIRING BIT** This field defines which 2 cachelines are combined in a 128B memory compression block.

Value	Name	Description
0h	Bit_6 **[Default]**	Pairing bit is Addr[6]: Two consecutive cachelines form a 128B compression block.
1h	Bit_7	Pairing bit is Addr[7]: Two cachelines with a 128B stride form a 128B compression block.
2h	Bit_8	Pairing bit is Addr[8]: Two cachelines with a 256B stride form a 128B compression block.

ComputeCS Hardware-Detected Error Bit Definitions

ComputeCS Hardware-Detected Error Bit Definitions

Source: ComputeCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:12	**Reserved** Access: RO Format: MBZ
	11	**Reserved** Access: RO Format: MBZ
	10:3	**Reserved** Access: RO Format: MBZ
	2	**Command Privilege Violation Error** This bit is set if a command classified as privileged is parsed in a non-privileged batch buffer. The command will be converted to a NOOP and parsing will continue.
	1	**Reserved** Access: RO Format: MBZ
	0	**Instruction Error** This bit is set when the Renderer Instruction Parser detects an error while parsing an instruction. Instruction errors include: • Client ID value (Bits 31:29 of the Header) is not supported (only MI, 2D and 3D are supported). • Defeatured MI Instruction Opcodes: Value: 1 — Name: — Description: Instruction Error detected **Programming Notes** This error indications cannot be cleared except by reset (i.e., it is a fatal error).

Compute Engine Interrupt Vector

COMPUTE_INTR_VEC - Compute Engine Interrupt Vector		
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15	**Catastrophic Error** This interrupt signals that a unrecoverable error (for e.g encountered fault when accessing a page mapped in Global GTT) during the engine processing. When Memory interface signals this error, the Command Streamer will stop parsing any more instructions. Scheduler is expected to reset the engine to evict the context
	14	**EU Restart Interrupt** EU Restart Interrupt is generated by the GA fabric, and not by Render Command Streamer. GA routes this interrupt to GuC independently of Command Stream.
	13	**Context Stall** Command streamer will generate a Context Stall interrupt when a high priority context gets stalled due to the other command streamer executing a normal priority or low priority context is "Run Alone" mode OR Command streamer will generate a Context Stall interrupt when a high priority context gets stalled while procuring run alone mode.
	12	**Reserved** Access: RO Format: MBZ
	11	**CS Wait On Semaphore**
	10	**Spare 10**
	9	**CS TR Invalid Tile Detection**
	8	**CS Context Switch Interrupt**
	7	**Page Fault Interrupt** This interrupt is for handling Legacy Page Fault interface for all Command Streamers [BCS, RCS, VCS, VECS]. When Fault Repair Mode is enabled, Interrupt mask register value is not looked at to generate interrupt due to page fault. Please refer to vol1c "page fault support" section for more details. In Advanced (PRQ) Fault Interface is done through GUC interface.
	6	**CS Watchdog Counter Expired**
	5	**Spare 5**
	4	**CS PIPE_CONTROL Notify**
	3	**CS Error Interrupt**
	2:1	**Spare 2**

COMPUTE_INTR_VEC - Compute Engine Interrupt Vector		
	0	**CS MI User Interrupt**

Context Descriptor Format

CONTEXT_DESCRIPTOR - Context Descriptor Format

Size (in bits):	64
Default Value:	0x00000000, 0x00000000

Description

This is the format of context descriptors which make up submitted execlists.

Context ID is a unique field assigned by GFX driver when a new context is created by which it is identified across all hierarchies of SW and HW.

- Context ID is used for semaphore signaling by hardware and software.
- Context ID matching is used by hardware to detect Lite Restore.
- Context ID is used by hardware for page fault reporting and response with IOMMU.
- Context switch reason and the associated Context ID are reported to Context Switch Status Buffer by hardware on a context switch.

Context ID which is a 32 bit field is further divided in to following segments described below:

- **Bits[63:61] (Bits 31:29 of Context ID)** represents **Engine class**.
- **Bits[60:55] (Bits 28:23 of Context ID)** represents **SW Counter**.
- **Bit[54] (Bit 22 of Context ID)** MBZ for SW programming; this bit is used by hardware to distinguish between F&H vs F&S page requests and response messages to and from IOMMU. This bit is used by hardware on receiving page response to properly manage the page fault counters.
- **Bits[53:48] (Bits 21:16 of Context ID)** represents **Engine Instance** (within a Engine class).
- **Bits[47:37] (Bits 15:5 of Context ID)**represents **SW Context ID** which is a software assigned unique context ID. (supports 2048 contexts per virtual function)
- **Bits[36:32] (Bits 4:0 of Context ID)** represents **Virtual Function Number** (when virtualization is enabled). Set to zero when virtualization is not enabled. This field contains the bits [4:0] of the Virtual Function Number.

Programming Note: "**Virtual Function Number**" must be always programmed to value 0x0.

Hardware compares the following fields of the outgoing context to that of the incoming context to detect a lite restore. Lite restore is detected when the following fields are equal and the incoming context does not have the "Force Restore" bit set. On a lite restore hardware will only sample the tail pointer from memory (LRCA) and keep executing the ongoing context with out initiating any context switch flows (Flush, Context Save, Context Restore). Lite restore is HW detected context switch optimization transparent to SW, Context Switch Status report and Context Switch Interrupt generation happens on a lite restore, Hardware Front End may temporarily get stalled from parsing new commands.

- **DW1.SW Context ID**
- **DW1.Virtual Function Number**
- **DW0.Logical Ring Context Address (LRCA)**
- **DW0. Reserved Bits[11:9]**

Context ID issued for comparing during lite restore and context specific OA enabling.

CONTEXT_DESCRIPTOR - Context Descriptor Format

Context ID is reported by hardware to OABUFFER along with the performance statistics counters, Context ID is used for filtering the statistics on per context basis.

DWord	Bit	Description
0..1	63:61	**Context ID - Engine Class** Bits 31:29 of Context ID represents Engine class.
	60:55	**Context ID - SW Counter** Bits 28:23 of Context ID represents SW Counter.
	54	**Reserved** Bits 22 of Context ID. This must be zero for SW programming; this bit is used by hardware to distinguish between F&H vs F&S page requests and response messages to and from IOMMU. This bit is used by hardware on receiving page response to properly manage the page fault counters.
	53:48	**Context ID - Engine Instance** Bits 21:16 of Context ID represents Engine Instance.
	47:37	**Context ID - SW Context ID** Bits 15:5 of Context ID represents SW Context ID, which is a software assigned unique context ID. (supports 2048 contexts per virtual function).
	36:32	**Context ID - Virtual Function Number** Bits 4:0 of Context ID represents the Virtual Function Number (when virtualization is enabled). Set to zero when virtualization is not enabled. This field contains the bits [4:0] of the Virtual Function Number.
	31:12	**Logical Ring Context Address (LRCA)** Format: GraphicsAddress[31:12] This field contains the 4 KB-aligned address of the Logical Ring Context associated with his execlist element. LRCA must be always programmed in GGTT memory.
	11	**Reserved** Access: RO Format: MBZ
	10:9	**Context Priority** This field indicates the prioritization of the thread dispatch associated with the corresponding context. Note that Render Engine and Compute Engine are executing contexts of their own with the corresponding priority programmed. For e.g: When Compute Engine is executing lower priority context when compared to the context executed by render engine, then threads dispatched from render engine (3D - VS, HS, DS, GS & PSD and GPGPU -TSG threads corresponding to render engine) are given priority over the TSG threads dispatched for compute engine. Value / Name: 0 – Low Priority 1 – Normal Priority 2 – High Priority

CONTEXT_DESCRIPTOR - Context Descriptor Format

Programming Notes
This field is only functional for RenderCS and ComputeCS and must be only programmed for context descriptor submitted to RenderCS and ComputeCS.

8 **Privilege Access**

Description
This field when set indicates PPGTT enabled.

Programming Notes
This field must be always set.

7:6 **Fault Handling**

Source:	CommandStreamer

Value	Name	Description
0h	Fault and Hang	Fault model is not supported and fault occurrence is treated as catastrophic. GAM indicates Fault Error to Command streamer. Fault Error interrupt is reported to scheduler. CommandStreamer will not initiate context switch on occurrence of Fault Error.
Others	Reserved	Reserved

Programming Notes
When execlist mode is set to "Legacy Context mode" Fault Handling mode must be set to "Fault and Hang." For proper programming for Page Fault modes, refer to memory interface section for the corresponding generation.

5 **Reserved**

Access:	RO
Format:	MBZ

4:3 **Addressing Mode & Legacy Context**

Format:	U2

Legacy context set indicates GPU is operating in legacy context mode of operation and doesn't support any SVM features. Legacy context reset indicates GPU is operating in advanced context mode of operation and support SVM features. Based on the Context mode set Addressing mode is interpreted appropriately. The table below summarizes the combinations supported.
GFX engine always uses 32b virtual addressing mode when translated using GGTT irrespective of below options.

Value	Name	Description
01b	Legacy Context with no 64 bit VA support	GPU is enabled for legacy context mode of operation and DOESN'T support any SVM features. GPU supports 32b PPGTT graphics virtual addressing. PDP*_DESCRIPTOR contains the base address to 4GB of memory space supported.

CONTEXT_DESCRIPTOR - Context Descriptor Format

11b	Legacy Context with 64 bit VA support	GPU is enabled for legacy context mode of operation and DOESN'T support any SVM features. GPU supports 64b (48bit canonical) PPGTT graphics virtual addressing and PDP0_DESCRIPTORcontains the base address to PML4 and other PDP Descriptors are ignored.
Others	Reserved	Other values are not supported.

2	**Force Restore** Setting this bit will force a context restore operation when switching to this context even if the LRCA in the CCID register (normally the LRCA of the last context from the prior execlist)matches this one. Note that it is legal (and likely desirable) for the **Render Context Restore Inhibit** bit(part of the CTXT_SR_CTL register) in the context image being restored to also be set. The "ring"context is being forced to be restored from a newly initialized context despite a possible LRCA match. However, the render context for such a newly initialized context will likely be uninitialized and so should not be restored.
1	**Reserved** Access: RO Format: MBZ
0	**Valid** Set if this register holds a valid context descriptor. SW should set this bit in the Element registers that it has set up to contain valid context descriptors. Any execlist elements that are not used in a submitted execlist must have this bit clear.

Context Status

Context Status

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

The context status is an update sent by a Command Streamer to the scheduler.
The Engine Class and Instance ID specifies the Command streamer the event came from.
See the **Engine ID Definition** structure.
Context ID Away: Context ID of the context that the command streamer is switching away from.
Context ID To: Context ID of the context that the command streamer is switching execution to

DWord	Bit	Description
0	31:26	**Context ID To SW Counter** Format: U6
	25:15	**Context ID To SW Context ID** Format: U11 0x7FF: Is reserved to indicate HW idle state. "Ctxt-ID To SW Context-ID"set to 0x7FF in the report indicates HW went to Idle following this context switch. Indicate Active to Idle switch
	14:12	**Context ID To Virtual Function Number** Format: U3 This field contains the bits [2:0] of the Virtual Function Number.
	11:6	**Engine Instance** Format: U6
	5:3	**Engine Class** Format: U3
	2	**Semaphore Wait Mode** This field indicates the Semaphore Wait Mode (Poll or Signal) when the context switch is due to "Wait on Semaphore". This field is only valid when "Switch Detail" indicates "Wait on Semaphore". Value: 0 — Name: Signal Mode Value: 1 — Name: Poll Mode
	1	**Reserved** Access: RO Format: MBZ
	0	**Switched to New Queue** Value: 0 — Name: False Value: 1 — Name: True

Context Status

1 — 31:26 — Context ID Away SW Counter

Format:	U6

25:15 — Context ID Away SW Context ID

Format:	U11

0x7FF: Is reserved to indicate HW idle state. Ctxt-ID Away SW Context-ID set to 0x7FF in the CSB report indicates HW was Idle with no valid context at the time of context switch. Indicates Idle to Active switch.

14:12 — Context ID Away Virtual Function Number

Format:	U3

This field contains the bits [2:0] of the Virtual Function Number.

11:5 — Wait Detail

Format:	U7

This field is only valid when Switch Detail" indicates "Wait on Sync Flip" or "Wait on Scanline" or "Wait on VBlank" or "Wait on Semaphore".

- This field indicates the Display Plane ID when the "Switch Detail" indicates "Wait on Sync Flip".
- This field indicates the Display PipeID when the "Switch Detail" indicates "Wait on Scanline" or "Wait on VBlank".
- This field indicates the Wait Token Number when the "Switch Detail" indicates "Wait on Semaphore".

Value	Name	Description
[0,27]	Wait on Display	The value entered here is the Display Plane ID.
[0,26]	Wait on Semaphore	The value entered here is the Wait Token Number.

4 — Reserved

Access:	RO
Format:	MBZ

3:0 — Switch Detail

Format:	U4

Any values not listed below are reserved.

Value	Name	Description
0	Context Complete	Indicates context is complete with Head Pointer equal to Tail Pointer. In case of Render Engine it implies both RenderCS and PositionCS are complete with head pointer equal to tail pointer.
1	Wait on Sync Flip	
2	Wait on VBlank	

Context Status				
		3	Wait on Scanline	
		4	Wait on Semaphore	
		5	Context Pre-empted	This field is set when the context is preempted on a preemptable command and the command is not MI_SEMAPHORE_WAIT or MI_WAIT_FOR_EVENT.
		[6h-Fh]	Reserved	

CPS_STATE

CPS_STATE

Source: RenderCS

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:27	**Reserved**
	26:16	**MinCPSizeY** Format: S3.7 This bit-field defines the minimum shading ratio in Y dimension in screen space. This value is used only when Coarse Pixel Shading is enabled. It also defines the floor of the non-quantized CPSizeY for CPS_MODE_RADIAL. HW quantizes this value to determine Decoupled Rate. This value is used to clamp the CPSizeY for the lowest bound.
	15	**RESERVED**
	14	**ScaleAxis** Format: U1 This bit defines which dimension (along X- or Y- axis) should be scaled when computing Coarse Pixel Size values along ellipse in CPS_MODE_RADIAL. **Value** / **Name** / **Description** 0h / X axis / Use aspect to scale X-dimension 1h / Y axis / Use aspect to scale Y-dimension
	13:12	**Coarse Pixel Shading Mode** Format: U2 This bit-field defines Coarse Pixel Shading Mode. **Value** / **Name** / **Description** 0h / CPS_MODE_NONE / Coarse Pixel Shading is disabled. HW may be required to drive default values to shader inputs e.g. ScaleX = ScaleY = 1 and LODCompX = LODCompY = 1. 1h / CPS_MODE_CONSTANT / Coarse Pixel Shading Ratios are defined per DRAW based on MinCPSizeX and MinCPSizeY fields in this state (constant across render target). 2h / CPS_MODE_RADIAL / Coarse Pixel Shading Ratio varies radially from a focal point defined by (X_Focal, Y_Focal) relative to the viewport X/Y origin. This mode is typically used when there is Depth of Field or Ring of Confusion camera effects are desired. 3h / Reserved /

CPS_STATE

		Programming Notes It is a valid configuration to set the CPS mode other than CPS_MODE_NONE and request per-pixel dispatch in 3DSTATE_PS_EXTRA. In such case, 3DSTATE_PS_EXTRA configuration overrides 3DSTATE_CPS configuration, and effective CPS mode is set to CPS_MODE_NONE for this draw primitive. It is an INVALID configuration to set the CPS mode other than CPS_MODE_NONE and request per-sample dispatch in 3DSTATE_PS_EXTRA. Such configuration should be disallowed at the API level, and rendering results are undefined. It is a valid configuration to set the CPS mode to CPS_MODE_NONE and at the same time set Pixel Shader Is Per Coarse Pixel in 3DSTATE_PS_EXTRA. In such case, 3DSTATE_PS_EXTRA bit is ignored and shader is dispatched at pixel-rate; shader inputs specific to coarse-rate have undefined value (ActualCoarsePixelSize for example).
	11	**Statistics Enable** Format: Enable
	10:0	**MinCPSizeX** Format: S3.7 This bit-field defines the minimum shading ratio in X dimension in screen space. This value is used only when Coarse Pixel Shading is enabled. It also defines the floor of the non-quantized ScaleX for Mode 1. HW quantizes this value to determine Decoupled Rate.
1	31:27	**Reserved** Access: RO Format: MBZ
	26:16	**MaxCPSizeY** Format: S3.7 This bit-field defines the maximum shading ratio in Y dimension in screen space. This value is used only when Coarse Pixel Shading is enabled and Coarse Pixel Shading Mode is set to CPS_MODE_RADIAL. This value is used to clamp the CPSizeY for the highest bound. MaxCPSizeY must be greater than or equal to MinCPSizeY when this value is used.
	15:11	**Reserved** Access: RO Format: MBZ
	10:0	**MaxCPSizeX** Format: S3.7 This bit-field defines the maximum shading ratio in X dimension in screen space. This value is used only when Coarse Pixel Shading is enabled and Coarse Pixel Shading Mode is set to CPS_MODE_RADIAL. This value is used to clamp the CPSizeX for the highest bound. MaxCPSizeX must be greater than or equal to MinCPSizeX when this value is used.
2	31:16	**Reserved** Access: RO Format: MBZ

CPS_STATE

	15:0	**Y_Focal** Format: S15 This field defines the Y-coordinate for a focal point with respect to which shading ratio is computed in CPS_MODE_RADIAL. **Programming Notes** The valid data range is (-2^14 to 2^14-1)
3	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**X_Focal** Format: S15 This field defines the X-coordinate for a focal point with respect to which shading ratio is computed in CPS_MODE_RADIAL. **Programming Notes** The valid data range is (-2^14 to 2^14-1)
4	31:0	**My** Format: IEEE_FLOAT32 This field defines the slope of the transfer function for computing CPSizeY for CPS_MODE_RADIAL. **Programming Notes** SW needs to compute this from API supplied parameters: $(M_x, M_y) = \left(\frac{S_x^{max}-S_x^{min}}{R_{max}-R_{min}}, \frac{S_y^{max}-S_y^{min}}{R_{max}-R_{min}} \right)$ Mymust be greater than or equal to zero
5	31:0	**Mx** Format: IEEE_FLOAT32 This field defines the slope of the transfer function for computing CPSizeX for CPS_MODE_RADIAL. **Programming Notes** SW needs to compute this from API supplied parameters: $(M_x, M_y) = \left(\frac{S_x^{max}-S_x^{min}}{R_{max}-R_{min}}, \frac{S_y^{max}-S_y^{min}}{R_{max}-R_{min}} \right)$ Mx must be greater than or equal to zero
6	31:0	**Rmin** Format: IEEE_FLOAT32 This field defines (smaller) radius of the inner ellipse for CPS_MODE_RADIAL. All points on inner ellipse have coarse point size = (MinCPSizeX, MinCPSizeY).

CPS_STATE		
7	31:0	**Aspect** Format: IEEE_FLOAT32 This field defines aspect for both inner and outer ellipses in CPS_MODE_RADIAL. The aspect parameter must be within <0,1> range and Driver must program it as ratio of smallest ellipse radius to larger ellipse radius: Aspect = min(radiusX, radiusY) / max(radiusX, radiusY) where radiusX and radiusY define ellipse radius along x- and y- axes respectively. Note: Aspect must be same for both inner and outer ellipses.

CSC COEFFICIENT FORMAT

CSC COEFFICIENT FORMAT

Size (in bits): 16

Default Value: 0x00000000

Coefficients for the CSC are stored in sign-exponent-mantissa format. Two CSC coefficients are stored in each dword, the table below show the data packing in each dword.

DWord	Bit	Description
0	15	**Sign** Value: 0b — Name: Positive Value: 1b — Name: Negative
	14:12	**Exponent_bits** Represented as 2^(-n) Value: 110b — Name: 4 — Description: 4 or mantissa is bb.bbbbbbb Value: 111b — Name: 2 — Description: 2 or mantissa is b.bbbbbbbb Value: 000b — Name: 1 — Description: 1 or mantissa is 0.bbbbbbbbb Value: 001b — Name: 0.5 — Description: 0.5 or mantissa is 0.0bbbbbbbbb Value: 010b — Name: 0.25 — Description: 0.25 or mantissa is 0.00bbbbbbbbb Value: 011b — Name: 0.125 — Description: 0.125 or mantissa is 0.000bbbbbbbbb Value: Others — Name: Reserved — Description: Reserved
	11:3	**Mantissa**

Data Port 0 Message Types

MT_DP0 - Data Port 0 Message Types

Source: EuSubFunctionDataPort0

Size (in bits): 5

Default Value: 0x00000000

Lists all the Message Types in a Data Port 0 Message Descriptor [18:14].The Legacy messages are encoded in Data Port 0 with Bit 18 set to zero. The Message Header is optional for many (but not all) of these operations. The Scratch Block messages are encoded in Data Port 0 with Bit 18 set to one. A Message Header is required.

DWord	Bit	Description
0	4	**Legacy DAP-DC Message** Legacy Message

Value	Name	Description
0h	No **[Default]**	Legacy DAP-DC Message
1h	Reserved	Scratch Block Message, descriptor uses different Message Type encoding

DWord	Bit	Description
0	3:0	**Message Type** Specifies type of message

Value	Name	Description
00h	MT0R_B **[Default]**	Block Read message
01h	MT0R_AB	Aligned Block Read message
03h	MT0R_DWS	Dword Scattered Read message
04h	MT0R_BS	Byte Scattered Read message
07h	MT0_MEMFENCE	Memory Fence message
08h	MT0W_B	Block Write message
0Bh	MT0W_DWS	Dword Scattered Write message
0Ch	MT0W_BS	Byte Scattered Write message
Others	Reserved	Ignored

Data Port 1 Message Types

MT_DP1 - Data Port 1 Message Types

Source: EuSubFunctionDataPort1

Size (in bits): 5

Default Value: 0x00000000

Lists all the Message Types in a Data Port 1 Message Descriptor [18:14].Most surface and atomic operations, both typed and untyped, are encoded on Data Port 1. The Message Header is optional for many (but not all) of these operations. Most A64 Stateless operations are also encoded on Data Port 1. The Message Header is forbidden for all A64 messages on Data Port 1.

DWord	Bit	Description
0	4:0	**Message Type** Specifies type of message

Value	Name	Description
01h	MT1R_US	Untyped Surface Read message
02h	MT1A_UI	Untyped Atomic Integer Operation message
03h	MT1A_UHI	Untyped Atomic Half Integer Operation message
04h	MT1R_MB	Media Block Read message
05h	MT1R_TS	Typed Surface Read message
06h	MT1A_TA	Typed Atomic Integer Operation message
07h	MT1A_TAH	Typed Atomic Half Integer Operation message
08h	Reserved	Ignored
09h	MT1W_US	Untyped Surface Write message
0Ah	MT1W_MB	Media Block Write message
0Bh	MT1A_TC	Typed Atomic Counter Operation message
0Ch	MT1A_TCH	Typed Atomic Half Counter Operation message
0Dh	MT1W_TS	Typed Surface Write message
0Eh	Reserved	Ignored
10h	MT1R_A64_SB	A64 Scattered Read message
11h	MT1R_A64_US	A64 Untyped Surface Read message
12h	MT1A_A64_UI	A64 Untyped Atomic Integer Operation message
13h	MT1A_A64_UHI	A64 Untyped Atomic Half Integer Operation message
14h	MT1R_A64_B	A64 Block Read message
15h	MT1W_A64_B	A64 Block Write message
18h	Reserved	Ignored
19h	MT1W_A64_US	A64 Untyped Surface Write message
1Ah	MT1W_A64_SB	A64 Scattered Write message
1Bh	MT1A_UF	Untyped Atomic Float Operation message

MT_DP1 - Data Port 1 Message Types				
		1Ch	MT1A_UHF	Untyped Atomic Half Float Operation message
		1Dh	MT1A_A64_UF	A64 Untyped Atomic Float Operation message
		1Eh	MT1A_A64_UHF	A64 Untyped Atomic Half Float Operation message
		Others	Reserved	Ignored

Data Port Bindless Surface Extended Message Descriptor

DP_EXTDESC_BTI252 - Data Port Bindless Surface Extended Message Descriptor

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:12	**Bindless Surface Offset** Format: SurfaceStateOffset[25:6] Specifies the bindless surface offset if the Binding Table Index is set to 252. Ignored otherwise. The bindless surface offset is added to the Bindless Surface Base Address as bits 25:6 of the byte-based address. The resulting address is the location of SURFACE_STATE for this message.
	11	**Reserved** Access: RO Format: MBZ
	10:0	**Reserved** Access: RO Format: MBZ

Data Size Message Descriptor Control Field

MDC_DS - Data Size Message Descriptor Control Field

Size (in bits): 2

Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**Data Size** Specifies the number of Bytes to be read or written

Value	Name	Description
00h	B	1 Byte
01h	W	2 Bytes
02h	DW	4 Bytes
03h	Reserved	Reserved

Depth Clear Value Format

Depth Clear Value Format		
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0 This field defines the clear value that will be applied to the depth buffer if the Depth Buffer Clear field is enabled. It is valid only if Depth Buffer Clear Value Valid is set. **Programming Notes:** The clear value must be between the min and max depth values (inclusive) defined in the CC_VIEWPORT. If the depth buffer format is D32_FLOAT, then values must be limited to the range of +0.0f and 1.0f inclusive; values outside this range are reserved	31:0	**Depth Clear Value** Format: IEEE_FLOAT

Deptrh Clear Value Format

STRUCTURE_TEMPLATE - Deptrh Clear Value Format		
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Address1** Format: IEEE_FLOAT32 Format: UNORM24 Format: UNORM16 When this field contains 24-bit UNORM, the upper 8-bits are reserved (0's) When this field contains 16-bit UNORM the upper 16-bits are reserved (0's)

DirectOperand

DirectOperand

Size (in bits): 14

Default Value: 0x00000000

DWord	Bit	Description
0	13:6	**RegNum** Format: U8 **Description** This field provide the register number for the operand. For a GRF register, is the part of a register address that aligns to a 256-bit (32-byte) boundary. For an ARF register, this field is encoded such that MSBs identify the architecture register type and LSBs provide the register number. An ARF register can only be destination or Source 0. Any Source 1 or Source 2 operands cannot be ARF registers. RegNum and SubRegNum together provide the byte-aligned address for the origin of a register region. RegNum provides bits 12:5 of that address. This field applies to both source and destination operands.
	5:1	**SubRegNum** This field provide the subregister number for the operand. For a GRF register, is the byte address within a 256-bit (32-byte) register. For an ARF register, determines the sub-register number according to the specified encoding for the given architecture register. RegNum and SubRegNum together provide the byte-aligned address for the origin of a GRF register region. RegNum provides bits 12:5 of that address. For one-source and two-source instructions, SubregNum provides bits 4:0. For three-source instructions, the address must be Word-aligned; SubRegNum provides bits 4:1of the address and bits 0 are zero.
	0	**RegFile** This field indicate whether Architecture register file or General register file are selected. Value / Name / Description 0 / ARF / Architecture Register File. 1 / GRF / General Register File. Allowed for any Source or Destination.

Display Engine Render Response Message Definition

DE_RRMD - Display Engine Render Response Message Definition

Size (in bits): 96

Default Value: 0x00000000, 0x00000000, 0x00000000

The Display Engine Render Response Registers use bit definitions from this table.

Programming Notes

Some events can be sent to CS (Render Command Streamer) or BCS (Blitter Command Streamer). For render response messages sending flip done or scanline events, the destination, CS or BCS, is selected depending on the initiator of the flip or the load scanline command. For render response messages sending vertical blank events, the destinations, CS or BCS, or both CS and BCS, is selected depending on the DE_RR_DEST setting. Command Streamer Plane number to the Display Plane name mapping is available in the Display Plane Capability and Interoperability section.

The STEREO3D_EVENT_MASK selects between left eye and right eye reporting of vertical blank and scanline events in stereo 3D modes.

DWord	Bit	Description
0	31	**Spare 31**
	30	**Reserved** Access: RO Format: MBZ
	29	**Reserved**
	28	**Spare 28**
	27	**Spare 27**
	26	**VDEnc Session3 Start** This event is reported when the Display pipe for this session reaches Tail Initial Update Delay. This event is not masked by DE_GUCRMR since it is sent directly by transcoder WD.
	25	**VDEnc Session2 Start** This event is reported when the Display pipe for this session reaches Tail Initial Update Delay. This event is not masked by DE_GUCRMR since it is sent directly by transcoder WD.
	24	**VDEnc Session1 Start** This event is reported when the Display pipe for this session reaches Tail Initial Update Delay. This event is not masked by DE_GUCRMR since it is sent directly by transcoder WD.
	23	**VDEnc Session0 Start** This event is reported when the Display pipe for this session reaches Tail Initial Update Delay. This event is not masked by DE_GUCRMR since it is sent directly by transcoder WD.

DE_RRMD - Display Engine Render Response Message Definition		
	22	**Pipe_C_DPST_Histogram_Event** This event is reported on the start of the DPST Histogram event for pipe C. This event should only be unmasked for GuC.
	21	**Pipe_C_Start_of_Vertical_Blank_Event** This event is reported on the start of the vertical blank of the transcoder attached to Pipe C.
	20	**Plane_6_Flip_Done_Event** This event is reported on the completion of a flip for Plane 6.
	19	**Plane_12_Flip_Done_Event** This event is reported on the completion of a flip for Plane 12.
	18	**Plane_11_Flip_Done_Event** This event is reported on the completion of a flip for Plane 11.
	17	**Plane_10_Flip_Done_Event** This event is reported on the completion of a flip for Plane 10.
	16	**Plane_9_Flip_Done_Event** This event is reported on the completion of a flip for Plane 9.
	15	**Plane_3_Flip_Done_Event** This event is reported on the completion of a flip for Plane 3.
	14	**Pipe_C_Scanline_Event** This event is reported on the start of the selected scan line for the transcoder attached to Pipe C.
	13	**Reserved**
	12	**Spare 12** Unused
	11	**Pipe_B_Start_of_Vertical_Blank_Event** This event is reported on the start of the vertical blank of the transcoder attached to Pipe B.
	10	**Plane_5_Flip_Done_Event** This event is reported on the completion of a flip for Plane 5.
	9	**Plane_2_Flip_Done_Event** This event is reported on the completion of a flip for Plane 2.
	8	**Pipe_B_Scanline_Event** This event is reported on the start of the selected scan line for the transcoder attached to Pipe B.
	7	**Plane_8_Flip_Done_Event** This event is reported on the completion of a flip for Plane 8.
	6	**Plane_7_Flip_Done_Event** This event is reported on the completion of a flip for Plane 7.
	5	**Reserved**

DUALSUBSLICE_HASH_TABLE_8x8

DUALSUBSLICE_HASH_TABLE_8x8

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

8x8 [Y][X] dualsubslice hashing table. Each entry is a single bit that indicates which dualSubSlice(DSS) the indicated xy location maps to. A value of 0 indicates the larger DSS, or DSS=0 if both DSS have are balanced(have same number of enabled lsubslices)

DWord	Bit	Description
0	31:24	**SubSlice Hashing Table Entries[3]x[7:0]** Format: U8 Indicates the dualsubslice_id for the pixel block that has y=3 and x=7..0
	23:16	**SubSlice Hashing Table Entries[2]x[7:0]** Format: U8 Indicates the dualsubslice_id for the pixel block that has y=2 and x=7..0
	15:8	**SubSlice Hashing Table Entries[1]x[7:0]** Format: U8 Indicates the dualsubslice_id for the pixel block that has y=1 and x=7..0
	7:0	**SubSlice Hashing Table Entries[0]x[7:0]** Format: U8 Indicates the dualsubslice_id for the pixel block that has y=0 and x=7..0
1	31:24	**SubSlice Hashing Table Entries[7]x[7:0]** Format: U8 Indicates the dualsubslice_id for the pixel block that has y=7 and x=7..0
	23:16	**SubSlice Hashing Table Entries[6]x[7:0]** Format: U8 Indicates the dualsubslice_id for the pixel block that has y=6 and x=7..0
	15:8	**SubSlice Hashing Table Entries[5]x[7:0]** Format: U8 Indicates the dualsubslice_id for the pixel block that has y=5 and x=7..0
	7:0	**SubSlice Hashing Table Entries[4]x[7:0]** Format: U8 Indicates the dualsubslice_id for the pixel block that has y=4 and x=7..0

DUALSUBSLICE_HASH_TABLE_16x8

DUALSUBSLICE_HASH_TABLE_16x8		
Size (in bits):	128	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000	
16x8 [Y][X] dualsubslice hashing table. Each entry is a single bit that indicates which dualSubSlice(DSS) the indicated xy location maps to. A value of 0 indicates the larger DSS, or DSS=0 if both DSS have are balanced(have same number of enabled lsubslices)		
DWord	**Bit**	**Description**
0	31:16	**SubSlice Hashing Table Entries y[1]x[15:0]** Format: U16 Indicates the dualsubslice_id for the pixel block that has y=1 and x=15..0
	15:0	**SubSlice Hashing Table Entries y[0]x[15:0]** Format: U16 Indicates the dualsubslice_id for the pixel block that has y=0 and x=15..0

0.7	31:0	**Dword7** Format: U32 Specifies the slot 7 data in this payload register

Dword SIMD8 Atomic Operation CMPWR Message Data Payload

MDP_AOP8_DW2 - Dword SIMD8 Atomic Operation CMPWR Message Data Payload		
Size (in bits):	512	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Src0** Format: MDCR_DW Specifies the Slot [7:0] Source 0 data
1.0-1.7	255:0	**Src1** Format: MDCR_DW Specifies the Slot [7:0] Source 1 data

Dword SIMD8 Data Payload

MDP_DW_SIMD8 - Dword SIMD8 Data Payload		
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Data[7:0]** Format: MDCR_DW Specifies the Slot [7:0] data

Dword SIMD16 Atomic Operation CMPWR Message Data Payload

MDP_AOP16_DW2 - Dword SIMD16 Atomic Operation CMPWR Message Data Payload

Size (in bits): 1024

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Src0[7:0]** Format: MDCR_DW Specifies the Source 0 data for Slot [7:0]
1.0-1.7	255:0	**Src0[15:8]** Format: MDCR_DW Specifies the Source 0 data for Slot [15:8]
2.0-2.7	255:0	**Src1[7:0]** Format: MDCR_DW Specifies the Source 1 data for Slot [7:0]
3.0-3.7	255:0	**Src1[15:8]** Format: MDCR_DW Specifies the Source 1 data for Slot [15:8]

Dword SIMD16 Data Payload

MDP_DW_SIMD16 - Dword SIMD16 Data Payload		
Size (in bits):	512	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Data[7:0]** Format: MDCR_DW Specifies the Slot [7:0] data
1.0-1.7	255:0	**Data[15:8]** Format: MDCR_DW Specifies the Slot [15:8] data

Encoder Statistics Format

Encoder Statistics Format

Source:	VideoEnhancementCS
Size (in bits):	128
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000

The per block data is intended for use by the video encoder and consists of 16 bytes of Denoise block data and FMD variances. Much of the data is encoded as an 8-bit mantissa with the leading 1 removed and a 4-bit shift. To recover the original 17-bit integer this code can be used: If (exp != 0) Number = ((0x100 | Mantissa) « exp) » 7; else Number = mantissa;

The values for STAD, SHCM and SVCM for each 4x4 are shited down by 2 bits to make 14-bit values before being summed for the 16x4 block to make a 16-bit value. The result is then converted into the mantissa/exp format.

DWord	Bit	Description
0	31:24	**Tearing_Count 1 (FMD Variance[8])** Format: U8 Number of pixels that have (diff_cTcB > diff_cTcT + diff_cBcB) Value 0: Name: Description: DI is Disabled
	23:16	**Tearing_Count 2** Format: U8 If the frame is Deinterlaced with Top First in the DN/DI state then this is (FMD Variance[9]) = Number of pixels that have (diff_cTpB > diff_cTcT + diff_pBpB) If the frame is bottom first then this is (FMD Variance[10]) = Number of pixels that have (diff_cBpT > diff_pTpT + diff_cBcB) Value 0: Name: Description: DI is Disabled
	15:8	**Motion_Count (FMD Variance[7])** Format: U8 Number of pixels that are moving (different above a threshold) Value 0: Name: Description: DI is Disabled
	7:0	**Reserved** Access: RO Format: MBZ

Encoder Statistics Format

1	31:28	**sSTAD** Format: U4 Shift for the Sum in time of absolute differences for 16x4. Value 0 — Name — Description: Temporal Denoise Filtering is Disabled.
	27:24	**sSHCM** Format: U4 Shift for the Sum horizontally of absolute differences. Value 0 — Name — Description: DN is Disabled
	23:20	**sSVCM** Format: U4 Shift for the Sum vertically of absolute differences.
	19:16	**sDiff_cTpT** Format: U4 Shift for the sum of differences in top fields of current and previous frame. Value 0 — Name — Description: DI is Disabled
	15:12	**sDiff_cBpB** Format: U4 Shift for the sum of differences in bottom field of current and previous frame. Value 0 — Name — Description: DI is Disabled
	11:8	**sDiff_cTcB** Format: U4 Shift for the sum of differences between top and bottom field in current frame. Value 0 — Name — Description: DI is Disabled
	7:4	**sDiff_cTpB** Format: U4 Shift for the sum of differences between current top and previous bottom. Value 0 — Name — Description: DI is Disabled

Encoder Statistics Format

	3:0	**sDiff_cBpT** Format: U4 Shift for the sum of differences between current bottom and previous top. Value: 0 — Name: — Description: DI is Disabled
2	31:24	**mDiff_cBpB (FMD Variance[1])** Format: U8 Mantissa of sum of differences in bottom field of current and previous frame. Value: 0 — Name: — Description: DI is Disabled
	23:16	**mDiff_cTcB (FMD Variance[2])** Format: U8 Mantissa of sum of differences between top and bottom field in current frame. Value: 0 — Name: — Description: DI is Disabled
	15:8	**mDiff_cTpB (FMD Variance[3])** Format: U8 Mantissa of sum of differences between current top and previous bottom. Value: 0 — Name: — Description: DI is Disabled
	7:0	**mDiff_cBpT (FMD Variance[4])** Format: U8 Mantissa of sum of differences between current bottom and previous top. Value: 0 — Name: — Description: DI is Disabled
3	31:24	**mSTAD** Format: U8 Mantissa of Sum in time of absolute differences for 16x4. Value: 0 — Name: — Description: Temporal Denoise Filtering is disabled.
	23:16	**mSHCM** Format: U8 Mantissa of Sum horizontally of absolute differences. Value: 0 — Name: — Description: DN is Disabled

Encoder Statistics Format

	15:8	**mSVCM** Format: U8 Mantissa of Sum vertically of absolute differences. **Value** / **Name** / **Description** 0 / / DN is Disabled
	7:0	**mDiff_cTpT (FMD Variance[0])** Format: U8 Mantissa of sum of differences in top fields of current and previous frame. **Value** / **Name** / **Description** 0 / / DI is Disabled

	33	**AccWrCtrl** Format: **AccWrCtrl**

EU_INSTRUCTION_BASIC_ONE_SRC

	32	**AtomicCtrl** Format: **AtomicCtrl**
	31	**MaskCtrl** Mask Control (formerly Write Enable Control). This field determines if the per channel write enables are used to generate the final write enable. This field should be normally "0". **Value** / **Name** / **Description** 0 / Normal **[Default]** / Normal. Per channel write enable used for final write enable generation. 1 / NoMask / NoMask.Skips the check for PcIP[n] == ExIP before enabling a channel, as described in the Evaluate Write Enable section.
	30	**Reserved**
	29	**CmptCtrl** Format: MBZ Compaction Control Indicates whether the instruction is compacted to the 64-bit compact instruction format. When this bit is set, the 64-bit compact instruction format is used. The EU decodes the compact format using lookup tables internal to the hardware, but documented for use by software tools. Only some instruction variations can be compacted, the variations supported by those lookup tables and the compact format. See EU Compact Instruction Format for more information. **Value** / **Name** / **Description** 0 / NoCompaction **[Default]** / No compaction. 128-bit native instruction supporting all instruction options. 1 / Compacted / Compaction is enabled. 64-bit compact instruction supporting only some instruction variations.
	28	**PredInv** This field, together with PredCtrl, enables and controls the generation of the predication mask for the instruction. When it is set, the predication uses the inverse of the predication bits generated according to setting of Predicate Control. In other words, effect of PredInv happens after PredCtrl. This field is ignored by hardware if Predicate Control is set to 0000 - there is no predication. PMask is the final predication mask produced by the effects of both fields **Value** / **Name** / **Description** 0 / Positive **[Default]** / Positive polarity of predication. Use the predication mask produced by PredCtrl. 1 / Negative / Negative polarity of predication. If PredCtrl is nonzero, invert the predication mask.
	27:24	**PredCtrl** Format: **PredCtrl** This field, together with PredInv, enables and controls the generation of the predication mask for the instruction. It allows per-channel conditional execution of the instruction based on the content of the selected flag register.

EU_INSTRUCTION_BASIC_ONE_SRC

	23	**FlagRegNum[0]** This field specifies bit[0] of the register number for a flag register operand.
	22	**FlagSubRegNum** This field specifies the sub-register number for a flag register operand. There are two sub-registers in the flag register. Each sub-register contains 16 flag bits. The selected flag sub-register is the source for predication if predication is enabled for the instruction. It is the destination to store conditional flag bits if conditional modifier is enabled for the instruction. The same flag sub-register can be both the predication source and conditional destination, if both predication and conditional modifier are enabled.
	21:19	**ChanOff** Format: **ChanOff** This field provides offset information for ARF selection. The can be thought of as a starting channel offset for the execution mask and other ARF registers implicitly accessed.
	18:16	**ExecSize** Format: **ExecSize** This field determines the number of channels operating in parallel for this instruction. The size cannot exceed the maximum number of channels allowed for the given data type.
	15:0	**Header** Format: **Header**

This field should be normally "0". **Value** / **Name** / **Description** 0 – Normal **[Default]** – Normal. Per channel write enable used for final write enable generation. 1 – NoMask – NoMask.Skips the check for PcIP[n] == ExIP before enabling a channel, as described in the Evaluate Write Enable section.
	30	**Reserved**
	29	**CmptCtrl** Format: MBZ

Compaction Control Indicates whether the instruction is compacted to the 64-bit compact instruction format. When this bit is set, the 64-bit compact instruction format is used. The EU decodes the compact format using lookup tables internal to the hardware, but documented for use by software tools. Only some instruction variations can be compacted, the variations supported by those lookup tables and the compact format. See EU Compact Instruction Format for more information.

Value	Name	Description
0	NoCompaction **[Default]**	No compaction. 128-bit native instruction supporting all instruction options.
1	Compacted	Compaction is enabled. 64-bit compact instruction supporting only some instruction variations.

28 **PredInv**

This field, together with PredCtrl, enables and controls the generation of the predication mask for the instruction. When it is set, the predication uses the inverse of the predication bits generated according to setting of Predicate Control. In other words, effect of PredInv happens after PredCtrl. This field is ignored by hardware if Predicate Control is set to 0000 - there is no predication. PMask is the final predication mask produced by the effects of both fields

Value	Name	Description
0	Positive **[Default]**	Positive polarity of predication. Use the predication mask produced by PredCtrl.
1	Negative	Negative polarity of predication. If PredCtrl is nonzero, invert the predication mask.

27:24 **PredCtrl**

Format:	PredCtrl

This field, together with PredInv, enables and controls the generation of the predication mask for the instruction. It allows per-channel conditional execution of the instruction based on the content of the selected flag register.

23 **FlagRegNum[0]**

This field specifies bit[0] of the register number for a flag register operand.

22 **FlagSubRegNum**

This field specifies the sub-register number for a flag register operand. There are two sub-registers in the flag register. Each sub-register contains 16 flag bits. The selected flag sub-register is the source for predication if predication is enabled for the instruction. It is the destination to store conditional flag bits if conditional modifier is enabled for the instruction. The same flag sub-register can be both the predication source and conditional destination, if both predication and conditional modifier are enabled.

21:19 **ChanOff**

Format:	ChanOff

This field provides offset information for ARF selection. The can be thought of as a starting channel offset for the execution mask and other ARF registers implicitly accessed.

EU_INSTRUCTION_BASIC_THREE_SRC		
	18:16	**ExecSize** Format: **ExecSize** This field determines the number of channels operating in parallel for this instruction. The size cannot exceed the maximum number of channels allowed for the given data type.

	27:24	**PredCtrl** Format: **PredCtrl** This field, together with PredInv, enables and controls the generation of the predication mask for the instruction. It allows per-channel conditional execution of the instruction based on the content of the selected flag register.

EU_INSTRUCTION_MATH

	23	**FlagRegNum[0]** This field specifies bit[0] of the register number for a flag register operand.
	22	**FlagSubRegNum** This field specifies the sub-register number for a flag register operand. There are two sub-registers in the flag register. Each sub-register contains 16 flag bits. The selected flag sub-register is the source for predication if predication is enabled for the instruction. It is the destination to store conditional flag bits if conditional modifier is enabled for the instruction. The same flag sub-register can be both the predication source and conditional destination, if both predication and conditional modifier are enabled.
	21:19	**ChanOff** Format: **ChanOff** This field provides offset information for ARF selection. The can be thought of as a starting channel offset for the execution mask and other ARF registers implicitly accessed.
	18:16	**ExecSize** Format: **ExecSize** This field determines the number of channels operating in parallel for this instruction. The size cannot exceed the maximum number of channels allowed for the given data type.
	15:0	**Header** Format: **Header**

EU_INSTRUCTION_SEND

34 EOT

This field controls the termination of the thread. For a send instruction, if this field is set, EU will terminate the thread and also set the EOT bit in the message sideband. This field only applies to the send instruction. It is not present for other instructions.

Value	Name
0	Thread is not terminated
1	EOT

33 FusionCtrl

This field provides explicit control for EU fusion lock-step execution. When this bit is set to 1b, the instruction is executed serially starting from the first EU to the last EU in the fused set.

Value	Name
0	Normal lockstep execution
1	Serialized execution

32 AtomicCtrl

Format:	AtomicCtrl

31 MaskCtrl

Mask Control (formerly Write Enable Control). This field determines if the per channel write enables are used to generate the final write enable. This field should be normally "0".

Value	Name	Description
0	Normal **[Default]**	Normal. Per channel write enable used for final write enable generation.
1	NoMask	NoMask.Skips the check for PcIP[n] == ExIP before enabling a channel, as described in the Evaluate Write Enable section.

30 Reserved

29 CmptCtrl

Format:	MBZ

Compaction Control Indicates whether the instruction is compacted to the 64-bit compact instruction format. When this bit is set, the 64-bit compact instruction format is used. The EU decodes the compact format using lookup tables internal to the hardware, but documented for use by software tools. Only some instruction variations can be compacted, the variations supported by those lookup tables and the compact format. See EU Compact Instruction Format for more information.

Value	Name	Description
0	NoCompaction **[Default]**	No compaction. 128-bit native instruction supporting all instruction options.
1	Compacted	Compaction is enabled. 64-bit compact instruction supporting only some instruction variations.

28 **PredInv**

This field, together with PredCtrl, enables and controls the generation of the predication mask for the instruction. When it is set, the predication uses the inverse of the predication bits generated according to setting of Predicate Control. In other words, effect of PredInv happens after PredCtrl. This field is ignored by hardware if Predicate Control is set to 0000 - there is no predication. PMask is the final predication mask produced by the effects of both fields

Value	Name	Description
0	Positive **[Default]**	Positive polarity of predication. Use the predication mask produced by PredCtrl.
1	Negative	Negative polarity of predication. If PredCtrl is nonzero, invert the predication mask.

27:24 **PredCtrl**

Format:	PredCtrl

This field, together with PredInv, enables and controls the generation of the predication mask for the instruction. It allows per-channel conditional execution of the instruction based on the content of the selected flag register.

23 **FlagRegNum[0]**

This field specifies bit[0] of the register number for a flag register operand.

22 **FlagSubRegNum**

This field specifies the sub-register number for a flag register operand. There are two sub-registers in the flag register. Each sub-register contains 16 flag bits. The selected flag sub-register is the source for predication if predication is enabled for the instruction. It is the destination to store conditional flag bits if conditional modifier is enabled for the instruction. The same flag sub-register can be both the predication source and conditional destination, if both predication and conditional modifier are enabled.

21:19 **ChanOff**

Format:	ChanOff

This field provides offset information for ARF selection. The can be thought of as a starting channel offset for the execution mask and other ARF registers implicitly accessed.

18:16 **ExecSize**

Format:	ExecSize

This field determines the number of channels operating in parallel for this instruction. The size cannot exceed the maximum number of channels allowed for the given data type.

15:0 **Header**

Format:	Header

Mask Control (formerly Write Enable Control). This field determines if the per channel write enables are used to generate the final write enable. This field should be normally "0".

Value	Name	Description
0	Normal **[Default]**	Normal. Per channel write enable used for final write enable generation.
1	NoMask	NoMask.Skips the check for PcIP[n] == ExIP before enabling a channel, as described in the Evaluate Write Enable section.

30 **Reserved**

29 **CmptCtrl**

Format:	MBZ

Compaction Control Indicates whether the instruction is compacted to the 64-bit compact instruction format. When this bit is set, the 64-bit compact instruction format is used. The EU decodes the compact format using lookup tables internal to the hardware, but documented for use by software tools. Only some instruction variations can be compacted, the variations supported by those lookup tables and the compact format. See EU Compact Instruction Format for more information.

Value	Name	Description
0	NoCompaction **[Default]**	No compaction. 128-bit native instruction supporting all instruction options.
1	Compacted	Compaction is enabled. 64-bit compact instruction supporting only some instruction variations.

28 **PredInv**

This field, together with PredCtrl, enables and controls the generation of the predication mask for the instruction. When it is set, the predication uses the inverse of the predication bits generated according to setting of Predicate Control. In other words, effect of PredInv happens after PredCtrl. This field is ignored by hardware if Predicate Control is set to 0000 - there is no predication. PMask is the final predication mask produced by the effects of both fields

Value	Name	Description
0	Positive	Positive polarity of predication. Use the predication mask produced

	[Default]	by PredCtrl.
1	Negative	Negative polarity of predication. If PredCtrl is nonzero, invert the predication mask.

27:24 PredCtrl

Format:	PredCtrl

This field, together with PredInv, enables and controls the generation of the predication mask for the instruction. It allows per-channel conditional execution of the instruction based on the content of the selected flag register.

23 FlagRegNum[0]

This field specifies bit[0] of the register number for a flag register operand.

22 FlagSubRegNum

This field specifies the sub-register number for a flag register operand. There are two sub-registers in the flag register. Each sub-register contains 16 flag bits. The selected flag sub-register is the source for predication if predication is enabled for the instruction. It is the destination to store conditional flag bits if conditional modifier is enabled for the instruction. The same flag sub-register can be both the predication source and conditional destination, if both predication and conditional modifier are enabled.

21:19 ChanOff

Format:	ChanOff

This field provides offset information for ARF selection. The can be thought of as a starting channel offset for the execution mask and other ARF registers implicitly accessed.

18:16 ExecSize

Format:	ExecSize

This field determines the number of channels operating in parallel for this instruction. The size cannot exceed the maximum number of channels allowed for the given data type.

0	31:24	**Reserved** Access: RO Format: MBZ
	23:0	**Event ID** Format: U24 Indicates the ID of the event to be signalled.
1..7	223:0	**Reserved** Access: RO Format: MBZ

ExMsgDesc

ExMsgDesc		
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:12	**ExtendedFunctionControl[31:12]** Format: U20 This field is sent to the target function unit as extended function control.
	11	**CPS LOD Compensation**
	10:6	**Extended Message Length** Format: U5 This field specifies the number of 256-bit GRF registers starting from <Src1.RegNum> to be sent out on the request message payload **Programming Notes** When <Src1> is null this field must be 0.
	5:0	**Reserved** Format: MBZ

Extended Message Descriptor Render Target

Extended Message Descriptor Render Target

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:25	**Reserved** Access: RO Format: MBZ
	24:21	**Reserved** Access: RO Format: MBZ
	20	**Null Render Target** **Description** When this bit is set, RT write or read message is considered to be a dummy message and as if it is directed to the NULL render target. Setting this bit in the descriptor, allows SW to not use any entry from the Binding Table to convey NULL RT. **Programming Notes** SW must set this bit for Render Target Write just to clear the Pixel Scoreboard without allocating an entry in the Binding Table. For Texel Shaders, this bit must be set while sending a NULL Render Target Write Message to communicate End of Texel Shader Thread (EOT) to the AMFSunit.
	19:16	**Pixel shading phase for CPS+PS inner loop** Format: U4 The loop counter value of a PS phase within CPS+PS(+S) monolithic shader; this value is same as value delivered to Pixel Interpolator when requesting input data for a new PS loop phase. Data Port uses this index to match pixel XY positions delivered by bypass path from PI hardware when a new phase started. **Programming Notes** The SIMD width of a render target read/write message with PS phase counter must match SIMD width of the Pixel Interpolator Pull message which returns PS phase counter.
	15	**Src0 Alpha Present** **Description** Setting this bit indicates that Src0 Alpha is present in the Render Target Write Message. **Programming Notes** SW must not send a header to send Src0 Alpha present, but instead, it must set this bit and avoid sending the header for RT write messages.

Extended Message Descriptor Render Target

	14:12	**Render Target Array Index** Format: U3 **Description** This bit-field is used to set the Render Target Index for MRT messages. **Programming Notes** SW must not send a header to send Render Target Array Index, but instead, it must set this bit-field appropriately and avoid sending the header for RT messages.
	11:10	**Reserved** Access: RO Format: MBZ
	9:6	**Extended Message Length** Format: U4 This field specifies the number of 256-bit GRF registers starting from <src1> to be sent out on the request message payload. Valid value ranges from 0 to 15. Must be 0 when <src1> is null register.
	5	**End of Thread** This field, if set, indicates that this is the final message of the thread and the threads resources can be reclaimed.
	4	**Reserved** Access: RO Format: MBZ
	3:0	**Target Function ID** This field indicates the function unit for which the message is intended. *Refer to GPU Overview document for the mapping of Shared Function IDs*

Programming Notes

The default values follow the pattern suggested by incomplete table below.

DWords	DWord 0	DWord 1	DWord 2	DWord 3
0..3 : Point[0]	00000000h	00000000h	00000000h	00000000h
4..7 : Point[1]	01000100h	01000100h	01000100h	01000100h
8..11 : Point[2]	02000200h	02000200h	02000200h	02000200h
12..15 : Point[3]	03000300h	03000300h	03000300h	03000300h
...				

Gamut_Expansion_Gamma_Correction

1016..1019 : Point[254]	fe00fe00h	fe00fe00h	fe00fe00h	fe00fe00h
1020..1023 : Point[255]	ffffffffh	ffffffffh	ffffffffh	ffffffffh

DWord	Bit	Description
0..1	63:48	**Inverse R-ch Gamma Corrected Value 0** Default Value: 0000h Format: U16
	47:32	**Inverse Pixel Value 0** Default Value: 0000h Format: U16
	31:16	**Inverse B-ch Gamma Corrected Value 0** Default Value: 0000h Format: U16
	15:0	**Inverse G-ch Gamma Corrected Value 0** Default Value: 0000h Format: U16
2..3	63:48	**Forward R-ch Gamma Corrected Value 0** Default Value: 0000h Format: U16
	47:32	**Forward Pixel Value 0** Default Value: 0000h Format: U16
	31:16	**Forward B-ch Gamma Corrected Value 0** Default Value: 0000h Format: U16
	15:0	**Forward G-ch Gamma Corrected Value 0** Default Value: 0000h Format: U16
4..5	63:48	**Inverse R-ch Gamma Corrected Value 1** Default Value: 0100h Format: U16
	47:32	**Inverse Pixel Value 1** Default Value: 0100h Format: U16

Gamut_Expansion_Gamma_Correction		
	31:16	**Inverse B-ch Gamma Corrected Value 1** Default Value: 0100h Format: U16
	15:0	**Inverse G-ch Gamma Corrected Value 1** Default Value: 0100h Format: U16
6..7	63:48	**Forward R-ch Gamma Corrected Value 1** Default Value: 0100h Format: U16
	47:32	**Forward Pixel Value 1** Default Value: 0100h Format: U16
	31:16	**Forward B-ch Gamma Corrected Value 1** Default Value: 0100h Format: U16
	15:0	**Forward G-ch Gamma Corrected Value 1** Default Value: 0100h Format: U16
8..9	63:48	**Inverse R-ch Gamma Corrected Value 2** Default Value: 0200h Format: U16
	47:32	**Inverse Pixel Value 2** Default Value: 0200h Format: U16
	31:16	**Inverse B-ch Gamma Corrected Value 2** Default Value: 0200h Format: U16
	15:0	**Inverse G-ch Gamma Corrected Value 2** Default Value: 0200h Format: U16
10..11	63:48	**Forward R-ch Gamma Corrected Value 2** Default Value: 0200h Format: U16
	47:32	**Forward Pixel Value 2** Default Value: 0200h Format: U16

Gamut_Expansion_Gamma_Correction		
	31:16	**Forward B-ch Gamma Corrected Value 2** Default Value: 0200h Format: U16
	15:0	**Forward G-ch Gamma Corrected Value 2** Default Value: 0200h Format: U16
12..13	63:48	**Inverse R-ch Gamma Corrected Value 3** Default Value: 0300h Format: U16
	47:32	**Inverse Pixel Value 3** Default Value: 0300h Format: U16
	31:16	**Inverse B-ch Gamma Corrected Value 3** Default Value: 0300h Format: U16
	15:0	**Inverse G-ch Gamma Corrected Value 3** Default Value: 0300h Format: U16
14..15	63:48	**Forward R-ch Gamma Corrected Value 3** Default Value: 0300h Format: U16
	47:32	**Forward Pixel Value 3** Default Value: 0300h Format: U16
	31:16	**Forward B-ch Gamma Corrected Value 3** Default Value: 0300h Format: U16
	15:0	**Forward G-ch Gamma Corrected Value 3** Default Value: 0300h Format: U16
16..17	63:48	**Inverse R-ch Gamma Corrected Value 4** Default Value: 0400h Format: U16
	47:32	**Inverse Pixel Value 4** Default Value: 0400h Format: U16

Gamut_Expansion_Gamma_Correction		
	31:16	**Inverse B-ch Gamma Corrected Value 4** Default Value: 0400h Format: U16

GGTT Entry

GGTT_ENTRY - GGTT Entry		
Size (in bits):	64	
Default Value:	0x00000000, 0x00000000	
The GPU accesses GGTT table entries as uncacheable.		
DWord	**Bit**	**Description**
0	63:54	**Reserved**
	53	**Reserved**
	52	**Reserved** Access: RO Format: MBZ
	51:46	**Reserved**
	45:12	**Address** Physical address of 4KB memory page referenced by this entry.
	11:5	**Reserved**
	4:2	**Function Number** The Number of the Function to which this page has been assigned. This field is ignored unless HW Graphics Virtualization (SRIOV) is enabled.
	1	**Ignored** *Ignored (h/w does not care about values behind ignored registers)*
	0	**Present** When set to 1, indicates that this Entry is Valid, and the corresponding page is Present in physical memory

GraphicsAddress63-0

GA63_0 - GraphicsAddress63-0		
Size (in bits):	64	
Default Value:	0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..1	63:57	**Reserved** Access: RO Format: MBZ
	56:48	**Reserved** Access: RO Format: MBZ
	47:0	**GraphicsAddress47-0** Format: GraphicsAddress[47:0] GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. For the specified product generations, use 48-bit addressing.

GraphicsAddress63-1

GA63_1 - GraphicsAddress63-1		
Size (in bits):	63	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bit 0 is already defined in the referring register. So bit 0 of this structure should correspond to bit 1 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1	62:56	**Reserved** Access: RO Format: MBZ
	55:47	**Reserved** Access: RO Format: MBZ
	46:0	**GraphicsAddress47-1** Format: GraphicsAddress[47:1] GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address. Bits 47:1 of a 48-bit GraphicsAddress. Look for bit 0 definition in the referring register.

GraphicsAddress63-2

GA63_2 - GraphicsAddress63-2		
Size (in bits):	62	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bits 1:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 2 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1	61:55	**Reserved** Access: RO Format: MBZ
	54:46	**Reserved** Access: RO Format: MBZ
	45:0	**GraphicsAddress47-2** Format: GraphicsAddress[47:2] GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address. Bits 47:2 of a 48-bit GraphicsAddress. Look for the definition of bits 1:0 in the referring register.

GraphicsAddress63-3

GA63_3 - GraphicsAddress63-3		
Size (in bits):	61	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bits 2:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 3 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1	60:54	**Reserved** Access: RO Format: MBZ
	53:45	**Reserved** Access: RO Format: MBZ
	44:0	**GraphicsAddress47-3** Format: GraphicsAddress[47:3] GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address. Bits 47:2 of a 48-bit GraphicsAddress. Look for the definition of bits 2:0 in the referring register.

GraphicsAddress63-4

GA63_4 - GraphicsAddress63-4		
Size (in bits):	60	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bits 3:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 4 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1	59:53	**Reserved** Access: RO Format: MBZ
	52:44	**Reserved** Access: RO Format: MBZ
	43:0	**GraphicsAddress47-4** Format: GraphicsAddress[47:4] GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address. Bits 47:4 of a 48-bit GraphicsAddress. Look for the definition of bits 3:0 in the referring register.

GraphicsAddress63-5

GA63_5 - GraphicsAddress63-5		
Size (in bits):	59	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bits 4:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 5 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1	58:52	**Reserved** Access: RO Format: MBZ
	51:43	**Reserved** Access: RO Format: MBZ
	42:0	**GraphicsAddress47-5** Format: GraphicsAddress[47:5] GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address. Bits 47:5 of a 48-bit GraphicsAddress. Look for the definition of bits 4:0 in the referring register.

GraphicsAddress63-6

GA63_6 - GraphicsAddress63-6		
Size (in bits):	58	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bits 5:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 6 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1	57:51	**Reserved** Access: RO Format: MBZ
	50:42	**Reserved** Access: RO Format: MBZ
	41:0	**GraphicsAddress47-6** Format: GraphicsAddress[47:6] GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address. Bits 47:6 of a 48-bit GraphicsAddress. Look for the definition of bits 5:0 in the referring register.

GraphicsAddress63-12

GA63_12 - GraphicsAddress63-12

Size (in bits): 52

Default Value: 0x00000000, 0x00000000

This structure is intended to define the upper bits of the GraphicsAddress, when bits 11:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 12 of the full GraphicsAddress.

DWord	Bit	Description
0..1	51:45	**Reserved** Access: RO Format: MBZ
	44:36	**Reserved** Access: RO Format: MBZ
	35:0	**GraphicsAddress47-12** Format: GraphicsAddress[47:12] GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address. Bits 47:12 of a 48-bit GraphicsAddress. Look for the definition of bits 11:0 in the referring register.

GTC Interrupt Bit Definition

GTC Interrupt Bit Definition		
Size (in bits):	32	
Default Value:	0x00000000	
The GTC Interrupt Registers all share the same bit definitions from this table.		
DWord	**Bit**	**Description**
0	31	**GTC Lock Loss** GTC has lost lock with a remote GTC sink.The difference between the local and remote GTC has exceeded programmed threshold.
	30:22	**Reserved** Access: RO Format: MBZ
	21	**GTC Aux Rx Error USBC6** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	20	**GTC Update Complete USBC6** A hardware initiated GTC update has completed with a sink attached to this port.
	19	**GTC Aux Rx Error USBC5** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	18	**GTC Update Complete USBC5** A hardware initiated GTC update has completed with a sink attached to this port.
	17	**GTC Aux Rx Error USBC4** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	16	**GTC Update Complete USBC4** A hardware initiated GTC update has completed with a sink attached to this port.
	15	**GTC Aux Rx Error USBC3** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	14	**GTC Update Complete USBC3** A hardware initiated GTC update has completed with a sink attached to this port.
	13	**GTC Aux Rx Error USBC2** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	12	**GTC Update Complete USBC2** A hardware initiated GTC update has completed with a sink attached to this port.
	11	**GTC Aux Rx Error USBC1** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	10	**GTC Update Complete USBC1** A hardware initiated GTC update has completed with a sink attached to this port.
	9:6	**Reserved** Access: RO Format: MBZ

GTC Interrupt Bit Definition		
	5	**GTC Aux Rx Error DDIC** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	4	**GTC Update Complete DDIC** A hardware initiated GTC update has completed with a sink attached to this port.
	3	**GTC Aux Rx Error DDIB** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	2	**GTC Update Complete DDIB** A hardware initiated GTC update has completed with a sink attached to this port.
	1	**GTC Aux Rx Error DDIA** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	0	**GTC Update Complete DDIA** A hardware initiated GTC update has completed with a sink attached to this port.

GTPM Interrupt Vector

GTPM_INTR_VEC - GTPM Interrupt Vector		
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15:14	**Reserved** Access: RO Format: MBZ
	13	**Unslice Frequency Control Up Interrupt** This interrupt is no longer used
	12	**Unslice Frequency Control Down Interrupt** This interrupt is no longer used
	11	**NFADFL Frequency Up Interrupt** This interrupt is no longer used
	10	**NFADFL Frequency Down Interrupt** This interrupt is no longer used
	9	**ARAT Interrupt** Always Running Apic Timer Interrupt. This interrupt is sent by GPM to GuCmicro-controller (for scheduling purposes). Host SW does not require this interrupt (so this interrupt is not sent to G-unit).
	8	**GTPM Engines Idle Interrupt**
	7	**GTPM Uncore to Core Trap Interrupt**
	6	**GTPM Render Frequency Downwards Timeout During RC6 Interrupt** This interrupt is no longer used
	5	**GTPM Render P-State Up Threshold Interrupt** This interrupt is no longer used
	4	**GTPM Render P-State Down Threshold Interrupt** This interrupt is no longer used
	3	**Spare 3** This interrupt is no longer used
	2	**GTPM Render Geyserville Up Evaluation Interval Interrupt** This interrupt is no longer used
	1	**GTPM Render Geyserville Down Evaluation Interval Interrupt** This interrupt is no longer used
	0	**Reserved** Access: RO Format: MBZ

GUC Interrupt Vector

GUC_INTR_VEC - GUC Interrupt Vector		
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15	**GUC Interrupt to Host**
	14	**GUC Execution Error**
	13	**GUC Display Event Received**
	12	**GUC Semaphore Signaled**
	11	**IOMMU Sent Message to GUC**
	10	**GUC Doorbell Rang**
	9	**GUC DMA Done**
	8	**GUC Fatal Error**
	7	**GUC Notification Error**
	6	**GUC SW interrupt 6**
	5	**GUC SW interrupt 5**
	4	**GUC SW interrupt 4**
	3	**GUC SW interrupt 3**
	2	**GUC SW interrupt 2**
	1	**GUC SW interrupt 1**
	0	**GUC SW interrupt 0**

G-Unit Interrupt Vector

GUNIT_INTR_VEC - G-Unit Interrupt Vector		
Size (in bits): 16 Default Value: 0x00000000		
This interrupt is delivered to GuC to indicate a request for Function Level Reset of a specific Virtual Function in Virtualization mode. GuC uses this request to clean up internal queues.		
DWord	**Bit**	**Description**
0	15:8	**Reserved** Access: RO Format: MBZ
	7	**Function Level Reset Request For Virtual Function 7**
	6	**Function Level Reset Request For Virtual Function 6**
	5	**Function Level Reset Request For Virtual Function 5**
	4	**Function Level Reset Request For Virtual Function 4**
	3	**Function Level Reset Request For Virtual Function 3**
	2	**Function Level Reset Request For Virtual Function 2**
	1	**Function Level Reset Request For Virtual Function 1**
	0	**Function Level Reset Request For Virtual Function 0 (Physical Function)**

Half Precision Dual Source SIMD8 Message Data Payload Register

MDPR_DSH_SIMD8 - Half Precision Dual Source SIMD8 Message Data Payload Register

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:16	**Src0 Data1** Format: IEEE_FLOAT16 Specifies the source 0 slot 1 data in this payload register
	15:0	**Src0 Data0** Format: IEEE_FLOAT16 Specifies the source 0 slot 0 data in this payload register
1	31:16	**Src0 Data3** Format: IEEE_FLOAT16 Specifies the source 0 slot 3 data in this payload register
	15:0	**Src0 Data2** Format: IEEE_FLOAT16 Specifies the source 0 slot 2 data in this payload register
2	31:16	**Src0 Data5** Format: IEEE_FLOAT16 Specifies the source 0 slot 5 data in this payload register
	15:0	**Src0 Data4** Format: IEEE_FLOAT16 Specifies the source 0 slot 4 data in this payload register
3	31:16	**Src0 Data7** Format: IEEE_FLOAT16 Specifies the source 0 slot 7 data in this payload register
	15:0	**Src0 Data6** Format: IEEE_FLOAT16 Specifies the source 0 slot 6 data in this payload register

MDPR_DSH_SIMD8 - Half Precision Dual Source SIMD8 Message Data Payload Register		
4	31:16	**Src1 Data1** Format: IEEE_FLOAT16 Specifies the source 1 slot 1 data in this payload register
	15:0	**Src1 Data0** Format: IEEE_FLOAT16 Specifies the source 1 slot 0 data in this payload register
5	31:16	**Src1 Data3** Format: IEEE_FLOAT16 Specifies the source 1 slot 3 data in this payload register
	15:0	**Src1 Data2** Format: IEEE_FLOAT16 Specifies the source 1 slot 2 data in this payload register
6	31:16	**Src1 Data5** Format: IEEE_FLOAT16 Specifies the source 1 slot 5 data in this payload register
	15:0	**Src1 Data4** Format: IEEE_FLOAT16 Specifies the source 1 slot 4 data in this payload register
7	31:16	**Src1 Data7** Format: IEEE_FLOAT16 Specifies the source 1 slot 7 data in this payload register
	15:0	**Src1 Data6** Format: IEEE_FLOAT16 Specifies the source 1 slot 6 data in this payload register

Half Precision OM Replicated SIMD16 Render Target Data Payload

MDP_RTWH_M16REP - Half Precision OM Replicated SIMD16 Render Target Data Payload

Size (in bits):	512
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**oMask** Format: MDPR_OMASK Slots [15:0] oMask
1.0-1.7	255:0	**RGBA** Format: MDPR_H_RGBA RGBA for all slots [15:0]

Half Precision OM S0A SIMD8 Render Target Data Payload

MDP_RTWH_MA8 - Half Precision OM S0A SIMD8 Render Target Data Payload

Size (in bits): 1536

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Source 0 Alpha
1.0-1.7	255:0	**oMask** Format: MDPR_OMASK Slots [7:0] oMask. Upper half ignored.
2.0-2.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red
3.0-3.7	255:0	**Green** Format: MDPR_H_SIMD8 Slots [7:0] Green
4.0-4.7	255:0	**Blue** Format: MDPR_H_SIMD8 Slots [7:0] Blue
5.0-5.7	255:0	**Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Alpha

Half Precision OM S0A SIMD16 Render Target Data Payload

MDP_RTWH_MA16 - Half Precision OM S0A SIMD16 Render Target Data Payload

Size (in bits): 1536

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Source 0 Alpha
1.0-1.7	255:0	**oMask** Format: MDPR_OMASK Slots [15:0] oMask
2.0-2.7	255:0	**Red[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Red
3.0-3.7	255:0	**Green[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Green
4.0-4.7	255:0	**Blue[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Blue
5.0-5.7	255:0	**Alpha[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Alpha

Half Precision OM SIMD8 Dual Source Render Target Data Payload

MDP_RTWH_M8DS - Half Precision OM SIMD8 Dual Source Render Target Data Payload

Size (in bits): 1280

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**oMask** Format: MDPR_OMASK oMask for slots [7:0] and [15:8]. Operation selects upper or lower half.
1.0-1.7	255:0	**Red** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Red
2.0-2.7	255:0	**Green** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Green
3.0-3.7	255:0	**Blue** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Blue
4.0-4.7	255:0	**Alpha** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Alpha

Half Precision OM SIMD8 Render Target Data Payload

MDP_RTWH_M8 - Half Precision OM SIMD8 Render Target Data Payload

Size (in bits): 1280

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**oMask** Format: MDPR_OMASK Slots [7:0] oMask. Upper half ignored.
1.0-1.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red
2.0-2.7	255:0	**Green** Format: MDPR_H_SIMD8 Slots [7:0] Green
3.0-3.7	255:0	**Blue** Format: MDPR_H_SIMD8 Slots [7:0] Blue
4.0-4.7	255:0	**Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Alpha

Half Precision OM SIMD16 Render Target Data Payload

MDP_RTWH_M16 - Half Precision OM SIMD16 Render Target Data Payload

Size (in bits): 1280

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**oMask** Format: MDPR_OMASK Slots [15:0] oMask
1.0-1.7	255:0	**Red[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Red
2.0-2.7	255:0	**Green[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Green

Half Precision OS SIMD8 Dual Source Render Target Data Payload

MDP_RTWH_S8DS - Half Precision OS SIMD8 Dual Source Render Target Data Payload

Size (in bits): 1280

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Red** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Red
1.0-1.7	255:0	**Green** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Green
2.0-2.7	255:0	**Blue** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Blue
3.0-3.7	255:0	**Alpha** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Alpha
4.0-4.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] or [15:8] of Stencil

Half Precision OS SIMD8 Render Target Data Payload

MDP_RTWH_S8 - Half Precision OS SIMD8 Render Target Data Payload

Size (in bits): 1280

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red
1.0-1.7	255:0	**Green** Format: MDPR_H_SIMD8 Slots [7:0] Green
2.0-2.7	255:0	**Blue** Format: MDPR_H_SIMD8 Slots [7:0] Blue
3.0-3.7	255:0	**Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Alpha
4.0-4.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] Stencil

Half Precision OS SZ OM S0A SIMD8 Render Target Data Payload

MDP_RTWH_SZMA8 - Half Precision OS SZ OM S0A SIMD8 Render Target Data Payload

Size (in bits): 2048

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Source 0 Alpha
1.0-1.7	255:0	**oMask** Format: MDPR_OMASK Slots [7:0] oMask. Upper half ignored.
2.0-2.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red
3.0-3.7	255:0	**Green** Format: MDPR_H_SIMD8 Slots [7:0] Green
4.0-4.7	255:0	**Blue** Format: MDPR_H_SIMD8 Slots [7:0] Blue
5.0-5.7	255:0	**Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Alpha

MDP_RTWH_SZMA8 - Half Precision OS SZ OM S0A SIMD8 Render Target Data Payload

6.0-6.7	255:0	**Source Depth** Format: **MDP_DW_SIMD8** Slots [7:0] Source Depth
7.0-7.7	255:0	**Stencil** Format: **MDPR_STENCIL** Slots [7:0] Stencil

Half Precision OS SZ OM SIMD8 Dual Source Render Target Data Payload

MDP_RTWH_SZM8DS - Half Precision OS SZ OM SIMD8 Dual Source Render Target Data Payload

Size (in bits): 1792

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**oMask** Format: MDPR_OMASK oMask for slots [7:0] and [15:8]. Operation selects upper or lower half.
1.0-1.7	255:0	**Red** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Red
2.0-2.7	255:0	**Green** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Green
3.0-3.7	255:0	**Blue** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Blue
4.0-4.7	255:0	**Alpha** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Alpha
5.0-5.7	255:0	**Source Depth** Format: MDP_DW_SIMD8 Slots [7:0] or [15:8] of Source Depth

MDP_RTWH_SZM8DS - Half Precision OS SZ OM SIMD8 Dual Source Render Target Data Payload		
6.0-6.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] or [15:8] of Stencil

Half Precision OS SZ OM SIMD8 Render Target Data Payload

MDP_RTWH_SZM8 - Half Precision OS SZ OM SIMD8 Render Target Data Payload

Size (in bits):	1792
Default Value:	0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**oMask** Format: MDPR_OMASK Slots [7:0] oMask. Upper half ignored.
1.0-1.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red
2.0-2.7	255:0	**Green** Format: MDPR_H_SIMD8 Slots [7:0] Green
3.0-3.7	255:0	**Blue** Format: MDPR_H_SIMD8 Slots [7:0] Blue
4.0-4.7	255:0	**Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Alpha
5.0-5.7	255:0	**Source Depth** Format: MDP_DW_SIMD8 Slots [7:0] Source Depth

MDP_RTWH_SZM8 - Half Precision OS SZ OM SIMD8 Render Target Data Payload

6.0-6.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] Stencil

Half Precision OS SZ S0A SIMD8 Render Target Data Payload

MDP_RTWH_SZA8 - Half Precision OS SZ S0A SIMD8 Render Target Data Payload

Size (in bits): 1792

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Source 0 Alpha
1.0-1.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red
2.0-2.7	255:0	**Green** Format: MDPR_H_SIMD8 Slots [7:0] Green
3.0-3.7	255:0	**Blue** Format: MDPR_H_SIMD8 Slots [7:0] Blue
4.0-4.7	255:0	**Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Alpha
5.0-5.7	255:0	**Source Depth** Format: MDP_DW_SIMD8 Slots [7:0] Source Depth

MDP_RTWH_SZA8 - Half Precision OS SZ S0A SIMD8 Render Target Data Payload		
6.0-6.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] Stencil

Half Precision OS SZ SIMD8 Dual Source Render Target Data Payload

MDP_RTWH_SZ8DS - Half Precision OS SZ SIMD8 Dual Source Render Target Data Payload

Size (in bits): 1536

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Red** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Red
1.0-1.7	255:0	**Green** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Green
2.0-2.7	255:0	**Blue** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Blue
3.0-3.7	255:0	**Alpha** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Alpha
4.0-4.7	255:0	**Source Depth** Format: MDP_DW_SIMD8 Slots [7:0] or [15:8] of Source Depth
5.0-5.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] or [15:8] of Stencil

Half Precision OS SZ SIMD8 Render Target Data Payload

MDP_RTWH_SZ8 - Half Precision OS SZ SIMD8 Render Target Data Payload

Size (in bits): 1536

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red
1.0-1.7	255:0	**Green** Format: MDPR_H_SIMD8 Slots [7:0] Green
2.0-2.7	255:0	**Blue** Format: MDPR_H_SIMD8 Slots [7:0] Blue
3.0-3.7	255:0	**Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Alpha
4.0-4.7	255:0	**Source Depth** Format: MDP_DW_SIMD8 Slots [7:0] Source Depth
5.0-5.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] Stencil

Half Precision Replicated Pixel Render Target Data Payload Register

MDPR_H_RGBA - Half Precision Replicated Pixel Render Target Data Payload Register

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:16	**Green** Format: U16 Specifies the value of all slots' green channel.
	15:0	**Red** Format: U16 Specifies the value of all slots' red channel.
1	31:16	**Alpha** Format: U16 Specifies the value of all slots' alpha channel.
	15:0	**Blue** Format: U16 Specifies the value of all slots' blue channel.
2..7	191:0	**Reserved** Access: RO Format: MBZ

Half Precision Replicated SIMD16 Render Target Data Payload

MDP_RTWH_16REP - Half Precision Replicated SIMD16 Render Target Data Payload

Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**RGBA** Format: MDPR_H_RGBA RGBA for all slots [15:0]

Half Precision S0A SIMD8 Render Target Data Payload

MDP_RTWH_A8 - Half Precision S0A SIMD8 Render Target Data Payload

Size (in bits): 1280

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Source 0 Alpha
1.0-1.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red
2.0-2.7	255:0	**Green** Format: MDPR_H_SIMD8 Slots [7:0] Green
3.0-3.7	255:0	**Blue** Format: MDPR_H_SIMD8 Slots [7:0] Blue
4.0-4.7	255:0	**Alpha** Format: MDPR_H_SIMD8 Slots [7:0] Alpha

Half Precision S0A SIMD16 Render Target Data Payload

MDP_RTWH_A16 - Half Precision S0A SIMD16 Render Target Data Payload

Size (in bits): 1280

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Source 0 Alpha
1.0-1.7	255:0	**Red[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Red
2.0-2.7	255:0	**Green[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Green
3.0-3.7	255:0	**Blue[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Blue
4.0-4.7	255:0	**Alpha[15:0]** Format: MDPR_H_SIMD16 Slots [15:0] Alpha

Half Precision SIMD8 Dual Source Render Target Data Payload

MDP_RTWH_8DS - Half Precision SIMD8 Dual Source Render Target Data Payload

Size (in bits): 1024

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Red** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Red
1.0-1.7	255:0	**Green** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Green
2.0-2.7	255:0	**Blue** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Blue
3.0-3.7	255:0	**Alpha** Format: MDPR_DSH_SIMD8 Slots[7:0] or [15:8] of Src0 and Src1 Alpha

Half Precision SIMD8 Message Data Payload Register

MDPR_H_SIMD8 - Half Precision SIMD8 Message Data Payload Register

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:16	**Data1** Format: IEEE_FLOAT16 Specifies the slot 1 data in this payload register
	15:0	**Data0** Format: IEEE_FLOAT16 Specifies the slot 0 data in this payload register
1	31:16	**Data3** Format: IEEE_FLOAT16 Specifies the slot 3 data in this payload register
	15:0	**Data2** Format: IEEE_FLOAT16 Specifies the slot 2 data in this payload register
2	31:16	**Data5** Format: IEEE_FLOAT16 Specifies the slot 5 data in this payload register
	15:0	**Data4** Format: IEEE_FLOAT16 Specifies the slot 4 data in this payload register
3	31:16	**Data7** Format: IEEE_FLOAT16 Specifies the slot 7 data in this payload register
	15:0	**Data6** Format: IEEE_FLOAT16 Specifies the slot 6 data in this payload register

MDPR_H_SIMD8 - Half Precision SIMD8 Message Data Payload Register		
4..7	127:0	**Reserved** Access: RO Format: MBZ

Half Precision SIMD8 Render Target Data Payload

MDP_RTWH_8 - Half Precision SIMD8 Render Target Data Payload

Size (in bits): 1024

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Red** Format: MDPR_H_SIMD8 Slots [7:0] Red

Hardware-Detected Error Bit Definitions

Hardware-Detected Error Bit Definitions

Source: RenderCS

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:8	**Reserved** Access: RO Format: MBZ
	7	**Reserved**
	6:3	**Reserved** Access: RO Format: MBZ
	2	**Command Privilege Violation Error** This bit is set if a command classified as privileged is parsed in a non-privileged batch buffer. The command will be converted to a NOOP and parsing will continue.
	1	**Reserved** Access: RO Format: MBZ
	0	**Instruction Error** This bit is set when the Renderer Instruction Parser detects an error while parsing an instruction. Instruction errors include: • Client ID value (Bits 31:29 of the Header) is not supported (only MI, 2D and 3D are supported). • Defeatured MI Instruction Opcodes: Value: 1 — Name: — Description: Instruction Error detected **Programming Notes** This error indications cannot be cleared except by reset (i.e., it is a fatal error).

HCP_PAK_INSERT_OBJECT_INDIRECT_PAYLOAD

HCP_PAK_INSERT_OBJECT_INDIRECT_PAYLOAD

Source: VideoCS

Size (in bits): 128

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**Indirect Payload Data Size in bits** Format: U32 Number of bits to be inserted. Not including those skipped bytes in the beginning. For VP9: the Data is always valid from start of cache-line, no offset is allowed.
1..2	63:0	**Indirect Payload Base Address** Format: SplitBaseAddress64ByteAligned 48-bit address of the indirect payload data in memory buffer. **Programming Notes** Payload must begin in a byte position, but the payload can be ended in a bit position.
3	31:0	**Indirect Payload Base Address** Format: MemoryAddressAttributes

HCP_REF_LIST_ENTRY

HCP_REF_LIST_ENTRY

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15	**bottom_field_flag** Format: U1 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. Value / Name: 0 – Bottom Field 1 – Top Field Programming Notes: Not supported in encoder mode.
	14	**field_pic_flag** Format: U1 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. Value / Name: 0 – Video Frame 1 – Video Field Programming Notes: Not supported in encoder mode.
	13	**LongTermReference** Format: U1 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. Value / Name: 0 – Short term reference 1 – Long term reference

HCP_REF_LIST_ENTRY

	12	**luma_weight_lX_flag** Format: U1 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. **Value** / **Name** 0 – Default weighted prediction for luma 1 – Explicit weighted prediction for Luma
	11	**chroma_weight_lX_flag** Format: U1 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. **Value** / **Name** 0 – Default weighted prediction for Chroma 1 – Explicit weighted prediction for Chroma
	10:8	**list_entry_lX: Reference Picture Frame ID (RefAddr[0-7])** Format: U3 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. The reference picture frame ID identifies the reference picture associated with the base addressdefined in **Reference Picture Address (RefAddr[0-7])** in the HCP_PIPE_BUF_ADDR_STATE command.
	7:0	**Reference Picture tb Value** Format: U8 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. clip(-128,127, CurrentPOC - RefPOC), where RefPOC is the POC value of the reference picture. 8-bit signed. See the "Derivation process for temporal luma motion vector prediction" in the HEVC standard.

HCP_TILE_POSITION_IN_CTB

HCP_TILE_POSITION_IN_CTB		
Size (in bits): 32 Default Value: 0x00000000		
DWord	**Bit**	**Description**
0	31:24	**CtbPos3+i** Format: U8
	23:16	**CtbPos2+i** Format: U8
	15:8	**CtbPos1+i** Format: U8
	7:0	**CtbPos0+i** Format: U8

HCP_TILE_POSITION_IN_CTB_MSB

HCP_TILE_POSITION_IN_CTB_MSB		
Size (in bits):	64	
Default Value:	0x00000000, 0x00000000	
Added to support 16k picture size.		
DWord	**Bit**	**Description**
0..1	63:44	**Reserved** Access: RO Format: MBZ
	43:42	**Ctb position of tile 21 [9:8]** MSB 2 bits of CTB row position of tile row 21. **Programming Notes** Please note that this field is MBZ for columns

	13:12	**Ctb row position of tile column 6 [9:8]** MSB 2 bits of CTB row or column position of tile row or column 6.
	11:10	**Ctb row position of tile column 5 [9:8]** MSB 2 bits of CTB row or column position of tile row or column 5.
	9:8	**Ctb row position of tile column 4 [9:8]** MSB 2 bits of CTB row or column position of tile row or column 4.
	7:6	**Ctb row position of tile column 3 [9:8]** MSB 2 bits of CTB row or column position of tile row or column 3.
	5:4	**Ctb row position of tile column 2 [9:8]** MSB 2 bits of CTB row or column position of tile row or column 2.
	3:2	**Ctb row position of tile column 1 [9:8]** MSB 2 bits of CTB row or column position of tile row or column 1.
	1:0	**Ctb row position of tile column 0 [9:8]** MSB 2 bits of CTB row or column position of tile row or column 0.

HCP_WEIGHTOFFSET_CHROMA_ENTRY

HCP_WEIGHTOFFSET_CHROMA_ENTRY

Source: VideoCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:24	**ChromaOffsetLX [i][1]** Where X is the RefPicListNum and i is the list entry number 0 through 15. DW 18corresponds to i=0, DW 33 corresponds to i=15. Valid only if explicit weighted prediction for chroma is enabled, otherwise must be zero. **Programming Notes** This (combined with its MSbyte below) shall be in the range of -WpOffsetHalfRangeC to (WpOffsetHalfRangeC - 1), inclusive WpOffsetHalfRangeC = 1 « (high_precision_offsets_enabled_flag ? (BitDepthC - 1) : 7)
	23:16	**delta_chroma_weight_lX[i][1]** Format: S7 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW 18 corresponds to i=0, DW 33 corresponds to i=15. Valid only if explicit weighted prediction for chroma is enabled, otherwise must be zero. **Programming Notes** This shall be in the range of 128 to 127, inclusive
	15:8	**ChromaOffsetLX[i][0]** Where X is the RefPicListNum and i is the list entry number 0 through 15. DW 18 corresponds to i=0, DW 33 corresponds to i=15. Valid only if explicit weighted prediction for chroma is enabled, otherwise must be zero. **Programming Notes** This (combined with its MSbyte below) shall be in the range of -WpOffsetHalfRangeC to (WpOffsetHalfRangeC - 1), inclusive WpOffsetHalfRangeC = 1 « (high_precision_offsets_enabled_flag ? (BitDepthC - 1) : 7)
	7:0	**delta_chroma_weight_lX[i][0]** Format: S7 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW 18 corresponds to i=0, DW 33 corresponds to i=15. Valid only if explicit weighted prediction for chroma is enabled, otherwise must be zero.

HCP_WEIGHTOFFSET_CHROMA_ENTRY		
		Programming Notes
		This shall be in the range of 128 to 127, inclusive

HCP_WEIGHTOFFSET_CHROMA_EXT_ENTRY

HCP_WEIGHTOFFSET_CHROMA_EXT_ENTRY		
Source:	VideoCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:24	**ChromaOffsetLX[i+1][1] MSByte** To support 4:4:4, the chroma offsetisextended into 16-bit. In order to keep SW back compatible, the most significant byte is programmed here. **Programming Notes** This is only MSByte portion of ChromaOffsetLX. Please refer to LSB section for available range.
	23:16	**ChromaOffsetLX[i][1] MSByte** To support 4:4:4, the chroma offsetisextended into 16-bit. In order to keep SW back compatible, the most significant byte is programmed here. **Programming Notes** This is only MSByte portion of ChromaOffsetLX. Please refer to LSB section for available range.
	15:8	**ChromaOffsetLX[i+1][0] MSByte** To support 4:4:4, the chroma offsetisextended into 16-bit. In order to keep SW back compatible, the most significant byte is programmed here. **Programming Notes** This is only MSByte portion of ChromaOffsetLX. Please refer to LSB section for available range.
	7:0	**ChromaOffsetLX[i][0] MSByte** To support 4:4:4, the chroma offsetisextended into 16-bit. In order to keep SW back compatible, the most significant byte is programmed here. **Programming Notes** This is only MSByte portion of ChromaOffsetLX. Please refer to LSB section for available range.

HCP_WEIGHTOFFSET_LUMA_ENTRY

HCP_WEIGHTOFFSET_LUMA_ENTRY		
Source:	VideoCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:24	**luma_offset_lX[i] MSByte** To support 4:4:4, the luma offsetisextended into 16-bit. In order to keep SW back compatible, the most significant byte is programmed here. **Programming Notes** This is only MSByte portion of luma_offset_lX. Please refer to LSB section for available range.
	23:16	**Reserved** Access: RO Format: MBZ
	15:8	**luma_offset_lX[i]** Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. Valid only if explicit weighted prediction for luma is enabled, otherwise must be zero. **Programming Notes** This (combined with it MSbyte above) shall be in the range of$WpOffsetHalfRange_Y$ to $WpOffsetHalfRange_Y$1,where $WpOffsetHalfRange_Y = 1 \ll (high\_precision\_offsets\_enabled\_flag ? (BitDepth_Y 1) : 7)$
	7:0	**delta_luma_weight_lX[i]** Format: S7 Where X is the RefPicListNum and i is the list entry number 0 through 15. DW2 corresponds to i=0, DW17 corresponds to i=15. Valid only if explicit weighted prediction for luma is enabled, otherwise must be zero. **Programming Notes** When luma_weight_l0_flag[i] is equal to 1, the value of delta_luma_weight_l0[i] shall be in the range of 128 to 127, inclusive.

Header

Header		
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15:12	**SWSB[7:4]** Format: SWSB[7:4] This field specify the Software Scoreboard information.
	11:8	**SWSB[3:0]** Format: SWSB[3:0] This field specify the Software Scoreboard information.
	7	**Reserved** Format: MBZ
	6:0	**Opcode** Format: EU_OPCODE This field determines the operation performed by the instruction.

Header Forbidden Message Descriptor Control Field

MDC_MHF - Header Forbidden Message Descriptor Control Field

Size (in bits): 1

Default Value: 0x00000000

DWord	Bit	Description
0	0	**Message Header Present** Indicates the message forbids a message header.

Value	Name	Description
0h	No **[Default]**	Message header is not present
1h	Reserved	Not used

Header Present Message Descriptor Control Field

MDC_MHP - Header Present Message Descriptor Control Field

Size (in bits): 1

Default Value: 0x00000000

DWord	Bit	Description
0	0	**Message Header Present** Format: Boolean Specifies if the message uses the optional message header. Value / Name / Description: 0h / No / Message header is not present 1h / Yes / Message header is present

Header Required Message Descriptor Control Field

MDC_MHR - Header Required Message Descriptor Control Field

Size (in bits): 1

Default Value: 0x00000001

DWord	Bit	Description
0	0	**Message Header Present** Format: Boolean Indicates the message requires a message header. Value / Name / Description 0h / Reserved / Not used 1h / Yes **[Default]** / Message header is present

HEVC_ARBITRATION_PRIORITY

HEVC_ARBITRATION_PRIORITY

Size (in bits): 2

Default Value: 0x00000000

This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.

DWord	Bit	Description
0	1:0	**Priority** Format: U2 Value / Name: 00b — Highest priority 01b — Second highest priority 10b — Third highest priority 11b — Lowest priority

HEVC_VP9_RDOQ_LAMBDA_FIELDS

HEVC_VP9_RDOQ_LAMBDA_FIELDS		
Source:	VideoCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:16	**LambdaValue1** Lambda value for Intra/Inter Luma/Chroma component of QP=1, 3, , 61, 63...73,75 (odd number) For 12-bit video, the QP range has extended to include 65 to 75. for HEVC
	15:0	**LambdaValue0** Lambda value for Intra/Inter Luma/Chroma component of QP=0, 2, , 60, 62,...72,74(even number) For 12-bit video, the QP range has extended to include 64to 74. for HEVC

HUC_VIRTUAL_ADDR_REGION

HUC_VIRTUAL_ADDR_REGION		
Source:	VideoCS	
Size (in bits):	96	
Default Value:	0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..2	95:64	**HUC Surface (VirtualAddrRegion[0-15])** Format: **MemoryAddressAttributes**
	63:0	**HUC Surface Base Address (VirtualAddrRegion[0-15])** Format: **SplitBaseAddress4KByteAligned** HUC surface base address for each virtual address region [0-15].

HW Generated BINDING_TABLE_STATE

HW Generated BINDING_TABLE_STATE		
Size (in bits):	16	
Default Value:	0x00000000	
The binding table binds surfaces to logical resource indices used by shaders and other compute engine kernels. The HW generated Binding_Table_State have different format than the SW generated Binding_Table_State. The HW generated Binding_Table_State is stored as an array of 256 elements, each of which contains one word as defined here. The start of each element is spaced one word apart. The first element of the binding table is aligned to a 64-byte boundary. Binding table indexes beyond 256 will automatically be mapped to entry 0 by the HW, w/ the exception of any messages which support the special indexes 240 through 255, inclusive.		
DWord	**Bit**	**Description**
0	15:0	**Surface State Pointer** Format: SurfaceStateOffset[21:6]

Hword 1 Block Data Payload

MDP_HW1 - Hword 1 Block Data Payload		
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Hword** Format: U256 Specifies the Hword data

Hword 2 Block Data Payload

MDP_HW2 - Hword 2 Block Data Payload		
Size (in bits):	512	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Hword0** Format: U256 Specifies the Hword data for element 0
1.0-1.7	255:0	**Hword1** Format: U256 Specifies the Hword data for element 1

Hword 4 Block Data Payload

MDP_HW4 - Hword 4 Block Data Payload		
Size (in bits):	1024	
Default Value:	0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Hword0** Format: U256 Specifies the Hword data for element 0
1.0-1.7	255:0	**Hword1** Format: U256 Specifies the Hword data for element 1
2.0-2.7	255:0	**Hword2** Format: U256 Specifies the Hword data for element 2
3.0-3.7	255:0	**Hword3** Format: U256 Specifies the Hword data for element 3

Hword 8 Block Data Payload

MDP_HW8 - Hword 8 Block Data Payload		
Size (in bits):	2048	
Default Value:	0x00000000, 0x00000000	

DWord	Bit	Description
0.0-0.7	255:0	**Hword0** Format: U256 Specifies the Hword data for element 0
1.0-1.7	255:0	**Hword1** Format: U256 Specifies the Hword data for element 1
2.0-2.7	255:0	**Hword2** Format: U256 Specifies the Hword data for element 2
3.0-3.7	255:0	**Hword3** Format: U256 Specifies the Hword data for element 3
4.0-4.7	255:0	**Hword4** Format: U256 Specifies the Hword data for element 4
5.0-5.7	255:0	**Hword5** Format: U256 Specifies the Hword data for element 5

MDP_HW8 - Hword 8 Block Data Payload		
6.0-6.7	255:0	**Hword6** Format: U256 Specifies the Hword data for element 6
7.0-7.7	255:0	**Hword7** Format: U256 Specifies the Hword data for element 7

Hword Channel Mode Message Header Control

MHC_A64_CMODE - Hword Channel Mode Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:0	**Reserved** Access: RO Format: MBZ

Hword Register Blocks Message Descriptor Control Field

MDC_DB_HW - Hword Register Blocks Message Descriptor Control Field

Size (in bits): 2

Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**Register Blocks** Specifies the number of Hword blocks to be read or written

Value	Name	Description
00h	HW1	1 Hword register
01h	HW2	2 Hword registers
02h	HW4	4 Hword registers
03h	HW8	8 Hword registers

Ignored Message Header

MH_IGNORE - Ignored Message Header		
Source:	EuSubFunctionDataPort0	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
Some messages require a message header or have an optional message header, but do not use any information in the header.		
DWord	**Bit**	**Description**
0..7	255:0	**Reserved** Access: RO Format: MBZ

IndirectOperand

IndirectOperand		
Size (in bits):	14	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	13:10	**AddrSubRegNum** Format: AddrSubRegNum
	9:0	**AddrImm** Format: S9 This field defines a 10-bit signed integer offset in units of byte, only used with the Indirect Addressing Mode. In that addressing mode, the Address Immediate Offset value is added to an address subregister value to determine the operand's address in the GRF.

Inline Data Description for MFD_AVC_BSD_Object

Inline Data Description for MFD_AVC_BSD_Object

Source: VideoCS

Size (in bits): 96

Default Value: 0x00000000, 0x00000000, 0x00000000

This structure includes all the required Slice Header parameters and error handling settings for AVC_BSD_OBJECT Command (DW3..DW5).

DWord	Bit	Description
0	31	**Concealment Method** This field specifies the method used for concealment when error is detected. If set, a copy from collocated macroblock location is performed from the concealment reference indicated by the ConCeal_Pic_Id field. If it is not set, a copy from the current picture is performed using Intra 16x16 Prediction method. Value / Name / Description: 0 / / Intra 16x16 Prediction 1 / / Inter P Copy
	30	**Init Current MB Number** When set, the current Slice_Start_MB_Num, Slice_MB_Start_Hor_Pos and Slice_MB_Start_Vert_Pos fields will be used to initialize the Current_MB_Number register.This effectively disables the concealment capability.
	29	**Intra PredMode (4x4/8x8 Luma) Error Control Bit** This field controls if AVC decoder will fix Intra Prediction Mode if the decoded value is incorrect according to MB position Value / Name / Description: 0 / / AVC decoder will detect and fix IntraPredMode (4x4/8x8 Luma) Errors. 1 / / AVC decoder will NOT detect IntraPredMode (4x4/8x8 Luma) Errors. The wrong IntraPredMode value will be retaind.
	28:27	**MB Error Concealment B Temporal Prediction mode** These two bits control how the reference L0/L1 are overridden in B temporal slice. Value / Name / Description: 00b / **[Default]** / Both Reference Indexes L0/L1 are forced to 0 during Concealment 01b / / Only Reference Index L1 is forced to 0; Reference Index L0 is forced to -1 10b / / Only Reference Index L0 is forced to 0; Reference Index L1 is forced to -1 11b / Reserved / Invalid
	26	**Reserved** Access: RO Format: MBZ

Inline Data Description for MFD_AVC_BSD_Object

25 — MB Error Concealment B Temporal Motion Vectors Override Enable Flag

During MB Error Concealment on B slice with Temporal Direct Prediction, motion vectors are forced to 0 to improve image quality.This bit can be set to preserve the original weight prediction.

Value	Name	Description
0	**[Default]**	Predicted Motion Vectors are used during MB Concealment
1		Motion Vectors are Overridden to 0 during MB Concealment

24 — MB Error Concealment B Temporal Weight Prediction Disable Flag

During MB Error Concealment on B slice with Temporal Direct Prediction, weight prediction is disabled to improve image quality.This bit can be set to preserve the original weight prediction.

Value	Name	Description
0	**[Default]**	Weight Prediction is Disabled during MB Concealment
1		Weight Prediction will not be overridden during MB Concealment

1 Intra 8x8/4x4 Prediction Error Concealment Control Bit

This field controls if AVC goes into MB concealment mode (next MB) when an error is detected on Intra8x8/4x4 Prediction Mode (these 2 modes have fixed coding so it may not affect the bitstream.

Value	Name	Description
0		AVC decoder will NOT go into MB concealment when Intra8x8/4x4 Prediction mode is incorrect.
1		AVC decoder will go into MB concealment when Intra8x8/4x4 Prediction mode is incorrect.

0 Intra Prediction Error Control Bit (applied to Intra16x16/Intra8x8/Intra4x4 Luma and Chroma)

This field controls if AVC decoder will fix Intra Prediction Mode if the decoded value is incorrect according to MB position.

Value	Name	Description
0		AVC decoder will detect and fix Intra Prediction Mode Errors.
1		AVC decoder will retain the Intra Prediction value decoded from bitstream.

21 DCT Type

This field specifies the DCT type of the current macroblock. The kernel should ignore this field when processing Cb/Cr data. See ISO/IEC 13818-2 #167;6.3.17.1. This field is zero if Coded Block Pattern is also zero (no coded blocks present).

Value	Name	Description
0	MC_FRAME_DCT	Macroblock is frame DCT coded
1	MC_FIELD_DCT	Macroblock is field DCT coded

20:19 Reserved

Access:	RO
Format:	MBZ

18 Macroblock Motion Backward

This field specifies if the backward motion vector is active. See ISO/IEC 13818-2 Tables B-2 through B-4.

Value	Name
0	No backward motion vector
1	Use backward motion vector(s)

17 Macroblock Motion Forward

This field specifies if the forward motion vector is active. See ISO/IEC 13818-2 Tables B-2 through B-4.

Value	Name
0	No forward motion vector
1	Use forward motion vector(s)

16 Macroblock Intra Type

This field specifies if the current macroblock is intra-coded. When set, Coded Block Pattern is ignored and no prediction is performed (i.e., no motion vectors are used). See ISO/IEC 13818-2 Tables B-2 through B-4.

Value	Name
0	Non-intra macroblock
1	Intra macroblock

0	31:6	**Kernel Start Pointer** Format: InstructionBaseOffset[31:6] Specifies the 64-byte aligned address offset of the first instruction in the kernel. This pointer is relative to the **Instruction Base Address.**
	5:0	**Reserved** Access: RO Format: MBZ
1	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Kernel Start Pointer High** Format: InstructionBaseOffset[47:32] This field specifies the high 16 bits of starting address of the Kernel Pointer.
2	31:21	**Reserved** Access: RO Format: MBZ
	20	**Thread Preemption disable** This field specifies whether, when dispatched, the thread is allowed to stop in middle on receiving mid-thread pre-emption request. Value / Name / Description 0h / Disable **[Default]** / Thread is pre-empted on receiving pre-emption indication. 1h / Enable / Thread is preempted only in case of page-fault.
	19	**Denorm Mode** This field specifies how Float denormalized numbers are handles in the dispatched thread. Value / Name / Description 0h / Ftz / Float denorms will be flushed to zero when appearing as inputs; denorms will never come out of instructions. Double precision float and half precision float numbers are not flushed to zero. 1h / SetByKernel / Denorms will be handled in by kernel.

INTERFACE_DESCRIPTOR_DATA

18 Single Program Flow

Specifies whether the kernel program has a single program flow (SIMDnxm with m = 1) or multiple program flows (SIMDnxm with m > 1).

Value	Name
0h	Multiple
1h	Single

17 Thread Priority

Specifies the priority of the thread for dispatch.

Value	Name
0h	Normal Priority
1h	High Priority

16 Floating Point Mode

Specifies the floating point mode used by the dispatched thread.

Value	Name
0h	IEEE-754
1h	Alternate

15:14 Reserved

Access:	RO
Format:	MBZ

13 Illegal Opcode Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[12] (note the bit # difference). See *Exceptions and ISA Execution Environment*.

12 Reserved

Access:	RO
Format:	MBZ

11 Mask Stack Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[11]. See *Exceptions and ISA Execution Environment*.

10:8 Reserved

Access:	RO
Format:	MBZ

7 Software Exception Enable

Format:	Enable

This bit gets loaded into EU CR0.1[13] (note the bit # difference). See *Exceptions and ISA Execution Environment*.

INTERFACE_DESCRIPTOR_DATA

	6:0	**Reserved** Access: RO Format: MBZ
3	31:5	**Sampler State Pointer** Format: DynamicStateOffset[31:5]SAMPLER_STATE Specifies the 32-byte aligned address offset of the sampler state table. This pointer is relative to the **Dynamic State Base Address.***This field is ignored for child threads.*
	4:2	**Sampler Count** Format: U3 Specifies how many samplers (in multiples of 4) the kernel uses. Used only for prefetching the associated sampler state entries. *This field is ignored for child threads. If this field is not zero, sampler state is prefetched for the first instance of a root thread upon the startup of the media pipeline.*

Value	Name
[0,4]	
0h	No samplers used
1h	Between 1 and 4 samplers used
2h	Between 5 and 8 samplers used
3h	Between 9 and 12 samplers used
4h	Between 13 and 16 samplers used

	1:0	**Reserved** Access: RO Format: MBZ
4	31:16	**Reserved** Access: RO Format: MBZ
	15:5	**Binding Table Pointer**

Format:	SurfaceStateOffset[15:5]SW Generated BINDING_TABLE_STATE*256 When HW Binding Table Alignment is alignment is clear.
Format:	SurfaceStateOffset[16:6]SW Generated BINDING_TABLE_STATE*256 [] When Binding Table Pool is Enabled.
Format:	SurfaceStateOffset[18:8]SW Generated BINDING_TABLE_STATE*256 When HW Binding Table Alignment is alignment set to 512KB size

Description
Specifies a pointer offset into the binding table. *This field is ignored for child threads.* • When Binding Table Pool is Disabled, this pointer is relative to the **Surface State Base Address**.

- When Binding Table Pool is Enabled, this pointer is relative to the **Binding Table PoolBase Address**.

4:0 **Binding Table Entry Count**

Format:	U5

Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state.*This field is ignored for child threads.If this field is not zero, binding table and surface state are prefetched for the first instance of a root thread upon the startup of the media pipeline.*

Value	Name
[0,31]	

Programming Notes
The maximum number of prefetched binding table entries is limited to 31. For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache.

5 31:16 **Constant/Indirect URB Entry Read Length**

Format:	U16

Specifies the amount of URB data read and passed in the thread payload for the Constant orIndirect URB entry, in 8-DW register increments. A value 0 means that no Constant or IndirectURB Entry will be loaded. The Constant URB Entry Read Offset field will then be ignored.In GPGPU mode this describes how much data is delivered in a single dispatch. Multiple dispatchesin a thread group will deliver constant data offset by this value. The total amount of constantdata is (Constant URB Read Length * Number of Threads in GPGPU Thread Group + Cross-ThreadConstant Data Read Length).

If **Cross-Thread Constant Data Read Length** for Indirect is greater than 0,then this field must also be greater than 0. The allowed combinations are:

Constant/Indirect URB Entry Read Length**Entry Read Length**	Cross-Thread Constant **Data Read Length**	Notes
=0	=0	No Payload
>0	=0	Per-thread payload only
>0	>0	Both kinds of payload
=0	>0	Only for CURBE payloads

Value	Name
[0,63]	

INTERFACE_DESCRIPTOR_DATA

15:0 Constant URB Entry Read Offset

Format:	U16

Specifies the offset (in 8-DW units) at which Constant URB data is to be read from the URB before being included in the thread payload.

Value	Name	Description
[0,1983]		Indicating [0,1983] 256-bit register increments. ROB has 64KB of storage; 2048 entries. However, lowest 64 entries are reserved for VFE/TS to store interface descriptor data. Hence, (URB Entry Read Offset + Read Length) shall not exceed 1984.

6 31:24 Reserved

Access:	RO
Format:	MBZ

23:22 Rounding Mode

Format:	U2

Value	Name	Description
00b	RTNE **[Default]**	Round to Nearest Even
01b	RU	Round toward +Infinity
10b	RD	Round toward -Infinity
11b	RTZ	Round toward Zero

21 Barrier Enable

Format:	Enable

This field specifies whether the thread group requires a barrier. If not, it can be dispatched without allocating one.

20:16 Shared Local Memory Size

Format:	U5

This field indicates how much Shared Local Memory the thread group requires. The amount is specified in 4k blocks, but only powers of 2 are allowed: 0, 4k, 8k, 16k, 32k and 64k per half-slice.

uses a different encoding to allow encodings for the new 1k and 2k SLM sizes.

Value	Name	Description
0	Encodes 0K	No SLM used
1	Encodes 1K	
2	Encodes 2K	
3	Encodes 4K	
4	Encodes 8K	

5	Encodes 16K	
6	Encodes 32K	
7	Encodes 64K	

15 — Reserved

Access:	RO
Format:	MBZ

14:13 — Over Dispatch Control

Format:	U2

Over Dispatch Control that enables and controls the amount of GPGPU thread over dispatch.

Value	Name
00b	None **[Default]**
11b	Normal
01b	Low
10b	High

Restriction
Set this over dispatch control to None if Mid Thread Preemption is used.

12:10 — Reserved

Access:	RO
Format:	MBZ

9:0 — Number of Threads in GPGPU Thread Group

Format:	U10

Specifies the number of threads that are in this thread group.

Value	Name	Description
[1,112]		The minimum value is 1, while the maximum value is the number of threads in two subslices for local barriers. See vol1b Configurations for the number of threads per subslice for different products.

7 — 31:8 Reserved

Access:	RO
Format:	MBZ

7:0 — Cross-Thread Constant Data Read Length

Format:	U8

Specifies the amount of constant data in CURBE in 8-DW register increments which will be sent to every thread in the thread group in addition to the per thread ids specified by **Constant URB Entry Read Length**.

Value	Name
[0,127]	

INTERRUPT

INTERRUPT

Size (in bits): 128

Default Value: 0x00000000, 0xFFFFFFFF, 0x00000000, 0x00000000

See the Interrupt Definition Tables to find the source event for each interrupt bit.There are multiple instances of this register format.

DWord	Bit	Description
0	31:0	**ISR** Access: RO These are the Interrupt Status Register Bits.This field contains the non-persistent values of the interrupt status bits.The IMR selects which of these interrupt conditions are reported in the persistent IIR **Value** / **Name** 0b – Condition Doesn't exist 1b – Condition Exists **Restriction** Some inputs to this register are short pulses. Do not use this register to sample these conditions.
1	31:0	**IMR** Access: R/W These are the Interrupt Mask Register Bits.This field contains a bit mask which selects which interrupt bits from the ISR are reported in the IIR. **Value** / **Name** FFFFFFFFh – All interrupts masked **[Default]** 0b – Not Masked 1b – Masked
2	31:0	**IIR** Access: R/WC These are the Interrupt Identity Register Bits.This field holds the persistent values of the interrupt bits from the ISR which are unmasked by the IMR.The IER enables an interrupt to be generated when the corresponding bit in the IIR becomes set. A disabled interrupt will still appear in the IIR.Bits set in this register will remain set (persist) until the interrupt condition is cleared by writing a '1' to the appropriate bits. **Value** / **Name** 0b – Condition Not Detected 1b – Condition Detected

<table>
<tr><th colspan="3">INTERRUPT</th></tr>
<tr><td></td><td></td><td>
<table>
<tr><th>Programming Notes</th></tr>
<tr><td>For each bit, the IIR can store a second pending interrupt if two or more of the same interrupt conditions occur before the first condition is cleared. Upon clearing the first interrupt, the IIR bit will momentarily go low, then return high to indicate there is second interrupt pending.</td></tr>
</table>
</td></tr>
<tr><td>3</td><td>31:0</td><td>IER
<table>
<tr><td>Access:</td><td>R/W</td></tr>
</table>
These are the Interrupt Enable Register Bits.The field enables an interrupt to be generated when the corresponding bit in the IIR becomes set. A disabled interrupt will still appear in the IIR.

LRI Data Entry

LRI_DATA - LRI Data Entry

Source:	RenderCS
Size (in bits):	64
Default Value:	0x00000000, 0x00000000

Each LRI command header is followed by LRI_DATA entries. Each of these entries is a pair of Dwords: the MMIO register address and the data to be written.

DWord	Bit	Description
0..1	63:55	**Reserved** Access: RO Format: MBZ
	54:32	**MMIO** Format: U23 **Programming Notes** Bits [1:0] MBZ
	31:0	**Data** Format: U32

MacroOperand

MacroOperand		
Size (in bits):	14	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	13:6	**RegNum** Format: U8 This field provide the register number for the operand. For a GRF register, is the part of a register address that aligns to a 256-bit (32-byte) boundary. For an ARF register, this field is encoded such that MSBs identify the architecture register type and LSBs provide the register number. An ARF register can only be destination or Source 0. Any Source 1 or Source 2 operands cannot be ARF registers. RegNum and SubRegNum together provide the byte-aligned address for the origin of a register region. RegNum provides bits 12:5 of that address. This field applies to both source and destination operands.
	5	**Reserved** Access: RO Format: MBZ
	4:1	**SpecialAccNum** This field specifies the accumulator numbers used by the IEEE macro instructions (madm and math.invm/math.rsqtm).The 8 special accumulators, acc2 to acc9 are encoded consecutively from 0000b to 0111b and noacc, indicating no special accumulator used is encoded as 1000b
	0	**RegFile** This field indicate whether Architecture register file or General register file are selected. **Value** / **Name** / **Description** 0 / ARF / Architecture Register File.Only allowed for Source 0 or Destination. 1 / GRF / General Register File. Allowed for any Source or Destination.

Manageability Engine Interrupt Vector

CSME_INTR_VEC - Manageability Engine Interrupt Vector

Size (in bits): 16

Default Value: 0x00000000

DWord	Bit	Description
0	15:2	**Reserved** Access: RO Format: MBZ
	1	**CSME Response** Format: U1 CSME sets this bit in the interrupt when responding to GuC initiated transaction for: • Response to wake up request from GuC • Payload message sent toto ME_MESG, ME_DATA for a GuC request
	0	**CSME Request** Format: U1 CSME sets this bit in the interrupt when CSME initiates the transaction for: • CSME to GuC wake up request • Payload message sent toto ME_MESG, ME_DATA for CMSE initiated request

MEDIA_SURFACE_STATE

MEDIA_SURFACE_STATE

Exists If:	//([MessageType] == 'Deinterlace') OR ([MessageType] == 'Sample_8x8')
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This is the SURFACE_STATE used by only deinterlace, sample_8x8, and VME messages.

DWord	Bit	Description
0	31:30	**Rotation** Value / Name: 00b — No Rotation or 0 Degree 01b — 90 Degree Rotation 10b — 180 Degree Rotation 11b — 270 Degree Rotation **Programming Notes** Rotation is only supported only with AVS function messages and not with HDC direct write and 16x8 AVS messages.
	29:27	**Reserved** Access: RO Format: MBZ
	26:20	**X Offset** Exists If: //[Surface Format] is one of Planar Formats Format: U7 This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the surface.This field effectively loosens the alignment restrictions on the origin of tiled surfaces. Previously, tiled surface origin was (by definition) located at the base address, and thus needed to satisfy the 4KB base address alignment restriction. Now the origin can be specified at a finer (4-wide x 4-high pixel) resolution. Value / Name / Description: [0,127] — In multiples of 4 (low 2 bits missing) **Programming Notes** For linear surfaces and Packed Formats, this field must be zero. For **Surface Format** with 8 bits per element, this field must be a multiple of 16. For **Surface Format** with 16 bits per element, this field must be a multiple of 8.

MEDIA_SURFACE_STATE

	19:16	**Y Offset** Exists If: //[Surface Format] is one of Planar Formats Format: U4 This field specifies the vertical offset in rows from the **Surface Base Address** to the start of the surface. (See additional description in the **X Offset** field) **Value** / **Name** / **Description** [0,15] / / In multiples of 4 (low two bits missing) **Programming Notes** For linear surfaces and Packed Formats, this field must be zero.
	15:12	**Reserved** Access: RO Format: MBZ
	11:0	**Reserved** Access: RO Format: MBZ
1	31:18	**Height** Format: U14-1 This field specifies the height of the surface in units of pixels. For PLANAR surface formats, this field indicates the height of the Y (luma) plane. **Value** / **Name** / **Description** [0,16383] / / representing heights [1,16384] **Programming Notes** Height (field value + 1) must be a multiple of 2 for PLANAR_420 surfaces. If Vertical Line Stride is 1, this field indicates the height of the field, not the height of the frame.
	17:4	**Width** Format: U14-1 This field specifies the width of the surface in units of pixels. For PLANAR surface formats, this field indicates the width of the Y (luma) plane. **Value** / **Name** / **Description** [0,16383] / / representing widths [1,16383] **Programming Notes** • The Width specified by this field multiplied by the pixel size in bytes must be less than or equal to the surface pitch (specified in bytes via the Surface Pitch field). • Width (field value + 1) must be a multiple of 2 for PLANAR_420, PLANAR_422, and all YCRCB_* and Y16_UNORM surfaces, and must be a multiple of 4 for PLANAR_411 and Y8_UNORM_VA surfaces.

		• For deinterlace messages, the Width (field value + 1) must be a multiple of 8. Width (field value + 1) must be a multiple of 2 for PLANAR_420_16 For Y16_UNORM format width should be in multiple of 2
	3:2	**Picture Structure** Specifies the encoding of the current picture. Value: 00b – Frame Picture Value: 01b – Top Field Picture Value: 10b – Bottom Field Picture Value: 11b – Invalid, not allowed
	1:0	**Cr(V)/Cb(U) Pixel Offset V Direction** Default Value: 0 Format: U0.2 Specifies the distance to the U/V values with respect to the even numbered Y channels in the V direction Programming Notes: This field is ignored for all formats except for PLANAR_420_8 and PLANAR_420_16 This offset has been increased from 2 bits to 3 bits to support U1.2 format, and the MSB bit is added as Pixel Offset V Direction MSB in DWord 2. Valid values for the combined field range from 0 to 4.
2	31:27	**Surface Format** Specifies the format of the surface. All of the Y and G channels will use table 0 and all of the Cr/Cb/R/B channels will use table 1.

Value	Name	Description
0	YCRCB_NORMAL	
1	YCRCB_SWAPUVY	
2	YCRCB_SWAPUV	
3	YCRCB_SWAPY	
4	PLANAR_420_8	
8	R10G10B10A2_UNORM	Sample_8x8 only
9	R8G8B8A8_UNORM	Sample_8x8 AVS only
10	R8B8_UNORM (CrCb)	Sample_8x8 AVS only
11	R8_UNORM (Cr/Cb)	Sample_8x8 AVS only
12	Y8_UNORM	Sample_8x8 AVS only
13	A8Y8U8V8_UNORM	Sample_8x8 AVS only
14	B8G8R8A8_UNORM	Sample_8x8 AVS only
15	R16G16B16A16	Sample_8x8 AVS only

18	PLANAR_422_8	Sample_8x8 AVS only
23	PLANAR_420_16	Sample_8x8 AVS only
24	R16B16_UNORM (CrCb)	Sample_8x8 AVS only
25	R16_UNORM (Cr/Cb)	Sample_8x8 AVS only
26	Y16_UNORM	Sample_8x8 AVS only
Others	Reserved	

26 **Interleave Chroma**

Format:	Enable

This field indicates that the chroma fields are interleaved in a single plane rather than stored as two separate planes. This field is only used for PLANAR surface formats.

25 **Cr(V)/Cb(U) Pixel Offset U Direction**

Default Value:	0
Format:	U0.1

Specifies the distance to the U/V values with respect to the even numbered Y channels in the U direction

Programming Notes
This field is must be zero for all formats except PLANAR_420_16, PLANAR_420_8, PLANAR_422_8, YCRCB_NORMAL, YCRCB_SWAPUVY, YCRCB_SWAPUV, YCRCB_SWAPY.

24 **Cr(V)/Cb(U) Pixel Offset V Direction MSB**

Default Value:	0
Format:	U1

Specifies the distance to the U/V values with respect to the even numbered Y channels in the V direction

Programming Notes
This field is must be zero for all formats except?PLANAR_420_16 and PLANAR_420_8
This offset has been increased from 2 bits to 3 bits as U1.2 format and this bit is used in conjunction with the bits in the Cr(V)/Cb(U) Pixel Offset V Direction field in DWord 1, which contain the rest of the bits for offset V-direction. Valid values for the combined field range from 0 to 4.

23 **Memory Compression Type**

Specifies the type of memory compression used.

Value	Name
0	Media Compression
1	Render Compression

22 **Memory Compression Enable**

Format:	Enable

This surface may contain compressed or compressible pixels. Memory compression will be attempted for writes to this surface. Reads from this surface will check for compressed data.

Programming Notes
The compression control must have 0 value for non-tileY modes.
Please refer to vol1a Memory Data Formats chapter -- section Media Memory Compression for more details, including format restrictions.

21 **Address Control**

Value	Name	Description
0	CLAMP	Clamp
1	MIRROR	Mirror

20:3 **Surface Pitch**

Format:	U18-1

This field specifies the surface pitch in (#Bytes - 1).

Value	Name	Description
[0,262143]		For other linear surfaces: representing [1B, 256KB]
[511, 262143]		For X-tiled surface: representing [512B, 256KB] = [1 tile, 512 tiles]
[127, 262143]		For Y-tiled surfaces: representing [128B, 256KB] = [1 tile, 2048 tiles]

Programming Notes
For tiled surfaces, the pitch must be a multiple of the tile widthIf Half Pitch for Chroma is set, this field must be a multiple of two tile widths for tiled surfaces, or a multiple of 2 bytes for linear surfaces.The Surface Pitches of current picture and reference picture should be declared as the identical type in VDI mode with identical Height, Width and Format.
If Media Memory Compression is enabled, the following max pitch size restriction must be honored. For larger resolution, Media Memory compression Must be disabled. Tiling Mode Pixel Format Max Frame Width (bytes) Max Frame Width (pixels) Max Pitch (bytes) Legacy 4K 8bpp 16k 16k 16k + 127 16bpp 16k 8k 16k + 127 32bpp 16k 4k 16k + 127 64bpp 16k 2k 16k + 127 128bpp 16k 1k 16k + 127 TileYF 8bpp 8k 8k 8k + 63 16bpp 16k 8k 16k + 127 32bpp 16k 4k 16k + 127 64bpp 16k 2k 16k + 255 128bpp 16k 1k 16k + 255 TileYS 8bpp 16k 16k 16k + 255 16bpp 16k 8k 16k + 511 32bpp 16k 4k 16k + 511 64bpp 16k 2k 16k + 1023 128bpp 16k 1k 16k + 1023

2 **Half Pitch for Chroma**

Format:	Enable

This field indicates that the chroma plane(s) will use a pitch equal to half the value specified in the Surface Pitch field. This field is only used for PLANAR surface formats.

Programming Notes
Must be Zero as this field is not used.

1:0 **Tile Mode**

Format:	U2

This field specifies the type of memory tiling (Linear, WMajor, XMajor, or YMajor) employed to tile this surface. See Memory Interface Functions for details on memory tiling and restrictions.

Value	Name	Description

		0h	TILEMODE_LINEAR	Linear mode (no tiling)
		1h	Reserved	Reserved
		2h	TILEMODE_XMAJOR	X major tiling
		3h	TILEMODE_YMAJOR	Y major tiling

Programming Notes

- Refer to *Memory Data Formats* for restrictions on TileMode direction for the various buffer types. (Of particular interest is the fact that YMAJOR tiling is not supported for display/overlay buffers).
- The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this field.
- Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled (X/Y/W) surfaces can only be mapped to Main Memory.

3	31:30	**Reserved**	
		Access:	RO
		Format:	MBZ
	29:16	**X Offset for U(Cb)**	
		Format:	U14
		For non planar surfaces this field specifies the horizontal offset in pixels from the Surface Base Address to the start (origin) of the surface.	
		For Planar surfaces this field specifies the horizontal offset in pixels from the Y-plane origin to the start (origin) of the U(Cb) plane or the interleaved UV plane if Interleave Chroma is enabled. Resultant X-offset = 'X-offset of the surface (Y-plane)' + 'X offset for U(Cb)'	
		For TileYS and TileYF this offset should be integral multiple of Tile width of Luma plane.	
		Programming Notes	
		For PLANAR_420 and PLANAR_422 surface formats, this field must indicate an even number of pixels.	
	15:14	**Reserved**	
		Access:	RO
		Format:	MBZ
	13:0	**Y Offset for U(Cb)**	
		Format:	U14
		For non planar surfaces this field specifies the vertical offset in pixels from the Surface Base Address to the start (origin) of the surface.	
		For Planar surfaces this field specifies the vertical offset in rows from the Y-plane origin to the start (origin) of the U(Cb) plane or the interleaved UV plane if Interleave Chroma is enabled.	

		Resultant X-offset = 'Y-offset of the surface (Y-plane)' + 'Y offset for U(Cb)' For TileYS and TileYF this offset should be integral multiple of Tile width of Luma plane. **Programming Notes** This field must be aligned by 4 bit[1:0] = 00 This field must be aligned by 4 bit[1:0] = 00 for all format besides PLANAR_420_*
4	31:30	**Reserved** Access: RO Format: MBZ
	29:16	**X Offset for V(Cr)** Exists If: //([Surface Format] is one of planar) AND ([Interleave Chroma] == '0') Format: U14 For Planar surfaces this field specifies the horizontal offset in pixels from the Y-plane origin to the start (origin) of the V(Cb) plane. Resultant X-offset = 'X-offset of the surface (Y-plane)' + 'X offset for V(Cb)' For TileYS and TileYF this offset should be integral multiple of Tile width of Luma plane. **Programming Notes** For PLANAR_420 and PLANAR_422 surface formats, this field must indicate an even number of pixels.
	15	**Reserved** Access: RO Format: MBZ
	14:0	**Y Offset for V(Cr)** Exists If: //([Surface Format] is one of planar) AND ([Interleave Chroma] == '0') Format: U15 For Planar surfaces this field specifies the vertical offset in rows from the Y-plane origin to the start (origin) of the V(Cb) plane. Resultant Y-offset = 'Y-offset of the surface (Y-plane)' + 'Y offset for V(Cb)' For TileYS and TileYF this offset should be integral multiple of Tile width of Luma plane. **Programming Notes** This field must indicate a multiple of 4 (bit 0 & 1 = 00).
5	31	**Vertical Line Stride** Format: U1 For Surfaces accessed via the sample_8x8 message:Specifies number of lines (0 or 1) to skip between logically adjacent lines - provides support of interleaved (field) surfaces as textures.For

		Other Surfaces:Vertical Line Stride must be zero.
	30	**Vertical Line Stride Offset** Format: U1 For Surfaces accessed via the sample_8x8 message: Specifies the offset of the initial line from the beginning of the buffer. For Other Surfaces: Vertical Line Stride Offset must be zero. **Programming Notes** This field must be set to 0 if Vertical Line Stride is 0.
	29:20	**Reserved** Access: RO Format: MBZ
	19:18	**Tiled Resource Mode** Format: U2 **For Sampling Engine, Render Target, and Typed/Untyped Surfaces:** This field specifies the tiled resource mode. **For other surfaces:** This field is ignored. **Value** / **Name** / **Description** 0h / TRMODE_NONE / No tiled resource 1h / TRMODE_TILEYF / 4KB tiled resources 2h / TRMODE_TILEYS / 64KB tiled resources 3h / Reserved / **Programming Notes** If **Tile Mode** is not set to TILEMODE_YMAJOR, this field must be set to TRMODE_NONE. If this field is not set to TRMODE_NONE, the **Surface Format** must be one with 8, 16, 32, 64, or 128 bits per element, or one of the compressed texture modes (BC*, ETC*, EAC*, ASTC*). Additionally, YCRCB* formats are supported and treated as 16 bits per element, and the PLANAR_420_8 and PLANAR_422_8 formats are supported and treated as 8 bits per element on the Y plane and 16 bits per element on the UV plane (if **Interleave Chroma** is enabled) or 8 bits per element on the U and V planes (if **Interleave Chroma** is disabled.
	17:7	**Reserved** Access: RO Format: MBZ
	6:0	**Surface Memory Object Control State** Default Value: 0h DefaultVaueDesc Format: **MEMORY_OBJECT_CONTROL_STATE** This 7-bit field is used in various state commands and indirect state objects to define cacheability and other attributes related to memory objects.

MEDIA_SURFACE_STATE

6	31:0	**Surface Base Address** Format: GraphicsAddress[31:0] Specifies the low 32 bits of the byte-aligned base address of the surface. **Programming Notes** For SURFTYPE_BUFFER render targets, this field specifies the base address of first element of the surface. The surface is interpreted as a simple array of that single element type. The address must be naturally-aligned to the element size (e.g., a buffer containing R32G32B32A32_FLOAT elements must be 16-byte aligned).For SURFTYPE_BUFFER non-rendertarget surfaces, this field specifies the base address of the first element of the surface, computed in software by adding the surface base address to the byte offset of the element in the buffer.Mipmapped, cube and 3D sampling engine surfaces are stored in a 'monolithic' (fixed) format, and only require a single address for the base texture.Linear render target surface base addresses must be element-size aligned, for non-YUV surface formats, or a multiple of 2 element-sizes for YUV surface formats. Other linear surfaces have no alignment requirements (byte alignment is sufficient.)Linear depth buffer surface base addresses must be 64-byte aligned. Note that while render targets (color) can be SURFTYPE_BUFFER, depth buffers cannot.Tiled surface base addresses must be 4KB-aligned. Note that only the offsets from Surface Base Address are tiled, Surface Base Address itself is not transformed using the tiling algorithm.For tiled surfaces, the actual start of the surface can be offset from the Surface Base Address by the X Offset and Y Offset fields.Certain message types used to access surfaces have more stringent alignment requirements. Please refer to the specific message documentation for additional restrictions.
7	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Surface Base Address High** Format: GraphicsAddress[47:32] Specifies the high 16 bits of the byte-aligned base address of the surface. Refer to Surface Base Address [31:0] for programming notes applying to this field.

MEMORY_OBJECT_CONTROL_STATE

MEMORY_OBJECT_CONTROL_STATE		
Size (in bits):	7	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	6:1	**Index to MOCS Tables** The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers.The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime. **Programming Notes** When an access is made through Data Port and the index to MOCS[6:1] = [48,59] (decimal), that surface or stateless memory access can be cached in HDC L1 cache. Accesses made through Data Port with MOCS[6:1] < 48 or > 59 will bypass the HDC L1 cache. This bypass is useful when software wants to ensure that Data Port access are coherent with the L3 memory.
	0	**Reserved**

MemoryAddressAttributes

MemoryAddressAttributes

Size (in bits): 32

Default Value: 0x00000000

This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface. It defines the attributes for VDBOX addresses.

DWord	Bit	Description
0	31:15	**Reserved** Access: RO Format: MBZ
	14:13	**Base Address - Tiled Resource Mode** Format: U2 **For Media Surfaces:** This field specifies the tiled resource mode. Value / Name / Description: 00b / TRMODE_NONE / TileY resources 01b / TRMODE_TILEYF / 4KB tiled resources 10b / TRMODE_TILEYS / 64KB tiled resources 11b / Reserved /
	12	**Base Address - Row Store Scratch Buffer Cache Select** Format: U1 Description: This field controls if the Row Store is going to store inside Media Cache (rowstore cache) or to LLC. When this is programmed to "1" (going to Media Cache), the corresponding base address will be programmed with the starting position in the media cache. The programming table is in "Buffer Size Requirement Page" in HEVC section Value / Name / Description: 0 / / Buffer going to LLC. 1 / / Buffer going to Internal Media Storage.
	11	**Reserved** Access: RO Format: MBZ
	10	**Compression Type** Indicates if buffer is render/media compressed.

MemoryAddressAttributes

		Value / **Name** 0 — Media Compression Enable **[Default]** 1 — Render Compression Enable
	9	**Base Address - Memory Compression Enable** Format: Enable Memory compression will be attempted for this surface.
	8:7	**Base Address - Arbitration Priority Control** Format: HEVC_ARBITRATION_PRIORITY
	6:1	**Base Address - Index to Memory Object Control State (MOCS) Tables** Format: U6 The index to define the L3 and system cache memory properties. The details of the controls arefurther defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Relatedcontrol registers can be updated during runtime.
	0	**Reserved**

Merged Media Block Message Header Control

MHC_MBM_CONTROL - Merged Media Block Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:30	**Message Mode** Specifies the Media Block Read message is Normal subtype. Value / Name / Description: 00h / Normal / The Block Height and Block Width fields are specified in this Dword. The Mask is ignofed by a media block read message. Others / Reserved / Reserved.
	29	**Reserved** Access: RO Format: MBZ
	28:24	**Sub-Register Offset** Format: U5 Provides the sub-register offset in unit of bytes of a Merged Media Block Read message. This field is ignored (reserved) for a media block write message. Range = [0, 28]. Only a multiple of BasePitch, including 0, is valid. **Programming Notes** Sub-Register Offset and Register Pitch Control allow software to assembly multiple media block reads directly into a shared GRF register set. For example, if both are set to zero, the read data are written to GRF registers, aligning to the least significant bits of the first register, and the register pitch is equal to the next power-of-2 that is greater than or equal to the Block Width. If Register Pitch Control is non-zero, multiple media block read messages sharing the same Register Pitch Control but with different Sub-Register Offset can fill in the same set of GRF registers with media block data line interleaved. **Restriction** For the Sampler Cache Data, this field must be zero. BasePitch is defined as the next the power-of-2 that is greater than or equal to the Block Width. Minimum BasePitch is 1 DWord. Sub-Register Offset must be aligned to BasePitch (therefore will be a multiple of DWords as well). When Register Pitch Control = 0, Sub-Register Offset must align to BasePitch*Block Height. ensuring the output fits in a single GRF register. In general (and specifically when Sub-Register Offset is greater than 0), when the resulting data will cross a GRF register boundary, the data must be placed symmetrically between GRF registers.

MHC_MBM_CONTROL - Merged Media Block Message Header Control

	23:22	**Reserved** Access: RO Format: MBZ
	21:16	**Block Height** Format: U6 Height in rows of block being accessed. Range = [0,63] representing 1 to 64 rows **Restriction** If Block Width (bytes), then Maximum Block Height (rows) is constrained by (# Dwords width) * (# rows) <= 64 Dwords.
	15:10	**Reserved** Access: RO Format: MBZ
	9:8	**Register Pitch Control** Format: U2 Controls the register pitch for a Merged Media Block Read message. This field is ignored (reserved) for a media block write message. Register Pitch Control is only allowed to be non-zero when Block Width is a multiple of DWords. Restriction : For the Sampler Cache Data, this field must be zero.

Value	Name	Description
0h	RPC_1 **[Default]**	1 Block
1h	RPC_2	2 Blocks
3h	RPC_4	4 Blocks

Restriction
BasePitch is defined as the next the power-of-2 that is greater than or equal to the Block Width. The effective register pitch (RPC*BasePitch)+SRO must be less than or equal to 32 bytes (to fit in a single GRF register).

	7:6	**Reserved** Access: RO Format: MBZ
	5:0	**Block Width** Format: U6 Width in bytes of the block being accessed. Range = [0,31] representing 1 to 32 Bytes.

Message Descriptor - Render Target Write

Message Descriptor - Render Target Write

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30	**Data Format** Format: U1 Value / Name / Description: 0 – Single Precision – 32b 1 – Half Precision – 16b **Programming Notes** This field is applicable for Render Target Write Messages ONLY.
	29:14	**Reserved** Access: RO Format: MBZ
	13	**Per-Sample PS outputs enable** This bit must not be set when Render Target is not bound to pixel-shader OR when Render Target is not multisampled. This bit must be set when PS runs at sample-frequency i.e. pixel shader dispatch mode is PER_SAMPLE. By setting this bit, PS sends Render Target Write Message that outputs color, depth(optional) and stencil(optional) phases on per sample basis for each slot. When Render Target is multisampled and this bit is reset, Render Target outputs color, depth(optional) and stencil(optional) at pixel frequency. It should be noted that the latter case is applicable for only per-pixel PS invocation.
	12	**Last Render Target Select** This bit must be set on the last render target write message sent for each group of pixels. For single render target pixel shaders, this bit is set on all render target write messages. For multiple render target pixel shaders, this bit is set only on messages sent to the last render target. This bit must be zero for SIMD8 Image Write message. **Programming Notes** In general, when threads are not launched by 3D FF, this bit must be zero.
	11	**Slot Group Select** This field selects whether slots 15:0 or slots 31:16 are used for bypassed data. Bypassed data includes the antialias alpha, multisample coverage mask, and if the header is not

present also includes the X/Y addresses and pixel enables. For 8- and 16-pixel dispatches, SLOTGRP_LO must be selected on every message. For 32-pixel dispatches, this field must be set correctly for each message based on which slots are currently being processed.

Value	Name	Description
0	SLOTGRP_LO	choose bypassed data for slots 15:0
1	SLOTGRP_HI	choose bypassed data for slots 31:16

Programming Notes
For SIMD8 Image Write message thsi field MBZ.

10:8 **Message Type**

This field specifies the type of render target message. For the SIMD8_DUALSRC_xx messages, the low bit indicates which slots to use for the pixel enables, X/Y addresses, and oMask.

Value	Name	Description
000b	SIMD16	SIMD16 single source message
001b	SIMD16_REPDATA	SIMD16 single source message with replicated data
010b	SIMD8_DUALSRC_LO	SIMD8 dual source message, use slots 7:0
011b	SIMD8_DUALSRC_HI	SIMD8 dual source message, use slots 15:8
100b	SIMD8_LO	SIMD8 single source message, use slots 7:0
111b	SIMD16_REPDATA_TM	It's only supported when accessing *Tiled Memory*. Using this Message Type to access linear *(Untiled)* memory is UNDEFINED.

Programming Notes
the above slots indicated are within the 16 slots selected by **Slot Group Select**. If SLOTGRP_HI is selected, the SIMD8 message types above reference slots 23:16 or 31:24 instead of 7:0 or 15:8, respectively.
SIMD16_REPDATA message must not be used in SIMD8 pixel-shaders.

7:0 **Reserved**

Access:	RO
Format:	MBZ

Message Descriptor - Sampling Engine

Message Descriptor - Sampling Engine

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31	**EOT**
	30	**Return Format** Format: U1 **Value / Name / Description** 0 / 32-bit / Return data is 32b 1 / 16-bit / Return data is 16b **Programming Notes** This field must be set to 32 for resinfo, LOD and sampleinfo messages.
	29	**SIMD Mode[2]** Format: U1 This field is the upper bit of the 3-bit SIMD Mode field.
	28:25	**Message Length** Format: U4 This field specifies the number of 256-bit GRF registers starting from (src) to be sent out on the request message payload. **Value / Name** [1,15] /
	24:20	**Response Length** Format: U5 This field indicates the number of 256-bit registers expected in the message response. **Value / Name** [0,16] / **Programming Notes** A value 0 indicates that the request message does not expect any response. The largest response supported is 16 GRF registers. This field must be programmed to 0 for a surface which is marked as a Procedural Texture (AMFS)

Message Descriptor - Sampling Engine

19 **Header Present**

Format:	Enable

Specifies whether the message includes a header phase. If the header is not present (this field is zero), all of the fields normally contained in the header are assumed to be 0.

If the header is not present, in some cases the **Write Channel Mask** fields are set according to the Response Length.

SIMD16 or**Return Format** Float16

Response Length	Mask R	Mask G	Mask B	Mask A
1	0	1	1	1
2	0	0	1	1
3	0	0	0	1
4	0	0	0	0

Else

Response Length	Mask R	Mask G	Mask B	Mask A
2	0	1	1	1
4	0	0	1	1
6	0	0	0	1
8	0	0	0	0

18:17 **SIMD Mode[1:0]**

Format:	U2

Description

Specifies the SIMD mode of the message being sent.

A third bit SIMD Mode[2] is added to this field (bit 29 of message descriptor). Encodings now range from 0-7. SIMD Mode[2:0] SIMD
000 Reserved
001 SIMD8
010 SIMD16
011 SIMD32/64
100 Reserved
101 SIMD8H
110 SIMD16H
111 Reserved

16:12 **Message Type**

Format:	U5

Specifies the type of message being sent. For more details, please refer to **Message Format** section for the definition of these 5 bits..

Message Descriptor - Sampling Engine

	11:8	**Sampler Index** Format: U4 Specifies the index into the sampler state table. Ignored for ld, resinfo, sampleinfo, and cache_flush type messages. **Value** / **Name** [0,15] /
	7:0	**Binding Table Index** Format: U8 Specifies the index into the **binding table**. Ignored for cache_flush type messages. Values of 255 and 253 indicate stateless. 254 indicates SLM. 252 indicates bindless. **Value** / **Name** [0,255] /

MFD_MPEG2_BSD_OBJECT Inline Data Description

MFD_MPEG2_BSD_OBJECT Inline Data Description

Source:	VideoCS
Size (in bits):	64
Default Value:	0x00000000, 0x00000000

DW0..1 corresponds to DW3..4 of the MFD_MPEG2_BSD_OBJECT.

DWord	Bit	Description
0	31:24	**Slice Horizontal Position** Format: U8 This field indicates the horizontal position of the first macroblock in the slice.
	23:16	**Slice Vertical Position** Format: U8 This field indicates the vertical position of the first macroblock in the slice.
	15:8	**Macroblock Count** Format: U8 This field indicates the number of macroblocks in the slice, including skipped macroblocks.
	7	**Slice Concealment Override Bit** This bit forces hardware to handle the current slice in Conceal or Deocde Mode. If this bit is set to one, VIN will force the current slice to do concealment or to decode from bitstream regardless if the slice boundary has errors or not. Value / Name / Description: 1h — VIN will use driver-provided "Slice Concealment Type" regardless of valid slice boundary 0h — Driver must program "Slice Concealment Type" to '0'. VIN will set "Slice Concealment Type" depending if the slice boundary has error or not
	6	**Slice Concealment Type Bit** This bit can be forced by driver ("Slice Concealment Override Bit") or set by VINunit depending on slice boundary errors. Value / Name / Description: 1h — VMD will conceal all MBs of the slice regardless of bitstream. (If driver does not force the value of this bit, VIN will set this bit depending on slice boundary error. If the next slice position of the current slice is out-of-bound or the same or earlier than the current slice start position, VIN will set this bit for the next slice) 0h — VMD will decode MBs from the bitstream until the bitstream is run-out. Then VMD will conceal the remaining MBs.

MFD_MPEG2_BSD_OBJECT Inline Data Description

		Programming Notes VIN can turn this bit from 0 to 1 internally if "Slice Concealment Disable Bit" is "0" and VIN detects slice boundary errors.
	5	**Last Pic Slice** This bit is added to support error concealment at the end of a picture. **Value** / **Name** / **Description** 1h / / The current Slice is the last Slice of the entire picture 0h / / The current Slice is not the last Slice of current picture
	4	**Reserved**
	3	**Is Last MB** **Value** / **Name** / **Description** 1h / / The current MB is the last MB in the current Slice 0h / / The current MB is not the last MB in the current Slice
	2:0	**First Macroblock Bit Offset** Format: U3 This field provides the bit offset of the first macroblock in the first byte of the input bitstream.
1	31:29	**Reserved** Access: RO Format: MBZ
	28:24	**Quantizer Scale Code** Format: U5 This field sets the quantizer scale code of the inverse quantizer. It remains in effect until changed by a decoded quantizer scale code in a macroblock. This field is decoded from the slice header by host software.
	23:17	**Reserved** Access: RO Format: MBZ
	16:8	**Next Slice Vertical Position** Format: U9 This field indicates the vertical position (in macroblock units) of the first macroblock in the next slice. **Programming Notes** This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set to the height of the picture (field picture will be in height of field) (since y-direction is zero-based numbering).

MFD_MPEG2_BSD_OBJECT Inline Data Description		
	7:0	**Next Slice Horizontal Position** Format: U8 This field indicates the horizontal position (in macroblock units) of the first macroblock in the next slice. **Programming Notes** This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set 0.

MFX_REFERENCE_PICTURE_BASE_ADDR

MFX_REFERENCE_PICTURE_BASE_ADDR

Source: VideoCS
Size (in bits): 64
Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:48	**Reserved** Access: RO Format: MBZ
	47:32	**MFX Reference Picture Address [n] High** Format: GraphicsAddress[47:32] This field is for the upper range of Reference Picture Addresses
	31:6	**MFX Reference Picture Address [n]** Format: GraphicsAddress[31:6] Specifies the 64 byte aligned reference frame buffer addresses for the motion compensation operation in AVC//MPEG2. AVC can specify up to 16 YUV frame-based surfaces for both forward and backward references, i.e. L0+L1 total = 16 max. Any entry can be assigned to L0 or L1 or both lists.But VC1 and MPEG2, worst case, can use up to 2 YUV frame-based surfaces for both forward and backward references: • P-MB : RefAddr[0] - temporal closest previous field of a reference frame (can be the current frame) • RefAddr[1]- next temporal closest previous field of a reference frame (must be different from the current frame) It is a variant (without the LongTermRefPic specification) of the RefFrameList[16] defined in AVC DXVA Spec. RefAddr[0-15] is indexed by frame_storeID »1. It is not a packed list, i.e. invalid entries can scatter among the list. All invalid addresses must be set to a valid address RefAddr[0] by the driver. The same applies to VC1 and MPEG2. **Programming Notes** AVC: Always specifies all 16 addresses even some of them are not needed as indicated by the max num of active reference pictures. This is done for preventing data corruption (error, fault condition, etc.) by having all the references being set to a legal location.
	5:0	**Reserved** Access: RO Format: MBZ

MPEG2

MPEG2		
Source:	VideoCS	
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15:6	**Reserved** Access: RO Format: MBZ
	5	**Missing EOB Error** This flag indicates missing EOB SEs coded in the bit-stream. Missing EOBs are concealed to match CBP of the error MB.
	4	**Inconsistent starting position Error - overlapping MBs** This flag indicates two slices overlapping one another by one or more MBs. Duplicate MBs decoded off the second slice shall be discarded.
	3	**Slice out-of-bound Error** This flag indicates a slice is running beyond the width of the picture. Out-of-bound MBs shall be discarded.
	2	**Premature frame end Error** This flag indicates missing slices/MBs coded in the bit-stream of a frame. One or more MBs are concealed to reach end of picture.
	1	**Inconsistent starting position Error - Missing MBs** This flag indicates one or more MBs are being concealed due to inconsistent MB starting and ending positions between slices.
	0	**MB Concealment Flag** . Each pulse from this flag indicates one MB is concealed by hardware.

MSAA Sample Number Message Address Control

MACD_MSAA_SN - MSAA Sample Number Message Address Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:4	**Reserved** Access: RO Format: MBZ
	3:0	**Sample Number** Format: U4 Specifies the sample number for the slot. If the sample number is larger than the **Number of Multisamples** in the Surface State, then the access is out of bounds.

Source: EuIsa
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Reserved** Format: MBZ
	30	**Data Format** Format: U1 **Description** This field specifies the width of data read from sampler or written to render target. This field specifies the width of data read from written to render target. **Value** / **Name** 0b / 32bit 1b / 16bit
	29	**SIMD Mode[2]** Format: MBZ This field is the upper bit of the 3-bit SIMD Mode Field. Refer to the SIMD Mode[1:0] Field for encodings
	28:25	**Message Length** This field specifies the number of GRF registers starting from <Src0.RegNum> to be sent out on the request message payload. Valid value ranges from 1 to 15. A value of 0 is considered erroneous. **Value** / **Name** 1-15 / Number of Registers
	24:20	**Response Length** This field indicates the number of GRF registers expected in the message response. The valid value ranges from 0 to 16. A value 0 indicates that the request message does not expect any response. The largest response supported is 16 GRF registers. **Value** / **Name** 0-16 / Number of Registers

MsgDesc		
	19	**Header Present** Format: Enable If set, indicates that the message includes a header. Depending on the target shared function, this field may be restricted to either enabled or disabled. Refer to the specific shared function section for details.
	18:0	**Function Control** This field is intended to control the target function unit. Refer to the section on the specific target function unit for details on the contents of this field.

Named Barrier State

NAMED_BAR_STATE - Named Barrier State

Size (in bits): 32

Default Value: 0x00000000

Hardware state of one "named barrier", which is part of the payload of Save_Barrier and Restore_Barrier messages.

DWord	Bit	Description
0	31:20	**Reserved** Format: MBZ
	19	**Designated Thread** Designated thread for WMTP Save. **Programming Notes** This field is ignored for Restore_Barrier message payload. **Restriction** This field is valid only for Logical Barrier ID 0.
	18:11	**Number of Consumers** Format: U8 Specifies the number of consumer threads in the barrier.
	10:3	**Number of Producers** Format: U8 Specifies the number of producer threads in the barrier.
	2:1	**Barrier Type** Format: U2 Value / Name: 0 Producer_Consumer 1 Producer_Only 2 Consumer_Only
	0	**Valid** Indicates this barrier's signal is set for the thread.

No Event Data Payload

MDP_NO_EVENT - No Event Data Payload		
Source:	EuSubFunctionGateway	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..7	255:0	**Reserved** Access: RO Format: MBZ

Normal Media Block Message Header

MH_MB - Normal Media Block Message Header

Source:	EuSubFunctionDataPort1
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**X Offset** Format: S31 X offset (in bytes) of the upper left corner of the block into the surface. **Programming Notes** Must be DWord aligned (Bits 1:0 MBZ) for the write form of the message.
1	31:0	**Y Offset** Format: S31 Y offset (in rows) of the upper left corner of the block into the surface.
2	31:0	**Normal Media Block Message Control** Format: MHC_MB_CONTROL Specifies the Normal message subtype and additional input parameters.
3	31:0	**Mask** Format: U32 The Mask is ignored by the Normal Media Block message: all Dwords are always returned on reads, and always enabled to be written on writes.
4	31:0	**FFTID** Format: MHC_FFTID Fixed Function Thread ID
5..7	95:0	**Reserved** Access: RO Format: MBZ

Normal Media Block Message Header Control

MHC_MB_CONTROL - Normal Media Block Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:30	**Message Mode** **Description** Specifies the interpretation of M0.3 (Pixel or Byte Mask). For the Sampler Cache Data Port, this field is ignored, behaving as if always set to NORMAL. Specifies the interpretation of M0.3 (Pixel or Byte Mask). **Value / Name / Description** 00h — Normal — The Block Height and Block Width fields are specified in this Dword. The Mask is ignored by a media block read message and behaves as if it is set to all ones for a media block write message. Others — Reserved — Reserved. **Programming Notes** The Media Block Read message is Normal subtype when both Sub-Register Offset and Register Pitch Control are zero. The Media Block Read message is Merged subtype when either Sub-Register Offset or Register Pitch Control are non-zero.
	29	**Reserved** Access: RO Format: MBZ
	28:24	**Sub-Register Offset** Default Value: 0 Format: U5 The sub-register offset must be 0 for Normal Media Block Read message subtype. This field is ignored (reserved) for a media block write message.
	23:22	**Reserved** Access: RO Format: MBZ
	21:16	**Block Height** Format: U6 Height in rows of block being accessed. Range = [0,63] representing 1 to 64 rows

MHC_MB_CONTROL - Normal Media Block Message Header Control

		Restriction If Block Width (bytes), then Maximum Block Height (rows) is constrained by (# Dwords width) * (# rows) <= 64 Dwords.
	15:10	**Reserved** Access: RO Format: MBZ
	9:8	**Register Pitch Control** Default Value: 0 Format: U2 The register pitch must be 0 for a Normal Media Block Read message. This field is ignored (reserved) for a media block write message.
	7:6	**Reserved** Access: RO Format: MBZ
	5:0	**Block Width** Format: U6 **Description** Width in bytes of the block being accessed. For normal Media Block Writes, Range = [0,63] representing 1 to 64 Bytes. For normal Media Block Reads and for masked and merged Media Block messages, Range = [0,31] representing 1 to 32 Bytes. **Programming Notes** Must be DWord aligned for the write form of the message.

oMask Message Data Payload Register

MDPR_OMASK - oMask Message Data Payload Register

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:16	**oMask1** Format: U16 oMask for Pixels [15:0] of Slot 1. Not used for Slot Group HI.
	15:0	**oMask0** Format: U16 oMask for Pixels [15:0] of Slot 0. Not used for Slot Group HI.
1	31:16	**oMask3** Format: U16 oMask for Pixels [15:0] of Slot 3. Not used for Slot Group HI.
	15:0	**oMask2** Format: U16 oMask for Pixels [15:0] of Slot 2. Not used for Slot Group HI.
2	31:16	**oMask5** Format: U16 oMask for Pixels [15:0] of Slot 5. Not used for Slot Group HI.
	15:0	**oMask4** Format: U16 oMask for Pixels [15:0] of Slot 4. Not used for Slot Group HI.
3	31:16	**oMask7** Format: U16 oMask for Pixels [15:0] of Slot 7. Not used for Slot Group HI.
	15:0	**oMask6** Format: U16 oMask for Pixels [15:0] of Slot 6. Not used for Slot Group HI.

MDPR_OMASK - oMask Message Data Payload Register		
4	31:16	**oMask9** Format: U16 oMask for Pixels [15:0] of Slot 9. Used only if Slot Group HI or SIMD16.
	15:0	**oMask8** Format: U16 oMask for Pixels [15:0] of Slot 8. Used only if Slot Group HI or SIMD16.
5	31:16	**oMask11** Format: U16 oMask for Pixels [15:0] of Slot 11. Used only if Slot Group HI or SIMD16.
	15:0	**oMask10** Format: U16 oMask for Pixels [15:0] of Slot 10. Used only if Slot Group HI or SIMD16.
6	31:16	**oMask13** Format: U16 oMask for Pixels [15:0] of Slot 13. Used only if Slot Group HI or SIMD16.
	15:0	**oMask12** Format: U16 oMask for Pixels [15:0] of Slot 12. Used only if Slot Group HI or SIMD16.
7	31:16	**oMask15** Format: U16 oMask for Pixels [15:0] of Slot 15. Used only if Slot Group HI or SIMD16.
	15:0	**oMask14** Format: U16 oMask for Pixels [15:0] of Slot 14. Used only if Slot Group HI or SIMD16.

7.0-7.7	255:0	**Stencil** Format: **MDPR_STENCIL** Slots [7:0] Stencil

OS SZ OM SIMD8 Dual Source Render Target Data Payload

MDP_RTW_SZM8DS - OS SZ OM SIMD8 Dual Source Render Target Data Payload

Size (in bits):	2816
Default Value:	0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**oMask** Format: **MDPR_OMASK** oMask for slots [7:0] and [15:8]. Operation selects upper or lower half.
1.0-1.7	255:0	**Src0 Red** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src0 Red
2.0-2.7	255:0	**Src0 Green** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src0 Green
3.0-3.7	255:0	**Src0 Blue** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src0 Blue
4.0-4.7	255:0	**Src0 Alpha** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src0 Alpha

MDP_RTW_SZM8DS - OS SZ OM SIMD8 Dual Source Render Target Data Payload

5.0-5.7	255:0	**Src1 Red** Format: MDP_DW_SIMD8 Slots[7:0] or [15:8] of Src1 Red
6.0-6.7	255:0	**Src1 Green** Format: MDP_DW_SIMD8 Slots[7:0] or [15:8] of Src1 Green
7.0-7.7	255:0	**Src1 Blue** Format: MDP_DW_SIMD8 Slots[7:0] or [15:8] of Src1 Blue
8.0-8.7	255:0	**Src1 Alpha** Format: MDP_DW_SIMD8 Slots[7:0] or [15:8] of Src1 Alpha
9.0-9.7	255:0	**Source Depth** Format: MDP_DW_SIMD8 Slots [7:0] or [15:8] of Source Depth
10.0-10.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] or [15:8] of Stencil

OS SZ OM SIMD8 Render Target Data Payload

MDP_RTW_SZM8 - OS SZ OM SIMD8 Render Target Data Payload

Size (in bits): 1792

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**oMask** Format: MDPR_OMASK Slots [7:0] oMask. Upper half ignored.
1.0-1.7	255:0	**Red** Format: MDP_DW_SIMD8 Slots [7:0] Red
2.0-2.7	255:0	**Green** Format: MDP_DW_SIMD8 Slots [7:0] Green
3.0-3.7	255:0	**Blue** Format: MDP_DW_SIMD8 Slots [7:0] Blue
4.0-4.7	255:0	**Alpha** Format: MDP_DW_SIMD8 Slots [7:0] Alpha
5.0-5.7	255:0	**Source Depth** Format: MDP_DW_SIMD8 Slots [7:0] Source Depth
6.0-6.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] Stencil

OS SZ S0A SIMD8 Render Target Data Payload

MDP_RTW_SZA8 - OS SZ S0A SIMD8 Render Target Data Payload

Size (in bits): 1792

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha** Format: MDP_DW_SIMD8 Slots [7:0] Source 0 Alpha
1.0-1.7	255:0	**Red** Format: MDP_DW_SIMD8 Slots [7:0] Red
2.0-2.7	255:0	**Green** Format: MDP_DW_SIMD8 Slots [7:0] Green
3.0-3.7	255:0	**Blue** Format: MDP_DW_SIMD8 Slots [7:0] Blue
4.0-4.7	255:0	**Alpha** Format: MDP_DW_SIMD8 Slots [7:0] Alpha
5.0-5.7	255:0	**Source Depth** Format: MDP_DW_SIMD8 Slots [7:0] Source Depth
6.0-6.7	255:0	**Stencil** Format: MDPR_STENCIL Slots [7:0] Stencil

OS SZ SIMD8 Dual Source Render Target Data Payload

MDP_RTW_SZ8DS - OS SZ SIMD8 Dual Source Render Target Data Payload

Size (in bits):	2560
Default Value:	0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Src0 Red** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src0 Red
1.0-1.7	255:0	**Src0 Green** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src0 Green
2.0-2.7	255:0	**Src0 Blue** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src0 Blue
3.0-3.7	255:0	**Src0 Alpha** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src0 Alpha
4.0-4.7	255:0	**Src1 Red** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src1 Red
5.0-5.7	255:0	**Src1 Green** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src1 Green

MDP_RTW_SZ8DS - OS SZ SIMD8 Dual Source Render Target Data Payload

6.0-6.7	255:0	**Src1 Blue** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src1 Blue
7.0-7.7	255:0	**Src1 Alpha** Format: **MDP_DW_SIMD8** Slots[7:0] or [15:8] of Src1 Alpha
8.0-8.7	255:0	**Source Depth** Format: **MDP_DW_SIMD8** Slots [7:0] or [15:8] of Source Depth
9.0-9.7	255:0	**Stencil** Format: **MDPR_STENCIL** Slots [7:0] or [15:8] of Stencil

OS SZ SIMD8 Render Target Data Payload

MDP_RTW_SZ8 - OS SZ SIMD8 Render Target Data Payload

Size (in bits): 1536

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Red** Format: **MDP_DW_SIMD8** Slots [7:0] Red
1.0-1.7	255:0	**Green** Format: **MDP_DW_SIMD8** Slots [7:0] Green
2.0-2.7	255:0	**Blue** Format: **MDP_DW_SIMD8** Slots [7:0] Blue
3.0-3.7	255:0	**Alpha** Format: **MDP_DW_SIMD8** Slots [7:0] Alpha
4.0-4.7	255:0	**Source Depth** Format: **MDP_DW_SIMD8** Slots [7:0] Source Depth
5.0-5.7	255:0	**Stencil** Format: **MDPR_STENCIL** Slots [7:0] Stencil

Oword 2 Block Data Payload

MDP_OW2 - Oword 2 Block Data Payload		
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.3	127:0	**Oword0** Format: U128 Specifies the Oword data for block element 0
0.4-0.7	127:0	**Oword1** Format: U128 Specifies the Oword data for block element 1

Oword 4 Block Data Payload

MDP_OW4 - Oword 4 Block Data Payload		
Size (in bits):	512	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Data[1:0]** Format: **MDCR_OW** Specifies the Oword data for block elements [1:0]
1.0-1.7	255:0	**Data[3:2]** Format: **MDCR_OW** Specifies the Oword data for block elements [3:2]

Oword 8 Block Data Payload

MDP_OW8 - Oword 8 Block Data Payload		
Size (in bits):	1024	
Default Value:	0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Data[1:0]** Format: MDCR_OW Specifies the Oword data for block elements [1:0]
1.0-1.7	255:0	**Data[3:2]** Format: MDCR_OW Specifies the Oword data for block elements [3:2]
2.0-2.7	255:0	**Data[5:4]** Format: MDCR_OW Specifies the Oword data for block elements [5:4]
3.0-3.7	255:0	**Data[7:6]** Format: MDCR_OW Specifies the Oword data for block elements [7:6]

Oword A64 SIMD8 Atomic Operation CMPWR16B Message Data Payload

MDP_A64_AOP8_OW2 - Oword A64 SIMD8 Atomic Operation CMPWR16B Message Data Payload		
Size (in bits):	2048	
Default Value:	0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Slot[1:0] Src0** Format: MDCR_OW Specifies the Slot [1:0] Source 0 data
1.0-1.7	255:0	**Slot[3:2] Src0** Format: MDCR_OW Specifies the Slot [3:2] Source 0 data
2.0-2.7	255:0	**Slot[5:4] Src0** Format: MDCR_OW Specifies the Slot [5:4] Source 0 data
3.0-3.7	255:0	**Slot[7:6] Src0** Format: MDCR_OW Specifies the Slot [7:6] Source 0 data
4.0-4.7	255:0	**Slot[1:0] Src1** Format: MDCR_OW Specifies the Slot [1:0] Source 1 data
5.0-5.7	255:0	**Slot[3:2] Src1** Format: MDCR_OW Specifies the Slot [3:2] Source 1 data

MDP_A64_AOP8_OW2 - Oword A64 SIMD8 Atomic Operation CMPWR16B Message Data Payload		
6.0-6.7	255:0	**Slot[5:4] Src1** Format: **MDCR_OW** Specifies the Slot [5:4] Source 1 data
7.0-7.7	255:0	**Slot[7:6] Src1** Format: **MDCR_OW** Specifies the Slot [7:6] Source 1 data

Oword Data Blocks Message Descriptor Control Field

MDC_DB_OW - Oword Data Blocks Message Descriptor Control Field

Size (in bits): 3

Default Value: 0x00000000

DWord	Bit	Description
0	2:0	**Data Blocks** Specifies the number of Oword blocks to be read or written

Value	Name	Description
00h	OW1L	1 Oword, read into or written from the low 128 bits of the destination register
01h	Reserved	Reserved
02h	OW2	2 Owords
03h	OW4	4 Owords
04h	OW8	8 Owords
Others	Reserved	Ignored

Oword Data Payload Register

MDCR_OW - Oword Data Payload Register		
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.3	127:0	**Oword0** Format: U128 Specifies the slot 0 data in this payload register
0.4-0.7	127:0	**Oword1** Format: U128 Specifies the slot 1 data in this payload register

Oword Dual Data Blocks Message Descriptor Control Field

MDC_DB_OWD - Oword Dual Data Blocks Message Descriptor Control Field

Size (in bits): 2

Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**OW Dual Data Blocks** Specifies the number of Oword Blocks to be read or written

Value	Name	Description
00h	OWD1	1 Hword register, 2 Owords
02h	OWD4	4 Hword registers, 8 Owords
Others	Reserved	Ignored

Performance Counter Report Format 101b

Performance Counter Report Format 101b		
Size (in bits):	2048	
Default Value:	0x00000000, 0x00000000	
DWord	**Bit**	**Description**

Per Thread Scratch Space Message Header Control

MHC_PTSS - Per Thread Scratch Space Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:4	**Reserved** Access: RO Format: MBZ
	3:0	**Per Thread Scratch Space** Format: U4 Specifies the amount of scratch space allowed to be used by this thread for messages in which the Binding Table Index is Stateless model, otherwise this field is ignored.The data port will use this to bounds check scratch space messages. Value range = [0,11] represents [1KB, 2MB] in powers of two. **Programming Notes** Writes out of bounds will be ignored. Reads out of bounds will return 0.

PIXEL_HASH_TABLE_1BIT_32ENTRY

PIXEL_HASH_TABLE_1BIT_32ENTRY		
Size (in bits):	32	
Default Value:	0x00000000	
Description		
2-way pixel hashing table. Table is 32-entries:8X,4Y in [Y][X] format. Each entry is a single bit that indicates which sub-slice hardware block the indicated xy pixel block is mapped.		
pixelhash_id maps to color-pipe. A value of 0 indicates the larger color-pipe, or first enabled color-pipe if both enabled color-pipes are balanced		

DWord	Bit	Description
0	31:24	**Pixel Hashing Table Entries y[3]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=3 and x=7..0
	23:16	**Pixel Hashing Table Entries y[2]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=2 and x=7..0
	15:8	**Pixel Hashing Table Entries y[1]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=1 and x=7..0
	7:0	**Pixel Hashing Table Entries y[0]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=0 and x=7..0

PIXEL_HASH_TABLE_1BIT_64ENTRY

PIXEL_HASH_TABLE_1BIT_64ENTRY		
Size (in bits):	64	
Default Value:	0x00000000, 0x00000000	
Description		
2-way pixel hashing table. Table is 64-entries:8X,8Y in [Y][X] format. Each entry is a single bit that indicates which sub-slice hardware block the indicated xy pixel block is mapped.		
pixelhash_id maps to color-pipe. A value of 0 indicates the larger color-pipe, or first enabled color-pipe if both enabled color-pipes are balanced		

DWord	Bit	Description
0	31:24	**Pixel Hashing Table Entries y[3]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=3 and x=7..0
	23:16	**Pixel Hashing Table Entries y[2]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=2 and x=7..0
	15:8	**Pixel Hashing Table Entries y[1]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=1 and x=7..0
	7:0	**Pixel Hashing Table Entries y[0]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=0 and x=7..0
1	31:24	**Pixel Hashing Table Entries y[7]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=7 and x=7..0
	23:16	**Pixel Hashing Table Entries y[6]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=6 and x=7..0
	15:8	**Pixel Hashing Table Entries y[5]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=5 and x=7..0
	7:0	**Pixel Hashing Table Entries y[4]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=4 and x=7..0

PIXEL_HASH_TABLE_1BIT_128ENTRY

PIXEL_HASH_TABLE_1BIT_128ENTRY		
Size (in bits):	128	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000	
Description		
2-way pixel hashing table. Table is 128-entries:16X,8Y in [Y][X] format. Each entry is a single bit that indicates which sub-slice hardware block the indicated xy pixel block is mapped.		
pixelhash_id maps to color-pipe. A value of 0 indicates the larger color-pipe, or first enbled color-pipe if both enabled color-pipes are balanced		

DWord	Bit	Description
0	31:16	**Pixel Hashing Table Entries y[1]x[15:0]** Format: U16 Indicates the pixelhash_id for the pixel block that has y=1 and x=15..0
	15:0	**Pixel Hashing Table Entries y[0]x[15:0]** Format: U16 Indicates the pixelhash_id for the pixel block that has y=0 and x=15..0
1	31:16	**Pixel Hashing Table Entries y[3]x[15:0]** Format: U16 Indicates the pixelhash_id for the pixel block that has y=3 and x=15..0
	15:0	**Pixel Hashing Table Entries y[2]x[15:0]** Format: U16 Indicates the pixelhash_id for the pixel block that has y=2 and x=15..0
2	31:16	**Pixel Hashing Table Entries y[5]x[15:0]** Format: U16 Indicates the pixelhash_id for the pixel block that has y=5 and x=15..0
	15:0	**Pixel Hashing Table Entries y[4]x[15:0]** Format: U16 Indicates the pixelhash_id for the pixel block that has y=4 and x=15..0
3	31:16	**Pixel Hashing Table Entries y[7]x[15:0]** Format: U16 Indicates the pixelhash_id for the pixel block that has y=7 and x=15..0
	15:0	**Pixel Hashing Table Entries y[6]x[15:0]** Format: U16 Indicates the pixelhash_id for the pixel block that has y=6 and x=15..0

PIXEL_HASH_TABLE_2BIT_64ENTRY

PIXEL_HASH_TABLE_2BIT_64ENTRY

Size (in bits): 128

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

Description
3-wayor 4-way pixel hashing table. Table is 64-entries:8X,8Y in [Y][X] format. Each entry is two bits that indicates which sub-slice hardware block the indicated xy pixel block is mapped.
pixelhash_id maps to color-pipe. A value of 0 indicates the largest color-pipe, or first enbled color-pipe if all enabled color-pipes are balanced. A value of 2 indicates the smallest color-pipe, or last enbled color-pipe if all enabled color-pipes are balanced.

DWord	Bit	Description
0	31:30	**Pixel Hashing Table Entry y[1]x[7]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=7 and y=1
	29:28	**Pixel Hashing Table Entry y[1]x[6]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=6 and y=1
	27:26	**Pixel Hashing Table Entry y[1]x[5]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=5 and y=1

PIXEL_HASH_TABLE_2BIT_128ENTRY

PIXEL_HASH_TABLE_2BIT_128ENTRY

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

Description

3-wayor 4-way pixel hashing table. Table is 128-entries:16X,8Y in [Y][X] format. Each entry is two bits that indicates which sub-slice hardware block the indicated xy pixel block is mapped.

pixelhash_id maps to color-pipe. A value of 0 indicates the largest color-pipe, or first enbled color-pipe if all enabled color-pipes are balanced. A value of 2 indicates the smallest color-pipe, or last enbled color-pipe if all enabled color-pipes are balanced.

DWord	Bit	Description
0	31:30	**Pixel Hashing Table Entry y[0]x[15]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=15 and y=0
	29:28	**Pixel Hashing Table Entry y[0]x[14]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=14 and y=0
	27:26	**Pixel Hashing Table Entry y[0]x[13]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=13 and y=0
	25:24	**Pixel Hashing Table Entry y[0]x[12]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=12 and y=0
	23:22	**Pixel Hashing Table Entry y[0]x[11]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=11 and y=0
	21:20	**Pixel Hashing Table Entry y[0]x[10]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=10 and y=0
	19:18	**Pixel Hashing Table Entry y[0]x[9]** Format: U2 Indicates the pixelhash_id for the pixel block that has x=9 and y=0

Pixel Sample Mask Render Target Message Header Control

MHC_RT_PSM - Pixel Sample Mask Render Target Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:16	**Dispatched Pixel/Sample Enables** Format: U16 One bit per pixel (or sample within pixel) indicating which pixels/samples were originally enabled when the thread was dispatched. The Dispatched Pixel/Sample Enables must be unmodified from the ones sent when the pixel shader thread was initiated. If the Dispatched Pixel/Sample Enables are modified, behavior is undefined. **Programming Notes** When operating in PER_SAMPLE mode these bits correspond to samples, not pixels. Each subspan slot (4 bits) corresponds to a specific sample location for the subspan. Note that in NUMSAMPLES_1 mode, a pixel and sample are synonomous. When operating in PER_PIXEL mode, this field is ignored, and instead the SampleEnableMask (obtained via bypass) are used to clear the Depth Scoreboard.
	15:0	**Pixel/Sample Enables** Format: U16 Specifies which pixels/samples are still lit based on kill instruction activity in the pixel shader. This mask is AND'd with the Dispatched Pixel/Sample Enables mask, and that is used to control actual accesses to the color buffer. Pixels/samples will be dropped on masked writes, and the GRF is not modified for masked reads. **Programming Notes** When operating in PER_SAMPLE mode these bits correspond to samples, not pixels, as the PS is run per-sample. Each subspan slot (4 bits) corresponds to a specific sample location for the subspan. When operating in PER_PIXEL mode, these bits still correspond to pixels, as the PS is run per-pixel. Each pixel's mask bit is replicated according to Number of Multisamples and combined with other masks to control writes to the multisample locations.

PPHWSP_LAYOUT

PPHWSP_LAYOUT - PPHWSP_LAYOUT	
Size (in bits):	32672

0..3	127:0	**Reserved** Access: RO Format: MBZ

PPHWSP_LAYOUT - PPHWSP_LAYOUT

4	31:0	**Ring Head Pointer Storage** Description: The contents of the Ring Buffer Head Pointer register (register DWord 1) are written to this location either as result of an MI_REPORT_HEAD instruction or as the result of an automatic report (see RINGBUF registers).
5..15	351:0	**Reserved** Access: RO Format: MBZ
16	0	**Cumulative Context Run Time** This has the cumulative run time of the context on HW. HW reports CTX_TIMESTAMP to this location on a context switch. This value is written after the context save is complete. The value that is saved in the context image does not include the time between the saving of the cumulative value to context to the time we complete the save. If required for the value to always increment and not take the context save into consideration, driver must look at the value in the context image.
17	31:1	**Reserved** Access: RO Format: MBZ
	0	**Element Switch** Value / Name / Description: 0 — Indicates the context is not submitted as the first element in the execlist. 1 — Indicates the corresponding context has been submitted as first element of the execlist. Preempt Request Received Timestamp is the time when the pending execlist has been submitted to HW. Note that across multiple submissions a given context could be first or second element of an execlist. This bit will get set if the context has been submitted as the first element in the execlist.
18..19	63:0	**Preempt Request Received Timestamp** TIMESTAMP register sampled on preemption request is reported.
20..21	63:0	**Context Restore Complete Timestamp** TIMESTAMP register sampled on context restore complete is reported.
22..23	63:0	**Context Save Finished Timestamp** TIMESTAMP register sampled on context save completion is reported.
24..27	127:0	**MI_SEMAPHORE_WAIT** MI_SEMAPHORE_WAIT command on which the context got switched out due to semaphore wait. This field is only valid and must be looked at when the context switch reason in context status buffer is stated as Wait on Semaphore.

PPHWSP_LAYOUT - PPHWSP_LAYOUT		
28..31	127:0	**Reserved** Access: RO Format: MBZ
32..33 This field describes the most recent context switch status of the corresponding context.	63:0	**Context Switch Status Qword**

Predicate Barrier Message Data Payload

MDP_PREDICATE_BARRIER - Predicate Barrier Message Data Payload

Source:	EuSubFunctionGateway
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This response message is sent back only if the Gateway Barrier Message specifies that this is a predicated barrier. This response is written to the GRF writeback location, and the response length specified in the send message to the EU must be 1.

DWord	Bit	Description
0	31:16	**Reserved** Access: RO Format: MBZ
	15:0	**Predicated Barrier Mask Sum** Format: U16 This field is a sum of the predicate mask bits sent by each thread. This field (and the DW containing it) is not written if the barrier is not marked as a predicated barrier. The kernel should compare this field to 0 for the predicated OR function and compare it to the workgroup size for the predicated AND function.
1..7	223:0	**Reserved** Access: RO Format: MBZ

Qword Data Payload Register

MDCR_QW - Qword Data Payload Register		
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.1	63:0	**Qword0** Format: U64 Specifies the slot 0 data in this payload register
0.2-0.3	63:0	**Qword1** Format: U64 Specifies the slot 1 data in this payload register
0.4-0.5	63:0	**Qword2** Format: U64 Specifies the slot 2 data in this payload register
0.6-0.7	63:0	**Qword3** Format: U64 Specifies the slot 3 data in this payload register

Qword SIMD8 Atomic Operation CMPWR8B Message Data Payload

MDP_AOP8_QW2 - Qword SIMD8 Atomic Operation CMPWR8B Message Data Payload

Size (in bits): 1024

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Slot[7:0] Src0[31:0]** Format: MDCR_DW Specifies the lower 32-bits of Slot [7:0] Source 0 data
1.0-1.7	255:0	**Slot[7:0] Src0[63:32]** Format: MDCR_DW Specifies the upper 32-bits of Slot [7:0] Source 0 data
2.0-2.7	255:0	**Slot[7:0] Src1[31:0]** Format: MDCR_DW Specifies the lower 32-bits of Slot [7:0] Source 1 data

Read Surface Info Address Payload

DP_ASTATE_INFO_PAYLOAD - Read Surface Info Address Payload

Size (in bits): 128

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0.0	31:0	**U** Format: U32 Specifies the U channel address offset.
0.1	31:0	**V** Format: U32 Specifies the V channel address offset.
0.2	31:0	**R** Format: U32 Specifies the R channel address offset.
0.3	31:0	**LOD** Format: MACD_LOD Specifies the LOD.

Read Surface Info Data Payload

MDP_RSI - Read Surface Info Data Payload

Size (in bits): 512

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.5	191:0	**Reserved** Access: RO Format: MBZ
0.6-0.7	63:0	**Instruction Base Address** Format: GraphicsAddress[63:0] Instruction Base Address from STATE_BASE_ADDRESS, extended to 64-bit format. **Programming Notes** The 48-bit address is returned in a 64-bit address in canonical form. **Restriction** The Instruction Base Address returned is incorrect if the thread is from CCS queue.
1.0	31:0	**Width** Format: U32 Surface Width generally computed from RENDER_SURFACE_STATE Width (stored as width minus 1). The value is 0 for NULL surface, and in all other cases (Width+1) » LOD. Surface Width from RENDER_SURFACE_STATE (U14), zero extended to 32 bits.
1.1	31:0	**Height** Format: U32 Surface Height, generally computed from RENDER_SURFACE_STATE Height (stored as height minus 1). The value for a 1D array is RENDER_SUFACE_STATE's (Depth + 1). The value for 1D non-array, BUFFER, and NULL surface is 0. In all other case, the value is (Height + 1) » LOD.
1.2	31:0	**Depth** Format: U32 Surface Depth, generally computed from RENDER_SURFACE_STATE Depth (which is stored depth minus 1). If 2D Array or Cube Array surface, value is the (Depth+1). If 3D surface, value is (Depth+1) » LOD. In all other case, the value is 0.
1.3	31:0	**MIP Count** Format: U32 MIP Count from RENDER_SURFACE_STATE, range [0, 14], zero extended to 32 bits.

MDP_RSI - Read Surface Info Data Payload

1.4	31:0	**Surface Type** Format: U32 Surface Type from RENDER_SURFACE_STATE, zero extended to 32 bits

Value	Name	Description
0h	SURFTYPE_1D	1-dimensional map or array of maps
1h	SURFTYPE_2D	2-dimensional map or array of maps
2h	SURFTYPE_3D	3-dimensional map (volumetric) of maps
3h	SURFTYPE_CUBE	Cube map or array of cube maps
4h	SURFTYPE_BUFFER	Element in a buffer
7h	SURTYPE_NULL	Null surface
Others	Reserved	Reserved

1.5	31:0	**Surface Format** Format: U32 Surface Format from RENDER_SURFACE_STATE (U9), zero extended to 32 bits.
1.6-1.7	63:0	**Reserved** Access: RO Format: MBZ

RENDER_SURFACE_STATE

RENDER_SURFACE_STATE

Exists If:	//[MessageType] != 'Sample_8x8'
Size (in bits):	512
Default Value:	0x0001C000, 0x80000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This is the normal surface state used by all messages that use SURFACE_STATE except those that use MEDIA_SURFACE_STATE.

DWord	Bit	Description
0	31:29	**Surface Type** This field defines the type of the surface.

Value	Name	Description
0h	SURFTYPE_1D	Defines a 1-dimensional map or array of maps
1h	SURFTYPE_2D	Defines a 2-dimensional map or array of maps
2h	SURFTYPE_3D	Defines a 3-dimensional (volumetric) map
3h	SURFTYPE_CUBE	Defines a cube map or array of cube maps
4h	SURFTYPE_BUFFER	Defines an element in a buffer
6h	Reserved	
7h	SURFTYPE_NULL	Defines a null surface

Programming Notes

A null surface is used in instances where an actual surface is not bound. When a write message is generated to a null surface, no actual surface is written to. When a read message (including any sampling engine message) is generated to a null surface, the result is all zeros. Note that a null surface type is allowed to be used with all messages, even if it is not specifically indicated as supported. All of the remaining fields in surface state are ignored for null surfaces, with the following exceptions:

- **Width, Height, Depth, LOD, Render Target View Extent, Minimum Array element** fields must match for all surfaces that compose the current render target.

All sampling engine and data port messages support null surfaces with the above behavior, even if not mentioned as specifically supported, except for the following:

- The **Surface Type** of a surface used as a render target (accessed via the Data Port's Render Target Write message) must be the same as the **Surface Type** of all other render targets and of the depth / stencil buffer (defined in 3DSTATE_DEPTH_BUFFER, 3DSTATE_STENCIL_BUFFER), unless either the stencil buffer, depth buffer or render targets are SURFTYPE_NULL.

	28	**Surface Array** Format: Enable This field, if enabled, indicates that the surface is an array. **Programming Notes** If this field is *enabled*, the **Surface Type** must be SURFTYPE_1D, SURFTYPE_2D, or SURFTYPE_CUBE. If this field is *disabled* and **Surface Type** is SURFTYPE_1D, SURFTYPE_2D, or SURFTYPE_CUBE, the **Depth** field must be set to zero. To avoid performance issues with the sampler texture cache this bit should not be set unless the depth of the arrayed surface is greater than 1 (Depth field >1).
	27	**Reserved** Access: RO Format: MBZ
	26:18	**Surface Format** Format: SURFACE_FORMAT This field specifies the format of the surface or element within this surface. This field is ignored for all data port messages other than the render target message and streamed vertex buffer write message. Some forms of the media block messages use the surface format. **Programming Notes** If **Number of Multisamples** is set to a value other than MULTISAMPLECOUNT_1, this field cannot be set to the following formats: • Any compressed texture format (BC*, DXT*, FXT*, ETC*, EAC*) • Any YCRCB* format If **ASTC_Enable** is set to 1: • ASTC_Profile: ASTC_Profile can be freely set to 1 or 0. • ASTC_BlockDimention: Bit [25] will be set to 0 if ASTC_Profile is LDR-profile since only 2D blocks are supported in LDR profile. 2D HDR-profile can be supported where the ASTC_Profile is set at 1 (Full-Profile) and ASTC_BlockDimention is set as 0 (2D). This field cannot be a YUV (YCRCB*) or compressed (BC*, DXT*, FXT*, ETC*, EAC*) format if the **Surface Type** is SURFTYPE_BUFFER. This field cannot be a compressed (BC*, DXT*, FXT*, ETC*, EAC*) format if the **Surface Type** is SURFTYPE_1D.
	17:16	**Surface Vertical Alignment** **Description** **For Sampling Engine and Render Target Surfaces:** This field specifies the vertical alignment requirement in elements for the surface. Refer to the "Memory Data Formats" chapter for details on how this field changes the layout of the surface in memory. An *element* is defined as a pixel in uncompressed surface formats, and as a compression block in compressed surface formats. For MSFMT_DEPTH_STENCIL type multisampled surfaces, an element is a sample.

This field is used for 2D, CUBE, and 3D surface alignment when Tiled Resource Mode is TRMODE_NONE (Tiled Resource Mode is disabled). This field is ignored for 1D surfaces and also when Tiled Resource Mode is not TRMODE_NONE (e.g. Tiled Resource Mode is enabled).
See the appropriate Alignment table in the "Surface Layout and Tiling" section under Common Surface Formats for the table of alignment values for Tiled Resources.

The vertical alignment field (VALIGN) is also used to determine the start of the surface in memory. All surface are vertically aligned to VALIGN rows or VALIGN rows times the block height for block-compressed surface formats.

For other surfaces: This field is ignored.

Value	Name	Description
0h	Reserved	Reserved
1h	VALIGN_4 **[Default]**	Vertical alignment factor j = 4
2h	VALIGN_8	Vertical alignment factor j = 8
3h	VALIGN_16	Vertical alignment factor j = 16

Programming Notes

This field is intended to be set to VALIGN_4 if the surface was rendered as a depth buffer, for a multisampled (4x) render target, or for a multisampled (8x) render target, since these surfaces support only alignment of 4. Use of VALIGN_4 for other surfaces is supported, but increases memory usage.

This field is intended to be set to VALIGN_8 only if the surface was rendered as a stencil buffer, since stencil buffer surfaces support only alignment of 8. If set to VALIGN_8, Surface Format must be R8_UINT.
This field should also be set to VALIGN_8 if the surface was rendered as a D16_UNORM depth buffer, for render target of 1X/4X/16X.

For uncompressed surfaces, the units of "j" are rows of pixels on the physical surface. For compressed texture formats, the units of "j" are in compression blocks, thus each increment in "j" is equal to h pixels, where h is the height of the compression block in pixels.
See**Surface Layout and Tiling**for a full description of how i and j parameters are used to determine horizontal and vertical offset to the start of a MIP.

15:14 **Surface Horizontal Alignment**

Description

For Sampling Engine and Render Target Surfaces: This field specifies the horizontal alignment requirement for the surface.

This field is used for alignment when LOD >= Mip Tail Start LOD
This field is ignored when Tiled Resource Mode is not TRMODE_NONE (i.e. Tiled Resources are enabled). See the "Surface Layout and Tiling" section under Common Surface Formats for the table of alignment values for Tile Resources.

For other surfaces: This field is ignored.

Value	Name	Description
0h	Reserved	Reserved
1h	HALIGN_4	Horizontal alignment factor j = 4
2h	HALIGN_8	Horizontal alignment factor j = 8
3h	HALIGN_16 **[Default]**	Horizontal alignment factor j = 16

Programming Notes
See **Alignment Unit Size** For restrictions on Horizontal Alignment.
When Auxiliary Surface Mode is set to AUX_MCS_LCE or AUX_CCS_E, HALIGN_16 must be used unless contradicts **Alignment Unit Size** restrictions.

13:12 **Tile Mode**

Description
This field specifies the type of memory tiling (Linear, WMajor, XMajor, or YMajor) employed to tile this surface. See *Memory Interface Functions* for details on memory tiling and restrictions.
This field specifies the type of memory tiling (Linear, XMajor, or YMajor) employed to tile this surface. See *Memory Interface Functions* for details on memory tiling and restrictions.

Value	Name	Description	Programming Notes
0h	LINEAR	Linear mode (no tiling)	
1h	Reserved	Reserved	
2h	XMAJOR	X major tiling	
3h	YMAJOR	Y major tiling	

Programming Notes
• Refer to *Memory Data Formats* for restrictions on *TileMode* direction for the various buffer types. (Of particular interest is the fact that YMAJOR tiling is not supported for display/overlay buffers). • The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this field. • Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled (X/Y/W) surfaces can only be mapped to Main Memory. • If **Surface Type** is SURFTYPE_BUFFER, this field must be TILEMODE_LINEAR • If **Number of Multisamples** is not MULTISAMPLECOUNT_1, this field must be YMAJOR.
If **Surface Type** is SURFTYPE_1D this field must be TILEMODE_LINEAR, unless **Sampler Legacy 1D Map Layout Disable** is set to 0, in which case TILEMODE_YMAJOR is also allowed. **Tiled Resource Mode** must be set to TRMODE_NONE for these cases.
If **Surface Format** is ASTC*, this field must be TILEMODE_YMAJOR.

11 **Vertical Line Stride**

Format:	U1

For 2D Non-Array Surfaces accessed via the Sampling Engine or Data Cache Data Port: Specifies number of lines (0 or 1) to skip between logically adjacent lines - provides support of interleaved (field) surfaces as textures.
For Other Surfaces: Vertical Line Stride must be zero.

Programming Notes
This bit must not be set if the surface format is a compressed type (BCn*, FXT1, ETC*, EAC*).
This bit must not be set if the **Auxiliary Surface Mode** is not AUX_NONE.
If this bit is set on a sampling engine surface, the mip mode filter must be set to MIPFILTER_NONE

10 **Vertical Line Stride Offset**

Format:	U1

For 2D Non-Array Surfaces accessed via the Sampling Engine or Data Cache Data Port: Specifies the offset of the initial line from the beginning of the buffer. Ignored when Vertical **Line Stride** is 0.
For Other Surfaces: Vertical Line Stride Offset must be zero.

9 **Sampler L2 Out of Order Mode Disable**

Format:	Disable

If disabled this will forced formats which would have bypassed the L2 and been filled into the L1 out of order to be cached in the L2 and send in order to the L1. In general that is any format which is expanded 1:4, 1:2 in L1 or not expanded at all. This would include all lossless compressed cases.

Programming Notes
This bit must be set for the following surface types: BC2_UNORM BC3_UNORM BC5_UNORM BC5_SNORM BC7_UNORM

8 **Render Cache Read Write Mode**
For Surfaces accessed via the Data Port to Render Cache: This field specifies the way Render Cache treats a write request. If unset, Render Cache allocates a write-only cache line for a write miss. If set, Render Cache allocates a read-write cache line for a write miss.
For Surfaces accessed via the Sampling Engine or Data Port to Texture Cache or Data Cache: This field is reserved : MBZ

Value	Name	Description
0h	Write-Only Cache	Allocating write-only cache for a write miss
1h	Read-Write Cache	Allocating read-write cache for a write miss

Programming Notes
This field is provided for performance optimization for Render Cache read/write accesses.

7:6 **Media Boundary Pixel Mode**

For 2D Non-Array Surfaces accessed via the Data Port Media Block Read Message or Data Port Transpose Read message: This field enables control of which rows are returned on vertical out-of-bounds reads using the Data Port Media Block Read Message or Data Port Transpose Read message. In the description below, frame mode refers to **Vertical Line Stride** = 0, field mode is **Vertical Line Stride** = 1 in which only the even or odd rows are addressable. The frame refers to the entire surface, while the field refers only to the even or odd rows within the surface.

For Other Surfaces: Reserved : MBZ

Value	Name	Description
0h	NORMAL_MODE	The row returned on an out-of-bound access is the closest row in the frame or field. Rows from the opposite field are never returned.
1h	Reserved	
2h	PROGRESSIVE_FRAME	The row returned on an out-of-bound access is the closest row in the frame, even if in field mode.
3h	INTERLACED_FRAME	In field mode, the row returned on an out-of-bound access is the closest row in the field. In frame mode, even out-of-bound rows return the nearest even row while odd out-of-bound rows return the nearest odd row.

5 **Cube Face Enable - Negative X**

Format:	Enable

For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine: This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided.

Programming Notes
When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
This field must be programmed to 1h (enabled) whenever **Surface Type** is programmed to **SURFTYPE_CUBE**

4 **Cube Face Enable - Positive X**

Format:	Enable

For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine: This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided.

Programming Notes
When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
This field must be programmed to 1h (enabled) whenever **Surface Type** is programmed to **SURFTYPE_CUBE**

3 **Cube Face Enable - Negative Y**

Format:	Enable

For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine: This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided.

Programming Notes
When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
This field must be programmed to 1h (enabled) whenever **Surface Type** is programmed to **SURFTYPE_CUBE**

2 **Cube Face Enable - Positive Y**

Format:	Enable

For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine: This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided.

Programming Notes
When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
This field must be programmed to 1h (enabled) whenever **Surface Type** is programmed to **SURFTYPE_CUBE**

1 **Cube Face Enable - Negative Z**

Format:	Enable

For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine: This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided.

Programming Notes
When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
This field must be programmed to 1h (enabled) whenever **Surface Type** is programmed to **SURFTYPE_CUBE**

0 **Cube Face Enable - Positive Z**

Format:	Enable

For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine: This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note

that storage for disabled faces must be provided.

Programming Notes
When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
This field must be programmed to 1h (enabled) whenever **Surface Type** is programmed to **SURFTYPE_CUBE**

1 | 31 **Enable Unorm Path in Color Pipe**

Format:	Enable

Enables Unorm Path (fixed Point Conversion of floating point for fill and blend in DAPRSS) in color Pipe.

Value	Name	Description
1	ENABLE **[Default]**	Enables Unorm Path in Color Pipe.
0	DISABLE	Disables Unorm path in Color Pipe.

Programming Notes
This bit should never be programmed to 0

30:24 **Memory Object Control State**

Format:	MEMORY_OBJECT_CONTROL_STATE

Specifies the memory object control state for this surface and the associated Auxiliary surface (if any).

23:19 **Base Mip Level**

Format:	U4.1

Range: [0.0, 14.0]
Specifies which mip level is considered the "base" level when determining mag-vs-min filter and selecting the "base" mip level.

Programming Notes
This field also exists in SAMPLER_STATE. If both fields are zero, the Base Mip Level is zero. If one is nonzero, Base Mip Level is the nonzero field. It is illegal to have both Base Mip Level fields nonzero.

18 **Corner Texel Mode**

Format:	Enable

This field, when ENABLED, indicates when a surface is using corner texel-mode for sampling.
Corner Texel Mode is ignored for Planar YUV/YCrCb surface formats.
Corner Texel Mode is ignored for sample_8X8 and sample_unorm messasge types.
Corner Texel Mode is not supported with Non-Normalized Coordinates
Does not support legacy sampler features set0 See legacy sampler page for more details

Value	Name	Description
0h	Disable **[Default]**	When programmed to 0h, Corner Texel Mode is disabled. This means texel references are shifted a half-texel from the upper-right corner of the texture map which is the standard texel reference mode.
1h	Enable	When programmed to 1h, Corner Texel Mode is enabled. The location of a sampled texel on a texture map is shifted a half-texel to the upper-left, meaning texel (0,0) isin the exact upper-left corner of the surface.

17 **Double Fetch Disable**

Format:	Disable

This bit is intended to disable the "double fetch" of adjacent cache-lines in most all cases. Double fetch is a performance mode, but for some surface types for formats it may be lower performance due to fetching unused cache-lines.

Value	Name	Description
0h	Enable **[Default]**	When programmed to 0h, double fetches are allowed.
1h	Disable	When programmed to 1h, double fetches are disabled.

16 **Reserved**

Access:	RO
Format:	MBZ

15 **Sample Tap Discard Disable**

This bit forces sample tap discard filter mode to be disabled for this surface state. This bit must be set for surfaces which are no Alpha Channel such as R8G8B8_UNORM.

Value	Name	Description
0h	DISABLE **[Default]**	When programmed to 0h, Sample Tap Discard filter mode is allowed and is not disabled by this bit. This bit is ignored if Sample Tap Discard is not enabled in the Sampler State.
1h	ENABLE	When programmed to 1h, Sample Tap Discard filter mode will be disabled even if enabled through Sampler State

Programming Notes
This bit must be set for all Planar YUV surface formats (e.g. PLANAR_420_8, PLANAR_420_16)

14:0 **Surface QPitch**

Format:	U17[16:2]

The interpretation of this field is dependent on Surface Type as follows:

- SURFTYPE_1D: distance in *pixels* between array slices
- SURFTYPE_2D/CUBE: distance in *rows* between array slices. For Quilted Textures this field specifies the distance in rows between *quilt* slices. For compressed texture formats, one row contains a complete compression block vertically.
- SURFTYPE_3D: distance in *rows* between R-slices [**Note:** these *rows* are only in the vertical dimension without considering the depth dimension]. For compressed texture formats, one row contains a complete compression block vertically.

- Other surface types: field is ignored

Value	Name	Description
[0,32767]		1 is added to the value and it is multiplied by 4 to determine the height in rows.

Programming Notes
For Surface Type 1D: This field must be set to an integer multiple of the **Surface Horizontal Alignment** **For Surface Type 2D, CUBE:** This field must be set to an integer multiple of the **Surface Vertical Alignment** **For Surface Type 3D:** *Tile Mode != Linear:* This field must be set to an integer multiple of the tile height (2^Cv) *Tile Mode == Linear:* This field must be set to an integer multiple of the Surface Vertical Alignment **Note:** for compressed textures (BC*, FXT1, ETC*, EAC*), this field is in units of rows of compression blocks.
Software must ensure that this field is set to a value sufficiently large such that the array slices in the surface do not overlap. Refer to the Memory Data Formats section for information on how surfaces are stored in memory.

2 | 31 **Depth/Stencil Resource**

Description
This bit field, when set, indicates if the resource is created as Depth/Stencil resource.

Programming Notes
SW must set this bit for any resource that was created with Depth/Stencil resource flag. Setting this bit allows HW to properly interpret the data-layout for various cases. For any resource that's created without Depth/Stencil resource flag, it must be reset.

30 **Reserved**

Access:	RO
Format:	MBZ

29:16 **Height**

Format:	U14-1

This field specifies the height of the surface, minus 1. If the surface is MIP-mapped, this field contains the height of the base MIP level. For buffers, this field specifies a portion of the buffer size.

Value	Name	Description	Exists If
[0,0]		must be zero	[Surface Type] == 'SURFTYPE_1D'
[0,8191]		height of surface - 1 (y/v dimension) If Vertical Line Stride is set for a 2D surface, then the maximum allowed height is 2^8.	([SurfaceType] == 'SURFTYPE_2D') && ([VerticalLineStride] == 1)
[0,16383]		height of surface - 1 (y/v	([SurfaceType] == 'SURFTYPE_2D') &&

	dimension)	([VerticalLineStride] == 0)
[0,2047]	height of surface -1 (y/v)	[SurfaceType]=='SURFTYPE_3D'
[0,16383]	height of surface - 1 (y/v dimension)	[SurfaceType] == 'SURFTYPE_CUBE'
[0,16383]	contains bits [20:7] of the number of entries in the buffer - 1	[SurfaceType] == 'SURFTYPE_BUFFER'

Programming Notes

For typed buffer and structured buffer surfaces, the number of entries in the buffer ranges from 1 to 2^{27}. For raw buffer surfaces, the number of entries in the buffer is the number of bytes which can range from 1 to 2^{30}. After subtracting one from the number of entries, software must place the fields of the resulting 27-bit value into the **Height, Width**, and **Depth** fields as indicated, right-justified in each field. Unused upper bits must be set to zero.

If **Vertical Line Stride** is 1, this field indicates the height of the field, not the height of the frame

The **Height** of a render target must be the same as the **Height** of the other render targets and the depth buffer (defined in 3DSTATE_DEPTH_BUFFER), unless **Surface Type** is SURFTYPE_1D or SURFTYPE_2D with **Depth** = 0 (non-array) and **LOD** = 0 (non-mip mapped).

If this surface in memory is accessed with Vertical Line Stride set to both 0 and 1, this field must be an even value when Vertical Line Stride is 0.

If Media Pixel Boundary Mode is not set to NORMAL_MODE, this field must be an even value.

If Surface Format is PLANAR*, this field must be a multiple of 4

15:14 **Reserved**

Access:	RO
Format:	MBZ

13:0 **Width**

Format:	U14-1

This field specifies the width of the surface, minus 1. If the surface is MIP-mapped, this field specifies the width of the base MIP level. The width is specified in units of pixels or texels. For buffers, this field specifies a portion of the buffer size.

For surfaces accessed with the Media Block Read/Write message, this field is in units of DWords.

For surfaces accessed with the Transpose Read Message, this field is in units of DWords.

Value	Name	Description	Exists If
[0,16383]		width of surface - 1 (x/u dimension)	[SurfaceType] == 'SURFTYPE_1D'
[0,16383]		width of surface - 1 (x/u dimension)	[SurfaceType] == 'SURFTYPE_2D'
[0,16383]		width of surface - 1 (x/u dimension)	[SurfaceType] == 'SURFTYPE_3D'
[0,2047]		width of surface - 1 (x/u dimension)	[SurfaceType]=='SURFTYPE_3D'
[0,16383]		width of surface - 1 (x/u dimension)	[SurfaceType] == 'SURFTYPE_CUBE'

		[0,127]		contains bits [6:0] of the number of entries in the buffer - 1	[SurfaceType] == 'SURFTYPE_BUFFER'

Programming Notes

- For surface types other than SURFTYPE_BUFFER. The Width specified by this field must be less than or equal to the surface pitch (specified in bytes via the Surface Pitch field).
- For cube maps, Width must be set equal to the Height.
- The **Width** of a render target must be the same as the **Width** of the other render target(s) and the depth buffer (defined in 3DSTATE_DEPTH_BUFFER), unless **Surface Type** is SURFTYPE_1D or SURFTYPE_2D with **Depth** = 0 (non-array) and **LOD** = 0 (non-mip mapped).
- The **Width** of a render target with YUV surface format must be a multiple of 2.
- For SURFTYPE_BUFFER: The low two bits of this field must be 11 if the Surface Format is RAW (the size of the buffer must be a multiple of 4 bytes).

If **Surface Format** is PLANAR*, this field must be a multiple of 2

A known issue exists if a primitive is rendered to the first 2 rows and last 2 columns of a 16K width surface. If any geometry is drawn inside this square it will be copied to column X=2 and X=3 (arrangement on Y position will stay the same). If any geometry exceeds the boundaries of this 2x2 region it will be drawn normally. The issue also only occurs if the surface has TileMode != Linear

3 | 31:21 | **Depth**

Format:	U11-1

This field specifies the total number of levels, minus 1, for a volume texture or the number of array elements, minus 1, allowed to be accessed starting at the **Minimum Array Element** for arrayed surfaces. If the volume texture is MIP-mapped, this field specifies the depth of the base MIP level. For buffers, this field specifies a portion of the buffer size.

Value	Name	Description	Exists If
[0,2047]		number of array elements - 1	[SurfaceType] == 'SURFTYPE_1D'
[0,2047]		number of array elements - 1	[SurfaceType] == 'SURFTYPE_2D'
[0,2047]		depth of surface - 1 (z/r dimension)	[SurfaceType] == 'SURFTYPE_3D'
[0,340]		number of array elements - 1 [see programming notes for range]	[SurfaceType] == 'SURFTYPE_CUBE'
[0,2047]		contains bits [31:21] of the number of entries in the buffer - 1	[SurfaceType] == SURFTYPE_BUFFER

Programming Notes

The **Depth** of a render target must be the same as the **Depth** of the other render target(s) and of the depth buffer (defined in 3DSTATE_DEPTH_BUFFER).

	For SURFTYPE_CUBE: For Sampling Engine Surfaces and Typed Data Port Surfaces, the range of this field is [0,340], indicating the number of cube array elements (equal to the number of underlying 2D array elements divided by 6). For other surfaces, this field must be zero.
	For SURFTYPE_1D, 2D, and CUBE: The range of this field is reduced by one for each increase from zero of **Minimum Array Element**. For example, if **Minimum Array Element** is set to 1024 on a 2D surface, the range of this field is reduced to [0,1023].

20 Tile Address Mapping Mode

Format:	U1

This field is used to select between Tile Address Mapping mode and for TileYs and TileYf.

Value	Name	Description
0h	Tile Address Mapping Mode	This field should always be programmed to 0h. Tiling mode is the standard tile layout for 3D.
1h	Tile Address Mapping Mode (for Standard Tiling)	This field should NOT be programmed to 1h as the Tiling Address Mapping mode is not supported by SW.

Programming Notes
Tile Address Mapping Mode must be set to Tile Address Mapping Mode when surface type is SURFTYPE_3D.

19 Standard Tiling Mode Extensions

It changes in the MIP Tail Packing. When enabled (programmed to 1h), MIP Tail packing for Volumetric and 1D are changed as defined in the Surface Layout and Tiling section.
This bit controls enabling of some Standard Tiling extensions:

Value	Name	Description
0h	Disable **[Default]**	When programmed to 0h, the extensions to support Standard Tiling are disabled. Behavior reverts to Miptail packing.
1h	Enable	When programmed to 1h, the changes to support Standard Tiling Extensions are enabled. See the Surface Layout and Tiling section for details.

18 Reserved

Format:	MBZ

17:0 Surface Pitch

Format:	U18-1

Description
Surface Pitch Range: • For surfaces of type SURFTYPE_BUFFER: [0,262143] -> [1B, 256KB] • For other linear surfaces: [0, 262143] -> [1B, 256KB] • For X-tiled surface: [511, 262143] -> [512B, 256KB] = [1 tile, 512 tiles]

- For Y-tiled surfaces: [127, 262143]->[128B, 256KB] = [1 tile, 2048 tiles]
- For W-tiled surfaces: [127, 262143]->[128B, 256KB] = [1 tile, 2048 tiles]
- For TileYF and TileYS surfaces, the range is dependent on the Cu parameter (refer to *Memory Data Formats* section for the definition of the Cu parameter depending on the case). The range in bytes is [2^{Cu}-1,262143] -> [(2^{Cu})B,256KB] = [1 tile, 256KB/(2^{Cu}) tiles]

This field specifies the surface pitch in (#Bytes - 1).
For surfaces of type SURFTYPE_BUFFER, this field indicates the size of the structure.

Programming Notes

- For linear *render target* surfaces and surfaces accessed with the typed data port messages, the pitch must be a multiple of the element size for non-YUV surface formats. Pitch must be a multiple of 2 * element size for YUV surface formats.
- For untyped data port messages, which are only supported with **Surface Type** SURFTYPE_BUFFER, the pitch must match the number of bytes implied by Surface Format..
- For linear surfaces with **Surface Type** of SURFTYPE_BUFFER and **Surface Format** RAW, the pitch must be 1 byte.
- For other linear surfaces, the pitch can be any multiple of bytes.
- For tiled surfaces, the pitch must be a multiple of the tile width.

- The width of a tile depends on the surface format if Tiled Resource Enable is enabled. Refer to the Tiled Resource Enable field to determine which sub-mode applies to the surface format in use, and determine the Cu parameter from the Surface Layout section. The tile width is equal to 2^Cu bytes.
- For surfaces of type SURFTYPE_1D, this field is ignored.

The following table indicates the maximum byte width, frame width, and pitch size allowed when memory compression is on.

Tiling Mode	Pixel Format	Max Frame Width (bytes)	Max Frame Width (pixels)	Max Pitch (bytes)
Legacy 4K	8bpp	16k	16k	16k + 127
	16bpp	16k	8k	16k + 127
	32bpp	16k	4k	16k + 127
	64bpp	16k	2k	16k + 127
	128bpp	16k	1k	16k + 127
TileYF	8bpp	8k	8k	8k + 63
	16bpp	16k	8k	16k + 127
	32bpp	16k	4k	16k + 127
	64bpp	16k	2k	16k + 255
	128bpp	16k	1k	16k + 255
TileYS	8bpp	16k	16k	16k + 255

	16bpp	16k	8k	16k + 511
	32bpp	16k	4k	16k + 511
	64bpp	16k	2k	16k + 1023
	128bpp	16k	1k	16k + 1023

4 — 31 — Decompress In L3

Value	Name	Description
0h	Disable **[Default]**	When this field is set to 0h, the associated compressible surface, when accessed by sampler and data-port, can be compressed in L3. If the surface is not compressible, this bit field is ignored.
1h	Enable	When this field is set to 1h, the associated compressible surface, when accessed by sampler and data-port, will be uncompressed in L3. If the surface is not compressible, this bit field is ignored.

30:29 — Render Target And Sample Unorm Rotation

Description
For Render Target Surfaces: This field specifies the rotation of this render target surface when being written to memory.
For sample_unorm Messages: This field specifies the rotation of the data returned by sampler for sample_unorm message.
For Other Surfaces:This field is ignored.

Value	Name	Description
0h	0DEG	No rotation (0 degrees)
1h	90DEG	Rotate by 90 degrees
2h	180DEG	Rotate by 180 degrees [for sample_unorm message]
3h	270DEG	Rotate by 270 degrees

Programming Notes

Programming Notes for Render Target Surfaces only

- Rotation is not supported for render targets of any type other than simple, non-mip-mapped, non-array 2D surfaces. The surface must be using tiled with X major.
- **Width** and **Height** fields apply to the dimensions of the surface before rotation.
- For 90 and 270 degree rotated surfaces, the **Height** (rather than the **Width**) must be less than or equal to the **Surface Pitch** (specified in bytes).
- For 90 and 270 degree rotated surfaces, the actual **Height** and **Width** of the surface in pixels (not the field value which is decremented) must both be even.

Rotation is supported only for surfaces with the following surface formats: B5G6R5_UNORM, B5G6R5_UNORM_SRGB, R8G8B8A8_UNORM, R8G8B8A8_UNORM_SRGB, B8G8R8[A|X]8_UNORM, B8G8R8[A|X]8_UNORM_SRGB, B10G10R10[A|X]2_UNORM, R10G10B10A2_UNORM,

		R16G16B16A16_FLOAT, R16G16B16X16_FLOAT
	28:18	**Minimum Array Element** Format: U11 Range 1D/2D/cube surfaces: [0,2047] 3D surfaces: [0,2047] **For Sampling Engine, Render Target, and Typed 1D, 2D and 3D Surfaces:** This field indicates the minimum array element that can be accessed as part of this surface. This field is added to the delivered array index before it is used to address the surface. For sampling 3D surfaces, this fieldis an offset in "R" slices into the LOD. **For Sampling Engine Cube Surfaces:** This field indicates the minimum array element in units of "cube faces" in the underlying 2D surface array that can be accessed as part of this surface (the cube array index is multiplied by 6 to compute this value, although Minimum Array Element is not restricted to only multiples of 6). This field is added to the delivered (array index)*6 before it is used to address the surface. **For all other surface types:** This field should be zero.
	17:7	**Render Target View Extent** Format: U11-1 Range [0,2047] to indicate extent of [1,2048] **For Render Target and Typed Dataport 3D Surfaces:** This field indicates the extent of the accessible 'R' coordinates minus 1 on the LOD currently being rendered to. **For Render Target and Typed Dataport 1D and 2D Surfaces:** This field must be set to the same value as the Depth field. **For Other Surfaces:** This field is ignored.
	6	**Multisampled Surface Storage Format** This field indicates the storage format of the multisampled surface. **Value** / **Name** / **Description** 0h / MSS / Multsampled surface was/is rendered as a render target 1h / DEPTH_STENCIL / Multisampled surface was rendered as a depth or stencil buffer **Programming Notes** • All multisampled render target surfaces must have this field set to MSFMT_MSS • IF this field is MSFMT_DEPTH_STENCIL, the only sampling engine messages allowed are "ld2dms", "resinfo", and "sampleinfo". • This field is ignored if **Number of Multisamples** is MULTISAMPLECOUNT_1
	5:3	**Number of Multisamples** This field indicates the number of multisamples on the surface. **Value** / **Name** 0h / MULTISAMPLECOUNT_1

		1h: MULTISAMPLECOUNT_2 2h: MULTISAMPLECOUNT_4 3h: MULTISAMPLECOUNT_8 4h: MULTISAMPLECOUNT_16 5h-7h: Reserved **Programming Notes** If this field is any value other than MULTISAMPLECOUNT_1, the **Surface Type** must be SURFTYPE_2DThis field must be set to MULTISAMPLECOUNT_1 unless the surface is a Sampling Engine surface or Render Target surface.
	2:0	**Multisample Position Palette Index** This field indicates the index into the sample position palette that the multisampled surface is using. This field is only used as a return value for the sampleinfo message, and is otherwise not used by hardware. **Value** [0,7] — **Name**
5	31:25	**X Offset** Format: U9[8:2] This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the surface. This field effectively loosens the alignment restrictions on the origin of tiled surfaces. Previously, tiled surface origin was (by definition) located at the base address, and thus needed to satisfy the 4KB base address alignment restriction. Now the origin can be specified at a finer (4-wide x 4-high pixel) resolution. Format: `PixelOffset[8:2]` **Value** [0,127] — **Name** — **Description**: This value is multiplied by 4 to determine X Offset in pixels. **Programming Notes** • For linear surfaces, this field must be zero. • For surfaces accessed with the *Data Port Media Block Read/Write* message, the pixel size is assumed to be 32 bits in width. • For surfaces accessed with the **Data Port Transpose Read message**, the pixel size is assumed to be 32 bits in width. • For **Surface Format** with other than 8, 16, 32, 64, or 128 bits per pixel, this field must be zero. • If **Render Target Rotation** is set to other than RTROTATE_0DEG, this field must be zero.

- If **Surface Type** not SURFTYPE_2D, this field must be zero.
- If **MIP Count** is not zero, this field must be zero.
- If **Number of Multisamples** is not MULTISAMPLECOUNT_1, this field must be zero.
- If **Surface Array** is enabled, this field must be zero.
- If **Auxiliary Surface Mode** is not AUX_NONE, this field must be zero.
- If **Surface Vertical Alignment** is VALIGN_8, this field must be a multiple of 8.
- For **Surface Format** with 8 bits per element, this field must be a multiple of 16.
- For **Surface Format** with 16 bits per element, this field must be a multiple of 8.

If Surface Format is PLANAR_420_16 or PLANAR_420_8 this field must be zero

- If **Tiled Resource Mode** is not TRMODE_NONE, this field must be zero.

24 **Reserved**

Access:	RO
Format:	MBZ

23:21 **Y Offset**

Format:	U5[4:2]

This field specifies the vertical offset in rows from the **Surface Base Address** to the start of the surface.(See additional description in the **X Offset** field.)

Format:

```
RowOffset[4:2]
```

Value	Name	Description
[0,7]		This value is multiplied by 4 to determine the actual Y Offset in Rows.

Programming Notes

- For linear surfaces, this field must be zero.
- For render targets in which the **Render Target Array Index** is not zero, this field must be zero.
- For **Surface Format** with other than 8, 16, 32, 64, or 128 bits per pixel, this field must be zero.
- If **Render Target Rotation** is set to other than RTROTATE_0DEG, this field must be zero.
- If **Surface Type** not SURFTYPE_2D, this field must be zero.
- If **MIP Count** is not zero, this field must be zero.
- If **Number of Multisamples** is not MULTISAMPLECOUNT_1, this field must be zero.
- If **Surface Array** is enabled, this field must be zero.
- If **Auxiliary Surface Mode** is not AUX_NONE, this field must be zero.

If Surface Format is PLANAR_420_16 or PLANAR_420_8 this field must be zero

- If **Tiled Resource Mode** is not TRMODE_NONE, this field must be zero.

This field must be zero if Surface Format is Planar and the U and V planes are half-pitch (e.g. YV12 format).

If VERTICAL STRIDE field is 1h, then the Y Offset must be a multiple of 8. Therefore, the lsb of this field must be 0.

20 **EWA Disable For Cube**

Format:	Disable

Specifies if EWA mode for LOD quality improvement needs to be disabled for cube maps.

Value	Name	Description
0h	Enable **[Default]**	EWA is enabled for cube maps
1h	Disable	EWA is disabled for cube maps

Programming Notes

This field indicates if EWA mode for LOD quality improvement needs to be disabled for cube maps.By default EWA would be on for cube maps hence this field must be 0. If there is any spec violation seen with EWA on cube maps then this field must be set to 1 to disable EWA for cubes.

19:18 **Tiled Resource Mode**

For Sampling Engine, Render Target, and Typed/Untyped Surfaces: This field specifies the tiled resource mode.**For other surfaces:**This field is ignored.

Value	Name	Description	Exists If
0h	NONE	No tiled resource	
1h	4KB	4KB tiled resources	[SurfaceType] == 'SURFTYPE_1D'
2h	64KB	64KB tiled resources	[SurfaceType] == 'SURFTYPE_1D'
1h	TILEYF	4KB tiled resources	[SurfaceType] != 'SURFTYPE_1D'
2h	TILEYS	64KB tiled resources	[SurfaceType] != 'SURFTYPE_1D'
3h	Reserved		

Programming Notes

If **Tile Mode** is not set to TILEMODE_YMAJOR, this field must be set to TRMODE_NONE, unless the Surface Type is SURFTYPE_1D.

If this field is not set to TRMODE_NONE, the **Surface Format** must be one with 8, 16, 32, 64, or 128 bits per element, or one of the compressed texture modes (BC*, ETC*, EAC*, ASTC*). Additionally, YCRCB* formats are supported and treated as 16 bits per element, and the PLANAR_420_8 format is support and treated as 8 bits per element on the Y plane and 16 bits per element on the UV plane (if **Separate UV Plane Enable** is disabled) or 8 bits per element on the U and V planes (if **Separate UV Plane Enable** is enabled).

If this field is set to TRMODE_NONE, the surface cannot contain any null pages unless **Surface Type** is BUFFER. A BUFFER surface with null pages must have **Surface Base Address** and **Surface**

Pitch set to an integer multiple of the element size, and **Surface Format** must be one with 8, 16, 32, 64, or 128 bits per element.

If **Surface Format** is PLANAR, the surface cannot contain any null pages.

If RENDER_SURFACE_STATE.Surface Type = 3D, and RENDER_SURFACES_STATE.Auxiliary Surface Mode != AUX_NONE , this field must be set to TILEYS

17:15 **Reserved**

Access:	RO
Format:	MBZ

14 **Coherency Type**

Specifies the type of coherency maintained for this surface.

Value	Name	Description
0h	GPU coherent	Surface memory is kept coherent with GPU threads using GPU read/write ordering rules. Surface memory is backed by system memory but is not kept coherent with CPU (LLC).
1h	IA coherent	Surface memory is kept coherent with CPU (LLC).

Programming Notes

This field may optionally be 1 (IA coherent) for messages sent to SFID_DP_DC0 or SFID_DP_DC1 or SFID_DP_DC2. This field is typically set to 0 (GPU coherent) if the context is operating in a non-SVM legacy mode (for example, Ring Buffer or a Execlist using 32-bit Virtual Address Legacy Context PPGTT32).

13:12 **Reserved**

Access:	RO
Format:	MBZ

11:8 **Mip Tail Start LOD**

Format:	U4

Description

For Sampling Engine, Render Target, and Typed Surfaces: This field indicates which LOD is the first one in the MIP tail if **Tiled Resource Mode** is not TRMODE_NONE. The MIP tail has a different layout than the rest of the surface. Refer to the *Memory Data Formats* section for more details. **For other surfaces:** This field is ignored.

Programming Notes

If **Tiled Resource Mode** is not TRMODE_NONE, this field must be set to ensure that mips within the mip tail do not overlap given the storage algorithms given in the Memory Data Formats section.

If **Tiled Resource Mode** is not TRMODE_NONE, to disable the Mip Tail this field must be set to a mip that larger than those present in the surface (i.e. 15). This is recommended for non-mip-

mapped surfaces.

The following table indicates the *maximum* size of the mip that is set to be the Mip Tail Start LOD for various cases:

Surface Type	Tiling Mode	#MS	Bits Per Element				
			8	16	32	64	128
1D	64KB	1	16384	8192	4096	2048	1024
	4KB	1	1024	512	256	128	64
2D/ CUBE	TIleYS	1	128x256	128x128	64x128	64x64	32x64
		2	128x128	128x64	64x64	64x32	32x32
		4	64x128	64x64	32x64	32x32	16x32
		8	64x64	64x32	32x32	32x16	16x16
		16	32x64	32x32	16x32	16x16	8x16
	TIleYF	1x	32x64	32x32	16x32	16x16	8x16
		2x	16x32	16x16	8x16	8x8	4x8
		4x	16x16	16x8	8x8	8x4	4x4
		8x	16x16	16x8	8x8	8x4	4x4
		16x	8x4	8x4	4x4	2x4	1x4
3D	TIleYS	1	32x32x32	16x32x32	16x32x16	16x16x16	8x16x16
	TileYF	1	16x8x16	8x8x16	8x8x8	8x4x8	4x4x8

7:4 **Surface Min LOD**

Format:	U4

For Sampling Engine and Typed Surfaces: This field indicates the most detailed LOD that can be accessed as part of this surface. This field is added to the delivered LOD (*sample_l*, *ld*, or *resinfo* message types) before it is used to address the surface.
For Other Surfaces: This field is ignored.

3:0 **MIP Count / LOD**

Format:	**Sampling Engine and Typed Surfaces:** U4 in (LOD units - 1) **Render Target Surfaces:** U4 in LOD units
Range	**Sampling Engine and Typed Surfaces:** [0,14] representing [1,15] MIP levels **Render Target Surfaces:** [0,14] representing LOD **Other Surfaces:** [0]

For Sampling Engine and Typed Surfaces:
This field indicates the number of MIP levels allowed to be accessed starting at **Surface Min LOD**, which must be less than or equal to the number of MIP levels actually stored in memory for this surface. For sample* messages, the mip map access is clamped to be between the mipmap specified by the integer bits of the Min LOD and the ceiling of the value specified here. For ld* messages, out-of-bounds behavior results for LODs outside of the range specified in this field.
For Render Target Surfaces: This field defines the MIP level that is currently being rendered into. This is the absolute MIP level on the surface and is not relative to the **Surface Min LOD** field, which is ignored for render target surfaces.

For Other Surfaces: This field is reserved : MBZ

Programming Notes
The **LOD** of a render target must be the same as the **LOD** of the other render target(s) and of the depth buffer (defined in 3DSTATE_DEPTH_BUFFER). For render targets with YUV surface formats, the **LOD** must be zero. For sampling engine surfaces with PLANAR* surface format, **MIP Count** must be zero.

6 | 31 **Separate UV Plane Enable**

Exists If:	([Surface Format] == 'PLANAR')
Format:	Enable

If enabled, this field indicates that the U and V are present as separate planes. If disabled, the UV data is interleaved on a single plane.

Programming Notes
See the section "Planar Memory Organization" for a description of how the size and location of the chroma planes (U and V) are calculated.

30 **Half Pitch for Chroma**

Exists If:	([Surface Format] == 'PLANAR')

This bit enables support for half-pitch chroma planes for Planar YUV surfaces. It is ignored for Non-Planar surfaces. For planar surfaces it allows the chroma planes to be one-half the width of a the Y (Luma) plane.
For example, should be set to 0h for NV12 surfaces.
Must be set to 1h for YV12 surfaces.

Value	Name	Description
0h	Disable **[Default]**	Setting this bit to 0h (default) causes Chroma planes to be treated as full width (same as Y plane).
1h	Enable	Setting this bit to 1h causes Chroma planes (U and V) to be treated as half the width of the Luma (Y) plane.

30:16 **Auxiliary Surface QPitch**

Exists If:	([Surface Format] != 'PLANAR')
Format:	U17[16:2]

This field specifies the distance in rows between array slices on the auxiliary surface.

Value	Name	Description
[0h,7FFFh]		1 is added to the value and it is multiplied by 4 to determine the actual QPitch in rows

Programming Notes
This field must be set to an integer multiple of the **Surface Vertical Alignment**
Software must ensure that this field is set to a value sufficiently large such that the array slices in the auxiliary surface do not overlap. Refer to the Memory Data Formats section for information on how surfaces are stored in memory.
Auxiliary surface parameters in the Surface State is only meant for Multisampling Control Surface.

	This field should be programmed when Multisampling is enabled. In all other cases HW will ignore this value.
29:16	**X Offset for U or UV Plane** Exists If: ([Surface Format] == 'PLANAR') Format: U14 This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the U plane or interleaved UV plane, depending on the setting of **Separate UV Plane Enable**. **Programming Notes** This field must be a multiple of 4 (bits 1:0 MBZ). If **Tiled Resource Mode** is enabled, this field must be a multiple of the tile width in pixels. **Auxiliary Surface Mode** is forced to AUX_NONE.
15	**YUV Interpolation Enable** Format: Enable **Description** This bit controls whether a Non-Planar YUV4:2:2 and Planar YUV4:2:0 surface use interpolated or replicated U and V channels for input to the Sampler filter. Programming to 1h causes interpolation of U and V channels. In this case the chrominance for odd pixels is computed by an interpolation between adjacent even pixels. Programming to 0h causes the chrominance to be copied from the pixel to the left. **Value** / **Name** / **Description** 0h / Disable **[Default]** / Programming to 0h causes the sampler to replicate U and V channels. This will lead to lower quality in certain cases where the YUV surface is being filtered (e.g. linear). 1h / Enable / Programming to 1h causes the sampler to interpolate the U and V channels between the horizontally neighboring pixels. This will improve image quality if the surface is being filtered.
14	**Reserved** Access: RO Format: MBZ
13:0	**Y Offset for U or UV Plane** Exists If: ([Surface Format] == 'PLANAR') Format: U14 This field specifies the vertical offset in rows from the **Surface Base Address** to the start (origin) of the U plane or interleaved UV plane, depending on the setting of **Separate UV Plane Enable**. **Programming Notes** For surfaces where **Surface Format** = PLANAR* and **Separate UV Plane** is Enabled, the Y Offset must be programmed in multiples of **half-rows**. For example, for a surface where Y is physically

followed by U and then V in memory, the Y Offset to U plane would be (2*Y-Height). For all other PLANAR YUV formats this is programmed in multiples of full rows.

For all format besides PLANAR_420_* This field must be a multiple of 4 (bits 1:0 MBZ). For formats PLANAR_420_* with separate chroma planes (e.g. YV12) this field must be multiple of 4 if U plane is the first chroma plane after the Y (luma) plane. It can be a multiple of 2 if it is the second chroma plane in memory. For formats PLANAR_420_* with interleaved chroma planes (e.g. NV12) this field can be multiple of 2.

If **Tiled Resource Mode** is enabled, this field must be a multiple of the tile height in rows.

Auxiliary Surface Mode is forced to AUX_NONE.

Workaround
For formats PLANAR_420_* when this field is not a multiple of 4 the Out-of-Bounds Supression check must be disabled to avoid false out of bound detection.

11:3 **Auxiliary Surface Pitch**

Exists If:	([Surface Format] != 'PLANAR')
Format:	U9-1

This field specifies the Auxiliary surface pitch in (#Tiles - 1).

Value	Name	Description
[0, 511]		-> [1 tile, 512 tiles]

2:0 **Auxiliary Surface Mode**

Exists If:	([Surface Format] != 'PLANAR')
Format:	U3

Specifies what type of surface the Auxiliary surface is. The Auxiliary surface has its own base address and pitch, but otherwise shares or overrides other fields set for the primary surface, detailed in the programming notes below.

Value	Name	Description
0h	AUX_NONE	No Auxiliary surface is used
1h	AUX_CCS_D	To be programmed only for Procedural Texture (PT). This mode is not valid for Render Targets.
2h	AUX_APPEND	The Auxiliary surface is an append buffer
3h	Reserved	
4h	AUX_MCS_LCE	[] Enables lossless compression on the top of MSAA compression for RTs with Number of Multisamples not equal to MULTISAMPLECOUNT_1. CCS is tiling format is linear. MCS tiling format is always tiledY.
5h	AUX_CCS_E	If Number of multisamples = 1, programming this value means lossless compression is enabled for that surface.Auxiliary surface is a CCS with linear tiling. AUX_CCS_E cannot be programmed for Procedural Texture surfaces

		If Number of multisamples > 1, programming this value means MSAA compression is enabled for that surface. Auxillary surafce is MSC with tile y.
6h	Reserved	
7h	Reserved	

Programming Notes
The CCS surface shares **Depth, Surface Type, Surface Array, Surface Min LOD, MIP Count / LOD, Surface Object Control State, Resource Min LOD**, and **Minimum Array Element** with the primary surface. **X & Y Offset** are set to zero for the purpose of accessing the Auxiliary surface. CCS Height and Width are scaled. CCS is always linear. MCS is always tile-y.
CCS surfaces are linear with **Tiled Resource Mode** of TRMODE_NONE regardless of the tile mode of the primary surface, and **Mip Tail Start LOD** is ignored for these surfaces.
The CCS Auxiliary surface for **Number of Multisamples** > 1 uses **Surface Horizontal Alignment** of 16 and **Surface Vertical Alignment** of 4 regardless of the primary surface's values for these fields.
If **Number of Multisamples** is MULTISAMPLECOUNT_1, AUX_CCS_E setting is only allowed if **Surface Format** is supported for Render Target Compression. This setting enables render target compression.
If **Number of Multisamples** is MULTISAMPLECOUNT_1, value of AUX_CCS_E is only allowed value if **Surface Format** is supported for Render Target Compression. If **Number of Multisamples** is other than MULTISAMPLECOUNT_1, value of AUX_MCS_LCE is only allowed if **Surface Format** is supported for Render Target Compression.
If **Number of Multisamples** is MULTISAMPLECOUNT_1, and if **Tiled Resource Mode** is NOT TRMODE_NONE, then, if CCS tile is NULL, Render Target Tiles represented by that CCS tile are assumed to be NULL by HW.
When Number of Multisamples > 1, and when MSAA compression is disabled, there is no way to enable lossless compression.
SW can enable lossless compression for MSRTs, by setting this the field to AUX_MCS_LCE for Render Targets with **Number of Multisamples** *not* equal to MULTISAMPLECOUNT_1. This value can not be progammed when **Number of Multisamples** equal to MULTISAMPLECOUNT_1.
Programming AUX_CCS_D is not allowed for all surfaces EXCEPT Procedural Texture (PT).
For an 8 bpp surface with NUM_MULTISAMPLES = 1, Surface Width not multiple of 64 pixels and more than 1 mip level in the view, Fast Clear is not supported when AUX_CCS_E is set in this field.
For Surface Type = SURFACETYPE_3D, Surface Format = 64bpp or 128bpp and Tiling Format = TiledYs, AUX_MODE must not be programmed to enable lossless compression or attaching CCS i.e. AUX_MODE must be programmed to AUX_NONE. except when Procedural Texture Enable bit is set. For Procedural Textures, Surface format TYS, 3D, 64/128 bpp is supported

ValidValue	Valu	Description	Msaa	CCS	Color	MCS	Msaa

	e		Mode	Aux Present	Compression Enabled	Aux Present	Compression Enabled
AUX_NONE	0	No Auxiliary surface is used					
AUX_CCS_D	1	To be programmed only for Procedural Texture (PT). This mode is not valid for Render Targets.	NA	True	False	False	False
AUX_APPEND	2	The Auxiliary surface is an append buffer	NA	-	-	-	-
RESERVED	3	-	-	-	-	-	-
AUX_MCS_LCE	4	Enables lossless compresion on the top of MSAA compression for RTs with **Number of Multisamples** *not* equal to MULTISAMPLECOUNT_1.	nX	True	True	True	True
AUX_CCS_E	5	If Number of multisamples = 1, programming this value means lossless compression is enabled for that surface. Auxiliary surface is a CCS with linear tiling.	1X	True	True	False	False
AUX_CCS_E	5	If Number of multisamples > 1, programming this value means MSAA compression is enabled for that surface. Auxillary surface is MSC with tiley.	nX	False	False	True	True

*nX = 2x, 4x, 8x, 16x

7	31	**Memory Compression Mode** Default Value: 0 Horizontal

Description
MBZ: Only Horizontal mode is supported.

30 **Memory Compression Enable**

Format:	Enable

This surface may contain compressed or compressible pixels. Memory compression will be attempted for writes to this surface. Reads from this surface will check for compressed data.

Programming Notes
Please refer to vol1a Memory Data Formats chapter section Media Memory Compression for more details, including format restrictions.

29:28 **Reserved**

Access:	RO
Format:	MBZ

27:25 **Shader Channel Select Red**

Format:	Shader Channel Select

Specifies which surface channel is read or written in the Red shader channel.

Programming Notes
For reads, the Shader Channel Select defines which surface channel is filled into the shader channel. If the Shader Channel Select is SCS_ZERO or SCS_ONE, then the shader channel takes on that fixed value, regardless of the surface channel's presence or value. Otherwise, if the Shader Channel Select is SCS_RED, SCS_GREEN, SCS_BLUE or SCS_ALPHA, then that surface channel is read into this shader channel. If the same Surface Channel Select appears for multiple shader channels, then that surface channel is replicated in each of those shader channels. If a Shader Channel Select is specified that is not present in the surface format, the value filled into the shader channel is undefined. Programs should always use SCS_ZERO or SCS_ONE for missing surface channels.
For writes, the Shader Channel Select defines which surface channel is written from the shader channel. If the Shader Channel Select is not present in the surface format or is SCS_ZERO or SCS_ONE, then the shader channel is not written to the surface. Otherwise, if the Shader Channel Select is SCS_RED, SCS_GREEN, SCS_BLUE or SCS_ALPHA, the shader channel is written to that surface channel. If more than one Shader Channel Select is set to the same surface channel, only the first shader channel in RGBA order will be written the surface channel, and subsequent shader channels with that Shader Channel Select are not written to the surface. If any surface channels are present but not specified by the Shader Channel Select, those surface channels are undefined (and might be written to zero). Programs should always specify the Shader Channel Select to cover all present surface channels.
Each Shader Channel Select must be set to the same surface channel (R = SCS_RED, G = SCS_GREEN, B = SCS_BLUE, A = SCS_ALPHA) if the surface is accessed via the sampler's sample_unorm* or sample_8x8 messages.
The Shader Channel Select fields do not affect the following sampling engine message types: resinfo, sampleinfo, LOD, and ld_mcs. These messages behave as if each Shader Channel Select is set to the same color surface channel.

For the sampling engine *gather4** messages, the Gather4 Source Channel Select field in the message header defines which channel's Shader Channel Select is used to select the surface channel to be sampled. Other Shader Channel Select fields are ignored.

For the sampling engine *sample*_c* and *gather4*_c* messages, the compare operation always occurs on the red channel from the surface regardless of the setting of the Shader Channel Select fields.

Restriction

For all Render Target and HDC messages, the Surface Channel Select is restricted to a subset of combinations that ensures, when reading the surface and then writing that value under the same Surface Channel Select, the identical value is put in memory. Any combination of Surface Channel Selects and channel surface format that do not guarantee this isomorphic property are not supported and may produce undefined results.
The isomorphism property is guaranteed by these restrictions:

- When the channel (R, G, B, A) is present in the surface format, then that channel (SCS_RED, SCS_GREEN, SCS_BLUE, SCS_ALPHA) is present exactly once in the 4 Surface Channel Selects (Red, Green, Blue, Alpha).
- For channels not present in the surface format, the corresponding Surface Channel Select is either SCS_ZERO or SCS_ONE.
- The Surface Channel Select for present channels either preserves or swaps the order of the surface channels. This guarantees write_swizzled(read_swizzled(x)) = x.

Render Target messages do not support swapping of colors with alpha. The Red, Green, or Blue Shader Channel Selects do not support SCS_ALPHA. The Shader Channel Select Alpha does not support SCS_RED, SCS_GREEN, or SCS_BLUE.

24:22 **Shader Channel Select Green**

Format:	Shader Channel Select

See **Shader Channel Select Red** for details.

21:19 **Shader Channel Select Blue**

Format:	Shader Channel Select

See **Shader Channel Select Red** for details.

18:16 **Shader Channel Select Alpha**

Format:	Shader Channel Select

See **Shader Channel Select Red** for details.

Programming Notes

For Render Target, this field MUST be programmed to value = SCS_ALPHA.

15:14 **Reserved**

Access:	RO
Format:	MBZ

	13:12	**Reserved** Access: RO Format: MBZ
	11:0	**Resource Min LOD** Format: U4.8 **For Sampling Engine Surfaces:**This field indicates the most detailed LOD that is present in the resource underlying the surface. Refer to the "LOD Computation Pseudocode" section for the use of this field. **For Other Surfaces:**This field is ignored. Value: [0,14] — Name: **Programming Notes** This field must be zero if the **ChromaKey Enable** is enabled in the associated sampler.
8..9	63:0	**Surface Base Address** Format: GA63_0 Specifies the byte-aligned base address of the surface. **Programming Notes** • For SURFTYPE_BUFFER render targets, this field specifies the base address of first element of the surface. The surface is interpreted as a simple array of that single element type. The address must be naturally-aligned to the element size (e.g., a buffer containing R32G32B32A32_FLOAT elements must be 16-byte aligned). • For SURFTYPE_BUFFER non-rendertarget surfaces, this field specifies the base address of the first element of the surface, computed in software by adding the surface base address to the byte offset of the element in the buffer. The base address must be aligned to element size. • Linear depth buffer surface base addresses must be 64-byte aligned. Note that while render targets (color) can be SURFTYPE_BUFFER, depth buffers cannot. • Mipmapped surfaces are stored in a "monolithic" (fixed) format, and only require a single address for the base MIP. All other MIPs are positioned relative to the base MIP. • The Base Address for linear (non-tiled) render target surfaces and surfaces accessed with the typed surface read/write data port messages must be element-size aligned for Non-YUV surface formats, or a multiple of 2 element-sizes for YUV surface formats. • Other linear (non-tiled) surfaces have no alignment requirements (byte alignment is sufficient). • For tiled surfaces, the actual start of the surface can be offset from the Surface Base Address by the X Offset and Y Offset fields. Tiles are inherently page-aligned (4K or 64K). • Certain message types used to access surfaces have more stringent alignment requirements. Please refer to the specific data-port message documentation for additional restrictions.

		Tiled surface base addresses must be 4KB-aligned. Note that only the offsets from Surface Base Address are tiled, Surface Base Address itself is not transformed using the tiling algorithm.
10..11	63:12	**Auxiliary Surface Base Address** Exists If: ([Surface Format] != 'PLANAR') AND [Memory Compression Enable] == 0 Format: GraphicsAddress[63:12] Specifies the 4kbyte-aligned base address of the Auxiliary surface associated with the primary surface specified in other SURFACE_STATE fields.
	61:48	**X Offset for V Plane** Exists If: ([Surface Format] == 'PLANAR') Format: U14 This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the V plane. **Programming Notes** This field must be a multiple of 4 (bits 1:0 MBZ). If **Tiled Resource Mode** is enabled, this field must be a multiple of the tile width in pixels. This field is ignored if **Separate UV Plane Enable** is disabled.
	45:32	**Y Offset for V Plane** Exists If: ([Surface Format] == 'PLANAR') Format: U14 This field specifies the vertical offset in rows from the **Surface Base Address** to the start (origin) of the V plane. **Programming Notes** For surfaces where **Surface Format** = PLANAR* and **Separate UV Plane** is Enabled, the Y Offset must be programmed in multiples of **half-rows**. For example, for a surface where Y is physically followed by U and then V in memory, the Y Offset to V plane would be (2*Y-Height+ U-Height). For all other PLANAR YUV formats this is programmed in multiples of full rows (e.g Y-Height + U-Height). For all format besides PLANAR_420_* This field must be a multiple of 4 (bits 1:0 MBZ). For formats PLANAR_420_* this field must be multiple of 4 if U plane is the first chroma plane after the Y (luma) plane. It can be a multiple of 2 if it is the second chroma plane. For formats PLANAR_420_* when this field is not a multiple of 4 the Out-of-Bounds Suppression check must be disabled to avoid false out of bound detection. If **Tiled Resource Mode** is enabled, this field must be a multiple of the tile height in rows. This field is ignored if **Separate UV Plane Enable** is disabled.
	11	**Procedural Texture** This bit, when set, indicates that the associated surface is a procedural texture which is used for AMFS. This bit can be ENABLED for the following surface types: SURFTYPE_2D arrayed / non-arrayed, SURFTYPE_3D non-arrayed, SURFTYPE_CUBE arrayed/ non arrayed, and surftype = NULL. This bit can be set for the pixel formats that are supported has typed UAVs as per the DX spec. Therefore,

writes from only HDC are supported to Procedural Textures.
This bit cannot be ENABLED for the following surface types: SURFTYPE_3D arrayed, SURFTYPE_BUFFER

Programming Notes
This bit cannot be set when surface walk (tiling mode) is legacy Y This bit cannot be set when Tiled Resource Mode = TileYS and LOD >= MIP tail LOD

10 **Clear Value Address Enable**

Format:	Enable

This field enables HW Managed Clear Value Layout for the Surface State. If this bit is enabled, Clear Value Address is present instead of explicit clear values.

Value	Name	Description
0h	Disable **[Default]**	Clear values are present in the surface state explicitly.
1h	Enable	Clear value Address is present instead of explicit clear values.

Programming Notes
Clear values can only be enabled for sampled surface formats which are supported for clear in the Pixel Data Port. See Render Target Surfaces section of **Pixel Data Port** for a list of surface types supported . This bit has to be programmed to 1 if clear buffer is attached to the surface or if AUX_MODE is AUX_CCS_E. No support for explicit clear values. Only hw managed clear values are supported.

9:5 **Quilt Height**

Format:	U5

This field specifies the height of a quilted texture in units of quilt slices. Refer to the section on Quilted Textures for more details.

Value	Name	Description
[0,31]		representing height of quilt - 1 (y/v dimension)

Programming Notes

Programming Notes
• Only power-of-2 **Quilt Height** and **Quilt Width** values are allowed: (1,2,4,8,16,32) mapping to (0,1,3,7,15,31) values in the fields.
• A surface is defined as a quilted texture if either **Quilt Height** or **Quilt Width** is nonzero (actual field value, not the incremented value).
• A quilted texture
  • is only supported by the sampling engine (other shared functions will ignore the **Quilt Width** and **Quilt Height** field, behaving as if they are set to zero).
  • must have a **Surface Type** of SURFTYPE_2D.
  • must have **Number of Multisamples** set to NUMSAMPLES_1.
  • must have **Vertical Line Stride** set to 0.
  • must have **Auxiliary Surface Mode** set to AUX_NONE.

- **Depth** indicates the array dimension of the quilted texture if **Surface Array** is enabled. The valid range of **Depth** is [0, 2048 / (QuiltWidth * QuiltHeight) - 1], i.e. the total number of underlying array slices including quilt slices cannot exceed 2048.
- cannot be accessed with any ld* message type or using a sampler with the **Non-Normalized Coordinate Enable** field enabled.

Quilted surfaces are not supported and this field must be programmed to 0h

4:0 **Quilt Width**

Format:	U5

This field specifies the width of a quilted texture in units of quilt slices. Refer to the section on Quilted Textures for more details.

Value	Name	Description
[0,31]		representing width of quilt - 1 (x/u dimension)

Programming Notes

Quilted surfaces are not supported and this field must be programmed to 0h

12 31:6 **Clear Address Low**

Format:	GraphicsAddress[31:6]

Description

For Sampling Engine Surfaces and Render Targets: Specifies the lower bits of Graphics Address where clear value is stored in
The memory layout of the clear color pointed to by this address is a value stored in the lower-order bytes of a 64-byte cache-line.
The clear color will be formatted as 32-bit IEEE Floating-point per channel, 32-bit UINT per channel, 32-bit SINT per channel, or SRGB depending on the surface type (e.g. R32G32B32A32_UINT surfaces assume use 32-bit UINT for clear color). 3D Sampler will always fetch clear color from the location 16-bytes above this address, where the clear color, converted to native surface format, will be stored.
For Sampling Engine Surfaces and Render Targets with Depth Surfaces: Specifies the lower bits of Graphics Address where the depth clear value is stored.
The memory format is IEEE 32 bit float. The numeric range is required to match the numeric range limitations of 3DSTATE_CLEAR_PARAMS:Depth Clear Value.
3D Sampler will always fetch clear depth from the location 16-bytes above this address, where the clear depth, converted to native surface format by software, will be stored.

For D24X8 depth surfaces (R24_UNORM_X8_TYPELESS), the format of the data at this location shall be UNORM24_X8 rather than a 32-bit format.

Render Data Port Message Types

MT_DP_RT - Render Data Port Message Types

Source:	EuSubFunctionRenderDataPort
Size (in bits):	5
Default Value:	0x0000000C

Lists all the Message Types in a Render Data Port Message Descriptor [18:14].

DWord	Bit	Description
0	4	**Reserved** Access: RO Format: MBZ
	3:0	**Message Type** Specifies type of message

Value	Name	Description
0Ch	MT_RTW **[Default]**	Render Target Write message
0Dh	MT_RTR	Render Target Read message
Others	Reserved	Ignored

Render Engine Interrupt Vector

RENDER_INTR_VEC - Render Engine Interrupt Vector

Size (in bits): 16

Default Value: 0x00000000

DWord	Bit	Description
0	15	**Catastrophic Error** This interrupt signals that a unrecoverable errorduring the engine processing. When Memory interface signals this error, the Command Streamer will stop parsing any more instructions. Scheduler is expected to reset the engine to evict the context
	14	**EU Restart Interrupt** EU Restart Interrupt is generated by the GA fabric, and not by Render Command Streamer. GA routes this interrupt to GuC independently of Command Stream.
	13	**Context Stall** Command streamer will generate a Context Stall interrupt when a high priority context gets stalled due to the other command streamer executing a normal priority or lowpriority context is "Run Alone" mode OR Command streamer will generate a Context Stall interrupt when a high priority context gets stalled while procuring run alone mode.
	12	**Reserved** Access: RO Format: MBZ
	11	**CS Wait On Semaphore**
	10	**Spare 10**
	9	**CS TR Invalid Tile Detection**
	8	**CS Context Switch Interrupt**
	7	**Legacy Context Per Process Page Fault Interrupt** This Fault interrupt is only delivered to the Host SW (not to GuC). Fault interrupt is generated by GA fabric, not by the CS This interrupt is for handling Legacy Page Fault. When Fault Repair Mode is enabled, Interrupt mask register value is not looked at to generate interrupt due to page fault. Please refer to vol1c "page fault support" section for more details. In Advanced (PRQ) Fault Interface is done through GUC interface.
	6	**CS Watchdog Counter Expired**
	5	**Spare 5**
	4	**CS PIPE_CONTROL Notify**
	3	**CS Error Interrupt**
	2	**Spare 2**

RENDER_INTR_VEC - Render Engine Interrupt Vector		
	1	**Reserved**
	0	**CS MI User Interrupt**

Render Target Index Message Header Control

MHC_RT_RTI - Render Target Index Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:3	**Reserved** Access: RO Format: MBZ
	2:0	**Render Target Index** Format: U3 Specifies the render target index that will be used to select blend state from BLEND_STATE.

Render Target Message Header

MH_RT - Render Target Message Header

Size (in bits): 512

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.0	31:0	**Render Target Controls 0** Format: MHC_RT_C0 Specifies controls for Render Target Write and Read messages.
0.1-0.1	31:0	**Color Calculator State Pointer** Format: MHC_RT_CCSP For Render Target Write message, specifies the HWORD-aligned GeneralStateOffset for Color State. Ignored by Render Target Read message.
0.2-0.2	31:0	**Render Target Index** Format: MHC_RT_RTI For Render Target Write message, specifies the render target index used to select blend state from BLEND_STATE. Ignored by Render Target Read message.
0.3-0.4	63:0	**Reserved** Access: RO Format: MBZ
0.5-0.5	31:0	**Color Code** Format: MHC_RT_CC Hardware uses to track synchronizing events and free resources on thread completion.
0.6-0.7	63:0	**Reserved** Access: RO Format: MBZ
1.0-1.0	31:0	**Reserved** Access: RO Format: MBZ
1.1-1.1	31:0	**Poly 0** Format: MHC_RT_POLY Poly Information

MH_RT - Render Target Message Header		
1.2-1.2	31:0	**Subspan 0** Format: **MHC_RT_SUBSPAN** Upper left corner of subspan 0
1.3-1.3	31:0	**Subspan 1** Format: **MHC_RT_SUBSPAN** Upper left corner of subspan 1
1.4-1.4	31:0	**Subspan 2** Format: **MHC_RT_SUBSPAN** Upper left corner of subspan 2
1.5-1.5	31:0	**Subspan 3** Format: **MHC_RT_SUBSPAN** Upper left corner of subspan 3
1.6-1.6	31:0	**Poly 1** Format: **MHC_RT_POLY** Poly Information for second poly when dual-SIMD8 dispatch
1.7-1.7	31:0	**Pixel Sample Enables** Format: **MHC_RT_PSM** Pixel Sample Enables

Render Target Message Header Control

MHC_RT_C0 - Render Target Message Header Control

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31:15	**Reserved** Access: RO Format: MBZ
	14	**Stencil Present to Render Target** Format: Enable For Render Target Write message, indicates that computed stencil is included in the message. Must be zero for Render Target Read message.
	13	**Source Depth Present to Render Target** Format: Enable For Render Target Write Message, indicates that source depth data is included in the message. Must be zero for Render Target Read message.
	12	**oMask to Render Target** Format: Enable For Render Target Write message, indicates that oMask data is present in the message and is to be used to mask off samples. Must be zero for Render Target Read message.
	11	**Source0 Alpha Present to Render Target** Format: Enable For Render Target Write message, indicates that Source0 Alpha (aka o0.a) data is included in RTWrite message. If present, these alpha values are used as inputs to AlphaTest and AlphaToCoverage functions. This is required to meet the API rules when writing to multiple render targets (MRTs). Must be zero for Render Target Read message. **Programming Notes** This bit should not be set when write to RT0, though sending and using redundant alpha will provide the correct results (at lower performance). This bit is not supported on Dual-Source Blend message types, as source0 alpha is already included in those messages. This bit is not supported on replicated data message types.
	10	**Reserved** Access: RO Format: MBZ

MHC_RT_C0 - Render Target Message Header Control

	9:6	**Sample Index** Format: U4 When pixel shader is dispatched in per-pixel mode with Per-Sample PS Enable bit set, this field indicates the index of a sample referenced by per-sample RT read or RT write messages. Range = [0, 15].
	5:0	**Reserved** Access: RO Format: MBZ

Render Target Message Header Poly

MHC_RT_POLY - Render Target Message Header Poly

Size (in bits): 32

Default Value: 0x00000000

DWord	Bit	Description
0	31	**Reserved** Access: RO Format: MBZ
	30:27	**Viewport Index** Format: U4 For Render Target Write message, specifies the index of the viewport currently being used. Range = [0,15] Ignored by Render Target Read message.
	26:16	**Render Target Array Index** Format: U11 Specifies the array index to be used for the following surface types: SURFTYPE_1D: specifies the array index. Range = [0,511] SURFTYPE_2D: specifies the array index. Range = [0,511] SURFTYPE_3D: specifies the Z or R coordinate. Range = [0,2047] SURFTYPE_BUFFER: must be zero. SURFTYPE_CUBE: specifies the face identifier. Mapping (0,+x) (1,-x) (2,+y) (3,-y) (4,+z) (5,-z). **Programming Notes** The Render Target Array Index used by hardware for access to the Render Target is overridden with the Minimum Array Element defined in SURFACE_STATE if it is out of the range between Minimum Array Element and Depth. For cube surfaces, a depth value of 5 is used for this determination.
	15	**Front/Back Facing Polygon** Format: U1 Determines whether the polygon is front or back facing. Used by the render cache to determine which stencil test state to use. Value / Name / Description 0h / Front facing / All 1h / Back facing / All
	14:9	**Reserved** Access: RO Format: MBZ
	8:6	**Starting Sample Pair Index** Format: U3 Indicates the index of the first sample pair of the dispatch. Range = [0,3]

MHC_RT_POLY - Render Target Message Header Poly		
	5:0	**Reserved** Access: RO Format: MBZ

Replicated Pixel Render Target Data Payload Register

MDPR_RGBA - Replicated Pixel Render Target Data Payload Register

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**Red** Format: U32 Specifies the value of all slots' red channel.
1	31:0	**Green** Format: U32 Specifies the value of all slots' green channel.
2	31:0	**Blue** Format: U32 Specifies the value of all slots' blue channel.
3	31:0	**Alpha** Format: U32 Specifies the value of all slots' alpha channel.
4..7	127:0	**Reserved** Access: RO Format: MBZ

Replicated SIMD16 Render Target Data Payload

MDP_RTW_16REP - Replicated SIMD16 Render Target Data Payload		
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**RGBA** Format: MDPR_RGBA RGBA for all slots [15:0]

Reversed SIMD Mode 2 Message Descriptor Control Field

MDC_SM2R - Reversed SIMD Mode 2 Message Descriptor Control Field

Size (in bits): 1

Default Value: 0x00000000

DWord	Bit	Description
0	0	**SIMD Mode** Format: Boolean Specifies the SIMD mode of the message (number of slots processed) Value / Name / Description 00h / SIMD16 / SIMD16 01h / SIMD8 / SIMD8

S0A SIMD8 Render Target Data Payload

MDP_RTW_A8 - S0A SIMD8 Render Target Data Payload

Size (in bits): 1280

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha** Format: MDP_DW_SIMD8 Slots [7:0] Source 0 Alpha
1.0-1.7	255:0	**Red** Format: MDP_DW_SIMD8 Slots [7:0] Red
2.0-2.7	255:0	**Green** Format: MDP_DW_SIMD8 Slots [7:0] Green
3.0-3.7	255:0	**Blue** Format: MDP_DW_SIMD8 Slots [7:0] Blue
4.0-4.7	255:0	**Alpha** Format: MDP_DW_SIMD8 Slots [7:0] Alpha

S0A SIMD16 Render Target Data Payload

MDP_RTW_A16 - S0A SIMD16 Render Target Data Payload	
Size (in bits):	2560
Default Value:	0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Source 0 Alpha[7:0]** Format: MDP_DW_SIMD8 Slots [7:0] Source 0 Alpha
1.0-1.7	255:0	**Source 0 Alpha[15:7]** Format: MDP_DW_SIMD8 Slots [15:8] Source 0 Alpha
2.0-2.7	255:0	**Red[7:0]** Format: MDP_DW_SIMD8 Slots [7:0] Red
3.0-3.7	255:0	**Red[15:8]** Format: MDP_DW_SIMD8 Slots [15:8] Red
4.0-4.7	255:0	**Green[7:0]** Format: MDP_DW_SIMD8 Slots [7:0] Green
5.0-5.7	255:0	**Green[15:8]** Format: MDP_DW_SIMD8 Slots [15:8] Green

MDP_RTW_A16 - S0A SIMD16 Render Target Data Payload		
6.0-6.7	255:0	**Blue[7:0]** Format: MDP_DW_SIMD8 Slots [7:0] Blue
7.0-7.7	255:0	**Blue[15:8]** Format: MDP_DW_SIMD8 Slots [15:8] Blue
8.0-8.7	255:0	**Alpha[7:0]** Format: MDP_DW_SIMD8 Slots [7:0] Alpha
9.0-9.7	255:0	**Alpha[15:8]** Format: MDP_DW_SIMD8 Slots [15:8] Alpha

SAMPLER_BORDER_COLOR_STATE

SAMPLER_BORDER_COLOR_STATE

Size (in bits): 128

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

Description

The interpretation of the border color depends on the Texture Border Color Mode field in SAMPLER_STATE as follows:

- DX9 mode: The border color is 8-bit UNORM format, regardless of the surface format chosen. For surface formats with one or more channels missing (i.e. R5G6R5_UNORM is missing the alpha channel), the value from the border color, if selected, will be used even for the missing channels.
